* J%S%~??K " ^ PJMtt^ In young ? mice, die pituitary of ducks receiving 25 fig, reserpine/100.a.) day or kept in artificial Ught showed a decrease in the gonadotrophic hormone content compared with normal birds, as shown by a decrease in follicle maturation of the ovary. Implantation of the pituitary of ducks to the crop of pigeons showed that prolactin level was higher in ducks stimulated by Ught than in normal ducks. The former contained the same amount of prolactin as ducks stimulated by Ught and receiving reserpine and more than iliose receiving reserpine. (French) M.A.Price

4581. ENZYMIC ACTIVITY IN PITUITARY OF EQUUS CABALLUS L. L.Arvy: C.R. Soc. Biol., Paris, 1962, 156, 1758-1759 (Lab. Physiol. du C.N.R.S., Jouy-en-Josas, S.-et-O.. France) The pars intermedia of the pituitary of *E. caballus* contained the highest activity of phosphomonoesterase and 5-nucleotidase. With the exception of the cells of the pars tuberalis, the cells of the pars distalis hydrolysed Na glycerophosphate in acid media. The pars intermedia hydrolysed a-naphthol acetate but not ACh or butyryl choline. The cells of the pars distalis and pars nervosa hydrolysed the choline esters. The pars intermedia contained the highest S-alucuronidase activity. (French) M.A.Wce

**4582. MODIFICATIONS IN NEUROSECRETORY ACTIVITY
OF HYPOTHALAMUS AND VOLUME TO C V A R & T I O N S
IN PITUITARY OF WHITE MICE: DURING PROMNGED
PERIODS WITHOUT WATER.**

WATER : . s . ol.
W S ^ 15¹⁶ ^ 1666 K^HiSot Sc^de
 (e., Nn^y, France) Involution of the pars intermedia, observed in mice after a period without water, was explained by hyperactivity of the hypothalamus accompanied by an increase in vol. of the pan nervosa. A measurement of the diam. of the cells of the supraoptic nucleus showed a marked decrease during the first 4 months of life, remaining const. up to 10 months. (French) M.A.Ptice

45 \wedge S ? » SK B C T S \wedge SLOW INFUSIONS OF HYPER-TONIC SOLUTIONS ON DRINKING AND DRINKING

PHYSIOLOGY

THRESHOLDS IN RATS. J.T.Fitzsimons: *J. Physiol., Lond.*, 1963, 167, 344-354 (Physiol. Lab., Univ. Cambridge, England) The amounts of water drunk by nephrectomised rats after slow infusions or rapid injn. of varying amounts of hypertonic NaCl, Na₂SO₄, sucrose or urea so In. were the same. NaCl and Na₂SO₄ were diluted to isotonicity by drinking. Sucrose was less effective as a drinking stimulus, and urea least effective. The threshold of drinking of normal rats infused with hypertonic NaCl was 1>6% increase in osmotic pressure. The NaCl and NtySty threshold of nephrectomised rats was about 2%, the sucrose threshold 2-4% and the urea threshold 5 *6%. The rate of infusion did not affect threshold. When drinking water was withheld up to 24 hr. after injn. of hypertonic NaCl into nephrectomised rats the amount of water drunk subsequently was the same as when drinking was allowed immediately after injn. Receptors for thirst do not adapt. *

4584. ESTIMATION OF VASOPRESSIN IN THE BLOOD AND URINE OF HYDRATED AND DEHYDRATED SUBJECTS. J.Lee: *J. Physiol., Lond.*, 1963, 167, 256-262 (Physiol. Lab., Charing Cross Hosp. Med. Sch., London, England) Blood samples from hydrated and dehydrated subjects were cone, and extracts prepared. In the majority of cases an extract of urine was prepared. The assays for antidiuretic activity were carried out on the water loaded rat under ethanol anaesthesia, using i.v. injn. As the antidiuretic activity was inactivated by Na thioglycollate, it was believed justifiable to assume that the activity when present was due to vasopressin. Normal hydrated subjects excreted < 10 mU./24 hr. of vasopressin, but it was never possible to detect the hormone in the blood even in subjects dehydrated for 24 hr.; the threshold of sensitivity of the method varied between 0*002 and 0*015 mU of vasopressin/ml. of blood. In dehydration (24 hr.) the rate of excretion of vasopressin amounted to 2 to 3 mU/hr., and with more severe dehydration it rose to 10 to 12 mU/hr. *

4585. STUDY OF INTERPHASE IN EXPERIMENTAL DIABETES INSIPIDUS. J.D.Crawford and L.R.Jrost: *Endocrinology*, 1963, 72, 677-683 (Pediat. Dept., Harvard Med. Sch., Boston, Mass., U.S.A.) The interphase of diabetes insipidus induced by electrolytic interruption of the supra-optic tract in rats has been studied in detail. Changes in water turnover observed are due to fluctuations in circulating vasopressin. H.C.Jones

4586. NEUROENDOCRINE CONTROL OF IHYROTROPHIN SECRETION IN RAT. W.H.Florsheim, N.S.Austin and S.M.Velcoff: *Endocrinology*, 1963, 72, 817-823 (U.S. Veterans' Hosp., Long Beach, Calif., U.S.A.) Hypothalamic lesions do not affect pituitary TSH function via control of pituitary blood flow. Cross-circulation expt. showed the presence of a neurohumour from the hypothalamus of a hypophysectomised rat which reversed goitre block induced by hypothalamic lesions in a 2nd rat. H.C.Jones

4587. NORMAL IHYROID FUNCTION AND RESPONSE TO HEMITHYROIDECTOMY IN CAT. K.M.Kuigge: *Anat. Rec.*, 1961, 141, 151-158 (Dept. Anat., Sch. Med., Univ. Cincinnati, Ohio, U.S.A.) Several parameters of normal thyroid function and response to hemithyroidectomy were studied in adult <f cats. A method of calculating the wt. of the intact lobe at the time of operation is presented. Two weeks after hemithyroidectomy 131I uptake of the intact lobe increases 230%, conversion ratio

and wt. of the lobe increases 110% and 44% respectively at 4 weeks, PBI levels reach supranormal levels (+ 40%) at 12 weeks. A steady state is achieved 32-48 weeks after operation with the intact lobe exhibiting 40% greater 131I uptake, a 15% wt. increase, a 45% decrease in ¹²⁷I concn. and a conversion ratio elevated 37%. F.Beck

4588. EFFECT OF RELAXIN ON THYROID FUNCTION IN RAT. E.R.Plunkett, B.P.Squires and F.C.Heagy: *J. Endocr.*, 1963, 26, 331-338 (Collip Med. Res. Lab., Univ. W. Ontario, London, Ont., Canada) Administration of relaxin to intact oestrus rats or oestrogen-treated spayed rats resulted in increased uptake of 131I by the thyroid. In the latter group plasma PB 131I and thyroid wt. were also elevated. Since these effects of relaxin were absent in hypophysectomised animals it is suggested that the thyroid-stimulating activity is mediated by release of increased amounts of pituitary TSH. CF.Blane

4589. THYROID FUNCTION IN CHICKENS AND RATS. **EFFECT OF IODINE CONTENT OF DIET AND HYPOPHYSECTOMY ON IODINE METABOLISM IN WHITE LEGHORN COCKERELS AND LONG-EVANS RATS.** L.R.Rosenberg, M.K.Dimick and G.Laroche: *Endocrinology*, 1963, 72, 749-758 (Anat. Dept., Univ. California, Berkeley, Calif., U.S.A.) In expt. using 131I, cockerels on a low I diet showed hyperthyroid activity with low levels of circulating thyroid hormone. When the diet was supplemented with I the thyroid activity fell. After hypophysecomy high thyroid activity was observed but there was reduced labelling of thyroglobulin thyroxine. Similar results were obtained in rats. H.C.Jones

4590. UPTAKE OF *31I BY THYROIDS OF RATS DURING HEALING OF FRACTURES. F.A.Soliman, A.H.Said, M.K.Soliman and M.S.Abdo: *Nature, Lond.*, 1963, 198, 203 (Dept. Physiol., Fac. Vet. Med., Giza, U.A.R.) In rats with expt. induced tibial fractures, thyroid function was estimated after injn. of 131I. Thyroid activity increased during the stage of cellular regeneration of callus formation, after which it dropped to normal value. G.M.Lewis

4591. THYROKINE AND THE OXIDISED FLAVOUR IN MILK. H.Astrup: *Nature, Lond.*, 1963, 198, 192-193 (Agric. Coll. of Norway, Vollebekk, Norway) Oral administration of thyroxine (200 mg. twice a day for 3 days) to cows significantly increased die oxidised flavour of the milk. Thiouracil (in 9 g. portions) had no effect. G.M.Lewis

4592. EFFECTS OF D-THYROXINE ON NORMAL SUBJECTS. R.Bames, J.A.P.Trafford and P.M.F.Bishop: *Brit. med. J.*, 1962, ii, 20-22 (Guy's Hosp., London, England) Results of a double blind trial indicate that Na D-thyroxine reduced mean serum cholesterol of normal euthyroid subjects by 48 mg./100 ml. (22*3%). This finding is contrary to previous reports. Thejy* was no significant change in wt. or B.M.R. in the groups, but radio-iodine uptake was reduced in all but 2 of 32 subjects after thyroxine. M.E.Nutt

REPRODUCTION AND GONADS

4593. MATERNAL BEHAVIOUR IN RABBIT: CRITICAL PERIOD FOR NEST BUILDING FOLLOWING CASTRATION DURING PREGNANCY. M.Zanow, A.Jaroor and

PHYSIOLOGY

443

V.H.Denenberg: Proc. Soc. exp. Biol., N.Y., 1962, 111, 537-538 (Dept. Biol. Sci., Purdue Univ., Lafayette, Ind., U.S.A.) Circulation of ovarian steroids for a period of 16-17 days, after onset of gestation, is necessary for the occurrence of nest building.

M.M.Shapland

4594. RESPONSE TO HANDLING AS A FUNCTION OF SEX AND EMOTIONAL DIFFERENCES IN THE ALBINO RAT. L.A.Stone and CSJ.Cnutson: J. genet. Psychol., 1963, 102, 69-74 (Dept. Psychol., Univ. N. Dakota, Grand Forks, N.Dak., U.S.A.) When T and ? rats were handled the ? showed more uncooperative response than cf. Uncooperative response to handling was significantly related to urinary response but not to defaecatory response. There was no relationship between urinary response and defaecatory response during testing under the same stress conditions. J.R.Broome

4595. HORMONAL REQUIREMENTS FOR INTERPUBIC LIGAMENT FORMATION IN HYPOPHYSECTOMISED MICE. B.C.Steinert and V.L.Beach: Endocrinology, 1963, 72, 771-776 (Warner-Lambert Res. Inst., Morris Plains, N.J., U.S.A.) Hypophysectomy of mice prevented or reduced interpubic ligament formation due to injn. of oestradiol cyclopentyl propionate [ECP] and combinations of ECP with relaxin. Thyroid administration improved the effect of ECP combined with relaxin, and GH prep, improved the pubic ligament response to both ECP alone and ECP with relaxin. H.C.Jones

4596. ACTION OF PINEAL GLAND EXTRACTS ON RESPONSE OF GENITAL TRACT OF RATS EXPOSED TO CONTINUOUS LIGHT. A.Moszkowska and M. des Gouttes: C.R. Soc. Biol., Paris, 1962, 156, 1750-1757 (Lab. de Histophysiol., Coll. de France, Paris, France) Water sol. extracts of pineal glands retarded vaginal opening and the first oestrus in rats exposed to continuous light. They inhib. hypertrophy of the ovary & development of follicles and opposed the maintenance of permanent oestrus. The extracts prevented the decrease in wt. of the pineal gland which occurred in untreated animals exposed to continuous light.

(French) M.A. Price

***597. ACTIVE LIPIDS IN MENSTRUAL FLUID.** V.R. Pickles: Biochem. Pharmacol., 1963, 12, 429-430 (Dept. Physiol., Univ. Sheffield, England) A group of lipid smooth muscle stimulants is liberated from the human endometrium during menstruation and may in part be recovered from the menstrual fluid. These stimulants cause the strong rhythmical uterine contractions that ext. the decidua menstrualis. L.G.Gillies

4598. EFFECTS OF GONADOTROPHIC HORMONES ON CONCENTRATION OF ASCORBIC ACID OF RAT OVARY. D.Foreman: Endocrinology, 1963, 72, 693-700 (Biol. Dept., Squire Vall^ue Farm, Western Reserve Univ., Cleveland, Ohio, U.S.A.) Ovarian ascorbic acid concn. of rats was found to be highest in dioestrous and lowest at oestrus. I.v. FSH and LH administration increased the ascorbic acid concn. but LTH, and GH did not. s.c. administration of FSH resulted in an increase in ascorbic acid concn. and s.c. IH and LTH resulted in a decrease in concn. H.C.Jones

599. GENETIC AND HORMONAL INFLUENCES ON OVULATION AND IMPLANTATION IN ADULT MICE TREATED WITH GONADOTROPHINS. R.G.Edwards and J.D.Wilson: J. Endocr., 1963, 26, 389-399 (Nat. Inst. Res., M.I.U. Hill, London, England) Details are

given of the effects of the strain of mice used, the dose of hormone, the innate oestrus cycle, and the injn. of prolactin on ovulation and implantation after treatment with gonadotrophins. Pre-treatment consisted of pregnant mare's serum gonadotrophin followed after 40 hr. by human chorionic gonadotrophin. While a suitable dose schedule would induce ovulation in all ? mice, the proportion of ova which implanted decreased with increasing dose of gonadotrophin. G.F.Blane

4600. RESPONSES TO GONADOTROPHIN IN INTACT AND HYPOPHYSECTOMISED IMMATURE FEMALE RATS AS RELATED TO AGE. E.H.Soper and A.J.Ladman: Proc. Soc. exp. Biol., N.Y., 1962, 111, 573-576 (Dept. Anat., Univ. Tennessee Med. Units, Memphis, Tenn., U.S.A.) Ovarian and uterine responses of 28-, 30-, and 33-day old normal and hypophysectomised rats to a single injn. of gonadotrophin 24 hr. prior to killing indicate that the intact pituitary is elaborating measurable amounts of hormone during this time interval.

M.M.Shapland

4601. OVULATION IN RABBIT: TIME OF FOLLICULAR RUPTURE AND EXPULSION OF EGGS, IN RELATION TO INJECTION OF LH. M.J.K.Harper: J. Endocr., 1963, 26, 307-316 (A.R.C. Unit of Reproductive Physiol., Univ. Cambridge, England) In rabbits treated with 25-50 I.U. IH no ovulation occurred within 10 hr., 50% ovulation between 104 and 10J hr., and 100% by 14 hr. (% of total no. of ripe follicles counted which had ruptured). From observations on the position of the released ova it appeared that appreciable time may elapse between follicular rupture and entry of ova into the Fallopian tube. G.F.Blane

4602. QUANTITATIVE STUDY OF RESPONSE TO LH AFTER HYPOPHSECTOMY IN OVARIAN ASCORBIC ACID DEPLETION TEST: EFFECT OF PROLACTIN. R.Guillemin and E.Sakiz: Endocrinology, 1963, 72, 813-816 (Lab. de Morphol. exp. et Endocrinol., Coll. de France, Paris, France) Using the ovarian ascorbic acid test for LH in rats it was found that the ascorbic acid content and response to inj. LH fell markedly a few hr. after hypophysectomy. Administration of prolactin at hypophysectomy prevented these effects. H.C.Jones

4603. ACTION OF PURIFIED GONADOTROPHIN ON CORPORA LUTEA IN TOE CYCLIC MOUSE. H.C.Brown, C.A.Large and W.D.White: Proc. Soc. exp. Biol., N.Y., 1962, 111, 686-690 (Dental Branch, Univ. Texas, Houston, Tex., U.S.A.) The life of hyperaemic (functional) corpora lutea in intraocular ovarian transplants in castrated ♀ mice was between one and two days. It was not affected by injn. of 0-1 mg. of FSH or LH every 12 hr. It was extended to approx. 5, 8 and 7 days respectively by 0*025, 0*1, or 0-2 mg. of luteotropic hormone [LTH] and to 17 days by 0-1 mg. of IH with 0*1 mg. of LTH. Deciduoma occurred in animals receiving 0*1 mg. LTH, or 0*1 mg. IH and LTH, but not in those receiving 0*025 mg. LTH or 0*1 mg. LH.

M.M.Shapland

4604. UTERUS AND OCCURRENCE OF OESTRUS IN PIGS. L.L.Anderson, R.L.Butcher and R.M.Melampy: Nature, Land., 1963, 198, 311-312 (Dept. Anim. Sci., Iowa State Univ., Ames, Iowa, U.S.A.) The persistence of corpora lutea and occurrence of oestrus in pigs after sub-total hysterectomy (from post, halves of oviducts to mid-cervix) was studied. Uterine autotransplants were made in immature gilts; after puberal oestrus, the transplants remained well developed only in cycling gilts.

PHYSIOLOGY

indicating that a certain amount of functional endometrium is necessary to provide a luteolytic stimulus for the regression of corpora lutea. Results from both expt. suggested that direct neural pathways from the uterus are not necessary for supplying the luteolytic stimulus.

G.M.Lewis

4605. EFFECT OF ALCOHOL ON RELEASE OF OXYTOCIN. A.R.*Fuchs and G.Wagner: *Nature*, Lond., 1963, 198, 92-94 (Inst. Med. Physiol., Univ. Copenhagen, Denmark) Uterine motility was measured in rabbits by means of a water-filled rubber balloon inserted into the uterus after delivery of young. Studies were made of the effect of inj. oxytocin and suckling young on uterine motility. Ethanol inhib. the release of oxytocin from the neurohypophysis. These results were confirmed on a human patient post-partum in which uterine motility was recorded externally.

CM.Lewis

4606. METABOLIC ACTIVITY OF OXYTOCIN IN THE Puerperium. R.L.Burt, N.H.Leake and W.N.Dannenburg: *Nature*, Lond., 1963, 198, 293 (Dept. Obstet., Bowman Gray Sch. Med., Winston-Salem, N.C., U.S.A.) I.v. administration of oxytocin to normal women within 36 hr. of delivery resulted in a decrease in blood glucose, increase in non-esterified fatty acid and little change in inoig. PO₄. The significance of these metabolic effects is discussed.

G.M.Lewis

4607. ORIGIN AND MODE OF PROPAGATION OF CONTRACTION WAVE IN HUMAN UTERUS. H.Niu and A.Nakajima: *Bull. Yamaguchi med. Sch.*, 1962, 9, 73-80 (Dept. Physiol., Yamaguchi Med. Sch., Ube, Japan) Excitation could originate from any part of the fundus, as studied by simult. recording of action potential from 3 parts of human uterus. In vertical aspect of the uterus, the excitation usually was conducted downwards, but sometimes it was conducted upwards. It is suggested that the pacemaker area may be also found somewhere in the middle or lower part of the uterus as well.

K.Jones

4608. EFFECT OF AN INFUSION OF PHOSPHOLIPID ON HUMAN MYOMETRIUM EARLY IN PREGNANCY. P.A. Jarvinen, T.Luukkainen, R.V.Short, H.Adlercreutz, S. Pesonen and E.Huhmar: *Ann. Med. exp. Fenn.*, 1963, 41, 21-26 (2nd Dept. Obstet and Gynec., Central Hosp., Univ., Helsinki, Finland) An i.v. fat emulsion, 'Infonutrol' was given to 11 patients admitted to hospital for legal abortions. After infusion of this substance, 8 of the patients showed increased myometrial activity and 5 of them showed an increased oxytocin sensitivity in Smyth's test. Pregnaneadiol excretion was increased after treatment, but there were significant changes in oestriol excretion or the blood progesterone level.

G.Faulkner

4609. VITAMIN B12 DEFICIENCY IN PREGNANCY AND PUERPERIUM. SJ.Baker, E.Jacob, K.T.Rajan and S.P. Swaminathan: *Brit. med. J.*, 1962, i, 1568-1661 (Dept. Haematol., Christian Med. Coll. Hosp., Vellore, S. India) Seven women with tropical malabsorption syndrome had moderate to severe megaloblastic anaemia of pregnancy with low serum vit. B12 levels. Breast milk B12 levels were similar to those of serum. Babies had no anaemia and their serum B12 levels were higher than in their motheis. One baby had 'intermediate*' megaloblasts in the bone marrow. Two stillborn foetuses had reduced B12 liver stores compared with those in normals. Babies born of and suckled by B12-deficient motheis are in danger of developing frank deficiency.

M.E.Nutt

4610. WATER CONTENT OF RAT FOETAL TISSUES FOLLOWING ADMINISTRATION OF WATER TO THE DAM. MJ.Seller: *Nature*, Lond., 1963, 198, 91 (Paediat. Res. Unit, Guy's Hosp. Med. Sch., London, England)

I.v. administration of excess water to pregnant rats increased the water content of the forebrain, skin and muscle and caused a fall in haematocrit. In the foetus, significant water increase occurred only in the skin.

G.M.Lewis

4611. FOETAL ANOXIA. L.Woodiw Cox: *Lancet*, 1963, i, 841-844 (Univ. Adelaide, S.Australia) A lecture.

4612. MILK EJECTION REFLEX AND MAINTENANCE OF LACTATION IN RABBIT. J.S.Tindal, C.Beyer and C.H.Sawyer: *Endocrinology*, 1963, 72, 720-724 (Anat. Dept., Univ. California, Los Angeles, Calif., U.S.A.) The milk yield of lactating rabbits anaesthetised with barbiturate and inj. with oxytocin was the same as the normal milk yield when the animals were suckled without anaesthesia or oxytocin.

H.C.Jones

4613. EXPERIMENTAL ^fLACTATIONAL MAMMARY GLAND GROWTH IN THE RAT AS MEASURED BY DNA. D.R.Griffith and C.W.Tumer: *Proc. Soc. exp. Biol.*, N.Y., 1963, 112, 424-427 (Dept. Dairy Husb., Univ. Missouri, Columbia, Mo., U.S.A.) The relative DNA content has been used as a comparative measure of cell growth in the development of the mammary glands in Sprague-Dawley-Rolfsmeyer rats. Animals were ovariectomised then treated with oestradiol and progesterone to induce growth of the mammary glands. The effects of hydrocortisone acetate, lactogen and growth hormone were studied separately and in combination treatments. All stimulated lactogenesis but growth hormone was least effective as a lactogenic agent. However, growth hormone and hydrocortisone treatment together had the most significant effect in enhancing the growth of the mammary gland tissue.

D.N.Wheatley

4614. TRANSFER OF OESTRADIOL-17g TO MILK IN CATTLE. T.Lunaas: *Natuie*, Lond., 1963, 198, 288-289 (Dept. Reprod. Physiol., Vet. Coll. of Norway, Oslo, Norway) After i.m. injn. of oestradiol-17g into a non-pregnant, lactating cow, negligible amounts of the free oestrogen were detected in the milk; it was secreted in an ether-insol. form, presumably conjugated in the mammary gland.

G.M.Lewis

4615. COMPARISON OF TOPICAL AND SUBCUTANEOUS METHOD OF ADMINISTRATION OF SIXTEEN OESTROGENS. C.F.Morgan: *J. Endocr.*, 1963, 26, 317-329 (Anat. Dept., Univ. Minnesota Med. Sch., Minneapolis, Minn., U.S.A.) The oestrogens were either inj. s.c. or applied to the shaved subscapular skin of rats at each of the dose levels 0*01, 0*1 and 1-0 jig. for both routes. Several of the hormones were found to be equally or in some cases more effective given by the percutaneous route as judged by the uterine and vaginal wt. response. The potency of the oestrogens was postulated as being related more to their mol. structure and activity within target organs than to the ease with which they were absorbed from either skin route.

G.F.Blane

4616. BIOASSAY OF OESTROGEN AND RECURRING OESTRUS IN OVARIECTOMISED EWES. M.W.Tomaszewska: *Nature*, Lond., 1963, 198, 299-301 (Whatawhata Hill Country Res. Stn., Dept. Agric, Hamilton, New Zealand) Measurement of ovine vaginal, dilatability may be a useful technique for bioassay of oestrogenic

PHYSIOLOGY

445

hormones. After a single injn. of stilboestrol recurrent oestrus occurred in some ovariectomised sheep.

G.M.Lewis

4617. OESTROGENS OF SOW IN EARLY PREGNANCY: ACCUMULATION OF OESTRONE IN ALLANTOIC FLUID. T.Lunaas: *J. Endocr.*, 1963, 26, 401-406 (Dept. Reproduct. Physiol. and Path., Vet. Coll. of Norway, Oslo, Norway) The concn. of oestrogens in pvarian, placenta and foetal tissues was determined during the 4th-5th week of pregnancy when urinary oestrogens are known to be elevated. A relatively high level of conjugated oestrone was found in the allantoic fluid and it is postulated that this is placental in origin.

C.F.Blane

4618. INTERRELATIONSHIP OF OESTROGEN CONCENTRATIONS IN MATERNAL CIRCULATION, FOETAL CIRCULATION AND MATERNAL URINE IN LATE PREGNANCY. F.D.Maner, B.D.Saffan, R.A.Wiggins, J.D. Thompson and J.R.K.Preedy: *J. clin. Endocr.*, 1963, 23, 445-458 (Dept. Med., Emory Univ., Atlanta, Ga., U.S.A.) K.Jones

4619. CRITICAL INTERACTION TIME BETWEEN OESTROGEN AND UTERINE TISSUE INDICATED BY CORTISOL INHIBITION AND INHIBITION RELEASE. E.Spaziani: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 637-639 (Dept. Zool., Univ. Iowa, Iowa City, Iowa, U.S.A.)

Cortisol given within 2 hr. after oestradiol administration depressed or prevented oestrogen-induced oedema and cell division in uteri of ovariectomised rats. When injn. ^as delayed longer than 2 hr., cortisol no longer completely inhib. these responses. M.M.Shapland

4620. RELATIONSHIP OF OESTROGEN AND VITAMIN K. P.B.R.Rao, A.M.Paolucci and B.C.Johnson: *Proc. Soc. exp. Biol.*, N.Y., 1963, 112, 393-396 (Div. Anim. Nutr., Univ. Illinois, Urbana, Ill., U.S.A.) Very

voing rats maintained on a vit. K deficient diet were given each a single injn. of oestradiol at a very low dosage. This effectively lowered the plasma prothrombin &me to a normal value. Testosterone administration to + rats caused an increased plasma prothrombin time, oestradiol at far greater concn. had no effect on the hyporombinaemia in chicks fed on a vit. K deficient diet.

D.N.Wheatley

4621. CONVERSION OF [6:7³H]OESTRADIOL-17³ INTO OESTRONE AND OESTRADIOL-17^a IN TOE MATURE MALE DOG. E.T.Siegel, R.I.Dorfman, R.S.Brody and M.H.F.Friedman: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 533-536 (Worcester Fdn. for Expt. Biol., Shrewsbury, Mass., U.S.A.) Oestradiol-17 OL h the major urinary metabolite after i.v. injn. of [3H]oestradiol-17g.

M.M.Shapland

***4622. GLUCURONIDE FORMATION IN PARTURIENTS.** L.Rauramo, M.Pulkkinen and K.Hartiala: *Ann. Med. exp. Fenn.*, 1963, 41, 32-38 (Dept. Physiol.Univ. Turku, Finland) Onehr. after oral administration of salicyl-^ide to parturients the blood content of free salicylamide and salicylamide glucuronide are considerably lower than in similarly treated non-pregnant women. After 4hr. both groups ^e similar blood concn. of these substances. The inhibn. of **Ucuronide formation or disturbances in resorption during We8nancy may be involved. G.Faulkner

4623. EFFECT OF OESTRADIOL, TESTOSTERONE AND PROGESTERONE ON GLUCURONATION [GLUCURON-JpE CONJUGATION] IN BITCHES. L.Rauramo, M. Pulkkinen and K.Hartiala: *Ann. Med., exp.Fenn.*, 1963, 41, 27-32 (Dept. Physiol. Univ., Turku, Finland) 30 bitches were used. Animals were given 200 mg. of salicyl-

amide/kg. body wt. Glucuronide was determined in plasma in the progesterone group, also free salicylamide and salicylamide glucuronide. The dogs were treated with oestradiol, testosterone and progesterone for 3 and 14 days. The hormones did not influence glucuronide level in plasma during fast 24 hr. nor did they affect presence of free salicylamide and salicylamide glucuronide in the plasma in the progesterone group. G.Faulkner

4624. MATING BEHAVIOUR IN MALE RATS AFTER REMOVAL OF SEMINAL VESICLES. F.A.Beach and J.R. Wilson: *Proc. nat. Acad. Sci. Wash.*, 1963, 49, 624-626 (Univ. California, Berkeley, Calif., U.S.A.)

10 sexually experienced rf rats were observed in standardised tests for sexual exhaustion before and after removal of seminal vesicles. Comparison of various quant. measures of mating performance before and after operation revealed no significant change in the pattern of behaviour or in the total capacity for sexual activity. J.R.Sargent

4625. PROSTAGLANDIN. PROPERTIES, ACTIONS AND SIGNIFICANCE. R.Eliasson: *Biochem. Pharmacol.*, 1963, 12, 405-412 (Dept. Physiol., Fac. Med., Karolinska Inst., Stockholm, Sweden) Prostaglandin is a lipid-sol. smooth muscle stimulating and b.p. lowering factor with acidic properties found in seminal fluid and in extracts of some accessory genital glands of man and sheep. A no. of cryst. active compounds were recently isolated from the total prostaglandin extract. The biol. activity of the most potent of these is of the same order as ACh and oxytocin. The effect on the isolated non-pregnant human myometrium is relaxation. It is suggested that prostaglandin is of importance in human fertility.

L.G.Giles

4626. 3SH^A(?) AND INSTRUCTION AS FACTOR m-AX^AJS^B?TM C^BJ^D T LOGICAL ACTIVITY OF CERTAIN S S f . f N D³-CYCLOPENTYL ENOL ETHERS CORRESPONDING. A.Meli: *Endocrinology*, 1963, 72, 715-719 (Warner-Lambert Res. Inst., Morris Plains, N.J., U.S.A.) Testosterone, testosterone propionate and methyltestosterone were all more active when administered s.c. than orally or i.p. Small doses of testosterone 3-cyclopentyl enol ether and methyl testosterone 3-cyclopentyl enol ether were less active when given s.c. and most active when given i.p. Single large doses of the enol ethers given s.c. were more active than the parent compounds. H.C.Jones

4627. NATURE OF PITUITARY LUTEOTROPHIC HORMONE ON ENZYMIC ACTIVITY OF THE TESTES OF GALLUS L. L.Arvy: *CR Soc. Biol. Paris*, 1962, 156, 1802-1804 (Lab. Physiol. du C.N.R.S., Jouy-en-Josas, S.-et-O., France) Interstitial cells of the testes of 48 hr. old *G. gallus* showed weak sulphatase, 0-glucuronidase and steroid-3 β -ol-dehydrogenase activity. Injn. of 0-3 mg. luteotrophic hormone/day for 7-10 days markedly increased development of interstitial cells. This tissue showed moderate alkaline glycerophosphatase activity and an increase in esterase, sulphatase, 3-glucuronidase and steroid-3 β S-ol-dehydrogenase activity. (French)

M.A.Pric

4628. INFLUENCE OF OXYTOCIN ON SPERMATOZOA TRANSPORT IN DUCTUS DEFERENS OF RAM. Z.Ewy, W.bielanski and Z.Zapletal: *Bull. Acad. pol. Sci.*, 1963, 11, 145-148 (Dept. Animal Hygiene, Agric. Coll., Cracow, Poland) The results of preliminary expt. in which the ductus deferens of 5 rams (2-3 yr. old) were cannulated demonstrated that there was an incessant passage of spermatozoa during 24 hr. After an injn. of

PHYSIOLOGY

oxytocin there was a considerable increase in the no. of spermatozoa flowing out of the fistula. The time elapsing between the injn. of oxytocin and the onset of increased flow of spermatozoa is required for the passage of spermatozoa through the epididymis and vas deferens.

E.Parkinson

4629. RE-INITIATION AND RESTORATION OF SPERMATOGENESIS WITH TESTOSTERONE PROPIONATE AND OTHER HORMONES AFTER LONG-TERM POST-HYPOPHYSECTOMY REGRESSION PERIOD. A.V.Boccabella: *Endocrinology*, 1963, 72, 787-798 (Anat. Dept., Seton Hall Med. Coll., Jersey City, N.J., U.S.A.)

Prolonged administration of testosterone propionate to rats 67-70 days after hypophysectomy partially restored spermatogenesis in 1/3 of the animals used. Administration of testosterone propionate with growth hormone and/or thyroxine in some cases gave a quicker response and restored spermatogenesis in 2/3 of the animals.

H.CJones

4630. SPERMATOZOA. Lord Rothschild: *Brit. med. J.*, 1962, ii, 743-749, 812-816 (Dept. Zool., Univ., Cambridge, England) *Reports of lectures*, 26 ref.

M.E.Nutt

4631. FREEZING OF DOG SPERMATOZOA TO -7(f). I.C.A.Martin: *Res. vet. Sci.*, 1963, 4, 304-314 (Sydney Univ. Vet. Physiol. Dept., Sydney, N.S.W.,

Australia) Methods of freezing dog spermatozoa to -70° were studied, and motility of the spermatozoa after thawing was used as the index of survival. 8% glycerol in the diluent gave better survival rates than 4% but to demonstrate strong motility it was necessary to suspend the spermatozoa in glycerol-free diluent. The basic phosphate buffer-Ringer soln. diluent was improved by the addition of fructose and bovine albumen or egg lecithin. Few spermatozoa survived deep-freezing when diluted 50-fold.

J.B.Derbyshire

4632. DEEP-FREEZING OF DOG SPERMATOZOA IN DILUENTS CONTAINING SKIM-MILK. I.C.A.Martin: *Res. vet. Sci.*, 1963, 4, 315-325 (Sydney Univ. Vet. Physiol. Dept., Sydney, N.S.W., Australia) The

survival of dog spermatozoa after deep-freezing was assessed by the % of motile spermatozoa, and the rapidity of their movement. Reconstituted skim-milk was a better diluent than Ringer-fructose-phosphate or citrate-fructose-phosphate. 12% skimmed milk gave greater longevity of spermatozoa after thawing than 6% or 9% skimmed milk. A 5 hr. equilibration period before deep-freezing depressed the activity of the spermatozoa after thawing, but viability as judged by the no. of spermatozoa which failed to stain with eosin-nigrosin, was increased.

J.B.Derbyshire

PHYSIOLOGY OF BEHAVIOUR

4633. EFFECTS OF ADRENAL DEMEDULLATION ON RETENTION OF A CONDITIONED AVOIDANCE RESPONSE IN THE MOUSE. D.F.Caldwell: J. comp. physiol. Psychol., 1962, 55, 1079-1081 (Wayne State Univ., U.S.A.) Mice were trained to avoid shock. The results of retention trials for the conditioned avoidance response showed that after bilateral adrenal demedullation more trials were required to attain the criterion and response latencies were greater than in sham-demедullated or non-operated controls. J.R.Broome

4634. ALTERATIONS IN LEARNING ABILITY CAUSED BY CHANGES IN CEREBRAL 5HT AND CATECHOL AMINES. D.W.Wooley and T. van der Hoeven: Science, 1963, 139, 610-611 (Rockefeller Inst., New York, U.S.A.) If brain 5HT levels were increased in mice by injn. of 5HTP and 1-benzyl-5-niethoxy-tryptamine, their learning ability in a simple *y* maze was decreased. An increase in catechol amines induced by treatment with phenylalanine and tyrosine, somewhat increased their learning ability. G.M.Lewis

4635. EFFECTS OF LESIONS IN THE CINGULUM ON MAZE LEARNING AND AVOIDANCE CONDITIONING IN THE RAT. G.J.Thomas and B.Slotnick: J. comp. physiol. Psychol., 1962, 55, 1085-1091 (Dept. Physiol., Univ. Illinois, 111, U.S.A.) Rats with lesions aimed at bilat. section of the cingulum, and operated controls, were trained post-operatively on avoidance responses in a double-grill box and then trained in a maze. A 2nd group learned the two tasks Post-operatively in the reverse order. In both groups significant retardation of conditioned avoidance response acquisition occurred after damage to the cingulum, but maze learning was not significantly affected. J.R.Broome

4636. PREFERENCE THRESHOLD OF THE WHITE RAT FOR SUCROSE. R.G.Burright and W.E.Kappauf: J. comp. physiol. Psychol., 1963, 56, 171-173 (Univ. Illinois, 111, U.S.A.) Rats were given a series of **min. drinking tests involving a choice between sucrose soln. and water. The preference threshold, or concn. at which 75% of the animals made more tongue contacts with the sucrose soln., was found to be 0.32 gm./100 cc. of soln. J.R.Broome

4637. EFFECTS OF ATROPINE SULPHATE ON THE CONDITIONED AVERSION TO SACCHARIN FLUID WITH X-RAYS AS THE UNCONDITIONED STIMULUS. J.C.Smith and D.D.Morris: Radiat. Res., 1963, 18, 186-190 (Dept. Physiol., Florida Univ., Tallahassee, Fla., U.S.A.) It was found that injn. of atropine sulphate had no effect on the conditioning aversion of rats to soln. of saccharine, with X-rays as noxious stimulus, the dose level was inversely proportional to amount of saccharine soln. drunk for groups receiving saccharine or to irradiation. B.J.Payne

4638. ALKALINE TASTE IN GOATS ASSESSED BY THE PREFERENCE TEST TECHNIQUE. F.R.Bell: J. comp. Physiol. Psychol., 1963, 56, 174-178 (Royal Vet. Coll. ** London, England) An expt. using the 2-dif. Preference technique indicated that goats can discriminate between alk. soln. (sodium bicarbonate) and alk. soln. showing a marked preference for 1% sodium carbonate. This preference was changed to an aversion

by the administration of a supplement of sodium bicarbonate through a stomach tube. J.R.Broome

4639. CALLOSAL SECTION : ITS EFFECT ON PERFORMANCE OF A BIMANUAL SKILL. C.Ettlinger and H.J.B.Morton: Science, 1963, 139, 485-486 (Inst. NeuroL, London, England) Four out of 5 monkeys showed no lessening of the ability to perform a motor habit, requiring concurrent movement of the 2 hands in opposite directions, when the callosum was cut after training. However, in only 1 animal was there significant transfer, between the hands, of a shape -discrimination habit learned post-operatively, indicating that the callosum is involved in transmission of tactile learning between the hemispheres. G.M.Lewis

EXPERIMENTAL PSYCHOLOGY

4640. WAVE-LENGTH GENERALISATION AS A FUNCTION OF SPACING OF TEST STIMULI. H.Friedman: J. exp. Psychol., 1963, 65, 334-338 (Duke Univ., Durham, N.C., U.S.A.) Pigeons were trained in a Skinner-type key-pecking apparatus and then tested for generalisation using stimuli 5, 10, or 20 m|i apart. The generalisation gradients in terms of wave-length were virtually identical. There was no evidence to suggest the development of a frame of ref. during testing. J.R.Broome

4641. STIMULUS GENERALISATION ALONG ONE AND TWO DIMENSIONS IN PIGEONS. C.M.Butten: J. exp. Psychol., 1963, 65, 339-346 (Univ. Michigan, Mich., U.S.A.) Pigeons trained in a Skinner box were tested for generalisation to stimuli varied in wavelength, in angular orientation and in one or two dimensions. Generalisation to stimuli varied in 2 dimensions was less than generalisation to stimuli varied in either dimension alone. Also the 2 dimensions had interacting effects on generalisation. J.R.Broome

4642. CLASSICAL CONDITIONING IN THE PIGEON: EXPLORATORY STUDIES OF PARTIAL REINFORCEMENT. N.Longo, S.Milstein and M.E.Bitterman: J. comp. physiol. Psychol., 1962, 55, 983-986 (Bryn Mawr Coll., Bryn Mawr, Pa., U.S.A.) Classical conditioning was studied in the pigeon, using light-onset as the conditioned stimulus and electric shock as the unconditioned stimulus, by measuring the general activity evoked by the conditioned stimulus. The acquisition and extinction functions obtained showed this to be a satisfactory technique for this sp., but there was no substantial evidence of increased resistance to extinction following partial reinforcement. J.R.Broome

4643. POSITIVE AND NEGATIVE GENERALISATION GRADIENTS OBTAINED AFTER EQUIVALENT TRAINING CONDITIONS. W.K.Honig, C.A.**oneau, K.R.Burstein and H.S.Pennypacker: J. comp. physiol. Psychol., 1963, 56, 111-116 (Denison Univ., U.S.A.) Two groups of pigeons were trained to discriminate between the presence and absence of a vertical black line on an illuminated response key, presence was pos. for one group and neg. for the other. Pos. and neg. gradients, compared on the dimension of angular orientation (tilt), were initially very similar, although the neg. gradient became flatter during testing. J.Oroome

ANIMAL BEHAVIOUR

4644. BAR PRESSING AS A FUNCTION OF TEST ENVIRONMENT AREA. A.Baron, J.J.Antonitis and A.H.Clark: *J. genet. Psychol.*, 1963, 102, 159-165 (Dept. Psychol., Univ. Wisconsin, Milwaukee, Wis., U.S.A.) Observation of the unconditioned bar-pressing behaviour of mice in 4 test environments showed that increase in the area of the test box decreased the total no. of bar-presses, but the no. was greater than expected from the 'general activity' hypothesis. Wood-works behaviour primacy theory was held to provide a reasonable explanation of the results. J.R.Broome

4645. PERFORMANCE IN DIFFERENTIAL CONDITIONING AS A FUNCTION OF VARIATION IN MAGNITUDE OF REWARD. H.Goldstein and K.W.Spence: *J. exp. Psychol.*, 1963, 65, 86-93 (State Univ., Iowa City, Iowa, U.S.A.) Four groups of rats received a different no. of food pellets associated with traversing either a black or white alley. The rate of differentiation was positively related to differences in reward magnitude. The function relating asymptotic response speeds for both large- and small-reward discriminanda was found to be a negatively accelerated increasing one. J.R.Broome

4646. DISCRIMINATION AND STIMULUS GENERALISATION OF APPROACH, OF AVOIDANCE, AND OF APPROACH AND AVOIDANCE DURING CONFLICT. H.S.Hoffman and M.Fleshlen: *J. exp. Psychol.*, 1963, 65, 280-291 (Pennsylvania State Univ., Pa., U.S.A.) Three groups of rats were trained in a Skinner box, one on approach (plate press to obtain food), one on avoidance (bar press to prevent shock) and one on both responses. The discrimination stimulus was a 3500c/s tone. Tests showed that approach generalised more broadly than avoidance, but the animals learned to discriminate more rapidly for approach than for avoidance. J.R.Broome

4647. COMPARISON BETWEEN CORRECTION AND NON-CORRECTION METHODS IN DRIVE DISCRIMINATION. N.F.Besch, H.Morris and S.Levine: *J. exp. Psychol.*, 1963, 65, 414-419 (Columbus Psychiat. Inst. and Hosp., Ohio State Univ., Ohio, U.S.A.) Rats were trained in a T-maze in a hunger-thirst discrimination for social reward. The results showed that the non-correction method is superior to the correction method in promoting learning on the basis of drive stimuli. J.R.Broome

4648. INFLUENCE OF DEPRIVATION AND AVAILABILITY OF GOAL BOX CUES ON THE TEMPORAL GRADIENT OF REINFORCEMENT. K.E.Renner: *J. comp. physiol. Psychol.*, 1963, 56, 101-104 (Northwestern Univ., Ill., U.S.A.) The performance of rats in a straight alley was studied using a factorial design of 3 delay intervals, 2 levels of food deprivation and the presence or absence of goal-related stimuli in the delay chamber. The temporal gradient of reinforcement obtained was, at least in part, a function of drive level and availability of goal-related cues. J.R.Broome

4649. EFFECTS OF DRIVE INTENSITY ON SECONDARY REINFORCEMENT. E.L.Wike and B.J.Farrow: *J. comp. physiol. Psychol.*, 1962, 55, 1020-1023 (Univ. Kansas, Kans., U.S.A.) Rats were given secondary reward training, involving the differential method, in a runway, and then tested for secondary reinforcement in a T maze. The running times varied systematically in

training with changes in drive level and the presence and absence of reward. J.R.Broome

4650. EFFECTS OF MAGNITUDE OF WATER REWARD ON SELECTIVE LEARNING AND HABIT REVERSAL. E.L.Wike and B.J.Farrow: *J. comp. physiol. Psychol.*, 1962, 55, 1024-1028 (Univ. Kansas, Kans., U.S.A.) The influence on rats of 3 levels of water incentive upon acquisition and habit reversal was studied using a T maze. J.R.Broome

4651. RUNWAY PERFORMANCE FOLLOWING A REDUCTION IN THE CONCENTRATION OF A LIQUID REWARD. M.J.Homzie and L.E.Ross: *J. comp. physiol. Psychol.*, 1962, 55, 1029-1033 (Univ. Wisconsin, Madison, Wis., U.S.A.) Rats were trained on a 20% sucrose soln. and then changed to either a 1% sucrose soln., distilled water or no reward. Reduction in concn. of the incentive produced a decline in performance, but there was no abrupt shift in performance and no depression effect. J.R.Broome

4652. EFFECT OF INCENTIVE MOTIVATION ON AN UNRELATED REFLEX RESPONSE. M.A.Trapold: *J. comp. physiol. Psychol.*, 1962, 55, 1034-1039 (State Univ., Iowa City, Iowa, U.S.A.) In expt. with rats a conditioning stimulus was paired with a soln. containing either 6% or 24% sucrose. Two test trials daily were also given, one in which a startle stimulus was presented in addition to the conditioning trial, and one in which this was presented alone. The minimal instrumental response involved in obtaining the reward was facilitated by the incentive stimulus, but the startle response was not facilitated. J.R.Broome

4653. EFFECTS OF STIMULUS SIZE AND PROXIMITY UPON AVOIDANCE OF COMPLEX OBJECTS IN RHESUS MONKEYS. E.W.Menzel jun: *J. comp. physiol. Psychol.*, 1962, 55, 1044-1046 (Yerkes Lab. Primate Biol., Orange Park, Fla., U.S.A.) Three sizes of complex representational objects were presented to rhesus monkeys. Avoidance increased directly with object size and proximity. Familiarity with the objects led to the replacement of avoidance by object contact. J.R.Broome

4654. LEVER HOLDING AND BEHAVIOUR SEQUENCES IN SHOCK-ESCAPE. S.L.Campbell: *J. comp. physiol. Psychol.*, 1962, 55, 1047-1053 (Indiana Univ., Ind., U.S.A.) The responses of rats to shock were classified according to whether the lever was pressed in the presence (escape response) or the absence (extra response) of shock and whether the lever was released during the absence of shock (non-punished) or after the reintroduction of shock (punished). J.R.Broome

4655. ACQUISITION AND RETENTION OF ACQUIRED AVOIDANCE WITH GENTLING AS REINFORCEMENT. D.K.C and Land, S.H.Horowitz and J.L.Culbertson: *J. comp. physiol. Psychol.*, 1962, 55, 1062-1064 (Bucknell Univ., Lewisburg, Pa., U.S.A.) Rats either 23 or 53 days old were trained to avoid the black half of a black and white compartment when gentling was used as the reinforcement during acquisition. The avoidance response was retained for 15, but not 30, days, the young rats requiring more gentlings during avoidance training than the older rats. J.R.Broome

4656. TERMINAL RETARDATION IN ACTIVITY GRADIENTS. R.D.Meade and R.J.Newman: *J. comp. physiol. Psychol.*, 1962, 55, 1065-1068 (Trinity Coll..

Hartford, Conn., U.S.A.) In the first expt. rats had to traverse 3 alleys and 3 boxes before reaching the food box. In the 2nd they were trained to cross an electric grid at 3 different distances from the food chamber to reach food. It was found that motivation to reach the goal increased as the goal was approached. No terminal retardation was observed in either expt. J.R.Broome

4657. LOCUS OF MAXIMAL "KAMIN EFFECT* IN RATS. M.R.Denny and R.E.Ditchman: *J. comp. physiol. Psychol.*, 1962, 55, 1069-1070 (Michigan State Univ., East Lansing, Mich., U.S.A.) Rats were tested in a shuttle box using electric shock as the unconditioned stimulus and a buzzer as the conditioned stimulus, with delay intervals of 0, 0*5, 0*75, 1, 1-25 and 1*5 hr. The no. of avoidance responses during re-learning declined from 0 to 1 hr. and then rose from 1 to 1-5 hr. The min._r representing the max. Kamin effect, occurred between the 0-75 hr. interval and 1-5 hr. interval. J.R.Broom e

4658. EFFECTS OF PRIOR FEAR EXPERIENCES ON AN APPROACH-AVOIDANCE CONFLICT. K.H.Kurtz and G.C.Walters: *J. comp. physiol. Psychol.*, 1962, 55, 1075-1078 (Univ. Buffalo, N.Y., U.S.A.) A series of intense electric shocks was administered to rats, which were trained approx. 1 month later, together with unshocked controls, to traverse a straight runway for food. The animals were shocked at the goal box and subsequent running performance was measured. It appeared that the cues associated with approaching the goal elicited stronger fear in expt. than in control animals. J.R.Broome

4659. EFFECTS OF PREWEANING AND POSTWEANING MANIPULATIONS UPON PROBLEM-SOLVING BEHAVIOUR. V.H.Denenberg and L.R.C.Morton: *J. comp. physiol. Psychol.*, 1962, 55, 1096-1098 (Purdue Univ., Lafayette, Ind., U.S.A.) Rats received either handling or no extrinsic stimn. between birth and weaning, and were then reared in either a restricted, neutral or enriched environment. Tests indicated that handling does not affect problem-solving behaviour as measured by the Hebb-Williams maze. J.R.Broome

4660. CRITICAL PERIOD FOR THE FACILITATION OF EXPLORATORY BEHAVIOUR BY INFANTILE EXPERIENCE. W.J.Meyers: *J. comp. physiol. Psychol.*, 1962, 55, 1099-1101. Rats were stim. by being carried about at different ages during infancy. Study of exploration behaviour in an alley attached to the home cage indicated that a critical period for facilitating exploration occurs in the 2nd week of life. J.R.Broome

4661. ACTIVITY DECREMENTS AND RECOVERY DURING REPEATED DAY TO DAY EXPOSURE TO THE SAME ENVIRONMENT. E.Howarth: *J. comp. physiol. Psychol.*, 1962, 55, 1102-1104 (Univ. Alberta, Alta., Canada) The initial exploration of rats in a 1 hr. period repeated over 15 successive trials given at 24 hr. intervals declined significantly for the first 3 days only. Activity for ensuing periods recovered by the fourth day. J.R.Broome

4662. ACTIVITY DURING AND BETWEEN PERIODS OF STIMULUS CHANGE RELATED TO FEEDING. A.Amsel: *J. comp. physiol. Psychol.*, 1962, 55, 1114-1117 (Univ. Toronto, Ont., Canada) The activity of hungry rats between and during periods of stimulus change which signalled feeding were measured. Animals were

fed either at every period of stimulus change and then switched to 50% feeding, or were fed on 50% of occasions throughout. The results showed a slowly developing gradient of activity between successive periods of stimulus change. Activity gradients also develop during the period of stimulus change. J.R.Broome

4663. SOME EFFECTS OF MAINTENANCE LUMINANCE AND STRAIN DIFFERENCES UPON SELF-EXPOSURE TO LIGHT BY RATS. R.B.Lockard: *I. comp. physiol. Psychol.*, 1962, 55, 1118-1123 (Univ. Wisconsin, Madison, Wis., U.S.A.) Dark-treated and light-treated rats were left in test-chambers with self-controlled light of 5 different luminances. It was found that dim light is preferred to darkness and darkness to bright light. In a comparison between hooded rats and albinos, hooded rats kept even high test luminances on about 17 hr. per day, whereas albinos showed shorter daily durations as luminance increased. J.R.Broome

4664. REINFORCING EFFECTS OF ILLUMINATION CHANGE IN DIFFERENT PHASES OF THE RAT'S DIURNAL CYCLE. H.Sarry III and D.Symmes: *J. comp. physiol. Psychol.*, 1963, 55, 117-119 (Univ. Connecticut, Storrs, Conn., U.S.A.) Rats were maintained on a 24 hr. cycle of equal light and darkness. Bar-pressing was reinforced by illumination change, regardless of the level of bar-pressing activity or direction of illumination change. J.R.JJroome

4665. EFFECT OF STOMACH LOADING ON SUCKING BEHAVIOUR IN NEONATAL PUPPIES. E.Satinoff and W.C.Stanley: *J. comp. physiol. Psychol.*, 1963, 56, 66-68 (Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) Neonatal puppies of various breeds were given a sucking test at different ages from 1 to 11 days. When the stomach was loaded with simulated bitch's milk, sucking was depressed, independently of breed and age. J.R.Broome

4666. PERFORMANCE AS A FUNCTION OF DEPRIVATION TIME FOLLOWING PERIODIC FEEDING IN AN ISOLATED ENVIRONMENT. J.S.Brown and M.Belloni: *J. comp. physiol. Psychol.*, 1963, 56, 105-110 (Univ. Florida, Gainesville, Fla., U.S.A.) Rats living in a sound-shielded room were fed at the same time of day for 35 days and then deprived for periods of 2 to 46 hr. Measurement of the freq. of depressions of the empty food troughs, together with starting and runway speeds in a straight runway, did not support the hypothesis that periodic feeding develops associations between drive stimuli and anticipatory drive-producing responses. J.R.JJroome

4667. DIFFERENTIAL REINFORCEMENT OF SHORT-LATENCY RESPONSES IN THE WHITE RAT. R.M.Church and J.Carnathan: *J. comp. physiol. Psychol.*, 1963, 56, 120-123 (Brown Univ., Providence, R.I., U.S.A.) Rats in a lever box were reinforced on all trials in which the response latency was less than the median of its latencies on the previous day. The mean log latency of response was similar in expt. and control animals, but the latency distribution was more variable in the expt. animals. J.R.Broome

4668. ACQUISITION, EXTINCTION, AND RETENTION OF AN AVOIDANCE RESPONSE IN RATS AS A FUNCTION OF AGE. R.H.Kirby: *J. comp. physiol. Psychol.*, 1963, 56, 158-162 (Princeton Univ., Princeton, N.J., U.S.A.) Rats 25, 50 and 100 days old were trained and extinguished in an avoidance response

ANIMAL BEHAVIOUR

in a runway. Neither randomly selected rats nor those matched for performance during acquisition showed significant differences in acquisition or extinction. In a 2nd expt. retention of an avoidance response was lowest in the 25-day old group.

J.R.Broome

4669. ESTABLISHMENT OF LEARNING SETS IN RATS. P.L.Wright, H.Kay and M.E.Sime: J. comp. physiol. Psychol., 1963, 56, 200-203 (Univ. Sheffield, England) Rats were trained to criterion on a series of 32 shape discriminations. Progressive improvement in the rate of learning occurred, but compared with most mammals so far investigated in learning-set studies the rat takes many more trials to learn individual problems.

J.R.Broome

4670. EFFECTS OF PRIOR EXPERIENCE WITH TEST STIMULI ON LEARNING-SET PERFORMANCE OF MONKEYS. H.A.Cross, H.J.Fletcher and H.F.Harlow: J. comp. physiol. Psychol., 1963, 56, 204-207

(Univ. Wisconsin, Madison, Wis., U.S.A.) Rhesus monkeys were given living-cage experience with stimulus objects which were subsequently used as the positively, negatively or inconsistently rewarded objects in a series of discrimination problems. The group rewarded for selecting the novel object was superior to that rewarded for selecting the familiar object on the first trial, but on subsequent trials the order was reversed.

J.R.Broome

4671. COERCIVE BEHAVIOUR IN THE RHESUS MONKEY. J.A.Horel, F.R.Treichler and D.R.Meyer: J. comp. physiol. Psychol., 1963, 56, 208-210 (Ohio State Univ., Ohio, U.S.A.) Seven rhesus monkeys (*Macaca mulatta*) and 1 *M. irus* were trained in pairs to turn a handle for food. Then the responses of the submissive animal only were rewarded, requiring the dominant animal to intercept pellets produced by the submissive. When the submissive animal was fed before testing the dominant monkeys only demonstrated coercive behaviour after several sessions or after special training.

J.R.Broome

4672. CONDITIONING IN THE NEONATAL PUPPY.

W.C.Stanley, A.C.Cornwell, C.Poggiani and A.Tratmen: J. comp. physiol. Psychol., 1963, 56, 211-214. Neonatal puppies received 7 days of conditioning using a manometer nipple paired with nipple-dropper feeding of either milk or quinine. Both appetitive conditioning, measured by no. of sucks per trial, and aversive conditioning, measured by vigour of struggling, occurred.

J.R.Broome

4673. CONDITIONING IN PIGS AS A FUNCTION OF THE INTERVAL BETWEEN CONDITIONED STIMULUS AND UNCONDITIONED STIMULUS. M.Noble and C.K.Adams: J. comp. physiol. Psychol., 1963, 56, 215-219 (Kansas State Univ., Kans., U.S.A.) Pigs were tested with conditioned stimulus-unconditioned stimulus of 0*5, 1'0, 1-5 and 2*0 sec. Conditioning was better at an interval of 2 sec. Conditioning improved as the interval was increased to 8 sec.

J.R.Broome

4674. CONDITIONING IN RHESUS MONKEYS AS A FUNCTION OF THE INTERVAL BETWEEN CONDITIONED STIMULUS [CS] AND UNCONDITIONED STIMULUS [US]. M.Noble and G.E.Harding: J. comp. physiol. Psychol., 1963, 56, 220-224 (Kansas State Univ., Kans., U.S.A.) Classical conditioning in rhesus monkeys was studied using CS-US intervals of 0*5, 1 *2 and 4 sec. The CS was an increase in illumination and the US was d.c. shock. The 2-sec. condition alone

gave more conditioned responses than the control condition.

J.R.Broome

4675. EFFECT OF TRANSITIONS FROM NON-REINFORCED TO REINFORCED TRIALS UNDER SPACED-TRIAL CONDITIONS. E.J.Capaldi and P.Wargo: J. exp. Psychol., 1963, 65, 318-319 (Univ. Texas, Austin, Tex., U.S.A.) Supplementary report.

J.R.Broome

4676. REPLICATION OF OVERLEARNING AND REVERSAL IN A T MAZE. W.F.Hill and N.E.Spean: J. exp. Psychol., 1963, 65, 317 (Northwestern Univ., U.S.A.) Supplementary report.

J.R.Broome

4677. COMPARISON OF THE EFFECTS OF DIFFERENT KINDS OF INFORMATION IN MAINTAINING EFFICIENCY ON AN AUDITORY MONITORING TASK. M.Loeb and E.A.Schmidt: Ergonomics, 1963, 6, 75-81 (U.S. Army Med. Res. Lab., Fort Knox, Ky., U.S.A.) 8 subjects had to respond as rapidly as possible to brief, infrequent, randomly occurring auditory signals over eight 50-minute sessions. The results indicate that if an operator merely has to detect the presence or absence of such a signal the no. of detections is unlikely to decrease as a function of the time on task.

A.A.Zimmerman

4678. NOISE AND HUMAN PERFORMANCE, A PSYCHOPHYSIOLOGICAL APPROACH. W.H.Teichner, E.Arees and R.Reilly: Ergonomics, 1963, 6, 83-97 (Univ. Massachusetts, Amherst, Mass., U.S.A.) A theoretical approach is given for the study of the effects of noise on human performance. Distraction studied in terms of changes in ambient noise levels was found to be a function of the amount of change.

A.A.Zimmerman

SPECIES STUDIES

4679. BEHAVIOUR IN HYDRA: CONTRACTION RESPONSES OF *HIPRARDI* TO MECHANICAL AND LIGHT STIMULI. N.B.Rushforth, A.L.Burnett and R.Maynard: Science, 1963, 139, 760-761 (Develop. Biol. Center, Western Reserve Univ., Cleveland, Ohio, U.S.A.) Contraction of

Hiprardi in response to mechanical stimn. is reduced after repeated stimn., and prevented by removal of the tentacles. Different receptors with an independent control mechanism must be responsible for the response to light, as this is not reduced after repeated exposure, and continues in the absence of tentacles.

G.M.Lewis

4680. THE EFFECT OF BRAIN EXTIRPATION ON LEARNING AND RETENTION IN NEREID POLYCHAETES. S.M.Evans: Anim. Behav., 1963, 172-178 (Dept. Zool., Univ. Bristol, England) Crawling to the exit of a glass channel could be abolished in *Nereis diversicolor*, *N.virens*, and *Perinereis cultrifera* by giving a slight electric shock at the exit. *N.virens* learnt much more rapidly than the other spp. Retention in *N.virens* was tested, and also learning and retention after removal of the supra-oesophageal ganglion.

Y.Spencer-Booth

4681. BEHAVIOUR OF YOUNG OCTOPUS BRIAREUS
ROBSON. J.B.Messenger: Nature, Lond., 1963, 197, 1186-1187 (Dept. Anat., University Coll., London, England) Observations of living adult and young *O. briareus* from the time of hatching are reported. G.M.Lewis
4682. SIMULTANEOUS DISCRIMINATION TRAINING OF OCTOPUS AND TRANSFER OF DISCRIMINATION ALONG A CONTINUUM. N.S.Sutherland, N.J.Mackintosh and J.Mackintosh: J. comp. physiol. Psychol., 1963, 56, 150-156 (Univ. Oxford, England) Octopuses (*Octopus vulgaris*) were trained to discriminate between various squares and parallelograms using either a simult. or a successive method. Animals pretrained to discriminate between shapes having a large difference along a dimension subsequently performed better on shapes having a small difference than those trained from the outset on the latter shapes. J.R.Broome
4683. EVENTS FOLLOWING QUEEN CELL CONSTRUCTION IN HONEYBEE COLONIES. W.E.Gary and R.A.Morse: J. apicult. Res., 1962, 1, 3-5 (Dept. Entomol., Cornell Univ., Ithaca, N.Y., U.S.A.) Queen rearing usually indicates prep. for swarming or replacement of an existing queen without swarming (supersedure). A study of 10 colonies for 6 months showed that several mature queens may be produced but their presence is not necessarily followed by either swarming or supersEDURE. J.R.Cockbain
4684. OBSERVATIONS ON THE BEHAVIOUR OF BEES IN A CONTROLLED ENVIRONMENT ROOM. W.P.Nye: J. apicult. Res., 1962, 1, 28-32 (Entomol. Res. Div., U.S.D.A., Logan, Utah, U.S.A.) A description of the room is given. Observations both inside and outside the hive showed that all aspects of behaviour were normal. The effect of light intensity on pollen collecting was studied. Collecting activity dropped from 100% to 6% when light was reduced from full to quarter strength. J.R.Cockbain
4685. IMPRINTING AND THE IMMOBILITY REACTIONS OF DOMESTIC FOWL. E.A.Salzen: Anim. Behav., 1963, 11, 66-71 (Dept. Zool., Univ. Liverpool, England) Chicks reared in isolation tended not to show the immobility response, and those reared socially did so chiefly when tested alone, so this fear reaction may be largely due to separation. The maturation of tearfulness is discussed. Y.Spencer-Booth
4686. OBSERVATIONS ON THE WOODPECKER-FINCH, CACTOSPIZA PALLIDA. LEibl-Eibesfeldt and H.Sielmann: Ibis, 1963, 105A, 279; J.Om., 1962, 103, 92-107. Some field notes on the Galapagos Woodpecker-finch introduce an account of the behaviour of a captive male sent alive to Germany. This bird not only retrieved food from crevices in a dead bough by means of a 'spine', but actually removed mealworms from a dish, stuck them into crevices and then used a 'spine' to get them out again. The origin of tool-using in this species, is uncertain, but it is pointed out that the Woodpecker-finch habitually hides food, such as seeds, in holes and crevices, as some tits and nuthatches do. Some of the movements used when extracting a seed from such a device suggest movements used when probing with a spine. (German) BIS

4687. FOOD MOTIVATION AND DELAYED RESPONSE IN GIBBONS. CBerkson: J. comp. physiol. Psychol., 1962, 55, 1040-1043 (Yerkes Lab. Primate Biol., Orange Park, Fla., U.S.A.) The food preferences of gibbons (*Hylobates lar*) were studied; grapes and raisins were liked best and celery and laboratory chow least. Preferred foods used as incentive improved delay response performance. Food deprivation produced an increased willingness to respond and improved performance for a non-preferred incentive. J.R.J.Broome

4688. EFFECTS OF ENVIRONMENTAL RESTRICTION UPON THE CHIMPANZEE'S RESPONSIVENESS TO OBJECTS. E.W.Manzel jun., R.K.Davenport jun., and C.M.Rogers: J. comp. physiol. Psychol., 1963, 56, 78-85 (Yerkes Lab. Primate Biol., Orange Park, Fla., U.S.A.) Nineteen chimpanzees of similar age were divided into one group of wild-born animals, and 4 groups raised in restricted environments. The latter were timid of objects, contacted them rarely and showed stereotyped self-activity. It is concluded, however, that restricted chimpanzees are retarded but potentially typical in their responsiveness to objects. J.R.Broome

GENERAL

4689. 'IMPRINTING*' IN NATURE. G.Gottlieb: Science, 1963, 139, 497-498 (Psychol. Lab., Dorothea Dix Hosp., Raleigh, N.C., U.S.A.) Observations of ground and hole-nesting duck spp., augmented by sound amplification equipment, indicate that hatchlings are exposed to the call of the mother for a relatively long period before they see her. It is suggested that in nature, imprinting is based primarily on auditory, rather than on visual, factors. G.M.Lewis
4690. SOCIAL FORCES DETERMINING SPACING AND HEAD ORIENTATION IN A FLOCK OF DOMESTIC HENS. G.McBride, J.W.James and R.N.Shoffner: Nature, Lond., 1963, 197, 1272-1273 (Dept. Anim. Husb., Univ. Queensland, Brisbane, Australia) The head spacing of poultry is more regular than it would be under random spacing. The regularity is probably based on visual interactions with neighbouring birds; they orientate their heads to avoid the frontal aspects of other birds, yet turn to face neighbours who approach closely. G.M.Lewis
4691. THE AVOIDANCE OF OVER-WRITING IN SELF-ORGANISING SYSTEMS. W.Ross Ashby and J.Riguet: J. theor. Biol., 1961, 1, 431-439 (Res. Lab. Elec. Eng., Univ. Illinois, Urbana, Ill., U.S.A.) Overwriting, i.e. results established early in the learning process being altered or destroyed by later learning, is a problem in a computer or brain which has to undertake a complex task. In the brain, natural selection may eliminate overwriting. But in self-organising computers there are only 2 ways of minimising overwriting (i) a necessary quantity of information must be used (ii) the design must reduce the chance level. J.A.Dawson

CYTOLOGY

CELL STRUCTURE AND CYTOCHEMISTRY

4692. FURTHER OBSERVATIONS ON STRUCTURE OF MAMMALIAN SPERM TAIL. A.Telkka, D.W.Fawcett and K.Christensen: Anat. Rec., 1961, 141, 231-245 (Dept. Anat., Cornell Med. Coll., Boston, Mass., U.S.A.) The sperm tail sheath is found to consist of a series of branching and interconnected ribs joining 2 longitudinal columns coursing along opposite sides of the sheath. This structure is widespread among mammals. Attention is drawn to spp. differences in the degree of development of the outer row of coarse longitudinal fibres. Observations of other investigators of flagella concerning the presence of the arms of one member of each double filament in the axial filament complex are extended to mammalian sperm tails and a significant difference in the internal density of the 2 subfibres is reported. F.Beck

4693. GOLGI APPARATUS OF AMELOBLAST OF RAT AT STAGE OF ENAMEL MATRIX FORMATION. E.Kallenbach, E.Sandborn and A.Warshawsky: J. cell Biol., 1963, 16, 629-632 (Dept. Anat., McGill Univ., Montreal, Canada) The secretory ameloblasts from the upper and lower incisors and pieces of the enamel organ of adult rats were investigated in the light and E.M. An elongated tube-like structure is described extending within the axis of the ameloblasts from the apical pole of the nucleus. The walls consist of several layers of flattened sacs typical of the Golgi apparatus. In immature and post-secretory ameloblasts the tubular structure was replaced by a reticular network characteristic of the usual Golgi apparatus. P.Barrow

4694. ULTRASTRUCTURE OF ISOLATED AND IN SITU HUMAN CARDIAC AGE PIGMENT. D.J.B.Malkoff and B.L.Strehler: J. cell Biol., 1963, 16, 611-616 (Gerontol. Branch, Nat. Heart List., N.I.H., Bethesda, Md., U.S.A.) The mitochondrial fraction of homogenised cardiac muscle and sections of myocardial tissue were studied in the E.M. Lipofuscin particles composed of small granules were seen in the mitochondria but there is no evidence for their mitochondrial origin. Their ultrastructure resembles that of lysosomes. P.Barrow

4695. JLM. OF PLASMOCYTOMA AND WALDENSTROM'S SYNDROME. M.Bessis, J.Breton-Gorius and J.L.Biner. Nouv. Rev. Franc. Hémat., 1963, 3, 159-184 (Centre Nat. de Transfusion Sanguine, Paris, France) Thirteen patients with plasmocytoma and 9 patients with Waldenstrom's syndrome (defined here as macro-globulinaemia with proliferation of mononuclear cells which are not plasmocytes) were studied. Abnormalities of the development, the cytoplasm, the nucleus and nucleolus are described. No clear correlation between abnormalities of the cells and of the plasma proteins could be established. (French) V.Eisen

4696. ELECTRICAL CONDUCTANCE AND POTENTIAL ACROSS THE MEMBRANE OF SOME CELL NUCLEI W.R.Lowenstein and Y.Kanno: J. cell Biol., 1963, 16, 421-425 (Dept. Physiol., Coll. Physn. and Surg., Columbia Univ., N.Y., U.S.A.) Direct measurements using microelectrodes were made on the nuclear and cell membrane of isolated oocytes of 300 p diam. of Triturus viridescens and Xenopus laevis, and salivary gland cells of Drosophila flavorepleta. The nuclear membrane of the

latter has a resistance of 1 *5 Q cm.2 and a resting potential of 13 mV between the nucleoplasm and the cytoplasm, constituting a diffusion barrier for particles of ion size. The former has a zero resting potential and relatively high permeability. P.Barrow

4697. CHROMOSOMAL DIFFERENTIATIONS OF LAMP-BRUSH TYPE FORMED BY Y CHROMOSOME IN DROSOPHILA HYDEI AND D.NEOHYDEL O.Hess and G.F.Meyer: J. cell Biol., 1963, 16, 527-539 (Max Planck-Inst. Biol., Tubingen, Germany) Cytol. examination of living spermatocytes by phase contrast and of OsO₄ fixed spermatocyte nuclei in the E.M. has shown that the paired loop-like structures seen in X/Y spermatocytes can only be formed in the presence of a Y chr. The loops appear to be phase-sp. morphol. differentiations of the Y chr. and are present in duplicate in XYY males. These structures are species-specific and characteristically different in D. hydei and D. neofrydei. P.Barrow

4698. MEASUREMENTS OF THE TOTAL SOLID MATERIAL IN THE BANDS AND INTERBANDS OF THE POLYTENE CHROMOSOMES IN LIVING CELLS OF CHIRONOMUS. H.D.Berendes and K.F.A.Ross: Chromosoma, Berlin, 1963, 14, 111-122 (Genet. Lab., Univ. Leiden, Netherlands) Using an interference microscope the n. of a no. of bands and interbands of the salivary gland chr. of 2 spp. of Chironomus were measured. The results indicated a higher % of solid material in the bands than in the interbands. The % in both regions was higher in intact living cells and in isolated chr. in 12% isotonic saline/protein medium than in isolated chr. in saline. S.A.Henderson

4699. OCCURRENCE AND POSSIBLE SIGNIFICANCE OF HAEMOGLOBIN IN CHROMOSOMAL REGIONS OF MATURE ERYTHROCYTE NUCLEI OF NEWT, TRURURUS CRISTATUS CRISTATUS. J.Tooze and H.C.Davies: J. cell Biol., 1963, 16, 501-511 (Wheatstone Lab., King's Coll., London, England) Whole blood was added to OsO₄ in veronal acetate buffer at pH 6 *3 and 7 -4 and the Hb distribution of their sections determined by absorption measurements in violet light (λ 4047A). A high concn. of porphyrin or ion-porphyrin compound was found within the chromosomal regions of the nucleus. The role of Hb in determining the nuclear structure of r.b.c. by interaction with nucleohistones is discussed. P^arrow

4700. NUCLEAR STABILITY DURING HISTOGENESIS, AGEING AND CARCINOGENESIS. B.E.Walker: Cancer Res., 1963, 23, 157-164 (Dept. Anat., Univ. Texas Med. Branch, Galveston, Tex., U.S.A.) Review. 82 ref. B.M.Stevens

4701. STUDIES ON CELL AGGREGATION: DEMONSTRATION OF MATERIALS WITH SELECTIVE CELL-BINDING ACTIVITY. A.A.Moscona: Proc. nat. Acad. Sci., Wash., 1963, 49, 742-747 (Dept. Zool., Univ. Chicago, ILL, U.S.A.) Reattachment of cells might be mediated by sp. materials functionally associated with the cell surface. Such materials could be dissolved off living cells and regenerated by cells under suitable conditions. Functional characteristics of these products might be involved in contact selectivity and preferential attachment of cells. The existence of such products was demonstrated by obtaining from living cells cell-free prep. with selective cell-binding activity. Their effectiveness was found to be Ca dependent and they contained no detectable nucleic acids. J.R.Sargent

4702. CYTO-ENZYMOLOGICAL STUDIES ON THE LIVING EGGS OF MICE INCUBATED IN THE PRESENCE OF ATP AND OTHER MONONUCLEOTIDES.

A.M.Dalcq: Arch. Biol., Liege, 1962, 73, 405-444
 (Lab. Anat. and Human Embryol., Univ. Brussels, Belgium) Mouse oocytes and fertilized eggs were incubated in the presence of various mononucleotides and of a lead salt. The results of this treatment were examined by mounting the specimens in toto. A distinct reaction occurs at the level of cortical and furrow granules, the enzyme present dephosphorylates the various triphosphates tested i.e. ATP, CTP, HP, UTP and also ADP. These granules are, it is suggested, not all of the same nature, since centrifugation distributes them irregularly at various levels. The small granules were best shown to be present using UTP. However the small internal granules, suggested to be mitochondria, also reacted to triphosphates, to ADP and even AMP. Attempts to isolate the nuclei and test their responses have not proved conclusive. The reaction at the cortex and along the furrows could be used for the determination of the doses of ATP necessary to initiate a reaction under definite conditions, to demonstrate the activating role of Mg, Ca and Co ions, and the effect of cysteine which appears to be inhibitory. (French) R.J.Walker

4703. FORMATION OF MITOCHONDRIA IN NEURO-SPORA CRASSA. A QUANTITATIVE RADIO-AUTOGRAPHIC STUDY. D.J.L.Luck: J. cell Biol., 1963, 16, 483-499 (Rockefeller Inst., New York, U.S.A.) A choline-requiring mutant was cultured in a medium containing 25 μ g./m. [3 H] or [14 C]-choline chloride. Labelled cells were transferred to flasks containing unlabelled medium and harvested at periods during their log. growth. The distribution of labelled choline was followed in the mitochondria by radioautographic analysis. During 3 mass-doubling cycles the distribution of grains among individual mitochondria followed a Poisson distribution. This suggests that mitochondrial mass increases by a continued process of addition of lecithin units to the existing framework. P.Barrow

4704. PATTERN OF X-CHROMOSOME DNA SYNTHESIS IN TWO WOMEN WITH ABNORMAL SEX-CHROMOSOME COMPLEMENTS. F.Giannelli: Lancet, 1963, i, 863-865 (Guy's Hosp., Med. Sch., London, England) G.H.^aeH

4705. [3 H]THYMIDINE INCORPORATION IN AN ISO-CHROMOSOME FOR THE LONG ARM OF THE X-CHROMOSOME IN MAN. S.Muldal, C.W.Gilbert, L.G.Lajtha, J.Lindsten, J.Rowley and M.Fraccaro: Lancet, 19G3, I, 861-863 (Cytogenet. Lab., Christie Hosp., Manchester, England) G.H.Bell

4706. HETEROCHROMATIN IN HUMAN MALE LEUKOCYTES. A.Lima-de-Faria and J.Reitlau: J. cell Biol., 1963, 16, 315-322 (Inst. Genet., Univ. Lund, Sweden) Peripheral blood cultures containing 113 Cytohaemagglutinin and [3 H]thymidine of concn. $2\text{J}^*\text{c/mL}_f$ sp. activity $1\text{*}9\text{ c/mM}$ were incubated for $3'$, hr. and prepared for autoradiography, nuclear and nucleolar staining. Non-tritiated cultures were stained with May-Grunwald-Giemsa's stain to identify the cell types. Unlabelled Feulgen-stained nuclei contained a central heterochromatic body composed of chr.segments around the nucleolus which is associated with 6 heteropycnotic segments. Cells of all sizes incorporated

[3 H]thymidine. DNA-synthesising nuclei occur in both eu- and heterochromatin but the latter has a higher DNA content and different rate of synthesis. P.Barrow

4707. HUMAN SEX CHROMOSOME ABNORMALITIES IN RELATION TO DNA REPLICATION AND HETEROCHROMATINEATION. M.M.Grumbach, A.Morishima and J.H.Taylor: Proc. nat. Acad. Sci., Wash., 1963, 49, 581-589 (Dept. Pediatrics, Coll. Phys. and Surg., Columbia Univ., N.Y., U.S.A.) pH_jThymidine and radioautography were used to study the sequence of DNA replication in X-chr. of the human complement. 5 individuals with extra X-chr. were found to have one X which replicates with the majority of the complement while all others replicate late. Results suggest that late-replicating chr. are heteropycnotic in interphase and their genetic expression is repressed. 2 patients with a structurally abnormal X were found to have this chr. consistently heteropycnotic and late-replicating. The observations are consistent with the 'fixed differentiation hypothesis*' of X-chr. behaviour. J.R.Sargent

4708. DIFFERENTIAL SYNTHESIS OF RNA AND SEXUAL DIFFERENTIATION OF ALLOMYCES. G.Turian: Develop. Biol., 1963, 6, 61-72 (Inst. Bot. gen. Univ. Geneva, Switzerland) In strains of *A.macrogyrus* x *A.arbuscula*, RNA: DNA and RNA: protein ratios increased sharply in the final stages of female gametangial maturation due to active RNA synthesis associated with formation of big nuclear caps. Increase in RNA: protein ratio was less marked in male garnetangia, RNA synthesis being proportional to the thinness of male gametic nuclear caps. The RNA: DNA ratio tended to decrease due to concurrent synthesis of DNA required by nuclear multiplication during gametangial maturation.

NUCLEO-CYTOPLASMIC RELATIONS

4709. NUCLEOLAR EXTRUSION IN THYROID EPITHELIUM OF WHITEMOUSE. M.A.E.Ramadan: Naturwissenschaften, 1963, 50, 2, 44 (Zool.Inst., Univ. Cologne, Germany) Li galloycyanin- chromealum prep. of active follicles, nucleoli were seen in contact with the nuclear membrane and also in direct contact with the cytoplasm through a direct breach in the nucleolar-nuclear membrane. The substance apparently being voided from the nucleolus into the cytoplasm appeared to be related to basophilic cytoplasmic material.

(German) AJ.Wansbrough

4710. INTRASPECIFIC NUCLEAR TRANSPLANTATION IN FROGS. R.G.McKinnell: J. Hered., 1962, 53, 199-207 (Dept. Zool., Newcomb Coll., Tulane Univ., New Orleans, La., U.S.A.) A sexually mature male *Rana pipiens* produced by the transplantation of a somatic diploid blastula nucleus into an enucleated egg is described. D.A.Jones

4711. THE ECDSONE CONCENTRATION-DEPENDENT GENE ACTIVATION PATTERN IN THE SALIVARY GLAND CHROMOSOMES OF CHKONOMUS TENTANS. U.Cleven Develop. Biol., 1963, 6, 73-98 (Max-Planck-Inst. Biol., Abt. Beermann, Tubingen, Germany)

CYTOLOGY

Duration and degree of activity (measured by the size of puffs) at loci I-18-C and IV-2-B, is dependent upon the concen. of ecdysone inj., locus IV-2-B having a lower sensitivity than locus I-18-C.

(German)

J.W.S.Harris

NUCLEAR AND CELL DIVISION

4712. OBSERVATIONS ON LECANOID SPERMATOGENESIS IN THE MEALY BUG, PLANOCOCCUS CITRI. W.A.Nelson-Rees. Chromosoma, Berlin, 1963, 14, 1-17 (Max-Planck-Inst. Meeresbiol., Tubingen, Germany) The second spermatogenic division, in which a heterochromatic set of autosomes is eliminated, is not, as previously suspected, either monopolar or monocentric bipolar. Examination of living and fixed material shows the spindle to be a bipolar structure on which the centromeres of both euchromatic and heterochromatic chr. are active. Radiation-induced anaphase bridges resulting from euchromatic - heterochromatic translocations further support this finding.

S.A.Henderson

4713. TEMPERATURE AND CHIASMA FORMATION IN SCHISTOCERCA GREGARIA. L AN ANALYSIS OF THE RESPONSE AT A CONSTANT 40°. S.A.Henderson: Heredity, 1963, 18, 77-94 (Genet. Dept., Univ. Cambridge, England) A const. high temp. of 40° greatly reduces the chiasma freq. at male meiosis after an initial 5-day lag. Those chiasmata which do form tend to be localised, particularly to the distal chr. ends. Detailed analyses are presented of the relationships of chiasma freq. and position, and univalent freq. for each of the 7 size groups recognised within the complement.

S.A.Henderson

4714. INHIBITION OF PROTEIN SYNTHESIS DURING MEIOSIS AND ITS BEARING ON EXTRACELLULAR REGULATION. Y.Hotta and H.Stern: J. cell Biol., 1963, 16, 259-279 (Dept. Bot., Univ. Illinois, Urbana, 111, U.S.A.) Anthers of *Tritium erectum* were cultured in Hoagland's inorg. medium at 3-5°, containing RNA inhibitors. The uptake of labelled compounds by the microsporocytes and the capacity of the cells to phosphorylate thymidine were measured. RNA and protein synthesis was noted during the meiotic cycle after chr. duplication, and the different effects of inhibitors at varying stages indicates a periodicity in the activities of different systems connected with protein formation. Chr. morphology and the processes of chr. segregation, cytokinesis, wall synthesis and enzyme appearance are discussed.

P Barrow

4715. SUBMICROSCOPICAL CHANGES OF SEGMENTING OVUM IN ALBINO RAT. K.Mazanec and M.Dvorak: Csl. Mcfol., 1963, 11, 103-108 (Inst. Histol. Embryol., J.E.Purkyne Univ., Brno, Czechoslovakia) The changes occurring on the cell surfaces during the process of segmentation from fertilised ovum to the young blastocyst stage are described.

K.Jones

4716. FREQUENCY OF MITOSIS IN THE SHOOT-BORNE ROOTS OF THE POTATO. T.Schreiter and G.Meinl: Z.Pflanzenz., 1963, 49, 81-86 (List. Pflanzenz., Tross-Loschwitz, Deutsche Akad. Landwirtschaftswiss. zu Berlin, Germany) Two varieties were studied. In

one, an endogenous rhythm of mitosis was detectable, with max. freq. after mid-day, though day-by-day variation was large. The other variety did not show such a rhythm. (German, English summary) H.Opik

4717. OBSERVATIONS ON DEVELOPMENT AND CYTOLOGY OF SEXUAL ORGANS OF ACHLYA APLANES VAR. INDICA. R.Dayal: Cytologia, 1961, 26, 423-427 (Dept. Bot., C.M.P. Degree-College, Allahabad, India) The development of the oogonia and antheridia is described. Discharge of antheridial contents into each of the 1-12 oospheres was followed, but nuclear fusion could only be observed in fixed material. Antheridial nuclear behaviour was not established, but the oogonial nuclei remaining after the rest degenerate each undergo one mitotic division.

CA.Stace

EFFECTS OF RADIATION AND CHEMICAL AGENTS

4718. RADIATION RECOVERY ENHANCED THROUGH INHIBITORS OF PROTEIN SYNTHESIS AND AMINO ACIDS. A.V.Beatty and J.W.Beatty: Proc/nat. Acad. Sci. Wash., 1963, 49, 434-439 (Emory Univ., Atlanta, Ga., U.S.A.) *Tradescantia paludosa*

inflorescences treated for 1/2 hr. with dihydrostreptomycin, puromycin or chloramphenicol, then X-irradiated in He gave lower chr. aberration yields than did untreated controls. Similar effects to those obtained with their protein inhibitors were obtained by addition of exogenous citrulline, histidine, proline, glycine, phenylalanine, cysteine, isoleucine, alanine, threonine and serine prior to irradiation. It is concluded that protein synthesis is not necessary for chr. rejoining and that accelerated recovery in treated cells is mainly due to presence of ATP in higher amounts than normal.

J.R.Sargent

4719. QUANTITATIVE STUDIES OF MITOSES AND DNA' SYNTHESIZING CELLS IN BONE MARROW AND BLOOD OF GUINEA-PIGS RECOVERING FROM SUBLETHAL WHOLE-BODY γ -IRRADIATION. PJF.Harris, G.Haigh and J.H.Kuglen Brit. J. Haemat., 1963, 9, 385-405 (Dept. Anat. and Histol., Univ. Sheffield, England)

13 days after 200 or 150 r irradiation young guinea-pigs showed proliferation of medium-sized and small mono-nuclear cells with the high nuclear-cytoplasmic ratio typical of a lymphocyte but with fine nuclear chromatin and basophilic cytoplasm typical of blast cells. After 200 r, the fewer proliferating erythroid cells were mostly the early form of erythroblast. After 150 r proliferation of polychromatic erythroblasts were dominant. Granulocyte cells show a similar difference with radiation dose, although proliferation is least evident here and mitosis and DNA-synthesis are rarely seen in them. More than 40% of the total telophases were forming in small or medium-sized lymphocytes. DNA synthesis also occurred in mononuclear cells in the blood stream.

J.Sneath

4720. CELL POPULATION STUDIES ON THE INTESTINE OF CONTINUOUSLY IRRADIATED RATS. D.R.Wimber and L.F.Lamerton: Radiat. Res., 1963, 18, 137-146 (Biol. Dept., Brookhaven Lab., Upton, N.Y., U.S.A.) Total population counts were made from squash prep. of

CYTOLOGY

individual whole crypts from the intestine. Autoradiographs were made of pH]thymidine-labelled cells. At 415 rads per day the crypt cell population decreased rapidly to a steady level after 2 days. After 5 days decrease in population increased with dose rate. The ratio of mitoses present indicated that the relative duration of mitosis was not altered during chronic irradiation. At 415 rads per day [3H]thymidine incorporation per labelled cell was double that of controls. B.Payne

4721. QUANTITATIVE STUDIES OF RELATIONSHIPS BETWEEN TUMOUR CELL PLOIDY AND DOSE RESPONSE TO IONIZING RADIATION IN VIVO. MODIFICATION OF RADIATION RESPONSE IN A PREVIOUSLY IRRADIATED TUMOUR. R.J.Berry: Radiat. Res., 1963, 18, 236-245 (Nat. Cancer Inst., Bethesda, Md., U.S.A.) A difference in dose response to radiation between 2 related murine lymphocytic leukaemias one diploid and one tetraploid was demonstrated in vivo. The slopes of the dose-response curves were similar in aerobic and anaerobic conditions, but the extrapolation no. for the tetraploid tumour exceeded that of the diploid tumour by a factor of 2 in both the presence and absence of O₂. A diploid tumour line was subjected to 1000 rad X-rays at each of 50 sequential passages in vivo. The radiation response altered during passage, a greater no. of tumour cells survived, an increase in nucleic acid content per cell was noticed and tetraploid and aneuploid cells appeared. B.Payne

4722. EFFECTS OF X-IRRADIATION OF OVARIAN OVA ON THE MORPHOLOGY OF FERTILIZED OVA AND DEVELOPMENT OF EMBRYOS. E.B.Harvey and M.C.Chang: J. cell. comp. Physiol., 1963, 61, 133-144 (Worcester Fndn. Expt. Biol., Shrewsbury, Mass., U.S.A.) Stages of meiosis in ovarian ova of the hamster *Mesocricetus auratus* were determined at various times of the oestrus cycle. When 1 ovary only was irradiated with 200 r X-rays, the rate of meiosis and morphology of ova were not affected. Irradiation during the late diplotene stage of prophase I and during meiosis resulted in a high incidence of foetal abnormalities and embryonic deaths. G.M.Lewis

4723. AN EFFECT OF EXOGENOUS THYMIDINE ON THE MITOTIC CYCLE. H.J.Barn: J. cell. comp. Physiol., 1963, 61, 119-127 (Dept. Zool., Columbia Univ., New York, U.S.A.) 1 X 10⁻⁴M thymidine does not affect the growth rate or mitotic index of cells in the root tip of *Hordeum vulgare*. In cultures of HeLa cells, at 2 x 10⁻⁴M, thymidine causes an increase in mitotic index, due entirely to a prolongation of mitosis; there is no increase in rate of cellular proliferation. G.M.Lewis

4724. RADIO-MIMETIC EFFECTS OF 1-METHYL-3-N-RO-1-NITROSOGUANIDINE IN Vicia faba. T.Gichner, A.Michaelis and R.Rieger: Biochem. biophys. Res. Comm., 1963, 11, 120-124 (Inst. Expt. Bot., Prague, Czechoslovakia) Induced aberrations in ¹N chromatin type in *V.faba* were preferentially realised in the heterochromatin. Resemblances in action of 1-methyl-phenyl-nitrosamine and cupferron are noted. B.Ketterer

4725. JR^r W^P OF DNase ACTIO^N ON CHROMOSOMES. & ²⁴U^XT, Lond., 1963, 198, 36-38 (Dept. of Genetics, U of Minnesota, Minneapolis, Minn., U.S.A.) Electronic flash photography was used to estimate the no.

of breaks produced in chr. isolated from the newt (*Triturus viridescens*) in the presence of DNase! rhe ISM E? ^{rela?} JP ^ t e d for chr. breaks in bato loop ^{visible} K^r & T^r Of chr.; b = k^{1/t^n} * here b = no. of visible breaks, k₂ = proportionality const., t = time S ^ f n l f f W ? ^{1 sub, UTdts} attacked/ n was determined to be 4.8 ± 0.4. J-R.Sargent

4726. TETRAPLOID BEETS BY MEANS OF ACENAPHTHENE APPLICATION. H ^ 1 d L n iSHS¹⁹⁶⁴ ^ 49, 91-95 (List. Pflanzenz., anzeichen, Deutsch Akad. zu Berlin, Germany) Seedlings were treated by application of acenaphthene and enclosure in a acenaphthene A second treatment The yield and prop.

4729. A GIRL WITH TRIPLOM CELLS. J.R.Ellis: R.Marshall, L.C.S.Wormand and L.S.Penrose: Nature, Lond., 1963, 198, 411 (Galton Lab., Univ. Coll., London, England) G.Sieirli

4730. P*T S^{10M}f ? ^ f^S ^ HUMAN CANCER CELLS. A.L.Spriggs, M.M.Boddington and C.M.Clarke: Brit. med. J., 1962, ii, 1431-1435 (Dept. Pathol., United Oxford Hospitals, England) Cells of malignant karyotypes. Chr. no. varied al modal value usually more than 46, but was occasionally less. Secondary peaks were found at multiples of the modal no. Cells with normal karyotype are due to the presence of normal dividing cells in the same specimen, as is shown by their appearance in stained smears. In many tumour cell populations distinctive abnormal chr. are seen in all cells, though no. varies. This may indicate descent from the same malignant cell. M.E.Nutt

4731. SEX CHROMATIN IN THE NEWBORN. A.L.Taylor: Lancet, 1963, i, 912-914 (Guy's Hosp. Med. Sch., London, England) A high proportion of 484 newborn girls s: chrom e sex first 2 days of life. Studies on stillborn girls and perinatal deaths suggest that the factor responsible for the reduction disappears at death. This reduction may be a reflection of the extremely high levels of SSSSAK^t G.H.Bell

CYTOLOGY

4732. CYTOLOGICAL ASPECTS OF SPECIATION IN TWO NORTH AMERICAN TELEOSTS, SALMO GAIRDNERI AND SALMO CLARKILEWISL R.C.Simon and A.M.Dollar. *Canad. J. Genet. Cytol.*, 1963, 5, 43-49 (Coll. Fisheries, Univ. Washington, Seattle, Wash., U.S.A.) The chr. complements of a population of rainbow trout (S.gairdneri) and one of cutthroat trout were compared. The complement of rainbow trout consisted of 16 aero- and 44 metacentric chr. while the cutthroat trout had 22 aero- and 42 metacentrics. The karyotype differences indicate that the populations belong to 2 distinct spp. D.A. Jones

4733. SEX CHROMOSOMES AND SEX-DETERMINATION IN SOME CALLIPHORA (CALLIPHORIDAE, DIPTERA). F.-H.Ullerich: *Chromosoma*, Berlin, 1963, 14, 45-110 (Max Planck-Inst. Meeresbiol., Tubingen, Germany) The chr. of 11 spp. belonging to the Dipteran family Calliphoridae were examined in both males and females. Two species, Chrysomyia albiceps and Crufifacies were parthenogenetic while all other spp. examined were not. All spp. possess the same chr. no. (2n = 12) which includes 5 pairs of large autosomes and 1 pair of small, partially or totally heterochromatic chr. These latter are without sex determining function in C.albiceps and Crufifacies but in all other spp. function as sex chr. A study of XO and sex-autosome translocation individuals provided some information on the sex determining mechanisms present.

(German) S.A.Henderson

4734. RELATIONSHIPS OF DIPLOID PROGENITORS OF HEXAPLOID WHEAT. G.Kimber and R.Riley: *Canad. J. Genet. Cytol.*, 1963, 5, 83-88 (Plant Breeding Inst., Cambridge, England) Comparisons are made between the cyt. behaviour of haploids and nullisomic-5B haploids of Triticum aestivum and hybrids between the diploid progenitors of T.aestivum. The pairing observed in the nullisomic-bb napioias can be predicted from an amalgamation of the pairing observed in hybrids between the diploid progenies. The implications of these results for the specificity of the action of chr. 5B and the evolution of polyploid wheats are discussed. D.A.Jones

4735. DETERMINATION OF CHROMOSOME ARM CARRYING GENE FOR CHLOROPHYLL PRODUCTION IN AVENA SATIVA. R.C.McGinnis, G.Y.Andrews and R.I.H.McKenzie: *Canad. J. Genet. Cytol.*, 1963, 5, 57-59 (Canada Dept. Agric. Res. Stat., Winnipeg, Canada) An F3 line from the cross Rodney 5 x Exeter, was found to be segregating for albino and green plants. The albino plants were nullisomic for chr. 14, whereas the green plants were monosomic or disomic. One albino plant was monotelocentric possessing only the short arm of chr. 14 indicating that a gene for chlorophyll production is located on the long arm of this chr. D.A.Jones

4736. CHROMOSOME NUMBERS OF SOME SOUTHWEST ASIAN SPECIES OF ASTRAGALUS AND OXYTROPIS (LEGUMEMOSAE). G.F.Ledingham and B.M.Reven: *Canad. J. Genet. Cytol.*, 1963, 5, 18-32 (Univ. Saskatchewan, Regina, Sask., Canada) Chr. counts for 83 spp. of Astragalus and 11 spp. of Oxytropis are given. The spp. show considerable polyploidy, 21 of them being polyploid. D.A.Jones

4737. INVESTIGATIONS ON THE SOLANUM CULTIVARS OF THE ISLAND OF CHILOE. H.Brncher. *Z.Pflanzenz.*, 1963, 49, 7-54 (Mendoza, Argentina)

98 varieties of Solanum from Chiloe were investigated with ref. to morphology, photoperiodic response and cytogenetics. A comparison was made with varieties from Peru, Bolivia and N.Argentina. It was concluded that the potato is not native to Chiloe, but has been brought there from the northern Cordillera. The implications for nomenclature of the genus, and for theories of gene centres, are discussed.

(German, English summary) H.Opik

4738. AN ATTEMPT TO HOMOLOGISE THE CHROMOSOME ENDS OF EUENOOTHERAS WITH THOSE OF RAIMANNIA- AND RENNERIA-OENOOTHERAS. C.G.Arnold: *Chromosoma*, Berlin, 1963, 14, 31-44 (Bot. Inst., Univ. Erlangen, Nurnberg, Germany) Reciprocal crosses were carried out between members of the Eu-Oenothera group and of the Raimannia- and Renneria-Oenothera groups. The numeration of chr. ends was attempted as far as possible but was made extremely difficult by the irregular pairing behaviour of the chr. in the hybrids.

(German) S.A.Henderson

4739. INDUCED TETRAPLOIDY IN SPARAXIS KER. AND IXIA L. W.Horn: *Z.Pflanzenz.*, 1963, 49, 87-90 (Fruit and Food Techn. Inst., Stellenbosch, S.Africa) Tetraploidy could be induced by colchicine treatment in both genera. Reversion to the diploid state was, however, frequent. Tetraploid flowers were obtained only in Sparaxis. Fertility was strongly reduced.

(German, English summary) H.Opik

4740. A LARGE CHROMOSOME IN THE LAMINARIAN NUCLEUS. L.V.Evans: *Nature*, Lond., 1963, 198, 215 (Marine Sci. Lab., Menai Bridge, Anglesey, Wales). G.M.Lewis

4741. CYTOLOGICAL STUDIES ON THE PERFECT STAGES OF SOME SPECIES OF FUSARIUM. W.T.Howson, R.C.McGinnis and W.L.Gordon: *Canad. J. Genet. Cytol.*, 1963, 5, 60-64 (Canada Dept. Agric. Res. Stat., Winnipeg, Manitoba, Canada) The 5 spp. of Gibberella: cyanea, cyanogena, fijiukuroi, stilboidea and zeae all have 4 chr. Five chr. were counted in a homothallic strain of Nectria haematococca and 7 in Calonectria nivalis. The meiotic chr. of these spp. were studied but the mitotic chr. of G.cyanea and G.cyanogena were large enough for karyotype study. D.A.Jones

TECHNIQUES

4742. PREPARATION OF CHROMOSOMES FOR LIGHT MICROSCOPY UTILISING AN AGAR FIXATION PROCEDURE. R.E.Pacha and D.T.Kingsbury: *Proc. Soc. exp. Biol.*, N.Y., 1961, 111, 710-712 (Dept. Microbiol., Univ. Washington Sch. Med., Seattle, Wash., U.S.A.) A rapid agar fixation method for delineation of chr. has been applied to suspensions of cultured and uncultured mammalian cells. Various stages of mitosis have been observed by controlling the osmotic strength of the agar. M.M.Shapland

4743. NEGATIVE STAINING METHOD FOR CELL-ASSOCIATED VIRUS. J.D.Almeida and A.F.Howatson: *J. cell Biol.*, 1963, 16, 616-620 (Ontario Cancer Inst., Toronto, Canada) A technique is described in which

the virus retains its structural detail and may be examined in relation to surrounding particles. The virus-infected cells are disrupted by treatment with hypotonic culture medium, frozen, and 4/j sections cut and stained with 3% phosphotungstic acid. The method is illustrated by micrographs of vaccinia and measles-virus infected cells.

PJSarrow

4744. NEGATIVE STAINING OF THINLY SPREAD CELLS AND ASSOCIATED VIRUS. D.F.Parsons: *J. cell Biol.*, 1963, 16, 620-626 (Ontario Cancer Inst., Toronto, Canada)

Normal, neoplastic and virus-infected cells of leukaemic mice and rats were studied by a procedure involving collection of the cells on a needle, floating on potassium phospho-tungstate and spreading on a formavar grid for E.M. The cytoplasmic structures and viruses are clearly seen.

P.Barrow

4745. METHOD FOR OBTAINING SERIAL SECTIONS OF KNOWN ORIENTATION FROM SINGLE SPERMATOZOA.

I.R.Gibbons: *J. cell Biol.*, 1963, 16, 626-629 (Biol. Lab., Harvard Univ., Cambridge, Mass., U.S.A.) Semen from bull, sea urchin and porgy (*Calamus* sp.) were fixed in OSO₄ and embedded in araldite using a flat embedding technique. The structural assymetry of the "Perm tail and the relationship between fine-structure and direction of beat were studied.

P.Barrow

4746. A PREPARATION OF CELL NUCLEI OF PURITY CONFIRMABLE BY E.M. J.-P.Zalta, R.Rozencwajg, N.Carasso and P.Favard: *C.R.Acad. Sci., Paris*, 1962, 255, 412-414 (Lab. de Synthèse atomique, C.N.R.S., Ivry, Seine, France)

Cell nuclei were obtained from free cells or tissues by treatment in bicarbonate-free Earle's medium at pH 6.8 with firstly 0* 15% nonyl-phenol-polyoxyethylene containing 6 moles of ethylene oxide (Cemulsol NPT 6, Bezou) and then 0.15% nonyl-phenol-polyoxyethylene containing 12 moles of ethylene oxide (Cemulsol NPT 12). Other media, e.g. saccharose/magnesium, can be used. The nuclei are free from cytoplasmic contamination on inspection by E.M. and retain their membranes and their ability to incorporate amino acids.

(French) S.A.Thistlewood

4747. HIGH-POWERED PHASE CONTRAST EQUIPMENT WITH LONG WORKING DISTANCE FOR OBSERVATION OF CULTURE FLASKS. G.Petursson and J.Fogh: *Proc. Soc. exp. Biol. N.Y.*, 1963, 112, 523-524 (Div.

Expt. Pathol., Sloan-Kettering Inst. Cancer Res., New York, U.S.A.) A Zeiss 1-6mm. working distance objective and a Wild 20mm. (long-working distance) condenser are used to make high power observations of living cells in tissue culture T-15 flasks. D.N.Wheatley

GENETICS

GENERAL

4748. SELECTION AT THE MOLECULAR LEVEL.

A.Lima-de-Faria: *J. theoret. Biol.*, 1962, 2, 7-15
 (Inst. Genet., Lund Univ., Sweden) Selection acts on the constitution and organisation of a chr., favouring mutations which conform to local chr. effects. At the organism level, selection only selects from individuals which have passed the first trial at the mol. level.

J.A.Dawson

4749. MIGRATIONAL SELECTION. A.W.F.Edwards:

Heredity, 1963, 18, 101-106 (Inst. Genet. Univ. Pa via, Italy) Fisher's migrational selection is discussed in relation to disruptive selection and a mathematical example given to show how an equilibrium gene distribution may result from it and how it will augment the genetic variance of a character. S.A.Henderson

4750. GENERATION OF SELF-INCOMPATIBILITY ALLELES.

D.Lewis: *J. theoret. Biol.*, 1962, 2, 69-71
 (Bot. Dept., Univ. Coll., London, England) Fisher's mathematical model predicts the generation of alleles by mutation or recombination at a rate of 10^{-4} . Self-pollination expt. reveal a rate of 10^{-8} . Until there is an explanation of this discrepancy, the biochem. of incompatibility cannot be profitably discussed.

J.A.Dawson

4751. ENVIRONMENTS OF ANIMALS AND PLANTS.

T.O.Browning: *J. theoret. Biol.*, 1962, 2, 63-68
 (Unit Anim. Ecol., Zool. Dept., Univ. Adelaide, Australia) In an amendment of the 'environment' concept of Andreartha and Birch (1954), for consideration of population no. weather, members of the same sp. and members of other spp. are analysed in relation to resources and hazards.

J.A.Dawson

4752. CONGENITAL ABNORMALITIES AND COMPETITION IN MAN AND OTHER MAMMALS AT DIFFERENT MATERNAL AGES. P.A.Parsons:

Nature, Lond., 1963, 198, 316-317 (Dept. Zool., Univ. Melbourne, Australia) Data are reviewed on the incidence of congenital defects in young born to mothers of different ages in mice, guinea-pigs and man. Differences between spp. may be due to the effect of overcrowding in utero in some cases. Developmental abnormalities in *Drosophila* increase in offspring from older females. G.M.Lewis

4753. METHOD FOR CALCULATING INBREEDING COEFFICIENT.

A.Kudo: *Amer. J. hum. Genet.*, 1962, 14, 426-432 (Maths. Inst., Kyushu Univ., Fukuoka, Japan) A novel method of computation of the inbreeding coeff. is described using a pedigree sheet. The method can be adopted for use in a high speed computer.

D.A.Jones

MICRO-ORGANISMS

4754. PLAQUE-SIZE MUTANTS OBTAINED FROM THE RNA PHAGE FR AFTER TREATMENT WITH NITROUS ACID.

F.Kaudewitz and P.Knolle: *Nature*, Lond., 1963, 198, 97 (Max-Planck-Inst. vergleichende Erbbiol. und Erbpathol., Berlin-Dahlem, Germany)
 The rate of inactivation of phage fr by nitrous acid is more

similar to that for TMV than that of DNA-phages. The treatment produced small plaque mutants Closely related to wild-type.
 G.M.Lewis

4755. PRELIMINARY GENETIC MAP OF 17 GALACTOSE MUTATIONS IN *E.COLI* K 12. M.L.Morse:

Proc. nat. Acad. Sci. Wash., 1962, 48, 1314-1318 (Webb Inst. Med. Res., Dept. Biophys. Univ. Colorado Med. Center, Denver, Colo., U.S.A.) A map of the galactose region of *E.coli* K 12 obtained by studying crossing over in heterogenotes showing position effect is presented. The order kinase cistron-operator region-transferase cistron is indicated. The relationship of the epimerase cistron to the above region is not known at present.
 J.R.Sargent

4756. INCORPORATION OF PARENTERAL DNA INTO GENETIC RECOMBINANTS OF *E.COLI*.

O.H.Siddiqi: *Proc. nat. Acad. Sci. Wash.*, 1963, 49, 589-592 (Div. Biol., Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) Evidence is presented indicating that recombinants arising from mating to an HFr with^{an} F" strain of *E.coli* inhibit labelled DNA from the F" parent. The procedure for detecting incorporation of parental DNA into recombinants involved mating of a T6-resistant HFr to a T 6-sensitive F" carrying specifically labelled DNA. When mated cells are exposed to a high multiplicity of phage T6, sensitive cells are rapidly lysed. T6-resistant F" recombinants are then separated by filtration and examined for the presence of the parental label.

J.R.Sargent

4757. F-PRIME TRANSFER AND MULTIPLICATION OF SEXDUCED CELLS.

P.G.de Haan and A.H.Stouthamer: *Genet. Res.*, 1963, 4, 30-41 (Lab. Microbiol., State Univ., Utrecht, Netherlands) The sex factor, F in *E.coli* when transmitted by cell contact, may undergo a variable delay before it is transmitted. The earliest transfer occurs at 4 min. and some are not transferred until 11 min. after mating. Each recipient cell possesses at least 2 copies of the newly acquired F particle before the next cell division in liquid media, due to the rapid multiplication of the F particle. Anomalous results were observed in solid media. It was possible to infect a cell with 2 different F particles, but such strains were unstable and segregated the particles. The evidence suggests that the no. of F particles per cell is small and that these are not distributed at random to the daughter cells. J.Sneath

4758. EPISOMIC CONTROL OF MUTATION IN

SALMONELLA.

G.W.P.Dawson and P.F.Smith-Kearny: *Heredity*, 1963, 18, 1-20 (Genet. Dept., Trinity Coll., Dublin, Ireland) Unstable reversions at the su - leuA locus in strain leu - 151 of *Salmonella typhimurium* are explained in terms of the movement to and from the locus of units similar to controlling elements described in maize. These units are called controlling episomes.

S.A.Henderson

4759. DIRECTED MUTATIONS IN YEASTS AND

BACTERIA.

C.C.Lindgren: *Bull. Res. Coun. Israel*, A, 1963, 11, 363-368 (Biol. Res. Lab., S.minois Univ., Carbondale, HI., U.S.A.) On the receptor hypothesis of gene structure a gene may mutate in 2 different ways, and crossing over may occur either within the gene by nucleotide exchange or between genes by breakage and reunion of the histone backbone of the chr. Arguments are put forward favouring the view that adaptive mutations may result from changes in the folding of receptors of genes directed by contact with different mutagenic substances.

L.G.

Gillies

4760. EFFECT OF GENE DOSAGE ON LEVEL OF C_t-GLUCOSBDASE W YEAST. F.Rudert and H.O.Halvorson: Bull. Res. Counc. IsraeLA, 1963, 11, 337-344 (Dept. Biochem., Univ. Wisconsin, Madison, Wis., U.S.A.) *S.cerevisiae* contain a no. of unlinked structural genes (M or Ma) for C_t-glucosidase synthesis. Only one dominant form of the gene is necessary for enzyme synthesis. However, the different gene differ in the induced level of enzyme produced. Two allelic genes, Mi and Mai, also differed by 60%. The level of enzyme is directly proportional to the gene dosage. Isomaltose regulatory genes (MGi and MG2) influence the level of α-glucosidase. THS5^E findfigTSuggested that the structural genes for α-glucosidase differ in the nature of closely linked control genes. L.G.Gillies
4761. SUPPRESSION BY METHIONINE OR REVERSIONS TO ADENINE INDEPENDENCE IN SCHIZOSACCHARO-MYCES POMBE. C.H.Clarke: J. gen. Microbiol., 1963, 31, 353-363 (List. Animal Genet., Edinburgh, Scotland) Spontaneous, u.v.-induced and nitrous acid-induced reverse mutations conferring ability to grow on minimal medium lacking adenine were scored in adenine auxotrophs and in adenine and methionine diauxotrophs. 40-/*g./ml. L methionine suppressed appearance of revertants of adenine-1 mutants, thus accounting for the apparently lower mutability of the ad-1 mutants in the ad-met-diauxotrophic strains as compared with the ad- strains as being due to methionine in the plating medium. Reversions of an adenine mutant at another locus and reversion of a leucine auxotroph show a similar effect. K.Brew
4762. CO-ORDINATE CHANGES IN COMPLEMENTATION, SUPPRESSION AND ENZYME PHENOTYPES OF A PYR-3 MUTANT OF NEUROSPORA CRASSA. V.W.Woodward and R.H.Davis: Heredity, 1963, 18, 21-25 (Biol. Dept., Rice Univ., Houston, Tex., U.S.A.) A non-complementing pyr-3 mutant lacking aspartate transcarbamylase [ATC] can be converted by Jijutia to a complementing type which possesses ATC. These alterations of phenotype may be due to mutation of a modifier within the pyr-3 gene. Some evidence supports the previously inferred bifunctional nature of this locus. S.A.Henderson
4763. GENETIC AND EPIGENETIC FACTORS CONTROLLING FEMALE STERILITY IN NEUROSPORA CRASSA. P.H.Fitzgerald: Heredity, 1963, 18, 47-62 (Cytogenet. Unit, Christchurch Hosp., Christchurch, New Zealand) Female sterility, due to failure to form protopenthecia, was found in a biochem. wild-type strain of N.crassa. One genotype, s bk, existed in a wide range of phenotypes which were not due to genedifferences but to different equilibrium states of physiol. or cytoplasmic interactions. S.A.Henderson
4764. INDEPENDENTLY SEGREGATING GENETIC LOCI CONCERNED WITH NITRATE REDUCTASE ACTIVITY IN ASPERGILLUS NIDULANS. D.J-Cove and J.A.Pateman: Nature, Lond., 1963, 198, 262-263 (Dept. Genet., Univ. Cambridge, England) 40 mutants obtained by u.v.-irradiation were unable to use nitrate as a sole N source. Some combinations of these mutants in heterokaryons were able to use nitrate. Linkage groups indicated that mutation in at least 6 genetic loci, which segregated independently, could prevent die-back of detectable nitrate reductase. It is possible that a multi-enzyme system is involved or that the

enzyme may be a large complex mol. made up of polypeptide subunits determined by different structural genes. G.M.Lewis

4765. PARASEXUAL CYCLE AND LINKAGE RELATIONSHIPS IN THE STORAGE ROT FUNGUS PENICILLIUM EXPANSUM. G.L.Barlow: Canad. J. Bot., 1962, 40, 1603-1613 (Dept. Bot., Ontario Agric. Coll., Ont., Canada) 104 nutritional, morphol. and acriflavine-resistant mutants were produced. Nutritional mutants were induced more readily with u.v. than with Y radiation. Heterocaryons were established between strains involving up to 8 pairs of markers. Heterozygous diploids were readily obtained by treatment of the heterocaryons with D-camphor but with great difficulty in untreated heterocaryons. Analysis of 110 independent segregants from the heterozygous diploid M53/M67 has resolved 7 genes into 2 linkage groups, viz. LW3, bii, pyr^A, br3, and II.nic2, rii, acrj. A.Meany

4766. HETEROCARYOSIS AND SOMATIC RECOMBINATION IN CEPHALOSPORIUM MYCOPHILUM. R.W.Tuveson and D.O.Coy: Mycologia, 1961, 53, 244-253 (Dept. Bot., Univ. Chicago, Chicago, Ill., U.S.A.) Each of 3 heterocaryons between auxotrophic strains responded to growth on supplemented minimal medium by alteration of nuclear proportions. In 2 of the heterocaryons grown on minimal medium only one component nuclear type was detected in the conidia. Analyses of conidia produced by 2 presumptive somatic diploid colonies, yielded recombinant nuclei bearing markers characteristic of the 2 parental strains. J.G.J.Brown

PLANT

4767. PARTHENOCARPY AND APOMIXIS IN RBES GENUS INDUCED BY GIBBERELLINE ACID. J.M.Zatyk& Naturwissenschaften, 1962, 49, 212-213 (Inst. Plant Breeding, Fertod, Hungary) JJE.Hobbs

4768. NON-DISJUNCTION IN AN OENOOTHERA INTER-CHANGE HETEROZYGOTE. D.C.Catcheside: Heredity, 1963, 18, 63-75 (Microbiol. Dept., Univ. Birmingham, England) A two-chr. interchange heterozygote is potentially capable of producing 14 types of gamete. In an interchange heterozygote of Oenothera blanda, which shows a position effect variegation of 2 genes, most classes will produce viable progeny when combined with a normal blanda gamete. This corrects the previous interpretation of certain duplication-deficiency plants. S.A.Henderson

4769. ON THE INFLUENCE OF GENES AND GIBBERELLINS ON FLOWER FORMATION IN ARABIDOPSIS THALIANA. K.Napp-Zinn: Ber. dtsch. bot. Ges., 1963, 76, 77-89 (Bot. Inst., Univ. KOln, Germany) Prelim, c^Amm. (German) H.Opik

4770. DISTORTED INHERITANCE OF STEM-RUST RESISTANCE OF TIMSTEIN WHEAT CAUSED BY POLLEN-KILLING GENE. W.Q.Loegering and E.R.Sears: Canad. J. Genet. Cytol., 1963, 5, 65-72 (U.S.Dept. Agric, Beltsville, Md., U.S.A.) A partial ^ sterility in the wheat variety Chinese spring leads to aberrant

GENETICS

segregations of susceptibility and resistance to Puccinia graminis amongst F2 and FQ progeny of the cross Chinese spring (susceptible) by Timstein (resistant). The rf sterility is nuclear in control the allele Ki (pollen killer) causing the abortion of ki microspores in Ki ki individuals. The Ki locus is aEout 9% recombination units from the resistance (Sr 11) locus. Certain varieties tested showed virtually no pollen abortion in their hybrids with either Chinese spring (Ki Ki) or Thatcher (ki ki). D.A.Jones

4771. DNA AND THE ANCESTRY OF WHEAT. H.Rees: Nature, Lond., 1963, 198, 108-109 (Dept. Agric. Bot., Univ. Coll. Wales, Aberystwyth, Wales) Estimates of DNA in root-tip nuclei confirm an allopolyploid origin of the cultivated wheats without appreciable change in the DNA content of genomes subsequent to hybridization. G.M.Lewis

4772. EVALUATION OF CLAIMS OF LE. GLOUCHT-CHENKO FOR VEGETATIVE HYBRIDISATION IN PLANTS. D.S.Dean: J. Hered., 1962, 53, 215-221 (Baldwin-Wallace Coll., Berea, Ohio, U.S.A.) Review. 35 ref. D.A.Jones

4773. HAPLOIDS IN GENETICALLY MARKED PROGENIES OF TOBACCO. L.G.Burte J. Hered.. 1962, 53, 222-225 (U.S.Dept.Agric., Beltsville, Md., U.S.A.) A technique for the ready identification of haploids is described. Some paternal haploids were obtained from the cross YgYg x ygyg (yg homozygotes have yellow-green cotyledons as seedlings). D.A.Jones

4774. THE EFFICIENCY OF HAPLOID METHOD OF PLANT BREEDING. M.Nei: Heredity, 1963, 18, 95-100 (Genet. Div., Nat. Inst. Radiolog. Sci., Chiba, Japan) The efficiency of the haploid method of plant breeding is examined in comparison with the conventional diploid method. Calen. show the haploid method to be advantageous when the no. of genes concerned is large and the freq. of favourable alleles in populations are small and when, as in forest trees, the generation time is long. S.A.Henderson

4775. REVIEWS IN GENETICS AND CYTOLOGY. I. PLANT BREEDING. C.J.Bishop: Canad. J. Genet. Cytol., 1963, 5, 1-11 (Canada Dept. Agric., Ottawa, Canada) Review. 89 ref. D.A.Jones

ANIMAL

4776. PHENOGNETICS OF HAIR MUTANTS IN THE HOUSE MOUSE: OPOSSUM AND RAGGED. S.J.Mann: Genet. Res., 1963, 4, 1-11 (BioU Dept., Brown Univ., Providence, R.I., U.S.A.) Results confirm previous linkage studies which suggested that the semi-dominant mutations Ragged (Ra) and Opossum (Ra°P) are alleles. Matings + + x Raop + show no deficiency in Ra°P embryos but Ra 4-x Ra>P 4- and Ra°P + x Ra°P + matings show in utero deaths of Raop 4- embryos in addition to RaRa°P and RaQRaP embryos. There is also a high freq. of oedema in the RaQP + embryos which increases with their age. Hair follicles develop later in the mutants and show the following order (in increasing delay). Ra +, Ra°P +, (when non-oedemic), RaRa and Raffi + "when

oedemic). The heterozygotes for Opossum and Ragged show failure of differentiation in some follicles and have a full complement of trichotrichs but variable concn. of awls. Ra + mice have fewer zigzags and fa22 + mice usually lack them. The mutants lack achenes. Their hair growth is asynchronous and often lacks the quiescent phase of the cycle. J.Sneath

4777. DEVELOPMENT OF SOMATIC MUTATIONS IN MICE WITH AGE. C.Crowley and H.J.Curtis: Proc. nat. Acad. ScL Wash., 1963, 49, 626-628 (Biol. Dept., Brookhaven Nat. Lab., Upton, N.Y., U.S.A.) Chr. aberrations in the liver cells of 2 strains of mice, one long-lived and the other short-lived, were measured as a function of age. Development of aberrations was inversely proportional to life expectancy. It is concluded that somatic mutations seem very likely to play a dominant role in the ageing process. J.J.Sargent

4778. GENETICS OF A Y-GLOBULIN KOANTKEN (ALLOTYPE) IN THE MOUSE. J.Wunderlich and LjV.Herzenberg: Proc. nat. Acad. ScL Wash., 1963, 49, 592-598 (Dept. Genet., Sch. Med., Stanford Univ., Calif., U.S.A.) Studies of a mouse yslobulin iso-Ag are presented which demonstrate that the iso-Ag is present on Ab molecules of 2 different Ab specificities. Inheritance of the Ag is controlled at a single genetic locus. J.R.Sargent

4779. SEX OF PARENT AND VARIATION OF RECOMBINATION WITH AGE IN THE MOUSE. D.H.Reid and P.A.Parsons: Heredity, 1963, 18, 107-108 (Zool. Dept., Univ. Melbourne, Australia)* S.A.Henderson

4780. REPEATABILITY OF LITTER SIZE AND WEIGHT IN LABORATORY RAT AS AFFECTED BY SELECTION AND PLANE OF NUTRITION. JJ.Kidwell, H.J.Weeth, L.H.Haverland, C.E.Shelby and R.T.Clark: J. Hered., 1962, 53, 247-250 (Animal Res. Inst., Central Exp. Farm, Ottawa, Ont., Canada) No definite conclusion could be reached as to whether selection for 70-day body wt. affected the repeatability of litter size and 28- and 70-day wt. A maternal effect on body wt. persisted to at least 70 days yet neither ratios nor method of selection had a significant effect on litter size. D.A.Jones

4781. RELATIONSHIP BETWEEN ROSE COMB AND REPRODUCTION IN DOMESTIC FOWL. R.D.Crawford and E.S.Merritt: Caaad. J. Genet. Cytol., 1963, 5, 89-95 (Res. Stat., Kentville, Nova Scotia, Canada) Subnormal reproductive ability in White Wyandotte fowl is attributable to low fertility rather than to poor hatchability or viability of the embryos. The condition is expressed only in males homozygous for the rose comb gene, heterozygotes being normal or nearly normal. D.A.Jones

4782. GENETIC DIFFERENCES IN GROWTH POTENTIAL ON AMINO ACID DEFICIENT DIETS. P.Griminger and H.Fisher: Proc. Soc. exp. Biol., N.Y., 1962, 111, 754-756 (Dept. Poultry ScL Rutgers, State Univ. of New Jersey, New Brunswick, N.J., U.S.A.) Chicks from hens of a random-bred flock raised to 4 weeks on either an arginine or a lysine-deficient diet showed an inherited growth potential. The majority of chicks from any one dam behaved differently on the 2 diets. The ranking of dams on the basis of growth potential of offspring given a complete ration was similar to that obtained on the arginine but not the lysine-deficient diet.

M.M.Shapland

4783. Hb PATTERNS OF PLAICE, FLOUNDER AND THEIR NATURAL AND ARTIFICIAL HYBRIDS. K.Sick, O.Frydenberg and J.T.Nielsen: Nature, Lond., 1963, 198, 411-412 (Inst. Genet., Univ. Copenhagen, Denmark) Agar electrophoretic patterns of Hb from Plaice, flounder, the F₁ hybrid and a mixture of Hb from the parent spp. are examined. A no. of novel Hb components in the hybrid individuals indicate that the tetrameric mol. of plaice and flounder Hb: are composed of at least 2 sub-units. G.M.Lewis

4784. THE GENETICS OF ARTEMIA SAUNA. I. THE REPRODUCTIVE CYCLE. S.T.Bowen: Biol. Bull. Woods Hole, 1962, 122, 25-32 (Dept. Biol., San Francisco State Coll., Calif., U.S.A.) A culture method is described. No evidence of parthenogenesis, Paedogenesis or pseudogamy was found in 2 races cultured In this way. Copulation was only effective when the eggs were in the oviducts, and females did not store sperm from one reproductive cycle to the next. G.J.Peakin

4785. THE CONTROL OF CROSSING-OVER IN THE X-CHROMOSOME OF DROSOPHILA MELANOGASTER. M.J.Lawrence: Heredity, 1963, 18, 27-46 (Genet. Dept., Univ. Birmingham, England) In a diallel cross of 5 inbred lines of D.melanogaster the X-chr. recombination freq. was scored among the backcross Progenies of the parent lines and their twenty F₁'s, at 2 temp. 18° and 25°. Crossing over in most parts of the X-chr. is under genetic control. Control is polygenic, with Part of the control exercised at the interchromosomal ^vel, and the additive component of genetic variation is die most important, there being only slight dominance and no genie interaction. S.A.Henderson

4786. SEX AND HETEROSESIS IN DROSOPHILA MELANO-GASTER. J.F.Kidwell: Canad. J. Genet. Cytol., 1963, 5, 50-56 (Canada Dept. Agric., Ottawa, Canada) An incomplete 5 x 5 diallel cross revealed significant sex x heterosis interactions for body wt. in 2 of the crosses between inbred lines. One line was common to both Crosses. Sex differences in the degree of heterosis for abdominal chaetae are not frequent and cannot be attributed to a consistently greater degree of heterosis expressed by the homogametic sex. There was evidence of neg. general combining ability for body wt. in one J^{ne}. Sex linkage was observed in 2 and maternal effect to one of 5 crosses for body wt. D.A.Jones

4787. ECOLOGICAL AND SEXUAL VARIATION IN DROSOPHILA RUBIDA INVERSION POLYMORPHISM. W.H.Mather: Heredity, 1963, 18, 109-111 (Zool. Dept., Univ. Queensland, Brisbane, Australia) S.A.Henderson

4788. GENETIC CONTROL OF CYTODIFFERENTIATION. T.M.Rizkfc J. cell Biol., 1963, 16, 513-520 (Dept. Zool., Univ. Michigan, Ann Arbor, Mich., U.S.A.) ^bat bodies of Drosophila melanogaster were separated into ^anterodorsal, ^bdorsolat. and caudal regions and implanted into 2-day old vermilion flies. The donor tissues were examined by fluorescence microscopy 16 hr. after transplantation. Anterior fat cells synthesised kynurenine only if the presence of the non-allelic suppressor gene, kynurenine was induced in the ant. and post. regions of *e normal Ore R strain by die precursor tryptophan. It is included that the absence of a physiol. process in a differentiated cell does not necessarily represent a loss of *e genetic potential for mat process. P.Bairow

4789. ATTEMPTS TO PRODUCE GENETICAL CHANGES IN DROSOPHILA BY CENTRIFUGATION. O.S.Reddi: Nature, Lond., 1963, 198, 316 (Radiation Genet. Project, Osmania Univ. Hyderabad, India) The freq. of sex-linked recessive lethals and translocations in D.melanogaster ♀ germ cells was not affected by centrifugation at 3000 r.p.m. for 60 min. G.M.Lewis

4790. GENETIC EVIDENCE OF X-RAY INDUCED EXCHANGES OCCURRING AT FOUR-STRAND STAGE IN DROSOPHILA SPERMATOCYTES. S.Zimmering: J. Hered., 1962, 53, 254-256 (Dept. Biol., Brown Univ., Providence, R.I., U.S.A.) Some genetic evidence is presented that X-ray induced exchanges between X and Y chr. occur at a 4-strand stage in spermatocytes. Some exceptional female progeny were recovered which had received both their X chr. from the irradiated male parent, one of these being a cross over and the other a non-crossover chr. D.A.Jones

4791. A PARTHENOGENETK SPECIES OF GRASSHOPPER WITH COMPLEX STRUCTURAL HETEROZYGOSITY (ORTHOPTERA: ACRIDOIDEA). MJ.D.White, J.Cheney and K.H.L.Key: Aust. J. Zool., 1963, 11, 1-19 (Dept. Zool., Univ. Melbourne, Australia). G.M.Lewis

HUMAN

4792. INFLUENCE OF SECRETOR AND LEWIS GENES ON SUSCEPTIBILITY TO DUODENAL ULCER. P.A.J.Ball: Brit. med. J., 1962, ii, 948-950 (Dept. Med., Univ. Coll. Hosp., Ibadan, Nigeria) There was an excess of group O subjects and of ABO non-secretors in Nigerian patients with duodenal ulcer in comparison with control subjects from the same tribe. The excess of non-secretors was entirely due to Le(a+b-) subjects, there were fewer than the expectefno. of Le(a-b-) non-secretors. Relative freq. of these groups in secretor patients did not differ from those in controls. Enhanced liability of ABO non-secretors to duodenal ulcer may depend on interaction of Lewis and secretor genes. M.E.Nutt

4793. BLOOD GROUPS AND DISEASE. ABH ANTIGENS IN HUMAN DUODENAL CELLS. W.K.Cowan: Brit. med. J., 1962, ii, 946-948 (Dept. Med., Univ. Liverpool, England) Examination of human duodenal mucosal cells by mixed cell aggltn. shows that blood group Ag is present in secretor subjects, but absent or scanty in non-secretors. M.E.Nutt

4794. BLOOD GROUPS AND DISEASE. PREVIOUS TRANSFUSIONS AS POTENTIAL SOURCE OF ERROR IN BLOOD TYPING. C.A.Clarke, W.T.A.Donohoe, R.B.McConnell, J.H.Martindale and P.M.Sheppard: Brit. med. J., 1962, i, 1734-1736 (Dept. Med., Univ. Liverpool, England) Transfusion of 1 pint of blood can lead to mistakes in determining a patient's Rh and MN genotype for at least 4 wefeks. An erroneously high Treq. of CDe/cDE and MN subjects may be found in surveys of hospital patfn's unless these are untransfused. Previous transfusion may explain the high CDe/cDE freq. found in duodenal ulcer by Buckwalter and Tweed (1962). M.E.Nutt

GENETICS

4795. RHEUMATIC FEVER AND BLOOD GROUPS*

J.A.Buckwalter, G.S.Naifeh and J.E.Auer. Brit. med. J. 1962, ii, 1023-1027 (Coll. Med. State Univ., Iowa, U.S.A.) An investigation of blood group freq. in rheumatic fever patients seen at Univ. Iowa hospitals during 15 yr. M.E.Nutt

4796. BLOOD GROUPS IN RHEUMATIC FEVER.

J.H.Edwards: Brit. med. J., 1962, ii, 1027-1028 (Dept. Social Med. Univ., Birmingham, England) (Appendix to Buckwalter et al.). M.E.Nutt

4797. ABO BLOOD GROUPS IN RELATION TO ISCHAEMIC HEART DISEASE. B.B.Stewart.

M.CBotha and L.H.Krut: Brit. med. J., 1962, i, 1647-1650 (Dept. Med. Univ. Capetown, S.Africa) A statistical investigation of blood groups of 792 patients (Bantu, Cape Coloured, English speaking, Afrikaans speaking and Jewish whites) attending prothrombin clinics throughout the Cape Peninsula. The group as a whole showed excess of A and B and a deficiency of group O in comparison with controls, but deviation was not significant in those races where incidence of ischaemic heart disease was high. The findings exemplify the complex interplay of genetic and environmental factors in the development of ischaemic heart disease. M.E.Nutt

4798. LINKAGE OF COLOUR BLINDNESS TO HAEMOPHILIAS A AND B. D.L.Whittaker,

D.L.Copeland and J.B.Graham: Amer. J. hum. Genet., 1962, 14, 149-158 (Dept. Path., Univ. N.Carolina, Chapel Hill, N.C., U.S.A.) One family segregating for colour blindness and Haemophilia A and another segregating for colour blindness and Haemophilia B were large enough to give evidence of recombination between the loci. Recombination between deutanopia and Haemophilia A is about 6% while recombination between protanopia and Haemophilia B is about 50%. Assuming that the colour blindness genes are alleles or very closely linked there is thus evidence that the two forms of haemophilia are probably not allelic. D.A.Jones

4799. IS CHOLELITHIASIS ASSOCIATED WITH A SPECIFIC BLOOD GROUP? E.W.Hauch and F.J.Moore:

Gastroenterology, 1963, 44, 125-126 (Univ. S.Calif. Med. Sch., Los Angeles, Calif., U.S.A.) The distribution of blood ABO grouping of cholelithiasis sufferers shows fewer 'Jo in the B group and more in the AB group than is found in the control group of patients free from cholelithiasis. D.N.Wheatley

4800. BLOOD GROUPING IN THREE FAMILIES WITH KARTAGENER'S SYNDROME. C.D.Cook, F.Geller,

G.B.Hutchison, P.Gerald and F.H.Allen jun: Amer. J. hum. Genet., 1963, 14, 290-294 (Children's Hosp. Med. Center, Boston, Mass., U.S.A.) No evidence for linkage between Kartagener's syndrome and ABO, Rh, MNS, Kell, Duffy, Kidd, P, Lewis, Lutheran and Wright blood group systems was obtained. D.A.Jones

4801. ABNORMAL HAEMOGLOBINS IN THE NEONATAL PERIOD AND THEIR RELATIONSHIP TO THALAS-

SAEMIA. DJ.Weatherall: Brit. J. Haemat., 1963, 9, 265-277 (Div. Haemat., Dept. Med., Johns Hopkins Univ. Sch. Med., Baltimore, Md., U.S.A.) The families of 11 Negro infants with Bart's Hb in the neonatal period, were tested haematol. In each family one parent of the affected child showed abnormal red cell morphology

with reduced osmotic fragility. The presence of Bart's Hb in infancy is associated with a mild tfoalassaemia-like disorder resulting from defective α -chain synthesis which is extremely variable in adult life. There is no interaction with the gene for sickle-cells. Thus it seems likely that the 2% of American negroes affected by the non-interacting type of thalassaemia are suffering from defective α -chain synthesis which has such variable effects in adult life that the neonatal period is the only phase in which die affected individual can be accurately typed. J.Sneath

4802. HEREDITARY HAEMORRHAGIC TELANGIECTASIA AND GASTROINTESTINAL HAEMORRHAGE.

C.R.Smith juiu, L.G.Bartholomew and J.C.Cain: Gastroenterology, 1963, 44, 1-6 (Sect. Med., Mayo Clinic, Rochester, Minn., U.S.A.), A study of some 150 family histories in this no. of cases of hereditary haemorrhagic telangiectasia showed that about 20% of the cases had no predecessors with the complaint. It was found that about 89% of the patients suffered from haemorrhage and the vast majority of these from epistaxis. The telangiectatic lesions were found mainly on the face, the hands and the mucous membranes of the head. Oestrogen therapy was found to be moderately successful. In most cases the symptoms are found at very early ages but become progressively more severe and come to a climax in the sixth decade. As far as the gastrointestinal tract is concerned the symptoms of telangiectasia were found in only 20% of the cases. Resections of incriminated regions of the gut was found to be wholly unsuccessful. D.N.Wheatley

4803. HIGH LEVELS OF Hb F WITH Hb A, S AND C IN GHANA. G.R.Thompson and H.Lehmann: Brit. med. J., 1962, i, 1521-1523 (St.Bartholomew's Hosp., London, England) Members of two Ghanian families illustrate interaction between the Hb F gene and genes responsible for Hb A, S and C. Persistent high Hb F was not associated with anaemia or morphol. abnormalities except numerous target cells in the Hb C-F combination. M.E.Nutt

4804. Xg BLOOD GROUPS AND FAMILIAL HYPO-

GAMMA GLOBULINAEMIA. R-Sanger and R.R.Race: Lancet, 1963, i, 859-860 (Lister Inst., London, England). G.H.Bell

4805. SECOND EXAMPLE OF ANTI-Xg^a. LA.Cox,

M.J.Polley and P.L.Mollison: Lancet, 1963, i, 857-859 (Wright-Fleming Inst., St.Mary's Hosp., Med. Sch., London, England). G.H.Bell

4806. THREE INHERITED RED-CELL ABNORMALITIES IN A DISTRICT OF GREECE. THALASSAEMIA,

SICKLING, AND GLUCOSE 6-PHOSPHATE-DEHYDROGENASE [G6PD] DEFICIENCY. C.Choremis, P.Fessas, C.Kattamis, G.Stamatoyannopoulos, L.Zannos-Marioleta, A.Karaklis and C.Belios: Lancet, 1963, i, 907-909 (Univ. Athens, Greece) The freq. of thalassaemia, sickling, and G6PD deficiency was investigated in the Arta district, which was known for its high malaria endemicity. The freq. of sickling and G6PD deficiency was found to decrease with increasing altitude, and to run parallel with the freq. of malaria. This supports the malaria theory. On the other hand, the freq. of thalassaemia was found to be almost equally distributed in all altitudes. This finding is in agreement with a previous study in the island of Corfu. G.H.J.Bell

4807. RELATIONSHIP BETWEEN SERUM ANTIBODY LEVELS AND THE ABO BLOOD GROUP POLYMORPHISMS. E.R.Eichner, R.Finn and J.R.Krevans: Nature, Lond., 1963, 198, 164-165 (Div. Med. Genet., Johns Hopkins Univ., Baltimore, Md., U.S.A.) The levels of natural Ab in man to r.b.c. from rabbit, dog, hamster, and guinea-pig and to E.coli 086B7, which are assumed to be related to natural resistance to infection, are not randomly distributed with regard to the ABO blood groups of the subjects examined. It is postulated that ABO polymorphism influences the capacity for Ab formation. G.M.Lewis

4808. SELF MARKER CONCEPT AS APPLIED TO Rh BLOOD-GROUP SYSTEM. K-Mayeda: Amer. J. hum. Genet., 1962, 14, 281-289 (Dept. Biol., Wayne State Univ., Detroit, Mich., U.S.A.) There is no correlation between the mother's Rh type and her Rh neg. daughter's failure to produce Rh Ab. When the complicating factor of ABO incompatibility is removed, the data also lead to the conclusion that the self marker concept does not apply to Rh sensitisation. D.A.Jones

4809. ABNORMAL HAEMOGLOBINS IN BRAZILIAN NEGRO POPULATION. C.V.Tondo and F.M.Salzano: Amer. J. hum. Genet., 1962, 14, 401-409 (Dept. Genet., Univ. Ria Grande do Sul, Porto Alegre, Brazil) The freq. of abnormal Hb types amongst the Negroid population of Porto Alegre was AS, 5% AC 1% and AD 0-2%. The sample was further divided into light mulattoes, dark mulattoes and Negroes and the freq. of AS individuals increased with the amount of Negro Series present. No significant age or sex differences were found in the freq. of Hb^s and Hb^c. D.A.Jones

4810. ANALYSIS OF TRIHYPBRID POPULATIONS. F.Ottensooser: Amer. J. hum. Genet., 1962, 14, 278-280 (Lab. Genet. Humana, Univ. de São Paulo, Brazil) By estimating the freq. of blood group alleles in a mixed population of Whites, Indians and Negroes and by knowing the allele freq. of the population from which the races come it is possible to calculate the racial disposition of the mixed population. D.A.Jones

4811. CONTROL GENE MUTATIONS IN THE HUMAN HAPTOGLOBIN SYSTEM. W.C.Parker and A.C.Bear: Nature, Lond., 1963, 198, 107-108 (Rockefeller List., New York, U.S.A.) The control gene concept is applied to the human haptoglobin system and the available data explained. The observed distribution of phenotypes is in agreement with that expected under the Hardy-Weinberg equilibrium. G.M.Lewis

4812. CYTOGENIC STUDIES ON BONE-MARROW IN CHRONIC MYELOID LEUKAEMIA. L.M.Tough, P.A.Jacobs, W.M.C.J.Brown, A.C.Baikie and E.R.D.Williamson: Lancet, 1963, i, 844-846 (Western Gen. Hosp., Edinburgh, Scotland) The ^gakaryocytes in the marrow in chronic myeloid leukaemia are Phi +ve. It is suggested that both erythroid and granulocytic cells, as well as megakaryocytes, are J⁺ +ve, and that these cell-lines are derived from a ^maon type of ancestral cell. G.H.Bell

4813. SEARCH FOR AUTOSOMAL LINKAGE IN TRISOMIC POPULATION: BLOOD-GROUP FREQUENCIES IN MONGOLS. M.W.Shaw and ^Gershowitz: Amer. J. hum. Genet., 1962, 14, 317-334 (Dept. Human Genet., Univ. Michigan,

Ann Arbor, Mich., U.S.A.) Blood and saliva typing of 370 mongols indicated that the MNS, P, Kell, Duffy, Kidd and ABH secretor loci are not closely linked to the centromere of chr. 21 in man. There was a significant deficiency of blood-group O (at the 5% level) amongst 793 mongols typed for ABH. D.A.Jones

4814. ATYPICAL DUFFY INHERITANCE IN THREE CAUCASIAN FAMILIES: POSSIBLE RELATIONSHIP TO MONGOLISM. B.Chown, M.Lewis and H.Kaita: Amer. J. hum. Genet., 1962, 14, 301-308 (Dept. Ped., Univ. Manitoba, Winnipeg, Canada) Among 22 families in which mongolism occurred 3 were found to have atypical inheritance in the Duffy blood group system. A chance concn. of so-called Fy in these families is given priority as an explanation of the Duffy anomaly. It is considered possible that in some cases there may be a genetic factor that may affect the expression of a Duffy (or an ABO) gene and may also predispose, but not commit, chr. 21 to non-disjunction. D.A.Jones

4815. DERMAL PATTERNS OF 18 AND Di TRISOMICS. L.A.Uchida, K.Patau and D.W.Smith: Amer. J. hum. Genet., 1962, 14, 345-352 (Dept. Paediatrics, Univ. Manitoba, Winnipeg, Canada) The presence of arches on a large no. of digits is characteristic of the chr.-18 trisomic state. All the Di trisomics studied had a distal mean axial triradius on the palms. D.A.Jones

4816. FINAL PEDIGREES OF Y-CHROMOSOME INHERITANCE. R.R.Gates, M.R.Chakravarti and D.R.Mukherjee: Amer. J. hum. Genet., 1962, 14, 363-375 (Indian Statistical Inst., Calcutta, India) Six new pedigrees of hypertrichosis pinnae abundantly reinforce the conclusion that the gene is in the Y-chr. The pedigrees demonstrate that the daughters of affected males do not pass on the gene to their sons. There is evidence that the gene originated to the West of India and not to the East. D.A.Jones

4817. INHERITANCE OF ERYTHROCYTE ACETYL-ESTERASE VARIANT IN MAN. R.C.Tashian and M.W.Shaw: Amer. J. hum. Genet., 1962, 14, 295-300 (Univ. Michigan Med. Sch., Ann Arbor, Mich., U.S.A.) It is suggested that the acetyl esterase variant observed in 8 closely related individuals is transmitted as if due to a single, possibly dominant autosomal gene. D.A.Jones

4818. INHERITANCE OF GLUCOSE 6-PHOSPHATE DEHYDROGENASE [G6PD] DEFICIENCY IN ERYTHROCYTES AND IN LEUCOCYTES. J.C.Sabine, E.D.Jung, M.B.Fish, L.C.Pestaner and R.E.Rankin: Brit. J. Haemat., 1963, 9, 164-171 (Cancer Res. Inst., Univ. Calif. Sch. Med., San Francisco, Calif., U.S.A.) G6PD levels in r.b.c. and w.b.c. were determined in 14 normal subjects and in the 30 members of 5 families. In the 2 Caucasian families studied, the r.b.c. G6PD is inherited with intermediate dominance in heterozygous females but w.b.c. G6PD defect is strongly dominant irrespective of sex. The 2 defects are not coincident, out of 13 members with w.b.c. G6PD defect, only 7 had defective r.b.c. activity. Negro families gave more variable results. Some interrelationship between the defects is suggested but it is not the simple manifestation of a single variable trait. J.Sneath

4819. NEONATAL JAUNDICE IN GLUCOSE 6-PHOSPHATE DEHYDROGENASE [G6PD] DEFICIENT INFANTS. P.Jessas, S.A.Doxiadis and T.Valaes: Brit. med. J.,

GENETICS

1962, ii, 1359-1362 (Univ. Athens, Greece) Of 786 randomly selected male neonates 2 *92% showed G6PD deficiency. Incidence of moderate and severe neonatal jaundice was greater in deficient than in normal infants. The accumulation of cases in some G6PD deficient families suggests that the development of severe jaundice is dependent on additional genetically determined factors. Rh incompatibility was excluded as a cause of jaundice.

M.E.Nutt

4820. L-XYLULOSURIA IN LEBANESE FAMILY.

W.M.Politzer and H.Fleischmann: Amer. J. hum. Genet., 1962, 14, 256-260 (S.African Inst. Med. Res., Johannesburg, S.Africa) Ten cases of L-xylulosuria (pentosuria) were found among 127 members of a Lebanese family. The mechanism of inheritance appears to be that of a dominant gene with reduced penetrance.

D.A.Jones

4821. ESSENTIAL PENTOSURIA. A.K.Khachaourian: Amer. J. hum. Genet., 1962, 14, 249-255 (Sch. Med., American Univ. Beirut, Lebanon) Pentosuria cases in 10 males and 2 females from 3 highly inbred Lebanese families, living in 2 neighbouring and isolated villages are described. The independent inheritance of retinitis pigmentosa and the recessive pentosuria in one sibship suggests that these genes are not closely linked.

D.A.Jones

4822. FREQUENCY OF SPINA BIFIDA OCCULTA AND RIB ANOMALIES IN PARENTS OF CHILDREN WITH SPINA BIFIDA APERTA AND MENINGOCOCELE.

J.R.Miller, F.C.Fraser and D.W.MacEwan: Amer. J. hum. Genet., 1962, 14, 245-248 (Dept. Genet., McGill Univ., Montreal, Canada) In 46 parents of children with spina bifida aperta (with meningocoele) the freq. of vertebral and rib anomalies was no higher than that in 175 controls. The evidence does not support the idea that spina bifida occulta is a minimal manifestation of a genetic mechanism predisposing to spina bifida aperta.

D.A.Jones

4823. CORRELATIONS BETWEEN RELATIVES ARISING FROM SEX-LINKED GENES. L.K.Mather and

J.L.Jinks: II. S.M.Garn and C.G.Rohmann: Nature, Lond., 1963, 198, 314-315, 315-316 (A.R.C. Unit Biometrical Genet., Univ. Birmingham, England, and Fels Res. Inst., Yellow Springs, Ohio, U.S.A.).

G.M.Lewis

4824. HEREDITY IN HYPERTENSION. R.PlatC Lancet, 1963, i, 899-904 (Dept. Med., Univ. Manchester, England) Evidence from the study of twins and of 350 sibs of 178 patients with severe hypertension shows that essential hypertension is a sp. inherited disorder of middle age.

G.H.Bell

4825. DYNAMICS OF RACIAL INTERMIXTURE.

D.F.Roberts and R.W.Hiorns: Amer. J. hum. Genet., 1963, 14, 261-277 (Dept. hum. Anat>, Univ. Oxford, England) Procedures are described for calculating the change in gene freq. when 2 or more populations are intermixing. The methods are illustrated by examples from African and N.American human populations.

D.A.Jones

4826. HEREDITARY ABILITIES STUDY: HEREDITARY COMPONENTS IN PSYCHOLOGICAL TEST BATTERY.

S.G.Vandenberg: Amer. J. hum. Genet., 1962, 14, 220-237 (Inst. Human Biol., Univ. Michigan, Ann Arbor, Mich., U.S.A.) There is an indication that hereditary factors play a role in many human skilled performances in spite of the fact that these skills are highly practised. Some evidence is presented which suggests that psychol. tests which work well as predictors of social criteria, such as success in academic studies, may not be the most promising for studies of hereditary factors.

D.A.Jones

4827. SECULAR CHANGES IN RATES OF MULTIPLE BIRTHS IN UNITES STATES. O.Jeanneret and

B.MacMahon: Amer. J. hum. Genet., 1962, 14, 410-425 (Sch. Public Hlth., Harvard Univ., Cambridge, Mass., U.S.A.) During the period from 1923 to 1958

the freq. of twins among white births in the U.S.A. declined by a little more than 10%. Data on trends by maternal age and by sex of multiple sets suggests that the decline has affected dizygous sets only. A brief examination of the more limited data for non-whites indicates some features of similarity but the freq. of monozygous sets has declined by 14% and that of dizygous sets by 8%.

D.A.Jones

4828. DIABETES MELLITUS: A THRIFTY GENOTYPE RENDERED DETRIMENTAL BY PROGRESS. J.U.Neel:

Amer. J. hum. Genet., 1962, 14, 353-362 (Dept. Human Genet., Univ. Michigan, Ann Arbor, Mich., U.S.A.) Review. 61 ref. D.A.Jones

4829. ALBINISM AMONG HOPI INDIANS IN ARIZONA.

C.M.Woolf and R.B.Grant: Amer. J. hum. Genet., 1962, 14, 391-400 (Dept. Zool., Arizona State Univ., Tempe, U.S.A.) Twenty-two living albinos were found in a total population of about 5000. All the pedigrees obtained demonstrate autosomal recessive inheritance for albinism. The factors maintaining the gene in this population at such a high freq. are unknown.

D.A.Jones

4830. THE GENE AND THE ALIMENTARY TRACT.

W.J.Burdette: Amer. J. Surg., 1963, 105, 49-57 (Dept. Surg., Univ. Utah Coll. Med., Salt Lake City, Utah, U.S.A.) Review. 58 ref. B.Cruickshank

WATER RELATIONS

4831. DETERMINATION OF DISTRIBUTION OF WATER IN WHEAT GRAINS BY INTERFERENCE MICROSCOPY. F.Ruch, U.Bosshard and W.Saurer: Nature, Lond., 1963, 197, 1318-1319 (Inst. Gen. Bot.. Swiss Federal Inst. Technol., Zurich, Switzerland) The water content at every point in a section of wheat grains may be determined with relatively high accuracy by interference microscopy in indane before and after complete drying in vacuo. In wheat grains exposed to air sat. with water at 20°, the scutellum took up water most rapidly.

G.M.Lewis

4832. THE WATER RELATIONS OF TREE SEEDLINGS, in. TRANSPERSION IN RELATION TO OSMOTIC POTENTIAL OF THE ROOT MEDIUM. P.G.Jarvis and M.S.Jarvis: Physiol. Plant, 1963, 16, 269-275 (Inst. Physiol. Bot., Uppsala, Sweden) Decreased transpiration rates as a result of increasing soil-water stress was compared for pine, spruce, birch and aspen seedlings. Pine was most sensitive, spruce least and birch and aspen intermediate.

D.J.Phillips

4833. TRANSPERSION OF FOREST TREES IN CLOSED STANDS. K.Ladefoged: Physiol. Plant, 1963, 16, 378-414 (Municipal Forest District, Arhus, Denmark) Transpiration of 39 sample trees were measured in relation to leaf area,* or kg-foliage. Rates of transpiration varied considerably from tree to tree as well as from sp. to sp. and this appeared to be mainly due to crown-shape. The interrelationships of the effects of relative humidity, light intensity, wind velocity and air temp, upon transpiration were studied.

PERMEABILITY AND SOLUTE UPTAKE

4834. RATE OF UPTAKE OF SALTS BY PLANT CELLS IN RELATION TO AN ANION PUMP. G.E.Briggs: J. exp. Bot., 1963, 14, 191-197 (Bot. Sch., Cambridge, England) The kinetics of accumulation of cations by plant cells is considered in relation to an anion pump with passive diffusion of cations and anions.

I.D.J.Phillips

4835. CHANGES IN THE PERMEABILITY OF CARROT TISSUES DUE TO γ -IRRADIATION AND OTHER PHYSICAL AND CHEMICAL TREATMENTS. J.P.Skov: Physiol. Plant, 1963, 16, 423-441 (Agric. Res. Dept., Danish Atomic Energy Commission, Risff, Roskilde, Denmark) Permeability was increased with increasing doses of radiation. Ca induced rigidity of the cell walls and reduced the permeability of the cells to sucrose. Na had the opposite effect. Low pH values increased cell permeability. Oxalate ions had no effect on water uptake, freezing of the tissue produced similar effects to those induced by radiation, but fixing fluids had the opposite effect. Respiration decreased simult. with increased permeability.

I.D.J.Phillips

4836. THE EFFECT OF HYDROSTATIC PRESSURE GRADIENTS ON THE MOVEMENT OF Na AND Ca ACROSS THE ROOT CORTEX. J.E.Jackson and P.E. Weatherly: J. exp. Bot., 1962, 13, 404-413 (Dept. Bot., Univ. Aberdeen, Scotland) Na flux from

medium to xylem was doubled by application of a hydrostatic pressure of 2 atm. around the roots. The flux was dependent on a maintained supply of Na in the medium, and was reduced by metabolic inhibitors to a passive flow. Metabolic inhibn. after the roots had been allowed to take up Na led to a large flux of Na into the xylem. Metabolism-facilitated processes also appeared to predominate in the flux of Ca to the xylem of *Ricinus*, but not in the flux through tomato roots.

I.D.J.Phillips

4837. RESOLUTION OF DUAL MECHANISMS OF POTASSIUM ABSORPTION BY BARLEY ROOTS. E.Epstein, D.W.Rains and O.E.Elzam: Proc. nat. Acad. Sci., Wash., 1963, 49, 684-692 (Dept. Soils and Plant Nutr., Univ. California, Davis, Calif., U.S.A.)

The relationship between the rates of absorption of K and Rb by barley roots and the concn. of these ions in the external soln. over the range 0.002 to 50mM, is predictable on the assumption that 2 carrier sites bind and transport the ions. One of these operates at half-max. velocity at a concn. of about 0.018mM, with very low affinity for Na, the 2nd at about 16mM, with severe competition by Na. The latter but not the former mechanism is inhibited when SO₄ is the anion instead of Cl.

J.R. Sargent

4838. ACCUMULATION OF Cs AND K, AND GROWTH OF BEAN PLANTS IN NUTRIENT SOLUTIONS AND SOILS. H.Nishita, D.Dixon and K.H.Larson: Plant and Soil, 1962, 17, 221-242. *Phaseolus vulgaris* (var.

Landreth) plants grown in nutrient soln. and soil were used to study the influence of Cs and K on the growth and uptake of K and ¹³⁷Cs and ¹³³Cs. ¹³⁷Cs uptake decreased with increasing concn. of K whilst K uptake increased. Application of ¹³³Cs increased plant uptake of ¹³⁷Cs. Ability of plants to discriminate between Cs and K varied with concn. of K and Cs. Cs was toxic to beans but the symptoms were different from K deficiency symptoms. Toxicity of Cs was alleviated by K. In the soils studied reduced plant yield occurred when Cs application was greater than 8% of the soil cation exchange capacity.

W.A.Stevens

4839. CALCIUM IN THE ROOT-HAIR WALL. R.G.H.Cormack, P.Lemay and G.A.Madachlan: J. exp. Bot., 1963, 14, 311-315 (Dept. Bot., Univ. Alberta, Canada) Seeds of white mustard, corn and tomato were treated with ⁴⁵CaCl₂ and allowed to develop in moist air. Bound ⁴⁵Ca was found by autoradiography to be present in walls of root-hair cells, with the greatest concn. at the base of the hair, except in the case of white mustard root-hairs where most radioactivity was detected at the tips.

LD.J.Phillips

4840. UPTAKE OF COPPER AND ITS PHYSIOLOGICAL EFFECTS ON CHLORELLA VULGARIS. K.A.Hassalk Physiol. Plant, 1963, 16, 323-332 (Dept. Physiol. Chem., Univ. Reading, Berks., England) Cu uptake was similar under aerobic and anaerobic conditions. A toxic effect was found under anaerobic conditions. Dead cells were found to absorb Cu very rapidly, but the total taken up was the same as when Cu itself kills die cells by prolonged anaerobic contact. Two thirds of Cu taken up is firmly retained by the cells. Glucose feeding conferred greater resistance to Cu. Measurements were made of die effect of Cu on P fraction* of the cells.

I.D.J.Phillips

4841. METHYL BROMIDE FOR INCREASING 131I UPTAKE BY PINE TREES. F.W. Woods, M.D.Ferrill and M.L. McCormack: Radiat. Bot., 1962, 2, 273-277 (Sch. Forestry, Duke Univ., Durham, N.C., U.S.A.)

EXPERIMENTAL BOTANY

Comparison of the uptake of 1311 by dead and live roots of Pinus taeda in soil sterilised by methyl bromide gas and in normal soil showed that uptake was greatest in dead roots in sterilised soil and least in live roots in normal soil.

J.R.Broome

4842. RADIOAUTOGRAPHIC STUDY OF 1311 FIXATION BY MARINE ALGAE. J.Roche and S.Andre: CH Soc. Biol., Paris, 1962, 156, 1968-1971 (Lab. de Biologie marine du Collège de France, Concarneau, France)

Uptake of 1311 added to sea water was studied in 9 spp. of marine algae by radioautography. Iodine was localised in various areas, in the thallus of higher algae and in the protoplasm of unicellular algae.

(French) M.A.Price

4843. THE SIGNIFICANCE OF CHEMICAL STIMULATION OF ABSORPTION OF [14c]GLUTAMIC ACID, 35SO4²⁻ AND 45Ca²⁺ BY DIONAEA MUSCIPULA. U.Littge: Naturwissenschaften, 1963, 50, 11 (Bot. Inst., Tech. Hochsch., Darmstadt, Germany)

The operation of the insectivorous glands was shown to stimulate the absorption of these substances.

(German) A.J.Wansbrough

4844. EFFECTS OF CHLORAMPHENICOL ON THE UPTAKE AND INCORPORATION OF AMINO ACIDS BY CARROT ROOT TISSUE. B.Jacoby and J.F.Sutcliffe: J. exp. Bot., 1962, 13, 335-347 (Dept. Bot., King's Coll., Univ. London, England)

Uptake of uniformly labelled L-[14c]glutamic acid, [14c]glycine and L-[14c]proline was inhib. by chloramphenicol [CHL] at a concn. of 2 g./l. L-glutamic acid uptake was affected to the greatest extent. 14c from the amino acids was incorporated into protein. The differential absorption of 14c into protein from different amino acids was studied, together with the effects of CHL upon this process. CHL w& also shown to inhibit net protein synthesis in carrot root slices in aerated soln. It is concluded that there are at least 2 mechanisms by which amino acids are incorporated into protein.

NUTRIENT RELATIONS

4845. AN EXTERNAL EFFECT OF INORGANIC NITROGEN IN ROOT NODULATION. J.W.Tanner and I.C. Anderson: Nature, Lond., 1963, 198, 303-304 (Dept. Agronomy, Iowa St. Univ., Ames, Iowa, U.S.A.)

Addition of nitrate to Rhizobium spp. does not affect the conversion of tryptophan to IAA, but the IAA level is reduced owing to its destruction by nitrite formed from the nitrate. This result may partly explain the inhibn. of nodulation by combined N.

G.M.Lewis

4846. THE INFLUENCE OF NITROGEN ON THE FORMATION OF CHLOROPHYLL WITH SPECIAL REGARD TO A DIFFERENCE IN EFFECT BETWEEN NaNO₃ AND Ca(NO₃)₂. J.J.Lehr. J.M.Wybenga and J.A.Hoekendijk: Plant and Soil, 1962, 17, 68-86 (Plant Nutr. Res. Lab., Chilean Nitrate Agric. Serv., Wageningen, Netherlands)

The effect of N nutrition on spinach and wheat crops was studied by means of pot expt. Both crops nearly always gave greater chlorophyll per pot with NaNO₃ than with Ca(NO₃)₂. In Spinach the chlorophyll content per unit wt. was lower with NaNO₃ than Ca(NO₃)₂ owing to increase plant yield with NaNO₃. The ratio of

chlorophyll ^a to chlorophyll ^b varied with N level rather than with form of nitrate present. In young wheat leaves the chlorophyll to protein content ratio was 6*0:100 in 1958 and 5*7:100 in the 1959 expt. * W.A.Stevens

4847. DIFFERENCES BETWEEN NATURAL POPULATIONS OF TRIFOLIUM REPENS L. IN RESPONSE TO MINERAL NUTRIENTS. I. PHOSPHATE. R.W.Snaydon and A.D. Bradshaw: J. exp. Bot., 1962, 13, 422-434 (Dept. Agric. Bot., Univ. Coll. N. Wales, Bangor, Wales)

Natural local populations were collected from soil of different PO₄ contents, and transferred to sand culture. A marked correlation ($r = +0.96$) was found between response of populations to PO₄ at low PO₄ levels and the amount of PO₄ in the soil of origin. Populations also differed in response to very high levels of PO₄, and in the range of PO₄ levels tolerated. Populations tolerant of low PO₄ levels had higher concn. of P in the shoot material, and a higher uptake of P/unit wt. of roots, than did intolerant populations.

I.D.J.Phillips

4848. MANGANESE CONTENT OF MUSTARD LEAVES IN RELATION TO IRON AND MAJOR NUTRIENT

SUPPLY. P.C.Dekock and R.H.E.Inkson: Plant and Soil, 1962, 17, 183-190 (Macaulay Inst. Soil Res., Craigiebuckler, Aberdeen, Scotland)

Using Mustard plants grown in nutrient culture the ratios of MmFe, PsFe, and K:Ca in the leaves were shown to vary in the same way with changes in Fe concn. of the medium.. Cu showed similar inverse changes with Fe. The metabolic significance of these ratios is discussed.

W.A.Stevens

4849. A REVIEW OF CERTAIN ASPECTS OF SULPHUR AS A SOIL CONSTITUENT AND PLANT NUTRIENT. J.R.Freney, N.J. Barrow and K. Spencer: Plant and Soil, 1962, 17, 295-308 (Div. Plant Ind., C.S.I.R.O., Canberra, Australia)

Review. 126 ref. W.A.Stevens

PHOTOSYNTHESIS AND PHOTOSYNTHETIC PIGMENTS

4850. ON BICARBONATE UTILISATION BY MARINE PHYTOPLANKTON IN PHOTOSYNTHESIS. WITH A NOTE ON CARBAMINO CARBOXYLIC ACIDS AS A CARBON SOURCE. E.S.Nielsen: Physiol. Plant, 1963,

16, 466-469 (Bot. Dept., Royal Danish Sch. Pharm., Copenhagen, Denmark)

A critical review of the nature of the carbon source utilised in photosynthesis by marine phytoplankton. It is concluded that there is no evidence for the utilisation of either the bicarbonate ion, or the carbamino complex of alanine in preference to inorg. forms of CO₂.

D.J.Phillips

4851. EFFECT OF LIGHT QUALITY ON THE PRODUCTS OF PHOTOSYNTHESIS IN GREEN AND BLUE-GREEN ALGAE. AND IN PHOTOSYNTHETIC BACTERIA.

A.H.W.Hauschild, C.D.Nelson and G.Krotkov: Canad. J. Bot., 1962, 40, 1619-1630 (Dept. Biol., Queen's Univ., Kingston, Ont., Canada)

The effect of light quality on the products of photosynthesis was studied in Chlorella pyrenoidosa, Scenedesmus acuminatus, Microcystis aeruginosa and Chromatium sp. The test organism was placed in U4c]bicarbonate and illuminated with red, red plus supplementary blue, blue or white light.

EXPERIMENTAL BOTANY

467

¹⁴O distribution was determined after 30 min. by paper chromatography and autoradiography. After a dark pre-treatment blue light increased the distribution of ¹⁴C in aspartic and glutaric acids in Chlorella, Scenedesmus and Microcystis. The results suggest that the nature of the effect of blue light is the same in all these organisms. No effect of light quality was observed in Chromatium.

A.Meany

4852. EFFECT OF FLASHING LIGHT ON PLANT GROWTH RATE. M.H.Dickson and S.E.Chua: Nature, Lond., 1963, 198, 305 (Dept. Hort., Ontario Agric Coll., Guelph, Ont., Canada) Max. growth rate of Lemna minor as measured by increase in dry wt. occurred at a Ught flash rate of 0.004 sec.; this was 4 times as great as the growth at 2 min. exposure and nearly twice as fast as 12 hr. light periods. G.M.Lewis

4853. EFFECT OF ISONICOTINYL HYDRAZIDE ON PHOTOSYNTHETIC INCORPORATION OF RADIOACTIVE CO₂ INTO ETHANOL-SOLUBLE COMPOUNDS OF CHLORELLA. G.G.Pritchard, C.P.Whittingham and W.J.Griffin: J. exp. Bot., 1963, 14, 281-289 (Dept. Bot., Queen Mary Coll., Univ. London, England) Treatment with the compound caused an increase in radioactivity in sucrose, glycollic acid and glycine, and decreased radioactivity in sugar monophosphates, serine and alanine. An unidentified strongly radioactive compound was present in INH-treated cells following short-term exposure to ¹⁴CO₂. I.D.J.Phillips

4854. CARBON DIOXIDE ASSIMILATION OF OCHROMONAS MALHAMENSIS DURING THIAMINE AND BIOTIN DEFICIENCY. II. PHOTOSYNTHESIS. H.Kauss and O.Kandlen Arch. Mikrobiol., 1963, 44, 406-420 (Inst. Angewandte Bot. der T.H., MUNCHEN, Germany) Photosynthesis is much reduced in thiamine deficient cells caused by decreased reduction of fixed CO₂ and inhibn. of the pentosephosphate cycle due to inactivation of transketolase. Biotin does not form the active group of a CO₂ activating enzyme for the carboxylation of ribulose-diphosphate. Heterotrophic and autotrophic CO₂ assimilation is not disturbed by vit. B12 deficiency.

(German) E.M.Ling

4855. SPECTRAL CHANGES OF CHLOROPLAST PIGMENTS IN RELATION TO OXYGEN, LIGHT AND SUBSTRATES. H.Lundegardh: Physiol. Plant, 1963, 16, 442-453. The absorption spectrum of chlorophasts showed neg. bonds at 500, 640, 554, 562-564 and 700 m/f. The first 2 have not been previously found. Quant. changes in the chlorophyll spectrum were found under various conditions. The new neg. band at 500 m/f attributed to carotenoids, and was strongly influenced by V variations in the steady state NADP ^ NADPH₂. The new band at 640 m/f was preferentially influenced by the steady state ADP + PO₄ ^ ATP. The spectrum of chlorophyll %U &, but not of chlorophyll f, was influenced by O₂. I.D.J.Phillips

4856. THE EFFECT OF AGE AND VARIOUS CHEMICALS ON THE LAG PHASE OF CHLOROPHYLL SYNTHESIS IN DARK GROWN BEAN SEEDLINGS. E.C.Sisler and W.H.Klein: Physiol. Plant, 1963, 16, 315-322 (Divn. Radiation and Organisms, Smithsonian Inst., Washington, D.C., U.S.A.) A lag phase occurred only after bean plants were 6 days old. Chlorophyll-synthesis in etiolated plants responded to the red-far red photoreceptor. Infiltration of leaves with 6-aminolaevulinic acid removed the S phase, and this effect was not increased by prior treatment with red light. LDJ.Phillips

4857. THE TIME COURSE FOR THE PHOTOCOMVERSION OF PROTOCHLOROPHYLL BY FLASH ILLUMINATION. A.Madsen: Physiol. Plant, 1963, 16, 470-473 (Dept. Plant Biol., Carnegie Inst. Washington, Stanford, Calif., U.S.A.) Chlorophyll formation from protochlorophyll in intact etiolated leaves was measured as the increase in absorption at 680 mp. The conversion was complete within 4 millisecl. after the beginning of a 1-millisecl illumination. Lowering the temp. had no measurable effect on the rate. In protochlorophyll-holochrome prep, the change in absorption was completed during 1 millisecl. illumination. I.D.J.Phillips

RESPIRATION

4858. OXYGEN ELECTRODE MEASUREMENTS OF POTATO SLICE RESPIRATION AT 0°. I.R.Macdonald and G.G.Laties: J. exp. Bot., 1962, 13, 435-442 (Dept. Plant Biochem., Univ. California, Los Angeles, Calif., U.S.A.) On transference from 27° to (f, a drop in respiration rate to approx. 10% of the rate at 24° occurred within 2 or 3 min. I.D.J.Phillips

4859. WATER CONTENT AND RESPIRATION RATE OF BEAN COTYLEDON. H.Opik and E.W.Simon: J. exp. Bot., 1963, 14, 299-310 (Dept. Bot., Univ. Manchester, England) The course of water uptake and respiration rate rise in cotyledons of Phaseolus vulgaris was found to be divided into 3 phases. In the first phase (10-16 hr. long) respiration rate was controlled by water content. This was followed by a second phase (3-8 hr. long) in which there was a pause in water uptake and in respiration rate rise. Subsequently there occurred a third phase (up to the 5th day) of rising respiration rate and metabolic activity. LD.J.Phillips

4860. THE MOVEMENT OF ¹⁴O₂ THROUGH BARLEY AND RICE PLANTS. D.A.Barber, M.Ebert and N.T.S. Evans: J. exp. Bot., 1962, 13, 397-403 (A.R.C., Radiobiol. Lab., Letcombe Regis, Wantage, Berks., England) The kinetics of movement of I&O₂ from shoot to root in rice and barley plants, are consistent with gaseous diffusion through continuous gas spaces. The size of the gas spaces in barley roots is considerably smaller than in rice roots. I.D.J.Phillips

METABOLISM

4861. METABOLISM OF ETHANOL IN GERMINATING PEA SEEDLINGS. E.A.Cossins and E.R.Turner: J. exp. Bot., 1963, 14, 290-298 (Chelsea Coll. Sci. and Technol., London, England) Several factors indicated oxidative degradation of ethanol during germination. Feeding ethanol to pea-cotyledon slices led to the formation of acetaldehyde and interconversion of acetaldehyde and acetone. Feeding with [14C]ethanol gave similar results, and confirmed the observations made on intact germinating pea seedlings. LD.J.Phillips

EXPERIMENTAL BOTANY

4862. ENZYMES OF GLYOXYLATE CYCLE IN CHLORELLA VULGARIS. PJ.Syrett, MJ.Merrett and S.M. Bocks: *J. exp. Bot.*, 1963, 14, 249-264 (Bot. Dept., Univ. Coll., London, England) The detection and assay of the enzymes of the glyoxylate cycle in *Chlorella* are described. Activity of the enzymes in cells grown on acetate was approx. adequate to account for the rate of growth with acetate as the sole C source. Activities of some of the enzymes were affected by incubation with acetate, but not with glucose, or CO₂ under illumination.

I.D.J.Phillips

4863. THE UPTAKE OF CO₂ BY PLANT ROOTS.

M.C.Stemmet. J.A.De Bruyn and P.B.Zeeman: *Plant and Soil.* 1962, 17, 357-364 (Merensky Inst. Physics, Univ. Stellenbosch, S. Africa) The uptake of ¹⁴CO₂ by the roots of intact tomato plants from soln. containing Na₂¹⁴CC₃ was studied at different light intensities and darkness. Plants starved of CO₂ for 12 hr. showed a higher rate of ¹⁴C uptake than plants transferred directly from the soil. ¹⁴C was generally found in higher concn. in roots than shoots. At light intensities under the compensation point and in darkness ¹⁴C content of shoot relative to the roots decreased. This was accompanied by release of ¹⁴CO₂ during respiration, indicating that the absorbed ¹⁴C was translocated upwards and released as ¹⁴CO₂. No such release of ¹⁴CO₂ occurred at light intensities above the compensation point. W.A.Stevens

4864. STUDIES OF STOMATAL MOVEMENT OF CRASSULACEAN PLANTS IN RELATION TO THE ACID METABOLISM. K.Nishida: *Physiol. Plant.* 1963, 16, 281-298 (Bot. Inst.. Fac. Sci., Univ. Kanazawa, Japan) Light and temp. affected both stomatal opening and level of org. acids. CO₂ was absorbed during darkness by guard cells. Expt. measuring starch contents, pH and osmotic values of the guard cells were performed.

LDJ.Phillips

4865. CHANGE OF PHYTOL INTO CHLOROPHYLL *a* IN CHLORELLA VULGARIS. L.Bianco, E.Lazzarini and P.Paris: *Nature*, Lond., 1963, 197, 1219-1220 (Centro Studi Nucleari Enrico Fermi, Politecnico, Milan, Italy) During incubation of *C. vulgaris* with [14C]glycine, the sp. activity of chlorophyll, pheophorbide and phytol was followed. It is suggested from the data that at least 3 sources of ¹⁴C contribute to the phytol.

G.M.Lewis

4866. AROMATIC BIOSYNTHESIS IN HIGHER PLANTS. IV. THE DISTRIBUTION OF DEHYDROSHIKIMIC REDUCTASE AND DEHYDROQUINASE. D.Balinsky and D.D.Davies: *J. exp. Bot.*, 1962, 13, 414-421 (Dept. Bot., King's Coll., London, England) Dehydroshikimic reductase and dehydroquinase occurred mainly in the supernatant fraction of cauliflower buds. In pea epicotyls 30% of the reductase activity was associated with the mitochondria. Synthesis of both enzymes occurred in roots, shoots and cotyledons of germinating pea seedlings over 8 days, and were found to be present in a variety of plant materials.

LDJ.Phillips

TRANS LOCATION

4867. ROOT-EXUDATION STUDIES ON THE EXCHANGE OF ¹⁴C-LABELLED ORGANIC SUBSTANCES BETWEEN THE ROOTS AND SHOOTS OF THE NODULATED

LEGUMES. J.S.Pate: *Plant and Soil.* 1962, 17, 333-356 (Dept. Bot., Queen's Univ., Belfast, N. Ireland) Using *Pisum sativum* L. daily progress of root exudation was followed with samples taken at 1-21 hr. intervals. A pronounced 24 hr. rhythm was exhibited with max. cation and amino acid output from 10 a.m. to noon and at midnight. Changes in individual amino acids were recorded. ¹⁴CO₂ feeding expt. were conducted on minus N sand cultures. Heavy labelling of exudate was recorded where plant tops were excised after 1-1½ hr. of photosynthesis in 20-100 /μc ¹⁴CO₂ per plant. Minor exudates failed to show ¹⁴C in samples collected up to 30 hr. after excision of labelled tops. Similar results were obtained with purple vetch (*Vicia sativa* Desf.).

W.A.Stevens

GROWTH AND DEVELOPMENT

(GENERAL)

4868. STUDY OF PHYSIOLOGICAL ROLE OF DIFFERENT LEAVES OF WHEAT STEM AND THEIR RELATIVE IMPORTANCE. M.J.Carles: *Rev. gen. Bot.*, 1963, 70, 258-265 (Lab. Physiol. Veg. Inst. Catholique de Toulouse, Toulouse, France) The wt. of plants, length of stem, sugar, protein, sol. N and mineral elements were determined 4 days and 1 month after removal of the leaf lamina. The reduction in dry wt. and sugar concn. is related to the reduction in photosynthesis which also modifies the C/N ratio. (French) C.W.Smith

4869. DYNAMICS OF GROWTH AND DEVELOPMENT IN SPRING WHEAT. P.Strebeyko, M.Wislocka and T.Krzywacka: *Physiol. Plant.* 1963, 16, 359-367 (Dept. Plant Physiol., Univ. Warsaw, Poland) Dry wt. increases of leaves, roots and stems were determined. The assimilating surface area was recorded at intervals. O₂ uptake of detached leaves was measured, and photographic records made of growing point and ear development. The short period of leaf activity appeared to be the main limiting factor in wheat growth.

LDJ.Phillips

4870. GROWTH AND DEVELOPMENT IN THE YOUNG TOMATO. I. THE EFFECT OF TEMPERATURE AND LIGHT INTENSITY ON GROWTH OF THE SHOOT APEX AND LEAF PRIMORDIA. II. THE EFFECT OF DEFOLIATION ON THE DEVELOPMENT OF THE SHOOT APEX. G.Hussey: *J. exp. Bot.*, 1963, 14, 316-325, 326-333 (J.Innes Inst., Bayfordbury, Herts., England) I. The shoot apex enlargement rate increased with light intensity, but apical enlargement was delayed at higher temp., the delay being longer the lower the light intensity. The rates of leaf formation and leaf growth increased with both temp. and light intensity.

II. Removal of the first 2 leaves during early vegetative growth counteracted the effect of high temp. on shoot apex enlargement and leaf formation. Growth analysis results suggest that the first 2 leaves compete with the apex for supplies of assimilate.

I.D.J.Phillips

4871. EFFECT OF LIGHT ON GROWTH OF SPORELINGS OF INTERTIDAL RED ALGA PLUMARIA ELEGANS (BONNEM.) SCHM. A.D.Boney: *J. mar. biol. Ass. U.K.*, 1962, 42, 65-92 (Dept. Chem. and Biol., Tech. Coll., Plymouth, England) Sporelings of *P. elegans*.

EXPERIMENTAL BOTANY

469

grown under continuous illumination from a fluorescent tube show a max. rate of cell production at a light energy flux of 10 ergs./sec.^{ymm.2} in the range 380-720 mji. Growth of the sporelings is much increased when they are screened from the light sources by weak soln. of phycoerythrin extracted from the adult plant. A similar result is obtained by replacing the phycoerythrin with an equiv. concn. of Eosin Yellow.

P.J. Baron

4872. PHYSIOLOGICAL AND BIOCHEMICAL STUDIES ON NITROGEN FIXATION BY BLUE-GREEN ALGAE. EI. GROWTH AND NITROGEN FIXATION OF *NOSTOC COMMUNE* AS INFLUENCED BY CULTURE CONDITIONS. E.E.M.Taha and A.M.H.EI Refai: Arch. Mikrobiol., 1983, 44, 356-365 (Microbiol. and Enzyme Chem. Res. Unit, Nat. Res. Centre, Cairo, U.A.R.) Optimum growth and N fixation of a local strain of *N. commune* was at pH 7[#]0-8[#]0, at 30-35° and at a light intensity of 6000 lux. E.M.Ling

4873. THE EFFECTS OF RNase ON THE GROWTH OF PEA ROOTS. M.M.Yeoman: J. exp. Bot., 1962, 13, 390-396 (Dept. Bot., Univ. Edinburgh, Scotland) RNase suppressed growth of cultured roots and changed the rate of extension of excised root segments. The enzyme also lowered the RNA content of the tissues.

L.D.J.Phillips

4874. CHEMICAL INDUCTION OF POLYEMBRYONY IN ANETHUM GRAVEOLENS L. B.M.Johri and C.B.Sehgak Naturwissenschaften, 1963, 50, 47-48 (Dept. Bot., Univ., Delhi, India) Polld. ovaries were cultured in vitro. Polyembryony could be induced by casein hydrolysate or yeast extract with or without IAA.

A.J.Wansbrough

*875. EFFECT OF FRUITING ON THE PHENOMENA OF HISTOGENESIS IN THE AUBERGINE AND THE TOMATO. J.L.Bonnemain: C.R. Acad. Sci., Paris, 1962, 255, 347-349 (Lab. Biol. veg., Coll. Sci. Univ., Limoges, France) In the aubergine and tomato fruiting produces a great acceleration in the ^{total} activity of the cells edging the internal phloem ^{islands} between the fruit and main stalk. A supernumerary system eventually develops. Removal of the flower events these changes. Infusion of 10⁻⁶ M IAA into the stalk produces identical effects at the level of infusion.

S.A.Thistlewood

**876. DEVELOPMENT OF ZOOSPORANGIUM AND LIBERATION OF ZOOSPORES IN ACHLYA APLANES VAR. INDICA. R-Dayal: Cytologia, 1961, 26, 372-377 (Dept. Bot., C.M.P. Degree Coll., Allahabad, India) Four stages in sporangial development were recognized. The liberated 'zoospores' release their contents to form secondary 'zoospores' which germinate by ^{ter}m-tubes. No motile stages are present. C.A.Stace

GROWTH SUBSTANCES

⁸^ THE EFFECT OF LIGHT ON THE UPTAKE AND TRANSPORT OF INDOLEACETIC ACID IN THE GREEN STEM OF PEA. K.V.Thimann and LF.Wardlaw: J.Physiol. Plant, 1963, 16, 368-377 (Harvard Biol. Lab., Cambridge, Mass., U.S.A.) High intensity light markedly promoted uptake of [14c]IAA by green Alaska stem segments, and also increased anti-polar move-

ment of IAA. Light had only a small effect on normal polar auxin transport. The action of light recorded was dependent on high light intensity and the presence of chlorophyll, and was not imitated by applied sugars. Active regions were in both red and blue wavelengths. The effect was restricted to the illuminated zone and not transported to adjacent darkened tissue. I.D.J.Phillips

4878. METABOLISM OF SOME INDOLE AUXINS IN EXCISED TOMATO ROOTS. D.A.Thurman and H.E. Street J. exp. Bot., 1982, 13, 369-377 (Dept. Bot., Univ. Coll., Swansea, Wales) Metabolic products of IAA were indolylacetylaspartic acid (IAAAsp.) and possibly indolylacetylglutamic acid. Little 'free' IAA remained in the tissue. A further unidentified substance reacting pink with nitric-nitrate reagent was formed. Further metabolism of these products occurred on transference to an IAA-free medium. IAA and IAAAsp. were inhibitory to excised root growth. No interconversion of IAA and indole-3-acetonitrile [IAN] was found. IAN-feeding caused accumulation of IAN and appearance of indolyl-carboxylic acid [ICA]. IAN was, and ICA was not, inhibitory to root growth. Excised tomato and wheat roots responded very differently to feeding with L-tryptophan, but in neither case was there evidence of conversion to ethyl-acetate-sol. auxins.

L.D.J.Phillips

4879. STUDIES OF THE GROWTH IN CULTURE OF EXCISED WHEAT ROOTS. IV. THE ACTIVATION OF DL-TRYPTOPHAN BY AUTOCLAVING. J.E.Carter and H.E.Street: Physiol. Plant, 1963, 16, 347-358 (Dept. Bot., Univ. Coll., Swansea, Wales) Two substances, one of which was IAA and the other unknown, were derived from tryptophan by autoclaving. Autoclaved tryptophan, but not unheated tryptophan, and also the unidentified substance alone enhanced lateral no., lateral length and dry wt. of excised wheat roots. IAA was, according to its concn., either without effect or inhibitory to extension growth and lat. emergence. IAA at 0*025-0*05 mg./l. plus unheated tryptophan at 50 mg./l. reproduced the effects of autoclaved tryptophan.

L.D.J.Phillips

4880. ACTION OF 2,3,5-TRIODOBENZOIC ACID [TIBA] AND GLUTATHIONE ON THE MORPHOLOGY AND AUXIN DESTRUCTION IN TISSUES CULTIVATED IN VITRO. P.E.Pilec Physiol. Plant, 1963, 16, 299-310 (Lab. Physiol. veg., Univ. Lausanne, Switzerland) Glutathione and TIBA caused sp. types of growth in tissue cultures of carrot. The effectiveness of glutathione in producing its effect was reduced by TIBA. Both compounds actively inhibited IAA-oxidase, in both *in vivo* and *in vitro* expt. The extent of TIBA-induced inhibn. of IAA-oxidase prep., was greater with higher levels of oxidase activity. TIBA caused a change in the distribution of IAA-oxidase activity within the tissues.

4881. SYNTHESIS OF GIBBERELLIN-LIKE SUBSTANCES IN MATTHIOLA INCANA UNDER DIFFERENT TEMPERATURE CONDITIONS. P.K.Biswas and M.N.Rogers: Physiol. Plant, 1963, 16, 311-314 (Dept. Hort., Univ. Missouri, Columbia, Mo., U.S.A.) The concn. of gibberellin-like substances in 2 varieties of *M. incana* were similar after 7 and 12 days cold treatment. Gibberellin levels increased from the end of the cold period up to flowering time. No such change was recorded in plants kept continuously at high temp. Spray-treatment with gibberellic acid increased the internal concn. of gibberellin in both varieties tested, and induced flowering in one.

L.D.J.Phillips

EXPERIMENTAL BOTANY

4882. PRESENCE OF GIBBERELLINS IN EXCISED TOMATO ROOTS. D.N.Butcher. J. exp. Bot., 1963, 14, 272-280 (Dept. Bot., Univ. Coll., Swansea, Wales)

Gibberellin-like substances were detected by dwarf-pea and dwarf-maize bioassays in extracts of excised tomato roots. The chromatographic behaviour of the most active zone was similar to that of Gibberellin-A₁. Expt. using d-i and d-5 mutants of maize failed to reveal the presence of substances with differential effects on these 2 mutants.

I.D.J.Phillips

4883. GIBBERELLIN ACTIVITY OF STEVIOLE, A PLANT TERPENOID. M.Ruddat and A.Lang: Naturwissenschaften, 1963, 50, 23 (Divn. Biol., California Inst. Technol., Pasadena, Calif., U.S.A.) Stevole (10 µg./plant) gave the same reaction with the d-5 dwarf maize as did 0.1 µg. gibberellin A₃. AJ.Wansbrough

4884. THE EFFECT OF GIBBERELLIN A AND PHENYL-BORIC ACID [PBA] ON XYLEM DIFFERENTIATION AND EPIDERMAL CELL ELONGATION IN BEAN ROOTS. C.Odhnoff: Physiol. Plant, 1963, 16, 474-483

(Princeton Univ., Princeton, N.J., U.S.A.) GA₃ produced shortening of the meristematic zone, a small decrease in cell no. and slightly shorter roots. PBA stim. root elongation and epidermal cell elongation, and slightly stim. cell division. GA₃ stim. xylem formation, but PBA inhib. this process. The interactions of GA₃ and PBA were studied in this system.

I.D.J.Phillips

4885. USE OF KININ IN BREAKING REST IN BUDS OF VITIS VINIFERA. R.J. Weaver: Nature, Lond., 1963, 198, 207-208 (Dept. Viticul., Univ. California, Davis, Calif., U.S.A.) A kinin [benzyladenine] at 1000 p.p.m. broke the rest of dormant grape buds.

G.M.Lewis

4886. BETAINE: A PLANT GROWTH SUBSTANCE FROM SUGAR-BEET [BETA VULGARIS]. A.W.Wheeler: J. exp. Bot., 1963, 14, 265-271 (Rothamsted Expt. Stn., Harpenden, Herts., England)

Chromatographic and colorimetric evidence indicated presence of betaine in sugar-beet seed balls, leaves and roots. This substance inhib. growth of dwarf French bean leaf discs, promoted growth of wheat coleoptile-sections and cress hypocotyls, and inhib. growth of cress roots. Cress germination was unaffected by water-sol. betaine, but was inhib. by ethyl acetate fractions of the extracts.

I.D.J.Phillips

4887. EFFECTS OF 2,2-DICHLOROPROPIONIC [DALAPON], TRICHLOROACETIC AND 2,3-DICHLOROISOBUTYRIC [DCIB] ACIDS ON SYNTHESIS OF ANTHOCYANIN IN FLOWERS OF SALVIA SPLENDENS CULTIVAR AMEPICA. S.Asen, L.J.Jansen and J.L.Hilton: Nature, Lond., 1963, 198, 185-186 (Crops Res. Divn., Agric. Res. Serv., U.S.D.A., Beltsville, Md., U.S.A.)

Foliar applications of aq. sprays of the herbicides 'Dalapon', TCA and DCIB reduced synthesis of anthocyanins in flowers of S. splendens. The colour of the flowers on plants grown from seeds of the treated plants was normal.

G.M.Lewis

4888. STUDIES ON FOLIAR PENETRATION. I. FACTORS CONTROLLING THE ENTRY OF 2,4-DICHLOROPHOXYACETIC ACID. J.A.Sargent and G.E.Blackman: J. exp. Bot., 1962, 13, 348-368 (A.R.C. Unit Expt. Agronomy, Dept. Agric., Univ. Oxford, England)

Leaf discs of Phaseolus vulgaris and Coleus blumei were used in a study of the uptake of [¹⁴C]2,4-D. The effects of leaf age, temp., surfactant agent, pH, light,

stomatal densities, IAA and triiodobenzoic acid upon uptake of 2,4-D were measured.

I.D.J.Phillips

4889. THE TOXIC EFFECT OF CHLORINATED PHENOXY-ACETIC ACIDS ON ASPEN. L.Eliasson: Physiol. Plant, 1963, 16, 255-268 (Coll. Forestry, Stockholm, Sweden)

Rooted cuttings growing in nutrient medium were treated with various synthetic auxins at several concn. and the effects on shoot growth, and their toxicity investigated, as well as on transpiration.

I.D.J.Phillips

4890. OBSERVATION ON ACTION ON TRIMETHYL-P-CHLOROETHYLAMMONIUM CHLORIDE [CCC] ON PLANTS. I. LEMNA MINOR, CHLORELLA PYRENOIDOSA AND RICCIJA FLUITANS L. II. WHEAT, CARROT, BEET. J.H.Supniewska: Bull. Acad. pol. Sci., 1963, 11, 149-154, 155-159 (Inst. Pharmacol., Cracow Polish Acad. Sci., Poland)

I. The most highly organised of the 3 aquatic plants studied, L. minor was found to be the most sensitive to the action of CCC, being killed at concn. of 6×10^{-2} to 6×10^{-4} M, and deformed at concn. of 6×10^{-5} to 6×10^{-6} M. In the highly cone. soln. the plants first exhibited deeper colouration indicating higher chlorophyll content, and later the fronds became etiolated. Chlorella grew at all concn. of CCC which were investigated while Riccia was intermediate in behaviour between Chlorella and L. minor.

II. Carrot root growth was promoted by 10^{-3} to 10^{-5} M CCC. More cone. soln. (10^{-2} to 10^{-3} M) inhib. the growth of wheat, red beet and carrot plants, producing smaller and more intensely coloured plants.

E. Parkinson

DORMANCY AND GERMINATION

4891. GROWTH AND DORMANCY IN LUNULARIA CRUCIATA (L) DUM. E. THE RESPONSE TO DAY-LENGTH AND TEMPERATURE. W.W.Schwabe and S.Nachmy-Bascomb: J. exp. Bot., 1963, 14, 353-378 (A.R.C. Unit Plant Morphogenesis, Wye Coll., Kent, England)

In the Israel strain of Lunularia, long day treatment induced dormancy whilst short day breaks it. Photoperiod perception occurred in all regions of the thallus. Temp. interacted strongly with photoperiod. Rinsing apparently removed some of the inhibitory factor formed under long day. Drought resistance was improved by dormancy-inducing treatments.

I.D.J.Phillips

4892. DORMANCY STUDIES IN SEED OF AVENA FÄTUAIE. A RELATIONSHIP BETWEEN MALTASE, AMYLASES AND GIBBERELLIN. G.M.Simpson and J.M. Naylon: Canad. J. Bot., 1962, 40, 1659-1673 (Dept. Crop Sci., Univ. Saskatchewan, Saskatoon, Sask., Canada)

Germination of excised embryos requires an exogenous energy source. Dormant and non-dormant seeds contain similar amounts of a- and 3-amylase but hydrolysis of starch in dormant seeds is blocked. Alone or in combination the amylases are unable to break down raw starch granules to sugars in vitro. Exogenous maltase in combination with (X-amylase hydrolyses raw starch to glucose. Examination of the maltase content of imbibed dormant and non-dormant seeds showed a marked increase in non-dormant seeds during the first 40 hr. GA-treatment of dormancy caryopses enhances maltase activity.

A.Meany

4893. STUDY OF FACTORS DETERMINING GERMINATION OF SEEDS OF LYTHRUM SALICARIA. P.RolIn and Y.Bidault: Photochem. Phorobiol., 1963, 2, 59-71 (Lab. Physiol. Vegetale, Sorbonne, Paris, France) These expt. have shown that there exist 2 Independent Processes in the germination of seeds of *L. salicaria*. One is a heat-dependent process in which germination only takes place in the dark if there is an alternation of temp. The other is a light dependent process. Light red light stimulates germination while dark red light counteracts this stimn. Gibberellic acid sensitises the seeds to the action of light red light. (French) G.C.Barr

4894. DEPRESSION OF GERMINATION IN CEREALS TREATED WITH SEVERE CENTRIFUGAL FORCE. E.D.Dodson and C.K.Yu: Canad. J. Bot., 1962, 40, 1714-1717 (Dept.Expt.Med., Baylor Univ., Houston, Tex.. U.S.A.) A note. A.Meany

4895. GERMINATION OF MELAMPYRUM LINEARE SEED. H.Zalasky: Canad. J. Bot., 1962, 40, 1713-1714 (Contribution No. 881, Forest Entomol. and Patriot Branch, Depr. Forestry, Ottawa, Ont., Canada)

A note. A.Meany

4896. EFFECT OF KANAMYCIN ON THE GERMINATION OF POTATO TUBERS. B.Monruella C.R. Acad. Sci., Paris, 1963, 255, 353-354 (Inst. Bot., Lille, France) *Saskia* potatoes were completely immersed in 1% aq. kanamycin in soli?, for 1, 2, 3 or 4 days. No germination occurred after over 80 days at room temp. Bintje potatoes were immersed for 1, 2 or 4 days in 0-005, 0-01, 0*02, 0*03, 0*05, O'1, 0*2, 0-5 or 1% kanamycin and kept days at room temp. Germination occurred only in those kept 1 day at 0'005, 0-01 or 0-02% or 2 days at 005%. To avoid the effects of soaking sections of Bintje potatoes were placed with the cut surface in a little *•fcramycin soln-* Germination was reduced or stopped when it had already started. (French) S.A.Thistlewood

4897. THE EFFECT OF VARIOUS BORON COMPOUNDS ON IN VITRO GERMINATION OF POLLEN. R-G.Stanley and E.A.Lichtenberg: Physiol. Plant., 1963, 16, 337-346 (Inst. Forest Genet., Pacific 5.W. Expt. Sm., U.S. Forest Service, Berkeley, Calif., U.S.A.) The ability of different org. and inorg. forms of B to modify *V* of *Amaryllis hybrida* and *Pyrus communis* (Banlett¹) in vitro was studied. The compounds studied were, *aM*, *oora*te> borax, boric acid, potassium tetraborate, Q phenyl borate. Depending on concn. all compounds **•* pollen germination and growth. Amaryllis and pear pollen exhibit different responses to the compounds. Pine *xin* *asQr^ed unequal amounts of B from different B* *Cre*. The effects of the compounds on pollen respiration determined. I.D.J.Phillips

chronic ionising radiation of low Intensity (3-15 r/20 hr. day) for several yr. In *Pinus* there was a decrease in cone length with increase in radiation accumulated by the trees, and also a decrease in seed germination and seedling height for plants grown from irradiated cones. Visually detectable abberations in floral morphology were present only in *Q. alba* receiving 6-12 r/day, but internal abnormalities in acorn morphology were observed in all *Quercus* spp. for levels above approx. 4 r/day.

J.R.Broome

4899. EFFECTS OF IONISING RADIATION ON A NATURAL PLANT COMMUNITY. J-CMcCormick and R.B.Piatc Radiat. Bot., 1962, 2, 161-168 (Vanderbilt Univ., Nashville, Tenn., U.S.A.) An 'island community' of spring and summer annuals transplanted from a granite outcrop to a γ -radiation field received ionising radiation along a gradient ranging from 8000 to 130000 r at rates of 5-82 r/hr. from March to August. Ecological analyses over 3 yr. indicated that ionising radiation has both stimulatory and inhibitory effects upon plant growth and survival and that these effects were reflected by sp. interactions at the community level. Results of autoecological studies indicated that the physiol. tolerances of all spp. usually varied inversely with the level of radiation received,

J.R.Broome

4900. CUMULATIVE RADIATION DAMAGE IN OAK TREES. L.W.Mericlc, R.P.Mericle and A.H.Sparrow: RadUt. Bot., 1962, 2, 265-271 (Biol. Dept., Brookhaven Nat. Lab., Upton, N.Y., U.S.A.) *Quercus alb?* and *Q. coccinea* were exposed to 7*19 r/day for 20 hr./day for 2184 days, giving a total cumulative dose of 16000 r. Gross effects included sparseness of foliage, shorter internodes, and the leaves were fewer in no., enlarged and distorted in shape. Hiszol. effects included inhibn. of formation and development of apical meristems, inter-nodal elongation and viable pollen. The oaks were more radiation resistant than trees of *Pinus nigra* growing in the same area.

J.R.Broome

4901. EFFECTS OF ACUTE γ -RADIATION ON GROWTH AND MORPHOLOGY IN PINUS MONOPHYLLA TORR. AND FREM. (PINION PINE). M.K.Brandenburg, ILL. Mills, W.H.Rickard and L.M.Shields: Radiat. Bot., 1962, 2, 251-263 (Dept. Biol., New Mexico Highlands Univ., Las Vegas, N. Mex., U.S.A.) A young mature pinyon pine was exposed from a position near the base for 8 hr. to a ^{60}Co source, the dosage ranging from approx. 2000 r one foot from the source to 5"1 r thirteen feet from the source. All tissue exposed to above approx. 1300 r was killed within 4 months. The actively growing regions of the stem were killed by approx. 600 r, and below 500 r terminal bud inhibited. or death subsequent to stem elongation was accompanied by development of lateral (dormant) buds which assume a significant role in shoot recovery.

J.R.Broome

4902. EFFECT OF CAESIUM 137 V-RADIATION ON PLANT GROWTH AND FLOWER COLOUR OF GREEN-HOUSE CHRYSANTHEMUM VARIETIES. G.M.Weaver: Canad. J. Genet. Cytol., 1963, 5, 73-82 (Canada Dept. Agric. Res. Stat., Harrow, Ont., Canada) Chronic exposure of some colour varieties of the Indianapolis series of chrysanthemums resulted in growth stimn. at dose rates from 1*9 ID 5*7 r per hr. The freq. and direction of colour changes following irradiation provides evidence for the genetic nature of the chimaeral tissue relationship in pink, white and bronze flowers,

RADIATION EFFECTS

4898. LOW LEVEL CHRONIC V-IRRADIATION OF AITCH PINE-OAK FOREST. ITS PHYSIOLOGICAL AND GENETICAL EFFECTS ON SEXUAL REPRODUCTION. F.Meier and G.R.Staira: Radiat. Bot., 1962, 2, 205-216 (Yale Univ., Sch. Forestry, New Haven, Conn., U.S.A.) *Pinus nigra* and *Quercus* spp. trees received

EXPERIMENTAL BOTANY

4903. ROLE OF THE QUIESCENT CENTRE IN THE RECOVERY OF VICIA FABA ROOTS FROM RADIATION. E.J.Hall, L.G.Lajtha and F.A.L.Clowes: Radiat. Bot., 1962, 2, 189-194 (Physics and Radiobiol. Lab., Radiotherapy Dept., Churchill Hosp., Oxford, England) Bean roots were exposed to a dose of 360 rad. and those which recovered were irradiated a second time with 100 to 200 rad. In a second expt. roots were irradiated either aerobically with 360 rad. or anaerobically with 1000 rad. The cells from which recovery takes place do not appear to be protected by anoxia in normal roots; also the progeny of these cells have the same radiosensitivity as normal meristems. This evidence does not exclude the possibility that cells of the quiescent centre are highly protected by some other means. J.R.Broome

PLANT CONSTITUENTS

4904. CHEMICAL STUDIES ON TAXONOMY OF HYPERICUM SPECIES. C.Mathis and G.Ourisson: Phytochemistry, 1963, 2, 157-171 (Fac Pharm., Strasbourg, France) The distribution of hypericin in 200 spp. of Hypericum has been studied by classical methods in conjunction with a new technique which involves 'printing*' on chromatographic paper. This technique has been used successfully on specimens up to 120 yr. old. Almost all hypericin-containing sp. belong to the sections Euhypericum and Kamyplosporus of Keller's classification. (French) B.H.Davies

4905. AN APPARENT SELENIFEROUS LEAF WAX FROM STANLEYA BIPINNATA. R.J.McColloch, J.W. Hamilton and S.K. Brown: Biochem. biophys. Acta, 1963, 11, 7-13 (Div. Agric. Biochem., Univ. Wyoming, Laramie, Wyo., U.S.A.) Evidence is presented that some of the org. selenium occurring in the leaves of Stanleya is in the form of a seleniferous wax. B.Ketterer

MISCELLANEOUS

4906. ON EFFECTS OF SOME CARCINOGENIC HYDROCARBONS ON GROWTH OF SPORELINGS OF MARINE RED ALGAE. A.D.Boney and E.D.Cornen: J. mar. biol. Ass. U.K., 1962, 42, 579-585 (Dept. Chem. and Biol. Coll. Technology, Plymouth, England) Various carcinogenic polycyclic aromatic hydrocarbons, in low concn., cause a considerable increase in cell production, when applied to sporelings of certain marine red algae. Low concn. of carcinogenic deriv. of benzanthracene stimulate cell production, but similar concn. of structurally related non-carcinogens inhibit it. P.J. Baron

4907. THE EFFECT OF SEED TREATMENT WITH THE EXTRACTS OF ORGANISMS AND THE SOLUTIONS OF SOME CHEMICAL SUBSTANCES ON THE RESISTANCE TO SALT CONCENTRATION IN WHEAT SEEDLINGS. T.Miyamoto: Physiol. Plant, 1963, 16, 333-336 (Inst. Pflanzenernährung, Justus Liebeg-Univ*, Giessen,

Germany) Distribution of substances which increase the resistance to salt concn. in wheat seedlings was studied in leaves of Hydrangea hortensis, in beef and in bakers' yeast. Treatment of wheat seed with 2-chloroethanol, LiBr or tannin soln. also increased resistance.

LD.J.Phillips

4908. CHEMISTRY OF ARENEBORONIC ACIDS. X. ACTION OF SOME ORGANOBORON COMPOUNDS ON WHEAT ROOTS AND ON POLLEN AND DISTRIBUTION OF 14C LABELLED BENZENEBORONIC ACID IN PLANTS. K.Torssell: Physiol. Plant, 1963, 16, 92-103 (Inst. Organ. Chem. and Biochem., Univ. Stockholm, Sweden) There was a variation in response of wheat root growth to various organoboron compounds. The effects of arenboronic acids were found to be similar with different plant spp. Benzeneboronic acid inhibited pollen germination and pollen-tube growth, and was also found to be readily and uniformly translocated in plants. Breakdown of benzeneboronic acid in plants was rapid, but the physiol. effects noted were due to the arenboronic acids themselves, rather than degradation products.

LD.J.Phillips

4909. COMPARATIVE BIOLOGY OF CLOSELY-RELATED SPECIES. VI. ANALYSIS OF GROWTH OF TRIFOLIUM REPENS AND T. FRAGIFERUM IN PURE AND MIXED POPULATIONS. J.L.Harper and J.N.Clatworthy: J. exp. Bot., 1963, 14, 172-190 (Dept. Agric, Univ. Oxford, England) Measurements were made of the first season's growth. T. repens achieved a faster early rate of leaf production than T.fragiferum in pure and mixed stands. Eighteen weeks after sowing T. fragiferum had more elongated petioles than T. repens and its leaves were borne higher in the canopy and contributed an increasing part to the leaf area index of mixtures. Increased leaf area of swards with time was largely associated with increased area of individual leaves. Differences between spp. were largely due to differences in no. of leaves.

I.D.J.Phillips

4910. ASPECTS OF BIOLOGY OF LAMINARIA HYPERBOREA. I. VERTICAL DISTRIBUTION. J.M.Kain: J. mar. biol. Ass. U.K., 1962, 42, 377-385 (Mar. Biol. Statn., Port Erin, Isle of Man, U.K.) Stable bottoms near the Isle of Man and of 2 areas of Scotland support Laminaria sacharina when sheltered from wave action of L. hyperborea when exposed. Downward penetration of L. hyperborea on exposed rocks near Port Erin is limited by an unknown factor.

P.J. Baron

4911. A RHIZOSPHERE EFFECT OF THE PEA ROOT ON SOIL ALGAE. D.R.Cullimore and M. Woodbine: Nature, Lond., 1963, 198, 304-305 (Microbiol. Unit, Dept. Agric. Sci., Univ. Nottingham, Leics., England) Germinated pea seedlings grown under sterile conditions on mineral agar were seeded with soil algae. Large colonies of algae were growing close to the roots within 10 days.

G.M.Lewis

4912. FUNGAL POPULATIONS IN THE RHIZOSPHERE OF PEANUT (ARACHIS HYPOGAEA L.). A.S.Rao: Plant and Soil, 1962, 17, 260-270 (Dept. Bot., S.V. Univ., Tirupati, (A.P.), India) The fungal populations of the rhizosphere of 8 varieties of peanut grown in soil amended with farmyard manure were compared using the diln. plate technique. Marked increases in rhizosphere fungi were recorded in 4 varieties and smaller increases in the remaining 4. High ratios of rhizosphere to soil fungi [R/S] were recorded at the time of max. vegetative growth, i.e. 30 days. The R/S ratio decreased for the next

EXPERIMENTAL BOTANY

473

3 months and then rose, this rise being correlated with increased microbial activity around dead or senescent roots. Rhizosphere effect and root nodule no. could not be correlated.

W.A.Stevens

4913. BEHAVIOUR OF MUSHROOM STRAINS IN MIXED CULTURE. G.Eger: Arch. Mikrobiol., 1963, 44, 421-432 (Max-Planck-Inst. Kulturpflanzenzuchtung, Hamberg-Volksdorf, Germany) Mixed cultures of mycelium of 2 white or 2 brown strains of cultivated mushrooms had no effect on the yield of fructifications but with mixtures of brown and white there was a reduction in yield and relatively rapid disappearance of mycelium. This was caused by suppression of the brown strain.
(German) E.M.Ling

4914. THE BEHAVIOUR OF NUCLEIC ACIDS AND OTHER CONSTITUENTS IN PROTOMYCES INUNDATUS DANGEARD. L.R.G.Valadon, A.Myers and J.G.Manners: J. exp. Bot., 1962, 13, 378-389 (Dept. Bot., Univ. Southampton, England) DNA content per cell was doubled in cultures derived from fusion bodies or from mycelium, compared with that in cultures from unfused endospores. Dry wt./cell, vol./cell, insol. N/cell, and P_{tot} /cell, like RNA/cell, had similar values for all 3 types of culture. DNA content and all the other measured constituents were doubled by camphor treatments of cultures from infused endospores. RNA/DNA ratios in any one culture remained const., though abs. values decreased with age. RNA/DNA ratios of haploid and diploid cultures of *P. inundatus* were compared with those of yeast and other organisms. I. D.J. Phillips

4915. INDUCED THERMOSENSITIVITY IN OPHIOSTOMA AND RHODOTORULA. N.Fries: Physiol. Plant., 1963, 16, 415-422 (Inst. Physiol. Bot., Univ. Uppsala, Sweden) Vegetative cells germinated at temp. up to 30° . Preheating of cells for a few min. at a sublethal temp. of between 40° and 50° reduced their ability to germinate at temp. of 28° and above, but did not reduce their capacity for germination at temp. below 25° (induced thermosensitivity¹). Rapidly dividing cells of *Ophiostoma* from a submerged culture reacted in the same way as did non-dividing aerial conidia. Induced thermosensitivity gradually disappeared but was still noticeable after 12 hr. at 25° . LD.J.Phillips

4916. FINE STRUCTURE OF THE YOUNG VEGETATIVE HYphae OF PYTHIUM DEBARYANUM. LE.Hawker and P.McV. Abbott: J. gen. Microbiol., 1963, 31, 491-494 (Dept. Bot., Univ. Bristol, England) The fine structure of *P. debaryanum* Hesse differs from that of

Rhizopus spp. and some other fungi in the abundant regularly distributed endoplasmic reticulum, the presence of typical Golgi-bodies and the irregularly tubular structure of the cristae mitochondriae. The resemblance of some characters to those of some algae and the liverwort *Anthoceros* is discussed. Typical lomasomes are present.

K.Brew

4917. OBSERVATIONS ON THE FINE STRUCTURE OF THE ZOOSPORE OF OEDOGONIUM CARDIACUM WITH SPECIAL REFERENCE TO THE FLAGELLAR APPARATUS. L.Hoffman and LManton: J. exp. Bot., 1962, 13, 443-449 (Bot. Dept., Leeds Univ., England) An E.M. study of the flagella of zoospores from o plants. LDJ-Phillips

4918. THE MICROELECTROPHORETIC BEHAVIOUR OF PLANT MITOCHONDRIA COMPARED WITH RAT MITOCHONDRIA. H.W.Douglas, M.V.Laycock and D.Boulten: J. exp. Bot., 1963, 14, 198-209 (Dept. Bot. and Inorg. and Phys. Chem., Univ. Liverpool, England) Electrophoretic mobility of 'heavy' mitochondrial prep. of bean, cauliflower and rat liver were similar, as were also pH-mean mobility curves. A microelectrophoretic study was made of 'heavy' and 'light' mitochondrial fractions from rat liver and bean. LD.J.Phillips

4919. PHYSIOLOGICAL STATE OF THE PUPIL IN VEGETATIVE HYBRIDISATION. F.Chodac: C.R. Acad. Sci., Paris, 1962, 255, 358-359 (Inst. Bot. Gen., Univ. Geneve, Switzerland) Repeated grafting disturbs the 'pupil's' stability causing disorder or the appearance of characteristics of the 'mentor'sp. Either stock or scion may be 'pupil' or 'mentor'. The 'pupil' must be repeatedly almost completely defoliated, thus exposing it to the building and information bearing substances of the 'mentor'. The 'pupil' must also be younger than the 'mentor'. A similar situation occurs in tissue culture where organs (leaves and roots) are only formed on stimm. by products of autotrophy.

(French) S.A.Thistlewood

4920. STUDIES IN STOMATAL BEHAVIOUR. DC PHOTO-PERIODIC EFFECTS ON RHYTHMIC PHENOMENA IN XANTHIUM PENNSYLVANICUM. T.A.Mansfield and O.V.S.Heath: J. exp. Bot., 1963, 14, 334-352 (Univ. Reading Hort. Res. Labs., Shinfield Grange, Shinfield, Berks., England) Stomata opened towards the end of the night under short day but not under long day, and there were non-persistent differences in the rates of stomatal opening in the morning after different lengths of night. There appeared to be an endogenous rhythm affecting the stomata in continuous darkness.

LD.J.Phillips

EXPERIMENTAL ZOOLOGY

METABOLISM

4921. RADIOACTIVE PHOSPHORUS ACCUMULATION AND DISTRIBUTION IN TETRAHYMENA. J.V.Slater and J.W.Tremor: Biol. Bull. Woods Hole. 1962. 122. 298-309 (Donner Lab., Univ. California. Berkeley. Calif., U.S.A.) The uptake of 32p by mating types I and II of variety 4 of Tetrahymena pyriformis was investigated. Mating type II accumulated 10 times as much as Mating type I, while in both type phosphate accumulation was affected by the population density, being less/cell in dense populations. Glucose in the medium increased the amount of 32p absorbed three fold. Six hr. after induction of conjugation in low density populations there was a significant increase in uptake of 32p. G.J.Peaikin

4922. UREASE ACTIVITY IN TRYPANORHYNCH CESTODES. J.E.Simmons jun.: Biol. Bull. Woods Hole. 1961, 121, 535-546 (Dept. Biol., Emory Univ., Atlanta, Ga., U.S.A.) The urease activity of the cestodes from elasmobranchs was measured and found to be high in two spp.. Lacistorhynchus tenuis and Pterobothrium lintoni. The value for the latter was about 10 times greater than for the former at 140 mg. urea hydrolysed/g. dry wt. of tissue. Living worms retained this activity for at least 100 hr. The production of ammonia and 14CO₂ from [14C]urea was demonstrated. G.J.Peaikin

4923. POLYPHENOL OXIDASE IN THE TEGUMENTAL GLANDS IN RELATION TO THE MOULTING CYCLE OF THE ISOPOD CRUSTACEAN ARMADILLIDIUM VULGARE. J.R.Stevenson: Biol. Bull. Woods Hole, 1961, 121, 554-560 (Dept. Biol., Kent State Univ. 'Kent, Ohio, U.S.A.) A method of determining the moulting stage of A. vulgare is described. Throughout the moulting cycle an oxidase was found in the secretory droplets of the tegumentary glands and evidence indicated that it was the polyphenol oxidase involved in the sclerotisation of the cuticle. G.J.Peaikin

4924. THE n-ALKYL GROUP SPECIFICITY OF CHOLINESTERASE FROM THE HOUSEFLY, MUSCA DOMESTICA L. AND THE 2-SPOTTED SPIDER MITE, TETRANYCHUS TELARIUS L. W.C.Dauterman and K.N.Mehrotra: J. Insect Physiol., 1963, 9, 257-263 (Pesticide Residue Labs., North Carolina State Coll., Raleigh, N.C., U.S.A.) 17 n-alkyl substituted analogues of ACh were tested as substrates for cholinesterase from M. domestica heads and from T. telarius. The M. domestica enzyme hydrolysed the dimethyl and diethyl alkyl analogues rapidly while the activity towards the dipropyl and dibutyl alkyl ester was low. No clear pattern of specificity could be obtained using the mite enzyme. The propylene and butylene analogues of ACh were hydrolysed differently by the enzyme from the 2 sources. R J.Walker

4925. CHITIN IN THE HYALINE EXOCUTICLE OF THE SCORPION. S.R.A.Malek: Nature, Lond., 1963, 198, 301-302 (Dept. Zool., Univ. Alexandria, Egypt) A lipoprotein complex impregnating the hyaline exocuticle in Pandinus imperator and Buthus quinauestriatus prevents a pos. iodine-chitosan reaction despite the presence of chitin. G.M.Lewis

4926. TRYPTOPHAN PYRROLASE ACTIVITY IN THE LIVER OF ADULT RANA PIPiens. M.Spiegel: Biol. Bull. Woods Hole. 1961. 121. 547-553 (Dept. Zool..

Dartmouth Coll., Hanover, N.H., U.S.A.) The effect of a no. of compounds inj. i.p. on the liver tryptophan pyrrolase activity in adult <? and ? R. pipiens was investigated. L-Tryptophan produced a large increase but cortisone acetate and hydrocortisone acetate had no effect. ACTH and L-histidine caused a slight decrease while pituitary injn. brought about a marked decrease. In adult ? enzyme activity varied, increasing after hibernation until ovulation, when there was a sharp drop in activity. G.J.Peaikin

4927. ASSOCIATION OF PTERIDINES WITH AMPHIBIAN LARVAL PIGMENTATION AND THEIR BIOSYNTHESIS IN DEVELOPING CHROMATOPHORES. M.Obika: Develop. Biol., 1963, 6, 99-112 (Biol. Lab., Keio Univ., Yokohama-Hiyoshi, Japan) Appearance of pteridines during chromatophore differentiation in larvae and adults of Triturus pyrrhogaster, Hynobius nigrescens and Li.tokyoensis, and their association with different types of chromatophores is described, together with results of an expt. study of the site of pteridine synthesis in larval stages. J.W.S. Harris

4928. METABOLIC RATE OF TREE-SHREWS (UROGALE EVERETTI). L.E.Nelson and C.W.Aslings Proc. Soc. exp. Biol. N.Y.. 1962, 109, 602-604 (Dept. Anat., Univ. California, Berkeley, Calif., U.S.A.) Observations were carried out on *d* and ? animals. The precise ages of none of the animals was known, they were maintained on a fruit meat cereal diet and kept in pairs in 2j cu. ft. cages. Metabolic rates were determined in a closed circuit respiration apparatus. The O₂ consumption was measured on each animal after it had slept overnight. The tree-shrews had a standard metabolic rate in the lower range of that of rats of comparable wt. and maturity, no significant differences could be determined between the sexes. M.M.Faulkner

EMBRYOLOGY

4929. EFFECTS OF ACTINOMYCIN D ON MORPHOGENESIS. J.Brachet and H.Denis: Nature, Lond., 1963. 198. 205-206 (Lab. Morphol. animale. Univ. Libre Bruxelles. Belgium) Actinomycin D inhibits growth and development in the alga Acetabularia mediterranea, particularly in nucleate portions. In amphElian eggs (Pleurodeles and Xenopus) actinomycin does not inhibit cleavage but neural induction stops and the nervous system is practically absent. It is suggested that inhibn. of the synthesis of nuclear RNA by actinomycin drastically reduces cephalocaudal and dorsoventral differentiation. I G.M.Lewis

4930. SULPHYDRYL GROUPS AND MORPHOGENESIS. III. BIOCHEMICAL STUDY OF THE EFFECTS OF MERCAPTOETHANOL [ME] ON AMPHIBIAN EMBRYOS AND THE ALGA ACETABULARIA MEDITERRANEA. J.Brachet, M.Decroly and J.Quertier: Develop. Biol., 1963, 6, 113-131. An increase of total and sol. -SH groups occurred in eggs treated with 3-ME, and [35s]ME was incorporated into proteins of amphibian embryos and Acetabularia. In amphibians, incorporation was mainly into pigment granules and yolk platelets of the animal, and later the dorsal half of the embryo; in Acetabularia it was highest in the nucleus and apical part* of the stem*

EXPERIMENTAL ZOOLOGY

475

Electrophoretic studies of ME treated eggs failed to detect the presence of a new sol. -SH-containing protein. No ecto-ATPase was detected in amphibian eggs, and the endo-ATPase was unaffected by ME. The significance of the observations on current explanatory hypotheses of the morphostatic effects of ME is discussed.

(French) J.W.S.Harris

4931. GAMETOGENESIS AND SPAWNING OF THE EUROPEAN OYSTER, OSTREA EDULIS IN WATERS OF MAINE. V.LLoosanoff: Biol. Bull. Woods Hole, 1962, 122, 86-94 (U.S.Bureau Commercial Fish., Biol. Lab., Milford, Conn., U.S.A.) Gametogenesis

was found to start in May, with spawning starting in the Middle of July and continuing to the end of August. The shortness of the summer allowed only one sex phase to be completed by an individual oyster. Resorption of gonads, which may continue through the winter and early spring, is carried out principally by phago-leucocytes which enter the gonadal follicles from the blood vessels.

G.J.Peaikin

4932. TRACHEAL CAPTURE [TC] IN ONTOGENETIC AND PHYLOGENETIC PHASES OF INSECT WING DEVELOPMENT. D.Leston: Proc. roy. ent. Soc. Lond. A, 1962, 37, 135-144 (Dept. Zool., Univ. Oxford, England) TC is defined as a process in development whereby a wing trachea (a) comes to occupy a vein not originally associated with it or (b) departs from its associated vein and terminates in a non-venous structure. TAis is studied in the Heteroptera. TC during development is demonstrated in Dysdercus superstiosus and during phylogeny in Triatoma infestans. An example of (b) is TC by the pigment spot organ of some spp.

D.M.S.Perkins

4933. EXISTENCE OF TWO TYPES OF DEVELOPMENT IN THE ODONATA. P.Aguesse: C.R. Acad. Sci., Paris, 1962, 255, 368-370 (Stat. Biol. Tour du Volat, Le Sambuc, Bouches-du-Rhone, France) The various developmental cycles observed in the Odonata consist of two main types, those with and those without a delay in the growth from egg to imago. All spp. in cold temperate climates and 90% of those in hot temperate climates have a delay either physiol. in origin or conditioned by the climate, and so timed that the image emerges under optimum climatic conditions. Spp. without a diapause occur mainly in the tropics where climatic conditions are always favourable. Tropical spp. living in stagnant water are however more abundant during and immediately after the rainy season.

(French) S.A.Thistlewood

4934. EMBRYONIC STUDIES ON FLUORESCENT COMPOUNDS IN SILKWORMS. G.Jimbo and T.Nishiyama: Bull. Yamaguchi med. Sch., 1962, 9, 81-83 (Dept. Anat., Yamaguchi Med. Sch., Ube, Japan) In the Malpighian tubes of silkworms, granules with inherent fluorescence were found in the secreted substance on the 9th day after incubation. These granules grew and eventually into needle-like plates, on the 21st day after incubation.

K.Jones

4935. RESTITUTION OF WHOLE LARVAE FROM DISAGGREGATED CELLS OF SEA URCHIN EMBRYOS. G.Giudice: Develop. Biol., 1962, 5, 402-411 (Lab. Comp. Anat., Univ. Palermo, Italy) Structural characteristics of dissociated cells from blastula to stages of Paracentrotus lividus and Arbacia lixula are described. Isolated cells reaggregated to form structures which differentiated into quasi-normal larvae, the development attained prior to dissociation. J.W.S. Harris

4936. INHIBITION OF FERTILIZIN AGGLUTINATION AND FERTILISATION IN ARBACIA BY FUCUS EXTRACTS. J.M.Branham and C.B.Metz: Biol. Bull. Woods Hole, 1962, 122, 194-207 (Oceanographic Inst., Florida State Univ., Tallahassee, Fla., U.S.A.)

Extracts of the brown alga, Fucus vesiculosus, were found to inhibit fertilizin aggltn. of sperm, apparently by some action of the sperm, which removed the colour and inhibitory prop. from the extract. Inhibn. of the agglutinating prop. of the fertilizin soln. was not irreversible as they returned after removal of the Fucus extract with activated charcoal. Sperm motility and O₂ consumption were stim. by the Fucus extract. Inhibn. of fertilisation was due to an irreversible action on the eggs. Tannic acid was shown to have similar prop. to the extract. G.J.Peaikin

4937. EFFECTS OF NUCLEOTIDES ON NEURULATION IN AMPHIBIAN EMBRYOS. E.Ambellan and G.Webster: Develop. Biol., 1962, 5, 452-467 (Dept. Biochem., Ohio State Univ., Columbus, Ohio, U.S.A.) Adenine nucleotides (tri- more than diphosphates) were more effective than other nucleotides in promoting neurulation in embryos of Rana pipiens. Adenosine-3'-monophosphate was less effective, and adenosine-5'-monophosphate was inhibitory. Effect was dependent upon nucleotide concn., pH and duration and time of treatment. Neurulation effect and pH dependence were not related to extent of nucleotide penetration into the cells. [14c]ADP and [14c]ATP were principally limited to neural and chordamesodermal tissues.

J.W.S.Harris

4938. APPEARANCES OF CATECHOLAMINES DURING DEVELOPMENT OF RANA PIPIENS. J.D.Caston: Develop. Biol., 1962, 5, 468-482 (Biol. Dept., Brown Univ., Providence, R.I., U.S.A.) Appearances and accumulation of dopamine, noradrenaline and adrenaline has been studied in whole embryos and isolated neural crests at different embryonic stages. The order in which individual catecholamines appeared was similar to that observed during adrenaline synthesis in adult tissues. Dopamine and noradrenaline appeared in whole embryos and neural crests at Shumway stages 15 and 16, respectively. Adrenaline appeared in whole embryos at stage 17+ but was not detected in neural crest material at stage 20+. J.W.S.Harris

4939. RADIOSensitivity TO NEUTRONS OF FERTILISED EGGS OF PLEURODELES WALTLH MICHAH.

L.Gallien and M.Labrousse: C.R. Acad. Sci., Paris, 1962, 255, 371-373 (Lab. d'Embryologie, Fac. Sci., Paris, France) Eggs of the amphibian P. waltlii were irradiated with neutrons after fertilisation. At a dose of 2*5 x 10⁷ neutrons/egg/hr. the max. radiosensitivity occurred with eggs in the first mitosis of segmentation, and the minimum during the migration and meeting of the pronuclei. At doses below 2*5 x 10⁷ neutrons/egg/hr. the % of abnormal animals produced decreased.

(French) S. A. Thistlewood

4940. ORGANISATION AND COMPOSITION OF THE AMPHIBIAN YOLK PLATELET. I. INVESTIGATIONS ON THE ORGANISATION OF THE PLATELET.

D.A.Ringle and P. R.Gross: Biol. Bull. Woods Hole, 1962, 122, 263-280 (Dept. Physiol., Columbia Univ. Coll. Phys. and Surg., New York, U.S.A.) The yolk platelets of ovarian eggs were studied, by various techniques, as washed isolated platelets, unwashed extruded platelets or in ovo. The presence of a surface coat was suggested by some evidence but it was not unlikely that it in fact represented a prep. artifact. A faint Feulgen-pos.

EXPERIMENTAL ZOOLOGY

response was obtained with platelets in ovo. Washed yolk platelets showed a periodic arrangement of components under E.M.

G.J.Peaikin

4941. ORGANISATION AND COMPOSITION OF THE AMPHIBIAN YOLK PLATELET. II. INVESTIGATIONS ON YOLK PROTEINS. D.A.R.Lngle and P.R.Gross: Biol. Bull. Woods Hole, 1962, 122, 281-297 (Dept. Physiol., Columbia Univ. Coll. Phys. and Surg., New York, U.S.A.) Yolk platelet suspensions lysed with NaCl or CaCl₂ gave yolk soln. and insol. 'ghost' residue. Yolk fractions pptd. from NaCl lysed material could be of 3 kinds which all had the same electrophoretic prop., whether or not the lipids had been extracted. P/N ratios supported the view that 'ghost' material is largely non-yolk in origin. Nucleic acid P varied among different batches of yolk. A minimum of 5 Ag were found in solubilised yolk, 3 of which were also found in 'ghost' Ag.

G.J.Peaikin

4942. EFFECTS OF HETEROBOTIC MUSCULATURE ON MYOGENESIS DURING LIMB REGENERATION IN AMBLYSTOMA LARVAE. P.Pietsch: Anat. Rec., 1961, 141, 295-303 (Bowman Gray Sch. Med., Wake Forest Coll., Winston-Salem, N.C., U.S.A.) Regenerating limb blastema was transplanted in place of eye in larvae. Skeletal muscle with a pattern unlike that found in normal limb regenerates developed around blastema-derived cartilages. When a narrow band of stump was left attached to the transplant muscle of limb and orbit appeared to mix. Under these expt. conditions muscle that developed around regenerate cartilages was mixed in pattern.

F.Beck

RESPIRATION

4943. A REPETITION OF EGE'S EXPERIMENTS AND A NOTE ON THE EFFICIENCY OF THE PHYSICAL GILL OF NOTONECTA (HEMIPTERA-HETEROPTERA).

E.J.Popham: Proc. roy. ent. Soc. Lond. A, 1962, 37, 154-160 (Dept. Zool., Univ. Manchester, England)

From his expt., Ege claimed that Notonectids use the gas stores carried on the body surface when they submerge to obtain, by diffusion, O₂ from the surrounding water, the bubble of air thereby acting as a physical gill. Repetition of the expt. in the original and a modified form is described, and the functioning of the gas store as a physical gill is confirmed but only at temp. below about 15°. The variation in the efficiency of the gill, causes no surfacing, role of N₂ and related topics are discussed.

D.M.S.Perkins

4944. OXYGEN-HAEMOCYANIN RELATIONSHIPS IN THE LAND CRAB, CARDISOMA GUANHUMI.

J.R.Redmond: Biol. Bull. Woods Hole, 1962, 122, 252-262 (Dept. Biol., Univ. Florida, Gainesville, Fla., U.S.A.) The relationship between O₂ and haemocyanin has been characterised in the land crab C. guanhumi and shown to be similar to that found in other decapod crustaceans in most respects. The higher O₂ affinity possessed by the pigment is unusual, however, and it is suggested that this may represent an adaptation to high environmental temp. and water conservation.

G.J.Peaikin

4945. SEASONAL VARIATIONS IN THE OXYGEN CONSUMPTION OF UCA PUGNAX. H.M.Webb and F.A. Brown jun.: Biol. Bull. Woods Hole, 1961, 121, 561-

571 (Dept. Biol. Sci., Goucher Coll., Towson, Md., U.S.A.) The respiratory rate of U. pu^nax in the winter was approx. half that of the summer. An apparent annual rhythm in mean rate of respiration was found but no seasonal changes in the diurnal rhythm was detected. The lunar rhythm altered from a bimodal pattern from June-September to a unimodal curve from October to January.

G.J.Peaikin

4946. METABOLISM OF THE MEXICAN FREE-TAILED BAT. C.F.Herreid, It J. cell. comp. Physiol., 1963, 61, 201-207 (Dept. Comp. Behav., Sch. Hyg. and Publ. Hlth., Johns Hopkins Univ., Baltimore, Md., U.S.A.) O₂ consumption of Tadarida brasiliensis mexicana was measured hourly at a series of temp. for 24 hr. The minimum metabolism was directly dependent on ambient temp. Some bats roused spontaneously to activity and some did not, resulting in a wide variation in max. metabolic rate. The ratio of max. to min. levels was greater than for other mammals of comparable size. No evidence of circadian rhythm was obtained.

G.M.Lewis

FEEDING AND DIGESTION

4947. A HISTOCHEMICAL STUDY OF DIGESTION AND DIGESTIVE ENZYMES IN THE RHYNCHOCOELAN LINEUS RUBER (O.F.MULLER). J.B.Jennings: Biol. Bull. Woods Hole, 1962, 122, 63-72 (Dept. ZODL, Univ. Leeds, England) Digestion of L. ruber has been shown to be both extra- and intra-cellular. The course of these processes is described and some of the enzymes concerned have been located and identified with histochem. methods.

G.J.Peaikin

4948. UNIDENTIFIED GROWTH FACTORS IN BREWERS' YEAST. IV. RELATIONS BETWEEN THESE FACTORS AND LEVEL OF N IN DIET OF TRIBOLIUM CONFUSUM DUVAL. R.Charbonneau and A.Lemonde: Arch. int. Physiol., 1962, 70, 379-392 (Dept. Biochem., Fac. Med., Laval Univ., Quebec, Canada) Larvae of T. confusum were reared on diets containing various proportions of casein and glucose, with the addition of cholesterol, salt mixture and B vitamins. Larvae on a casein free diet failed to grow, but addition of whole yeast replaced casein and gave optimal growth. Water insol. fraction was almost as effective as whole yeast, water sol. fraction ineffective. The larval period lasted 35 days on 20% casein. Addition of b% yeast reduced this to 20 days. Water insol. fraction reduced the period to 23 days and water sol. fraction to 30 days. On 95% casein and optimal B vitamins the larval period was 36*7 days, reduced to 27 days by addition of yeast. Water insol. fraction gave a similar reduct&n when B vitamins were optimal, but the water sol. fraction was as active as whole yeast whatever the vitamin mixture used. Thus the water insol. yeast fraction is most active in diets low in casein and the water sol. fraction in diets with a high casein content. (French, English summary) M.E.Nutt

4949. ANTIMETABOLITES IN THE NUTRITION OF AEDES AEGYPTI L. LARVAE. PYRIDOXINE ANTAGONISTS, S.Akov and K.Guggenheim: Comp. Biochem. Physiol., 1963, 9, 61-68 (Dept. Entomology* Israel Inst. Biol. Res., Ness-Ziona, Israel)

EXPERIMENTAL ZOOLOGY

477

The effects of 4-deoxypyridoxide, uu-methylpyridoxine and INH on *A. aegypti* larvae grown on synthetic medium containing known amounts of pyridoxine were studied. Pyridoxine reverse[^] the inhibitory effect of 4-deoxy-Pyridoxine, but not competitively. UU-Methylpyridoxine replaced the vitamin partially but was inhibitory in large amounts. Isoniazid was least toxic of the antimetabolites.

S.Laverack

4950. BEHAVIOURAL ASPECTS OF PROTEIN INGESTION BY THE BLOWFLY, PHORMIA REGINA MEIGEN.

V.G.Dethien Biol. Bull. Woods Hole, 1961, 121, 456-470 (Zool. Lab., Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) Males of *Phormia*, whether mated or not, gradually increased their protein ingestion from the time of emergence until the 4-8th day and thereafter little is taken. Virgin ♀ show a similar pattern but the vol. ingested is greater. Mated ♀ showed an increased ingestion after each batch of eggs had been laid. The removal of ovaries, corpus allatum or medial neurosecretory cells did not alter the pattern of protein ingestion.

G.J.Peaikin

4951. A TOXIC PRINCIPLE IN THE DIGESTIVE FLUIDS OF PIERIS BRASSICAE. G.Benz: J. insect Path., 1962, 4, 492-495 (Entom. Lab., Swiss Federal Inst. Tech., Zurich, Switzerland) Digestive fluid of healthy

larvae of *P. brassicae* were subjected to different treatments and then tested for paralysing action. The toxic substance is dissolved in the digestive fluid and it is not ppt. in neutral or slightly acid soln. The substance is not heat stable; it may be ppt. by freezing and thawing; and it is not dialysable. Partial purification was attempted. It may be salted out with cone, ammonium sulphate and this product does not readily redissolve in neutral saline but dissolves at pH 8. It is suggested that the toxic substance may be a protein. Expt. indicate that the paralysing substance is produced only by certain sp. of lepidopterous larvae but that it acts on other insects when inj. The primary action of the toxin is to cause leakage of the gut wall.

R.J.Walker

4952. A FURTHER FUNCTION OF THE AIR SACS IN SOME INSECTS. V.B. Wigglesworth: Nature, Lond., 1963, 198, 106 (Unit Insect Physiol., Dept. Zool., Univ. Cambridge, England) With particular ref. to *liriomyza*, it is suggested that the air sacs in the mature insect cause a reduction in blood vol. by one third, thereby increasing the efficiency of transport of sugar reserves during flight.

G.M.Lewis

4953. SEASONAL VARIATIONS IN THE FEEDING OF THE GUDGEON (GOBIO GOBIO L.). G.Moreau: C.K. Acad. Sci., Paris, 1962, 255, 397-399 (Stat. biol. des Eyzies, Dordogne, France) From June to September gudgeon in outside ponds were spontaneously active and hunting food, throughout the day and in the evening. From November to February the fish were inactive throughout the day even when food was offered but were active and fed at night even at 4°. Between March and May, and in October a gradual transition occurred, artificial darkness in winter induced activity but artificial lengthening of the day to 18 hr. had no effect on the activity observed. Warming a lighted aquarium to 20° produced only slight increase in activity, unless the period of illumination/day was prolonged when intense activity occurred. (French) S.A.Thistlewood

4954. TRICHOBEZOARS (HAIR BALLS) IN RATTUS ASSIMILIS. B.E.Hornen: Nature, Lond., 1962, 196,

553-554 (Smith Coll., Northampton, Mass., U.S.A.) In laboratory-maintained *R. assimilis*, hair-ball formation is facilitated by the ingestion of large amounts of hair in association with a relatively low intake of cellulose-containing food materials and high fat intake.

G.M.Lewis

OSMOREGULATION AND EXCRETION

4955. IONIC AND WATER BALANCE OF PLANARIANS.

H.B.Steinbach: Biol. Bull. Woods Hole, 1962, 122, 310-319 (Dept. Zool., Univ. Chicago, Chicago, Ill., U.S.A.) The concn. of Na, K and Cl has been determined in *Dugesia tigrinum* and *Bdelloura* sp., an ectoparasite of *Limulus*. FIUX rates for these ions and water were found to be higher in the marine worms, while the exchange rates for water were high for both forms. *Bdelloura* on exposure to dil. sea water swelled to a new const. vol. In this condition it did not lose K, but the concn. fell with the vol. increase.

G.J.Peaikin

4956. IONIC BALANCE IN BLOOD AND COELOMIC

FLUID OF EARTHWORMS. F.L.Kamemoto, A.E.S. Spalding and S.M.Keisten: Biol. Bull. Woods Hole, 1962, 122, 228-231 (Dept. Zool., Univ. Missouri, Columbia, Mo., U.S.A.) The concn. of Na, K, Ca and Cl in the blood of coelomic fluid was determined in *Lumbricus terrestris*, *Helodrilus caliginosus* and *Eisenia fetida* (coelomic flu13 only) which had been kept in moist soil, tap water and 0.1M NaCl soln. The concn. of cations was higher in the blood than in the coelomic fluid, while the chloride was evenly distributed. The ionic concn. were similar in the 3 spp. The concn. of Na in the blood and coelomic fluid was greater than the medium in 0.1M NaCl.

G.J.Peaikin

4957. ASPECTS OF OSMOREGULATION IN TWO

SPECIES OF INTERTIDAL CRABS. P.A.Dehnel: Biol. Bull. Woods Hole, 1962, 122, 208-227 (Dept. Zool., Univ. British Columbia, Vancouver, B.C., Canada)

The total osmotic pressure of the blood of *Hemigrapsus oregonensis* and *H. nudus* was determined for a range of salinities extending from 6‰ to 175‰ sea water and for temp., extending from 5° to 25° in both summer and winter. Both spp. were hypertonic to all expt. concn. Their osmoregulatory abilities changed seasonally a change which could be related to temp. conditions. Blood concn. increased significantly with decreasing temp., as the salinities became less. No detectable wt. changes were noted when animals were subjected to the extreme expt. sea water concn. No simple relationship between respiratory and osmoregulatory data was established.

G.J.Peaikin

4958. ADAPTATION TO SEA WATER OF SPECIMENS OF ERIOCHEIR SINENSIS HAVING A HIGH FREE AMINO-ACID CONTENT IN THE MUSCLES IN FRESH WATER.

G.Duchateau-Bosson and M.Florkin: Arch. int. Physiol., 1962, 70, 345-355 (Inst. Léon Fredericq, Univ. Liège, Belgium) On adaptation to sea water specimens of *E. sinensis* with a high free amino acid content in their muscles show a further increase in this component, due mainly to rise in alanine, total glutamic acid, glycocoll and proline. Arginine concn. is unchanged. On returning

EXPERIMENTAL ZOOLOGY

to fresh water these changes are reversed and concn. of total glutamic acid and proline returns to the value found in controls kept continuously in fresh water. Alanine and glycocoll concn. decrease further and approach the lower levels found in animals newly caught from fresh water.
(French) M.E.Nutt

4959. INTRACELLULAR ISOSMOTIC REGULATION IN ERIOCHEIR SINENSIS AFTER ABLATION OF OCULAR PEDUNCLES. G.Duchateau-Bosson and M.Florkin: Arch. int. Physiol., 1962, 70, 393-396 (Inst. Léon Fredericq, Univ. Liège, Belgium) Ablation of the ocular peduncles of *E. sinensis* is without effect on the osmoregulatory changes in free amino acid concn. of muscles which occur on transfer of animals from fresh to sea water and their replacement in fresh water.
M.E.Nutt

4960. THE LARVAL EXCRETORY SYSTEM OF CHAO-BORUS CRYSTALLINUS (DEGEER) DIPTERA: CULICIDAE. B.W.Staddorff Proc. roy. ent. Soc. Lond. A, 1962, 37, 99-103 (Dept. Zool., Univ. Coll. S.Wales and Monmouthshire, Cardiff, Wales) The structure and histology of the hindgut and Malpighian tubules [MT] are described. The cytoplasm of the MT cells has an inner striated region bordering the lumen of the tubule. The cells of the distal and prox. parts of die MT show differences in size and character suggesting differences in function. Granules in the MT were observed moving into the hindgut. N excretion is probably mostly as NH₃. The haemolymph has an abnormally high NH₃ content.
D.M.S.Perkins

4961. IDENTIFICATION OF XANTHINE IN EXCRETA OF THE GREATER WAX MOTH, GALLERIA MELLONELLA (L.). J.L.Nation: J. insect Physiol., 1963, 9, 195-200 (Dept. Biol., Univ. Florida, Gainesville, Fla., U.S.A.) Xanthine was identified as an excretory product of *G. mellonella* larvae, pupae and adults using paper electrophoresis. Purine spots were located with an u.v. light and also with the mercury-diphenylcarbazone re* agent. At least 2 other unknown substances are also present in the excreta.
R.J.Walker

4962. THE EFFECT OF SALINITY ON THE AMINO ACID CONCENTRATION IN RANGIA CUNEATA (PELECYPODA). K.Allen: Biol. Bull. Woods Hole, 1961, 121, 419-424 (Zool. Dept., Univ. California, Los Angeles, Calif., U.S.A.) The concn. of alanine, glycine, glutamic acid and aspartic acid was determined in specimens of *R. cuneata* which had been acclimatised to salinities ranging from 3 p.p.t. to 25 p.p.t. Alanine was the most and aspartic acid the least abundant of these amino acids all of which increased in concn. with salinity increase.
G.J.Peakin

4963. SURVIVAL AND GROWTH OF THE LARVAE OF THE EUROPEAN OYSTER, OSTREA EDULIS AT LOWERED SALINITIES. H.C.Davis and A.D.Ansell: Biol. Bull. Woods Hole, 1962, 122, 33-39 (U.S. Bureau Commercial Fish., Biol. Lab., Milford, Conn., U.S.A.) Growth of larvae and intensity of setting was significantly different at salinities of 25 and 22*5 p.p.t. from the controls at 26-27 p.p.t. At salinities of 20 p.p.t. and below there was a progressive reduction in setting out, growth and metamorphosis until at 10 p.p.t. all larvae died within 4 days. Some larvae which had been reared at 26-27 p.p.t. were capable of setting at 15 p.p.t. No normal larvae were obtained from oysters kept at 20 p.p.t. or below.
G.J.Peakin

4964. NITROGENOUS EXCRETA IN HELIX POMATIA AND THEIR METABOLIC ORIGIN. S.Bricteux-Gregoire and M.Florkin: Arch. int. Physiol., 1962, 70, 496-506 (Inst. Léon Fredericq, Univ. Liège, Belgium) Production of uric acid, the chief nitrogenous metabolite of *H. pomatia*, is not the result of biosynthesis with urea as an intermediate stage. It is probably produced by a similar path to that in the pigeon, a lepidopteran, *E. coli* and *Neurospora crassa*, by synthesis of purine nuclei from amino acids. Uric acid results from the action of xanthine oxidase, proved present in the snail, on the purine nucleus. Uricase, allantoinase and allantoicase are absent in the snail, thus purine breakdown ceases at the uric acid stage. The small quantities of urea found in the excreta are probably derived from arginine since arginase is present in the organism. It is uncertain whether there is an arginine-ornithine cycle as in mammalia.
(French) M.E.Nutt

4965. ACCUMULATION OF CALCIUM AND STRONTIUM BY BROWN TROUT FROM WATERS IN THE U.K. W.L.Templeton and V.M.Brown: Nature, Lond., 1963, 198, 198-200 (Radiobiol. Group, U.K.A.E.A., Windscale Works, Cumberland, England) Relationships between the Ca and Sr concn. in the water and in bone and muscle of brown trout (*Salmo trutta* L) were examined.
G.M.Lewis

4966. SITE OF SODIUM OUTFLUX FROM THE GILL OF FUNDULUS KANSAE. W.R.Fleming and F.L.Kamemoto: Comp. Biochem. Physiol., 1963, 8, 263-269 (C.L.Thiv. Missouri, Columbia, Mo., U.S.A.) The cells of the pseudobranch of the killifish *F. kansae* do not contain cholinesterase as shown by chem. and histochem. techniques. Group 1 cholinesterase in the gill is distributed throughout the gill epithelium and not restricted to the base of the leaflets which is the site of the Keys-Willmer cells. Na outflux from the animal reached a min. rate within 4-5 hr. after transfer from 0'60M NaCl to tap water and during this time no morphol. changes were observed in the Keys-Willmer cells.
M.S.Laverack

4967. OSMOTIC STUDIES OF AMPHIBIAN EGGS. III OVULATED EGGS. O.de Luque, A.S.Hunter and F.R.Hunter: Biol. Bull. Woods Hole, 1961, 121, 497-506 (Dept. Biol., Univ. of the Andes, Bogota, Colombia) The permeability of the eggs of *Bufo marinus* and *Hyla labialis* to water, Na and K after Key had been laid was investigated and compared with ovarian eggs.
G.J.Peakin

4968. TISSUE CONSTITUENTS OF REPTILES IN RELATION TO THEIR MODE OF LIFE. III. NITROGEN CONTENT AND SERUM PROTEINS. F.Khalil and G.Abdel-Messeih: Comp. Biochem. Physiol., 1963, 9, 75-79 (Zool. Dept., Cairo Univ., U.A.R.) The skin, skeletal muscles, heart, ileum, kidney, liver, lung, brain and spinal cord of *Crocodilus niloticus*, *Tropidonotus tessellatus*, *Chalcides ocellatus*, *Varanus criseus* and *Testudo leithii* have been analysed for their content of N, and the serum proteins of all except *C. ocellatus* have also been determined. Aquatic reptiles, *C. niloticus* and *T. tessellatus* have a high water content correlated with low N and low lipid content. On the other hand desert reptiles *V. griseus* and *T. leithii* have low water but high N and lipid content. Semi-desert animals *C. ocellatus* are somewhat intermediate between these extremes. Serum results indicate no relationship between habitat and composition although albumin was lower in aquatic sp. and globulin higher, than in desert animals.
M.S.Laverack

NERVOUS SYSTEM

4969. A SIMULATION STUDY OF A DIFFUSE CONDUCTING SYSTEM BASED ON COELENTERATE NERVE NETS. R.K.Josephson, R.F.Reiss and R.M. Worthy: J. theor. Biol., 1961, 1, 460-487 (Zool. Dept., Univ. California, Los Angeles, Calif., U.S.A.) Mathematical and mechanical models of the diffuse, random, mono-planar network of interlacing neurons in Coelenterates can be constructed. The mathematical model for digital computers shows reduction in variability, and enables a study of expected behaviour of nerve nets of defined structure to be made. The model is described in 3 parts (i) net topology, (ii) function of the crossings, (iii) method of simulation of excitation spread. Detailed descriptions of expt. are given. The results indicate that the type of spread found in the model could be applied to other types of nets. J.A.Dawson

4970. THE MOTOR AXON TERMINATION OF ANELIDS. D.A.Dorsett: Nature, Lond., 1963, 198, 406 (Marine Sci. Lab., Menai Bridge, Anglesey, Wales) The termination of motor endings on the parapodial muscle in Nereis diversicolor is described in Methylene Blue stained Prep. G.M.Lewis

4971. SOME OBSERVATIONS ON FINE STRUCTURE OF GIANT FIBRES OF CRAYFISHES (CAMBARUS VIRILIS AND CAMBARUS CLARKE) WITH SPECIAL REFERENCE TO SUBMICROSCOPIC ORGANISATION OF SYNAPSES. K.Hama: Anat. Rec., 1981, 141, 275-293 (Dept. Anat., Sch. Med., Univ. Washington, Seattle, Wash., U.S.A.) The giant axon is surrounded by a lamellated sheath consisting of alternating layers of cell cytoplasm intervening between connective tissue layers. The innermost cell layer is Schwann cell cytoplasm. The segmental septum between lat. giant axon segments contains representatives of each sheath component of adjacent nerve units. These elements are pierced by many small synaptic areas where no sheath structure exists and where synaptic membranes face each other across gaps of 8-12 mji. Vesicles and small tubules are cone, in both giant axons near synaptic areas. The giant fibre to motor neurone synapse is formed by close apposition of synaptic processes from the motor fibre. The membranes of the 2 adjacent nerve axon units lie close to each other separated by a space of 10 mji. Synaptic vesicles and a highly developed system of small tubular components are associated with these synaptic membranes. F.Beck

4972. MEMBRANE CURRENT OF CRAB MUSCLE. A.Strickholm: Nature, Lond., 1963, 198, 393-394 (Dept. Physiol., Univ. California Med. Sch., San Francisco, Calif., U.S.A.) Expt. performed on the Closer muscle of the walking legs of Cancer magister. J^th related transmembrane current for a given transmembrane potential with time showed that the crab muscle membrane behaved similarly to the squid axon membrane. The observations showed a weak membrane current generating system, quite different from results on ^{fr} sartorius muscle membrane. G.M.Lewis

4973. AMINO ACID SENSITIVITY OF THE DACTYL CHEMORECEPTORS OF CARCINIDES MAENAS. J.Case and G.F.Gwilliam: Biol. Bull. Woods Hole, *'81, 121, 449-455 (Dept. Zool., Univ. Iowa, Iowa City, Iowa, U.S.A.) The presence of dactyl chemoreceptors was demonstrated in C. maenas, Libinia

emarginata, Callinectes sapidus and Pagurus pollicaris. In Carcinids the receptors responded to diln. in excess of 5×10^{-6} M of L-glutamic acid and to boiled dialysate of Mytilus. Deriv. of glutamic acid and other amino acids produced smaller responses. A few of the receptors distinguished optical isomers of glutamic acid, aspartic acid and leucine. G.J.Peakin

4974. ON THE RESPONSE OF THE STRETCH RECEPTOR NEURONES OF CRAYFISH TO 3-HYDROXYTYRAMINE AND OTHER COMPOUNDS. H.McLennan and B.A. Hagen: Comp. Biochem. Physiol., 1963, 8, 219-222 (Dept. Physiol., Univ. British Columbia, Vancouver, Canada) The effects of GABA, 3-hydroxytyramine, imidazoleacetic acid and homotaurine upon the slowly adapting stretch receptor, neurones of the abdomen of 4 spp. of crayfish have been investigated. Pacifastacus leniusculus and Procambarus clarkii neurones are inhibited by 3-hydroxytyramine whilst the neurones of Oncorhynchus propinquus and Procambarus blandus are not. The other substances are approx. equal on all spp. Homotaurine is 1-3 times as active as GABA. M.S.Laverack

4975. E.M. STUDY OF AN ABDOMINAL STRETCH RECEPTOR OF THE COCKROACH. M.P.Osborne: J. insect Physiol., 1963, 9, 237-245 (Dept. Zool., Physiol., Univ. Birmingham, England) The longitudinal stretch receptor from the abdomen of the cockroach, Blaberus craniifer, was used in this study. It consists of a single multipolar neurone associated with a strand of connective tissue. The cell body of the neurone is about 30 by 10 ji. Schwann cells invest the axon, cell body, and dendrites. The terminal portion of the dendrites are naked and embedded in the connective tissue matrix. There are no connections between the naked sensory endings and the collagen-like connective tissue fibrils. The only obvious cytoplasmic inclusions in the dendritic terminations are mitochondria. The ultrastructure is compared with vertebrate and invertebrate mechanoreceptors and related to electrophysiological data. R.J.Walker

4976. BRISTLE FIELDS: GRAVITY RECEPTORS OF SOME HYMENOPTERA. H.Markl: Nature, Lond., 1963, 198, 173-175 (Zool. Inst. Univ., MOnchen, Germany) The morphology of bristle fields in Hymenoptera are described in at least 16 spp.; they are located on the antenna at the base of the scapus and at the proximal end of the pedicellus. The function of these sense organs as gravity receptors is investigated in detail in ants by observing their orientation on a perpendicular surface after blinding and following various expt. manipulations of the appendages. G.M.Lewis

4977. STUDIES ON THE HEXAPOD NERVOUS SYSTEM. IV. A CYTOLOGICAL AND CYTOCHEMICAL STUDY OF NEURONS AND THEIR INCLUSIONS IN THE BRAIN OF A COCKROACH, PERIPLANETA AMERICANA (L.). R.L.Pipa: Biol. Bull. Woods Hole, 1961, 121, 521-534 (Dept. Ent. and Parasitol., Univ. California, Berkeley, Calif., U.S.A.) Using a variety of staining methods it was shown that the neurosecretory material in the A-cells of the pars intercerebralis was rich in cystine or cysteine phospholipoprotein. p-Granules possibly containing lipid or glycolipid were found in most neurons, being most conspicuous in the axon hillock and around the periphery of the cell. Granules of another kind, 6-granules, were found in some of the smaller neurons, occurring singly in each cell, and apparently composed of lipo- or glycolipoprotein with phospholipid. The Golgi

EXPERIMENTAL ZOOLOGY

apparatus consisted of sudanophilic crescent-shaped or spheroidal bodies. G.J.Peaikin

4978. RESPONSE OF INSECT MUSCLE TO DENERVATION. I. RESTING POTENTIAL CHANGES. P.N.R.Usherwood: J. insect Physiol., 1963, 9, 247-255 (Dept. Zool., Univ. Glasgow, Scotland) The metathoracic extensor tibiae prep. of the locust Schistocerca gregaria was used in this study. The metathoracic nerves were sectioned on one side only. Resting potentials were recorded from single muscle fibres using glass intracellular microelectrodes of 5-15M ohm resistance and tip potentials of less than 5 mV. During the first 2 post-operative days, the resting potential of denervated muscles fell below normal. The potential then rose rapidly during the next 2-6 days, and then fell again to a level about 10-30% below normal. R.J. Walker

4979. STUDY OF PHOTONHIBITION IN LOCUSTA MIGRATORIA MIGRATORIOIDES (R. AND F.) (ORTHOPTEROID INSECT). P.Cassier: C.R. Acad. Sci., Paris, 1962, 255, 385-387 (Lab. Evolution des Êtres organisés, 105, Boulevard Raspail, Paris, France) Immature adult (/insects, phase gregaria, aged 12 to 30 days, were exposed to lights of 2000, 540, 185 or 50 lux with and without an opaque, coloured or clear varnish over the ocelli. The latent period before phototaxis increased with the intensity of illumination. Varnishing the median ocellus decreased the latent period for intensities over 50 lux. The opaque varnish was most effective. Varnishing all 3 ocelli facilitated phototaxis for intensities over 185 lux. The colourless varnish was most effective. Varnishing the compound eyes did not reduce the inhibn. of phototaxis by excess light. (French) S.A.Thistlewood

4980. ORGANISATION AND INNERVATION OF LUMINESCENT ORGAN IN FIREFLY, PHOTURIS PENNSYLVANICA (COLEOPTERA). D.S.Smith: J. cell Biol., 1963, 16, 323-359 (Dept. Zool., Univ. Cambridge, England) Intact light organs were removed from OsO₄ fixed abdomens and embedded in Epon or methacrylate. The ultrastructure of the cells of the tracheal system, the peripheral and terminal axons, the photocytes and cells of the dorsal layer is described. Specialised nerve endings containing axoplasmic components identical with synaptic vesicles and neurosecretory droplets lying between the tracheal end-cell and tracheolar cell are described. The mechanism of light emission is discussed. P. Barrow

4981. 'DESENSITISATION' OF CHOLINERGIC RECEPTORS BY ACh IN MOLLUSCAN CENTRAL NEURONES. L.Tauc and J.Bruner: Nature, Lond., 1963, 198, 33-34 (Centre Etudes de Physiol. Nerveuse du Centre Nat. Rech. Sci., Paris, France) Expt. were performed on ganglion cells of Aplysia depilans and Archachatina marginata to determine the kinetics of desensitisation of the somatic membrane by repeated doses of ACh. Desensitisation is similar in both D and H central neurones and also when ACh is replaced by carbachol. G.M.Lewis

4982. ELECTRONMICROSCOPICAL EXAMINATION OF THE EPIPHYSIS CEREBRI OF RANA ESCULENTA L. A.Oksche and M.Vaupel-von Harnack: Z. Zellforsch., 1963, 59, 582-614 (Anat. Inst., Univ. Kiel, Germany) The fine structure of the epiphysis cerebri of R. esculenta is described; it possesses sensory cells which bear a strong similarity to the cones of the retina; its organisation

agrees to a far reaching extent with the structure of the frontal organ; 6 specimens of R. esculenta and of R. temporaria were examined. (German) J.E.Linder

4983. THE HABENULA AND THE DORSAL THALAMUS OF SOME TELEOSTS. H.N.Schnitzlein: J. comp. Neurol., 1962, 118, 225-267 (Dept. Anat., Univ. Alabama Med. Center, Birmingham, Ala., U.S.A.) G.M.Lewis

4984. COLOURING OF THE TENCH. RELATION TO THE STATE OF THE SPINAL CORD AND SYMPATHETIC NERVOUS SYSTEM. J.Ripplinger, M.Joly, J.Cardot and R.Guyetant: C.R. Acad. Sci., Paris, 1962, 255, 377-379 (Lab. Zool., Fac. Sci., Besancon, France) The paraspinal sympathetic nervous chain was cut in tench. For section behind the dorsal fin the parts caudal to the section darkened on exposure to bright light and those in front paled. Section in front of the dorsal fin had the reverse effect. Section at the level of the dorsal fin had no effect. When the spinal cord was cut in front of the dorsal fin all pigmentary reactions were obtunded. Colouration of the tench is controlled by 2 centres which receive stimuli from the eyes via the spinal cord and inhibitory stimuli from neurones in the cord itself at the level of the dorsal fin. (French) S.A.Thistlewood

4985. AUTOACTIVE SENSORY ORGANS IN THE SKIN OF GYMNARCHUS NILOTICUS (A MORMYROID FISH). T.Szabo: C.R. Acad. Sci., Paris, 1962, 255, 177-178 (Centre d'Etudes de Physiol. nerv. et d'Electrophysiol., Paris, France) Local rhythmic potentials with freq. between 310 and 340 per sec. were measured in the skin of the electric fish G. niloticus, a relative of Mormyrides (African electric fishes). The activity was best observed when the electric organs were denervated to prevent interference, and continued even in the spinal fish or in detached portions of skin. (French) S.A.Thistlewood

4986. PIGMENT IN THE DURA MATER OF MAMMALS. W.Sokolov: Nature, Lond., 1963, 198, 105-106 (Dept. Vert. Zool., Univ. Moscow, U.S.S.R.) The dura mater of the desert rodent Spermophilopsis leptodactylus Licht. is deeply pigmented due to the presence of melanophores, while the pia mater is poorly pigmented. It is suggested that this pigmentation prevents penetration of harmful rays from the sun to the brain and spinal cord; it was found that 80% of rays with wavelength 750 m/i and 85% at 700 m/j were detained. G.M.Lewis

4987. COMPARATIVE ANATOMICAL EXAMINATION OF THE MICROMORPHOLOGY OF THE NERVOUS APPARATUS OF THE KIDNEY: II. THE MORPHOLOGY OF THE NERVOUS APPARATUS OF THE REPTILIAN KIDNEY. Ch.G.Waleewa: Aiiat. Anz., 1963, 112, 165-171 (Anat. Inst., Med. Inst., Kasan U.S.S.R.) Using the silver impregnation technique of Bielschowsky-Gros, the renal innervation of Testudo ibera, Tropidonotus natrix and of Lacerta apilis is examined. A complex pattern of innervation was found to exist in the parenchyma of the reptilian kidney; most of the nerve plexus are associated with blood vessels; some fine nerve-fibres were found to end with free brushlike endings in the epithelial cells of the uriniferous tubules and some fibres were seen on the capsule of the Malpighian corpuscle. (German) J.E.Linder

RR PRODUCTION

4988. ON THE REPRODUCTIVE CYCLE AND BREEDING HABITS OF TWO WESTERN SPECIES OF *HALIOTIS*. R.A.Booloontian, A.Farmanfarmaian and A.C.Giese: Biol. Bull. Woods Hole, 1962, 122, 183-193 (Univ. California, Los Angeles, Calif., U.S.A.) The annual reproductive cycles of *Haliotis cracherodii* and *B. rufescens* was studied by methods which are described. *H. cracherodii* was found to have a well marked summer breeding season, while *B. rufescens* spawned throughout the yr. These findings are compared with similar data from 8 other spp. of *Haliotis* from various parts of the world. G.J.Peakin

4989. RESTORATION OF THE BISEXUAL CYCLE BY BIOPTERIN AND FOLIC ACID IN THE PARTHENOGENETIC APHID *SAPPAPHIS PLANTAGINEA*. C.L'Hélias: CR. Acad. Sci., Paris, 1962, 255, 388-390 (Lab. Genet. evolutive C.N.R.S., Gif-sur-Yvette, S.-et-O., France) Fertile cfand ? of *S. plantaginea*? Pear with increasing length of darkness and decreasing temp, and contain more isoxanthopterine, bipterin, hydroxybipterin, xanthopterin and riboflavin than Parthenogenetic ?. O'l jug./il- of pterin was inj. into wingless, live bearing, parthenogenetic ♀ during the last larval stage. The insects were fed on plantain under continuous light at 20°. Isoxanthopterin and xanthopterin had no effect. With bipterin and folic acid, oviporous ? appeared in generation F3 and again in F6 and c? in F3. The delay is ascribed to the state of development of succeeding generations in the parent's body at the time of injn. (French) S.A.Thistlewood

4990. THE STRUCTURE OF THE REPRODUCTIVE ORGANS OF THE EUROPEAN RABBIT-FLEA, *SPILOPSYLLUS CUNICULI* (DALE) (SIPHONAPTERA). A.R.Mead-Briggs: Proc. roy. ent. Soc. Lond. A, 1962, 37, 79-88 (Min. Agr., Infest. Control Lab., Tangley Place, Worplesdon, Surrey, England) The structure of ? and ? reproductive organs are described and figured. Attention was paid to maturational changes that might be Elated to the flea *s reproductive history. Results were not as definite as in previous work on mosquitoes. A pigmented corpus luteum is produced both after ovulation and after egg resorption. However, the presence of corpora lutea and of sperm in the spermatheca was Warded as evidence that eggs had been laid. D.M.S. Perkins

4991. THE MUSCULAR STRUCTURE OF THE OVIPOSITOR AND ITS MODE.QF FUNCTION IN *NASONIA VITRIPENNIS* (WALKER)(HYMENOPTERA: PTEROMALIDAE). P.E.King: Proc. roy. ent. Soc. Lond. A, 1962, 37, 121-128 (Univ. Coll. Swansea, Wales) The ^ipositor and its musculature and their action during ^Position in the host puparium are described and combined with other Hymenoptera, both parasitic and non-asitic. D.M.S. Perkins

4992. THE STRUCTURE AND ACTION OF THE SPERMATHECA IN *NASONIA VITRIPENNIS* (WALKER) (HYMENOPTERA: PTEROMALIDAE). P.E.King: Proc. X- ent. Soc. Lond. A., 1962, 37, 73-75 (Univ. Coll.

of Swansea, Wales) The single spermatheca is composed of capsule, gland and duct which connects the capsule with the vagina, so allowing entry and exit of sperm. The gland secretes some substance through small canals into the duct which has an inner spiral thickening but no valves, unlike conditions previously found in other Chalcidoids. When quiescent, the spermatozoa are arranged in the capsule with their heads near the duct opening, their tails passing around the periphery and undulations passing from head to tail. These alter to lashing movements with change of pH and the sperm spin in the capsule, suggesting that they might be able to screw themselves along the duct. D.M.S.Perkins

4993. SOME BRITISH PSYCHODIDAE (DIPTERA, NEMATOCERA): DESCRIPTIONS OF SPECIES AND A DISCUSSION ON THE PROBLEMS OF SPECIES PAIRS. D.A.Duckhouse: Trans. roy. ent. Soc. Lond., 1962, 114, 403-436 (Univ. Leicester, England) Sp. pairs occurring among Psychodidae have the cf quite distinct and the ? morphol. inseparable, the 2 spp. having similai ecology and occurring side by side. This problem is discussed in relation to reproductive isolating mechanisms. D.M.S.Perkins

4994. ENVIRONMENTAL CAUSES OF VARIATION IN SEX RATIO OF ARRHENOTOKOUS INSECT, DAHBO-MINUS FULIGINOSUS (NEES) (HYMENOPTERA: EULOPHIDAE). A.Wilkes: Canad. Ent., 1963, 95, 183-202 (Entom. Res. Inst. Br., Canada Dept. Agric, Ottawa, Ont., Canada) Variations occurred in unfavourable environmental conditions before, during and after mating. Males more than middle-aged inseminated less than half the mated ?. Above 27° postembryonic <? larvae were sterilised. Larval mortality from super-parasitism above 65 per host favoured o* survival so natural pairing is increased when hosts are less numerous. Extension of oviposition period at low temp, reduced the 2 %. H.W. Spencer

4995. FACTORS AFFECTING THE ATTRACTIVENESS OF FOLIAGE FOR OVIPOSITION BY CARDIOASPINA ALBITEXTURA (PSYLLIDAE). L.R.Clarkz Aust. J. Zool., 1963, 11, 20-34 (Div. Entomol., C.S.I.R.O., Canberra, Australia) The attractiveness of leaves of *Eucalyptus blakelyi* as oviposition sites for *C albitextura* is increased by the presence of eggs but decreased when heavy feeding by nymphal or adult psyllids has occurred. G.M.Lewis

4996. THE EGG OF AGRAPTOCORKA GESTROI KIRKALDY (HEMIPTERA-HETEROPTERA: CORDCIDAE). G.A.Walton: Proc. roy. ent. Soc. Lond. A, 1962, 37, 104-106 (Dept. ZODL, Univ. Coll., Cork, Ireland) The large eggs are stalked with an expansion at the base of the stalk which ensures a firm grip when the eggs are fastened to submerged plants or other material during oviposition. The ovaries and the position of the eggs in them are described. D.M.S.Perkins

4997. SURVIVAL AND DIFFERENTIATION IN IN VITRO CULTURE OF GONADS OF LATE LARVAE OF *GALLERIA MELLONELLA* (LEPIDOPTERA, PYRALIDAE). Th.Lender and J.Doveau-Hagege: Develop. Biol., 1963, 6, 1-22 (Lab. Biol. Animate, S.P.C.N., Fac. Sci. de Paris, centre d'Orsay, France) 67% of the gonads cultured as a solid medium survived for at least one week. Multiplication of germ cells occurred in both sexes, spermatocytes were transformed into spermatozooids and oogonia entered into previtellogenesis with differentiation of follicles. (French) J.W.S.Harris

EXPERIMENTAL ZOOLOGY

ENDOCRINES

4998. EFFECT OF EYESTALK EXTRIPATION ON METAMORPHOSIS OF MEGALOPS OF THE BLUE CRAB, CALLINECTES SAPIDUS RATHBUN. J.D.Costlow, jun.: Gen. Comp. Endocr., 1963, 3, 120-130 (Duke Univ. Marine Lab., Beaufort, N.C., U.S.A.) One or 2 eyestalks were removed from the megalops of the blue crab on days 0-5 following the final zoeal moult. The post larval stages were studied over 4-6 consecutive moulting periods. Removal of both eyestalks within 12 hr. of the final zoeal moult considerably accelerated metamorphosis to the first crab stage, but results obtained were not completely compatible with current concepts of the control of moulting. S.A.Carney

4999. EFFECT OF AMPUTATING THE OCULAR PEDUNCLES ON THE LENGTH OF TIME BETWEEN MOULTS AND THE GROWTH OF A DECAPOD NATANTIA: LEANDER SERRATUS (PENNANT). C.Tchernigovtzeff: C.R. Acad. Sci., Paris, 1962, 255, 400-402 (Station Biol. Roscoff, France)

150 *L. serratus* 40 to 45 mm. long were kept in running sea water in individual tanks at 12, 16 or 2(f). In 69 the ocular peduncles were removed immediately before a moult. The interval before the next moult was shortened by 16 to 20% and sex differences in this interval appearing at 12° in controls were abolished. The increase in size between moults was greater. The optimum temp, for growth was 16° but the effects of temp, were less in the expt. group. (French) S.A.Thistlewood

5000. THE PROBLEM OF THE HORMONE DEPENDENCE OF THE MATING BEHAVIOUR OF INSECTS. INVESTIGATION IN *GALLERIA MELLONELLA* (L.). H. Roller, H.Piepho and L.Holz: J. insect Physiol., 1963, 9, 187-194 (Zool. Inst., Gottingen Univ., Germany) It has been shown that allatectomy, gonadectomy and a combination of the 2, do not influence the mating behaviour of <\$ or ? wax moths, *G. mellonella*. The implantation of additional corpora allata in pupae or adults did not influence the mating behaviour. (German) R.J.Walker

5001. THE ROLE OF PHOTOPERIOD AND TEMPERATURE IN THE DETERMINATION OF PARTHENOGENETIC AND SEXUAL FORMS IN THE APHID MEGOURA VICIAE BUCKTON. III. FURTHER PROPERTIES OF THE MATERNAL SWITCHING MECHANISM IN APTEROUS APHIDS. A.D.Lees: J. insect Physiol., 1963, 9, 153-164 (Agric. Res. Council, Unit Insect Physiol., Cambridge, England) Photosensitivity first develops when the parent is still an embryo, some 2 days prior to birth. The prenatal light regime influences the progeny sequence, e.g. a reversal from a long to a short day photostimn. at birth accelerates the response to a second reversal, e.g. from short to long days, during the adult life of the same individual. Photoperiods 30 min. longer or shorter than the critical length exert weak long and short day effects. Short photoperiods of 4-14 hr. are strong, but permanent darkness exerts a weak short day effect. At 15°, the critical daily photoperiod is approx. 14 hr. 55 min. Within the range of 10-20°, the critical photoperiod shortens by about 15 min./5° rise. Above 23°, the temp. compensation is gradually lost and virginoparae are produced even under strong short day conditions. It is suggested that the photoperiodic mechanism involves a light receptor and a humoral component, both possibly located in the neuroendocrine system.

RJ.Walker

5002. THE JUVENILE HORMONE- II. ITS ROLE IN THE ENDOCRINE CONTROL OF MOULTING, PUPATION AND ADULT DEVELOPMENT IN THE CECROPIA SILKWORM. CM.Williams: Biol. Bull. Woods Hole, 1961, 121, 572-585 (Biol. Lab., Harvard Univ., Cambridge, Mass., U.S.A.) Using a method of standardised 'pupal assay' for juvenile hormone it was shown that the corpora allata in each of the larval instars are least active just before and most active shortly after moulting. At pupation their activity is low but definite, while during the pupal stage they are inactive. This inactivity persists for the first two-thirds of adult development, but during the final week of development the corpora allata recover and are maximally active at emergence of the adult.

G.J.Peakin

5003. PHOTOPERIODIC INDUCTION OF DIAPAUSE IN AN INSECT. S.D.Bek: Biol. Bull. Woods Hole, 1962, 122, 1-12 (Dept. Ent., Univ. Wisconsin, Madison, Wis., U.S.A.) Induction of diapause in the larvae of *Ostrinia nubilalis* was dependent on the no. of hr. of the photoperiodic phases, the dark phase being more critical than the light phase. A 12-hr. dark phase was most effective when combined with a light phase ranging from 5-18 hr. and a significant incidence of diapause was obtained with light phases extending from 4*5-32 hr. with this dark phase. The incidence of diapause was inversely proportional to the ambient temp, during the dark phase. A 1 hr. interruption of the dark phase modified the photoperiodic response, the effect depending on the position of this interruption in the dark phase.

G.J.Peakin

5004. DATA ON THE NEUROSECRETION OF A SUB-TERRANEAN OLIGOCHAETE, PELODRILUS LERUTHI HRABE. CJuberthie and M.Mestrov: C.R. Acad. Sci., Paris, 1962, 255, 394-396 (Lab. souterrain du C.N.R.S., Moulis, Ariège, France) The c.n.s. of *P. leruthi*, a cave-dwelling Oligochaete of the family Haplotaxidae, contains various types of neurosecretory cells in the brain, the sub-oesophageal ganglion and the nervous chain. (French) S.A.Thistlewood

5005. NEUROSECRETION AND CRUSTACEAN RETINAL PIGMENT HORMONE: DISTRIBUTION OF THE LIGHT-ADAPTING HORMONE. L.H.Kleinholz, P.R.Burgess, D.B.Carlisle and O.Pflueger: Biol. Bull. Woods Hole, 1962, 122, 73-85 (Biol. Lab., Reed Coll., Portland, Ore., U.S.A.) Nervous tissue from 8 decapod crustaceans was tested for distal retinal pigment light-adapting hormone. It was demonstrated in a no. of tissues and its distribution agreed with the histol. demonstration of neurosecretory cells and axons in these tissues.

G.J.Peakin

5006. NEUROSECRETORY MATERIAL FROM THE NUCLEUS LATERALIS TUBERIS IN THE HYPOPHYSIS OF THE EASTERN BROOK TROUT, SALVELINUS FONTINALIS. D.CBillenstien: Z. Zellforsch., 1963, 59, 507-512 (Dept. Anat., Einstein Coll. Med., New York, U.S.A.) The neurosecretory pathway from the nucleus preopticus into the hypophysis can be demonstrated using aldehyde fuchsin or chrome-alumhaematoxylin; the secretory substance of the nucleus lateralis tuberis can be stained with either acid Fuchsin or Azocarmine.

J.E.Linder

5007. FIXATION AND ASSIMILATION OF 131I BY A BRYOZOAN, BUGULA NERTITINA L. J.Roche, S.Andrs and LCovelli: C.R. Soc. Biol., Paris, 1962, 156, 1817-1822 (Lab. Biol. Marine, Coll. France, Concabeau, France) *B. neritina* actively cone. 131I from sea water. This process which was reversibly

EXPERIMENTAL ZOOLOGY

483

inhibited by thiourea, resulted in the formation of iodo-Proteins which were localised in the zooids. Alk. hydrolysis of these proteins showed the presence of 3-monoiodotyrosine and 3,5-diiodotyrosine. (French) M.A.Price

5008. COMPARATIVE OBSERVATIONS ON IODINE BINDING BY SACCOGLOSSUS HORSTII BRAMBELL AND GOODHART, AND BY THE TUNIC OF CIONA INTESTINALIS (L.) E.J.W.Barrington and A.Thorpe: Gen. Comp. Endocr., 1963, 3, 166-175 (Dept. Zool., Univ. Nottingham, England) Chromatographic and autoradiographic studies were made of the J-311-labelled compounds in extracts of whole *S. horsti*, and of the surface layer of the tunic of *C. intestinalis* maintained in sea water containing 200 JIC 1311 per l. In the former case only iodine and 3-iodotyrosine were found, but 3-iodotyrosine, 3,5-diiodotyrosine, and a no. of unknowns were present in the *Ciona* extracts. S.A.Carney

5009. ON THE RESPONSES OF THE GLANDULAR TRACTS AND ASSOCIATED REGIONS OF THE ENDOSTYLE OF THE LARVAL LAMPREY TO GOITROGENS AND THYROXINE E.J.W.Barrington and M.Sage: Gen. Comp. Endocr., 1963, 3, 153-165 (Dept. Zool., Univ., Nottingham, England) Histol. and autoradiographic techniques were used in a study of the developmental relationships existing between the glandular tracts and the types 2a and 2b regions of the endostyle. The responses of the tracts to thiourea and thiouracil were essentially hypersecretory and the responses of the 2a and 2b cells resulted in an increased rate of replacement of the exhausted cells of the tracts. The responses were not Polished by simult. treatment of the animals with fcoitogens and thyroxine. S.A.Carney

6010. FUNCTIONAL RENAL THYROID FOLLICLES IN WILD SPECIMENS OF THE FRESHWATER TELEOST BARBUS STIGMA (CUV. ET VAL.) A.G.Sathyanaesan: Z. Zellforsch., 1963, 59, 530-534 (Dept. Zool., Banaras Hindu Univ., Varanasi-5, India) Thyroid follicles were found to occur in the kidney of *B. stigma*; the renal thyroid follicles were similar in appearance to those in the pharyngeal area. Over 320 specimens were examined. J.E.Linder

5011. THE EFFECT OF THIOUREA, ADMINISTERED BY THE IMMERSION OF THE MATERNAL ORGANISM, ON THE EMBRYOS OF LEBISTES RETICULATUS, WITH NOTES ON THE ADULT GONADAL CHANGE. L.L.Grosso Biol. Bull. Woods Hole, 1961, 121, 481-496 (Dept. Biol., Coll. Saint Teresa, Winona, Minn., U.S.A.) Exposure of the adult thyroid of *L. reticulatus* to a 0.4% thiourea soln. resulted in the increase in the number of the cells and the follicles they formed and their establishment in abnormal areas such as the heart, kidney, spleen and intestine. Similar changes were found in young fish obtained from females treated in the same way. Breeding capacity was also affected by producing abortions, reducing brood size, decreasing their freq. and reducing the no. of ova in the gonad. G.J.Peakin

5012. A STUDY OF THE ADRENAL TISSUE OF THE MALE AFRICAN BULLFROG, RANA ADSPERSA. D.E.MoDrhouse: Quart. J. micr. ScL, 1963, 104, 51-56 (World Health Organization, P.O. Box 13, Kuala Lumpur, Malaya) Adrenal tissue, investigated by histological and histochem. techniques, contains steroid, lymphoid and chromaffin tissues. The structure of the adrenal in the bullfrog does not support a theory of

zonation within the cortical tissue of the Anura. There is no alteration in the appearance of no. of 'summer cells' of stilling that can be correlated with the time of year or with the sexual activity of the animal, these cells are therefore called 'stilling cells'. There is evidence that structural differences are to be found between the stilling cells and granulocytes of the lymphoid tissue.

W.A.Stevens

5013. PROPERTIES OF THE OXYTOCIC MILK EJECTION AND ANTIDIURETIC PRINCIPLE OF THE NEURO-INTERMEDIATE LOBE OF THE ELASMOBRANCH PITUITARY. A.M.Perks and M.H.I.Dodd: Gen. Comp. Endocr., 1963, 3, 184-195 (Gatty Marine Lab., Univ. St. Andrews, Scotland) The prop. of the oxytocic, milk ejection, and antidiuretic agent of the neurointermediate lobes of the pituitaries of various elasmobranchs were studied. The results obtained indicate close chem. and pharmacol. similarity between this agent and oxytocin. S.A.Carney

5014. EFFECT OF ADAPTATION TO BLACK AND WHITE BACKGROUNDS ON THE TELEOST PITUITARY. B.I.Baker: Nature, Lond., 1963, 198, 404 (Lab. d'Histophysiol., College de France, Paris, France) Cells in the meta-adenohypophysis of teleost pituitaries were studied after adaptation of the fish for prolonged periods to dark or light backgrounds. It appeared that cellular activity was promoted during black adaptation but release of chromatophore-regulating hormones was not necessarily accompanied by pronounced cytol. changes. G.M.Lewis

5015. EFFECT OF STARVATION ON THE ACTIVITY OF THE HYPOTHALAMO-HYPOPHYSIAL SYSTEM OF VARANUS GRISEUS DAUD. G.Abdel-Messeih and J.Tawfik: Z. Zellforsch., 1963, 59, 395-404 (Zool. Dept., Univ. Coll. for Girls, Ain-Shams Univ., Heliopolis, Cairo, U.A.R.) Gomori stainable neurosecretory substance of the neurohypophysis may be related to antidiuretic hormone; histol. changes which occur in the neurosecretory system of *V. griseus* under conditions of starvation for variable periods were investigated to elucidare some problems of the water economy of desert reptiles. Adult *V. griseus* were kept without food and water for 2 months and 3 months. Changes in the histol. picture of the nucleus supraopticus, the nucleus paraventricularis and amount of stainable Gomori material indicate an increased rate of release of vasopressin - adiuretin during starvation. Severe starvation causes degeneration of neurosecretory cells of the nucleus supraopticus and paraventricularis as well as depletion of Gomori material in die pars nervosa of the pituitary of *V. griseus*. J.E.Linder

5016. REPRODUCTIVE CYCLE OF THE BIG FRUIT-EATING BAT, ARTIBEUS LITURATUS OLFRS. J.R-Tamsitt and D.Valdivieso: Nature, Lond., 1963, 198, 104 (Dept. of Biol., Univ. of the Andes, Bogota, Colombia) *A. lituratus* is polyoestrous and breeds throughout the yr.; 6 remain in full sexual activity.

G.M.Lewis

PARASITOLOGY

5017. SURVIVAL OF ECHINOCOCCUS GRANULOSUS AND TAENIA HYDATIGENA EGGS IN TWO EXTREME

EXPERIMENTAL ZOOLOGY

CLIMATIC REGIONS OF NEW ZEALAND- G.K.Sweatman and R.J.Williams: Res. vet. Sci., 1963, 4, 199-216 (N.Z. M.R.C., Otago Univ. Med. Sch., Dunedin, New Zealand) The survival and availability of E. granulosus and T. hydatigena eggs on pasture in a region of oceanic climate were compared with survival and availability in a quasicontinental climate region. The results showed that heavy rainfall reduced the availability of the eggs more than meteorological dryness with freezing and thawing and wide diurnal temp, variation. J. B. Derbyshire

5018. EXPERIMENTS ON EPIDEMIOLOGY OF NEMATO-DIRIASIS. T.E.Gibson: Res. vet. Sci., 1963, 4, 258-268 (Cent. Vet. Lab., Weybridge, England)

In studies with grass plots artificially-infected with N. battus or N. filicollis it was shown that infection could be built up to epidemic level by grazing lambs on the plots each yr.. but a pasture could be made safe by resting it for 1 grazing season. Resistant adult sheep perpetuated infection on the pastures. Outbreaks of disease due to N. battus occurred only in spring, but N. filicollis caused disease at other times of yr. because of the more rapid rate of hatching of the larvae of this sp. J.B.Derbyshire

5019. THE NOSEMA-INHIBITORY ACTIVITY OF ALCOHOL I. A COMPONENT OF FUMAGILLIN.

T.A.Gochnauer and B.Furgala: J. insect Path., 1962, 4, 489-491 (Entom. Res. Inst., Canada Dept. Agric., Ottawa, Canada) Honey bees, Apis mellifera, were individually inoculated with 30000 Nosema spores and kept in batches of 100. Nearly complete suppression of Nosema development was produced by feeding sucrose with levels of 12*5 mg. fumagillin and 500 mg. alcohol I/I. respectively. All treatments reduced the longevity of the test bees compared with the controls. R.J. Walker

5020. THE EFFECT OF THE INTENSITY OF NOSEMA INOCULUM ON QUEEN SUPERSEDURE IN THE HONEY BEE APIS MELLIFERA L. B.Furgala: J. insect Path., 1962, 4, 429-432 (Entom. Res. Inst., Canada Dept. Agric., Ottawa, Canada) 60 queens of A. mellifera were established in 5 frame nuclei. When the queens were performing normally, each received one of 6 levels of inocula. of Nosema apis. Inocn. with as few as 1000 spores led to supersEDURE. All the superseded queens were infected. With a given dose, it was found that the degree of infection and the time before supersEDURE became apparent varied. Some of the inoc. queens recovered and were free of spores from which it would appear that selection for resistance to the spores is possible.

R.J.Walker

5021. A REVIEW OF THE INSECT ENEMIES OF ACRID-QIDEA (ORTHOPTERA). D.J.Greathead: Trans, roy. ent. Soc. Lond., 1962, 114, 437-517 (Commonwealth Inst. Biol. Control, P.O. Box 265, Kampala, Uganda) Insect parasites and predators of the eggs and of the post-embryonic stages are listed with a review of their biology and geographical distribution. D.M.S.Perkins

5022. SOME ECOLOGICAL ATTRIBUTES OF PTEROMALID PARASITE AND ITS HOUSEFLY HOST.

W.P.Nagel and D.Pimentel: Canad. Ent., 1963, 95, 208-213 (Dept. Entom., Cornell Univ., Ithaca, N.Y., U.S.A.) Nasonia vitripennis? parasitise Musca domestica pupae. When hosts and parasites were kept together with cf and ? parasite longevity averaged 1*62 and 6*96 days respectively. Average progeny per 2 was

139*8. With 3 sizes of host pupae percentage parasitism for the small, medium and large was 45*0, 72*8 and 65*7 respectively. For each pupal size 2?20, 4*30 and 6*11 parasites resulted. Parasites in multicell cages dispersed more quickly when unfed. With increasing parasite-host ratio, parasitism rate became 100% in 24 hr. at 1:1. 11*jo parasitised hosts produced parasites at 1:2 and 0% above 10:1 due to superparasitism.

H.W.Spencer

5023. CAUSES OF VARIATIONS IN EFFECTIVENESS OF BRACON CEPHI (GAHAN) (HYMENOPTERA: BRACONIDAE) AS PARASITE OF WHEAT STEM SAWFLY.

N.D.Holmes, W.A.Nelson, L.K.Peterson and C.W. Forstad: Canad. Ent., 1963, 95, 113-126 (Entom. Sect., Canada Agric. Res. Stn., Lethbridge, Alta., Canada)

Parasite and host adults emerge at the same time. Sometimes there is a complete 2nd generation of parasites. Fluctuations in the amount of parasitism were due to: (1) lack of synchronisation of development between host and parasite, this being the most important cause, (2) temp, and moisture of the soil in the growing season, (3) differences in development rates of different host plants, their resistances to host attack and the date of seeding, (4) high host density of hollow-wheat stems which lessens parasitism because unparasitised larvae destroyed parasite larvae and (5) longer host survival which leads to higher parasitism.

H.W.Spencer

5024. DAILY SELECTION BY DRINO BOHEMICA MSEN. (DIPTERA: TACHINIDAE) OF FOUR SPP. OF HOSTS.

L.G.Monteith: Canad. Ent., 1963, 95, 162-166 (Entom. Res. Inst. Biol. Control., Res. Br., Canada

Dept. Agric., Belleville, Ont., Canada) Daily selection of sawfly host larvae Diprion hercyniae, Neodiprion sertifer, N. swainei and N. lecontei by D. bohemica was observed at $21^{\circ} \pm Y$ and $70 \pm 1\%$ R.H. Four generations of parasites were used, 2 which had been reared on D. hereynfee and 2 on N. lecontei. Generation fluctuation was apparently unrelated to that between generations but was influenced by the host preferences of its generation.

H.W.Spencer

5025. STUDIES ON THE BIONOMICS OF HEXAMERMIS ARVALIS POINAR AND GYRISCO, A MERMITHID PARASITE OF THE ALFALFA WEEVIL, HYPERA POSTICA (GYLLENHAL). G.O.Poinar, jun. and G.G.Gyrisco: J. insect Path., 1962, 4, 469-483 (Cornell Univ., Ithaca, New York, U.S.A.)

The life cycles of the weevil, H. postica and the nematode H. arvalis are described with ref. to the parasitism of the nematode on the weevil. Parasitised larvae are most abundant in early July. The pre-parasitic H. arvalis larvae probably penetrate the weevil larvae by direct penetration. The developmental period within the weevil is 7-12 days. The weevil larvae die soon after the emergence of the mermithid larvae. Most of the nematodes emerging from the weevil are <?, ? would appear to parasitise other insects in the field. Parasitism may reach 33% but it is very sparse and irregular and so it has no general economic importance at present.

5026. STORAGE OF AMBROSIA FUNGUS SPORES BY PITTED AMBROSIA BEETLE, CORTHYLUS PUNCTATISSUMUS ZIMM. (COLEOPTERA: SCOLYTIDAE).

R.J.Finnegan: Canad. Ent., 1963, 95, 137-139 (Forest Res. Lab., Quebec, P.Q., Canada) The d beetles store spores inside a long folded tube on each side of the pro thoracic coseal cavity and is closed by a coseal process. As no attached muscles are visible the spores are probably discharged by

EXPERIMENTAL ZOOLOGY

485

squeezing of the insects retracted head against the pro-thoracic wall. Such tubes were not found in ? beetles.

H.W. Spencer

50127. PROGRESSIVE HISTOCHEMICAL CHANGES IN VIRUS-INFECTED FAT BODY OF THE WESTERN OAK LOOPER. O.N.Morris: J. insect Path., 1962, 4, 454-464 (Forest Entom. and Path. Lab., Dept. Forestry, Victoria, British Columbia, Canada) The changes in DNA, glycogen, and protein in the fat body following infection with a nuclear polyhedrosis virus was investigated. DNA and protein increased progressively until just prior to the formation of the polyhedron, the 6th to the 7th day following infection. After this, there appeared to be a breakdown in DNA and a further rise in the rate of nuclear protein synthesis. Glycogen was reduced to a mere trace between the 4th to the 5th day following infection. Symptoms of starvation appeared at this time and this may account for the glycogen depletion.

J.Walker

5028. A CYTOPLASMIC POLYHEDROSIS IN AN AUSTRALIAN SATURNIID. ANTHERAEE EUCALYPTI. T.D.C.Grace: J. insect Physiol., 1963, 9, 201-205 (Div. Entom., C.S.I.R.O., Canberra, Australia)

During laboratory rearing of A. eucalypti, a cytoplasmic Polyhedrosis infection was observed. Infected larvae at first are lethargic and cease to feed, then the cuticle becomes soft and changes colour. The mid-gut of infected larvae are white, very thin, approx. 4/5 of their normal length and the gut cells are packed with polyhedra. In electron micrographs, the polyhedra show cubic symmetry with 42 Å spacings between the centres of the Protein molecules. The virus particles are spherical and ^aPProx. 370 Å in diam. The virus is extremely pathogenic to A. eucalypti larvae. Five of the 6 spp. of Lepidoptera fed with the virus developed symptoms of a cytoplasmic polyhedrosis. R. J.Walker

5029. HOST-CONTAMINANT BIOLOGY OF MUSCOID FLIES. HI. EFFECT OF HIBERNATION. DIAPAUSE, AND LARVAL BACTERICIDES ON NORMAL FLORA OF BLOW-FLY PREPUPAE. B.Greenberg: J. insect Path., 1962, 4, 415-428 (Univ. Illinois, Coll. Pharmacy, Chicago, 111., U.S.A.) There is no significant quant.

Variation in the bacterial content of the crop, midgut, and hindgut of normal prepupae of Lucilia sericata and Oxomyopsis cadaverina. Mean counts at the beginning 5th after 7th moults hibernation revealed the following feline in bacteria content; crop, 500-fold; midgut, 10-fold; hindgut, 10-fold. Diapaused induced prep. Pae maintained at room temp, for 30 days showed a significant loss of bacteria from the crop and midgut. In these expt. the hindgut population increased in the ant. Portion, remained stable in the middle, and fluctuated in the rectum. Homogenates of gut and washings from several spp. of blowfly larvae yielded no bacterial activity ^against various Gram-pos. and Gram-neg. bacteria.

MISCELLANEOUS

5030. BIOELECTRIC POTENTIALS IN RELATION TO MOVEMENT IN AMOEBAE. M.S.Bingley and CM. Thompson: J. theor. Biol., 1962, 2, 16-32 (Zool. Dept., King's Coll., Univ. London, England)

Movement of Amoeba proteus can be redirected by application of electric potentials to the rear of the cell. An electric potential gradient which is related to the medium, exists in the cytoplasm along the axis of movement. It is suggested that bioelectric potentials should be taken into account when discussing amoeboid movement.

J.A.Dawson

5031. MORPHO-PHYSIOLOGICAL STUDY OF AMOEBOID MOVEMENT. I. DYNAMIC ORGANISATION OF STRIATA AMOEBAE. T.H.Abe: Cytologia, 1961, 26, 378-407 (Lab. Biol., Hosei Univ., Tokyo, Japan)

The morphology of living organisms named Amoeba striata is described in detail. The flow-speeds of various parts of the amoeboid surface during locomotion are measured by observation on adhering particles, and the flow-lines mapped. The formation and fate of the contractile vacuole is also described, as is the origin and behaviour of the gelled strands found in the endoplasm. These observations are used to explain in part amoeboid movement, and more especially the method of change of direction by the organism.

C.A.Stace

5032. PREPARATION AND USE OF INSECT HAEMOCYTE MONOLAYERS IN VITRO. M.E.Martignoni and R.J. Scallion: Biol. Bull. Woods Hole, 1961, 121, 507-520 (Dept. Insect Pathology, Univ. California, Berkeley, Calif., U.S.A.) A method of prep. of monolayers of haemocytes which could be maintained for 10-15 days is described. The source of the cells was 2-4 day old 6th instar larvae of Peridroma saucia.

G.J.PeaWn

5033. RESPONSES OF MYTILUS EDULIS LARVAE TO INCREASES IN HYDROSTATIC PRESSURE. B.L.Bayne: Nature, Lond., 1963, 198, 406-407 (Marine Sci. Lab., Menai Bridge, Anglesey, Wales) Young larvae of M. edulis respond positively to increased hydrostatic pressure, thus remaining in the surface layers of the water. The response weakens as the larvae approach metamorphosis and settlement.

INTERNATIONAL ABSTRACTS OF BIOLOGICAL SCIENCES

Volume 31 Numbers
December 1963

Denotes an Author's abstract edited primarily by the journal of origin-

ANATOMY HISTOLOGY AND HISTOCHEMISTRY

5049. A STRIATED INTERCELLULAR MATERIAL IN RAT BRAIN. R.A.Naumann and D.E.Wolfe: Nature, Lond., 1963, 198, 701-703 (Lab. of Neuroanatomical Sci., Nat. Inst. of Neurol. Dis., Bethesda, Md., U.S.A.)

A unique intercellular material has been observed by t'M. beneath the subcommissural organ of brains of young adult rats of both sexes in 2 strains. At the vascular poles of the cells of the subcommissural organ, it occupies the renvascular space and may be seen intercellularly as much as 4-5 [i from a vessel. G.M.Lewis

5050. AN E.M. STUDY OF THE STRATUM RADIATUM OF THE RAT HIPPOCAMPUS (REGIO SUPERIOR, CA1) WITH PARTICULAR EMPHASIS ON SYNAPTOLOGY. L.E.Westrup and T.W.Blackstad: J. comp. Neurol., 1962, 119, 281-316 (Anat. Inst., Univ., Oslo, Norway). G.M.Lewis

5051. NUCLEAR STRUCTURE OF THE THALAMUS OF THE FERRET. J.Herbert: J. comp. Neurol., 1963, 120, 105-127 (Dept. Anat., Univ., Birmingham, England) Differences from other CarriLvor are noted in the representation of the medianum and in the structure of the post, part of the lat. group of G.M.Lewis

5052. AN E.M. STUDY OF THE INFERIOR OLIVE OF THE CAT. F.Walberg: J. comp. Neurol., 1963, 120, 1-17 (Anat. Inst. Univ., Oslo, Norway). G.M.Lewis

5053. ULTRASTRUCTURE OF NERVE FIBRES IN TRIGEMINAL GANGLION OF RAT. A.D.Dixon: J. ultrastructure Res., 1963, 8, 107-121 (Anat. Dept., Univ. Med. Sch., Manchester, England) Myelinated fibres of the trigeminal ganglion in 4-48 day old rats had a

similar structure to that of peripheral nerve fibres elsewhere in the body. Some Schwann cells contained supplementary myelin sheaths in the form of protrusions into the surrounding cytoplasm. Unmyelinated nerve fibres were observed between myelinated ones. The axons of the former were contained in imaginations of the Schwann cell plasma membrane. H.B.Waynfirth

5054. ULTRASTRUCTURE OF PLASMA MEMBRANE AND MYELIN SHEATH OF PERIPHERAL NERVE FIBRES AFTER FIXATION BY FREEZE-DRYING. L.-G.Elfvin: J. ultrastructure Res., 1963, 8, 283-304 (Zool. Dept., Univ. California, Los Angeles, Calif., U.S.A.)

The plasma membrane of frozen-dried unmyelinated and myelinated splenic nerve fibres, stained with uranyl acetate is a 3-layered structure. The cell boundaries between axons and the Schwann cells usually have a 5-layer appearance due to close packing of adjacent membranes. H. Waynfirth

5055. COMPARISON OF EFFECTS OF FREEZING AND OF TREATMENT WITH HYPERTONIC SOLUTIONS OF STRUCTURE OF NERVE MYELIN. R.T.Joy and J.B. Fincair: J. ultrastructure Res., 1963, 8, 264-282 (Med. Biochem. and Pharmacol. Dept., Univ., Birmingham, England) Low angled X-ray diffraction patterns of frog peripheral nerves indicated that the lipoprotein structure of their myelin contracted when the nerve was frozen or immersed in hypertonic soln. Re-expansion took place after thawing or in isotonic saline. The normal structure was usually then attained. Hypertonicity, which normally accompanies freezing and thawing could therefore be responsible for the expansion in thawed specimens. H.B. Waynfirth

5056. PARANODAL APPARATUS OF PERIPHERAL MYELINATED NERVE FIBRES OF MAMMALS. P.L.Williams and D.N.Landon: Nature, Lond., 1963, 198, 670-673 (Dept. Anat., Guy's Hosp. Med. Sch., London, England) Microscopic examination of muscle nerves from rabbits, rat and mouse gives evidence that the paranodal apparatus

ANATOMY

comprises a complex series of alterations of the form and quant. relationships of both axon and myelin sheath with the development of columns of Schwann cell cytoplasm containing a large population of mitochondria; these may provide an energy source for the surface membrane of the axon at the node.

G.M.Lewis

5057. MORPHOGENESIS OF SCHWANN CHANNELS IN SQUID NERVE G.M.Villegas and R.Villegas: J. ultrastructure Res., 1963, 8, 197-205 (Biofisica Dept., I.V.I.C., Caracas, Venezuela) E.M. study of the whole contour of cross sections of the giant nerve fibres of the squid, *Dorytenthis plei*, has shown the existence of about 8 Schwann cell nuclei. The non-synctial nature of the Schwann cell was demonstrated. Digitations of the Schwann cell surface were seen and these, from two or more cells, may interdigitate. The slit channels of the giant fibres were thought to originate in the opposition of the digitations of neighbouring cells.

H.B.Waynforth

5058. E.M. STUDY ON THE REGENERATIVE PROCESS OF PERIPHERAL NERVES OF MICE R.Wettstein and J.R.Sotelo: Z. Zellforsch., 1963, 59, 708-730 (Inst. Investigacion de Ciencias Biol., Montevideo, Uruguay) The post, branch of dorso-spinal nerves of mice were sectioned to study the regenerative process taking place. The sectioned stumps were left in contact and the skin incision closed as soon as possible. Fixation was performed at various times ranging from 30 min. to 30 days. Early after sectioning (30 min.) the nerve membrane becomes masked by microvesicles which appear to originate from the membrane; some of the microvesicles coalesce and give the appearance of a row of vesicles. At a later stage this reactive process becomes more general in the nerve stump and large areas of microvesicles appear in the neuroplasm of the fibre; the microvesicles become later on elongated and lead to the formation of tubules with a progressively thinner diam.

J.E.Linder

5059. E.M. OF WALLERIAN DEGENERATION J.C.Y.Lee: J. comp. NeuroL, 1963, 120, 65-79 (Dept. Anat., Univ. Saskatchewan, Saskatoon, Canada) Wallerian degeneration was studied in sectioned sciatic nerves of rats and rabbits in the E.M., observations being continued for more than 35 days.

G.M.Lewis

5060. OCCURRENCE OF MYELINATED AND UNMYELINATED NERVES IN IRIS ANGLE OF MAN AND RHESUS MONKEY G.B.Chapman and W.W.Spelsburg: Exp. Eye Res., 1963, 2, 130-133 (Dept. Anat., Cornell Univ. Med. Coll., New York, U.S.A.) E.M. of ultra-thin sections of portions of human and the rhesus monkey iris angle and its immediate vicinity was carried out on tissues fixed in buffered OSO₄. Myelinated and unmyelinated nerve fibres were found in human and rhesus monkey iris angle. In the human angle, the nerve fibres were seen in the collagen core of a trabecula. In the monkey sclera, adjacent to Schlemm's canal, the nerve fibres were observed in an area set apart by attenuated processes of epithelial cells. Basement membrane appeared on both sides of the trabecular endothelial cells. The myelinated fibres revealed a myelin periodicity in the range typical for this material. The possible role of these nerve fibres in appreciating ciliary muscle tonus and regulating aq. outflow is discussed. J. Whiting

5061. DISTRIBUTION OF MAST CELLS IN NORMAL EYE. METHOD OF STUDY. G.K.Smelser and S. Silver: Exp. Eye Res., 1963, 2, 134-140 (Dept. Ophthalmology,

Columbia Univ., New York, U.S.A.) The no. and structure of connective tissue mast cells was studied in various ocular tissue and comparisons were made with non-ocular tissue in four spp. The post; choroid of the eye of several laboratory animals contained many mast cells, shown in whole mounts of the entire uvea stained with Toluidine Blue at pH 1⁶. A greater no. of mast cells/unit area were found in the post, uvea than in peritoneal and pericardial membranes. The iris of all spp. studied was devoid of mast cells. The ocular mast cells were readily degranulated by a histamine liberator, showing their similarity in this respect to mast cells in other connective tissues. The uvea of a carnivore, in contrast to that of a rodent, contained very few mast cells, although they were abundant in non-ocular tissues.

J. Whiting

5062. NEURONE-GLIA RELATIONSHIP IN BIPOLAR CELL LAYER OF FISH RETINA G.M.Villegas and R.Villegas: J. ultrastructure Res., 1963, 8, 89-106 (Biofisica Dept., I.V.I.C., Caracas, Venezuela) The ultra-structure of the horizontal cells of the fish retina suggest that they are glial cells rather than neurones. This is further supported by electrical and osmotic studies. The amacrine and Muller bipolar cells are found among the innermost layer of horizontal cells. The amacrine cells can be glial or neuronal. A study of the cellular osmotic behaviour of the retina in anisotonic media is presented and indicates the greater susceptibility of the horizontal cells to anisotonicity.

H.B.Waynforth

5063. OPTICAL PROPERTIES OF THE HUMAN EPIDERMIS R.Elam, D.W.Goodwin and K.L.Williams: Nature, Lond., 1963, 198, 1001-1002 (Hilger and Watts, Ltd., London, England) The emissivity of a specimen of human abdominal epidermis was calculated from the variation of transmittance with wavelength. The absorption which occurs is primarily a function of moisture content, the epidermis acting only as a light scatterer between 1 and 6 ft? beyond 6 p the epidermis acts as a black body.

G.M.Lewis

5064. FINE STRUCTURE OF DEVELOPING DOWN FEATHER C.W.Kischnen: J. ultrastructure Res., 1963, 8, 305-321 (Entomol. and Zool. Dept., Iowa State Univ., Ames, Iowa, U.S.A.) Numerous granules were seen in the cytoplasm and mitochondrial matrix of the cells of the developing down feather of the chick embryo. Clusters of granules were also seen in the barb ridge cells, especially in the light zone of the dermo-epidermal boundary and in the cytoplasm surrounding the mitochondria. The basement membrane showed no pores or breaks and was granular in appearance. H.B.Waynforth

5065. E.M. OF MILK SECRETION IN MAMMARY GLAND OF C3H/Crgl MOUSE. II. CYTOMORPHOLOGY OF INVOLUTING GLAND S.ftY/ellings and K.B.DeOme: J. nat. Cancer Inst., 1963, 30, 241-267 (Pathol. Dept., Oregon Univ. Med. Sch., Portland, Ore., U.S.A.) A descriptive account.

J.G.Bennette

5066. EFFECT OF AGE ON THE ACIDOPHILIA OF AORTIC ELASTIN D.W.Menzies and J.T.Roberts: Nature, Lond., 1963, 198, 1006-1007 (Dept. Pathol., Univ., Melbourne, Australia) In the infant, Bromphenol Blue staining of aortic elastin resists water extraction almost indefinitely. This stability diminishes rapidly as the somatic age rises to 5, and fades out at an upper level in the 3rd to 4th decaae.

G.M.Lewis

ANATOMY

491

5067. X-RAY STUDY OF HUMAN AORTAS.

R.W.G.Wyckoff and O.Croissant: *J. Infrastructure Res.*, 1963, 8, 154-160 (Physics Dept., Arizona Univ., Tucson, Ariz., U.S.A.) A description of, and a discussion on the microradiographs of healthy and calcified human aortas using the K X-rays of Ti and Al are Presented. Also described are the X-ray probe and macro X-ray spectrographic analyses of these aortas.

H.B.Waynfirth

5068. E.M. OF NEWBORN RAT AORTA. W.J.Paule:

J. ultrastructure Res., 1963, 8, 219-235 (Anat. Dept., Med. Sch., S. California Univ., Los Angeles, Calif., U.S.A.) A comparison between the aortas of newborn and adult rats is made. The subendothelial space in the newborn is more prominent, the elastic membranes are thinner than in the adult and the elastin in the newborn has a vesicular organisation as in the adult but the vesicles are more variable and larger. Many stages between mature and immature elastin can be observed in the newborn. The elastic membrane is PA-Schiff pos. in the young rat and neg. in the adult. H.B.Waynfirth

5069. INTIMAL CHANGES IN THE ARTERIES OF

AGEING SWINE. J.E.French, M.A.Jennings, J.C.F. Poole, D.S. Robinson and Sir H.Florey: *Proc. roy. Soc. B*, 1963, 158, 24-42 (Dept. Path., Univ., Oxford, England) Studies by light and E.M. of the aorta, coronary arteries and other main arteries in pigs between 4-10 yr. of age revealed intimal thickenings including changes in elastic tissue and accumulation of Upids resembling early human atherosclerosis. Total Plasma lipid concn. was lower than in man. In ?a higher Proportion of total plasma lipid was associated with low-density lipoproteins, incT, with the high-density fraction. No correlation was found between individual values for Plasma lipids and the extent and severity of the arterial lesions, which, in general, increased with age.

G.M.Lewis

5070. THE FINE STRUCTURE OF THE PIG AORTA IN EXPERIMENTAL LATHYRISM. K.Seifert and F.Hartmann:

2. *Zellforsch.*, 1963, 59, 878-907 (Path. Inst., Univ., Kiel, Germany) Changes of the fine structure of the aorta in osteo-lathyrism, produced in piglets by daily administration of g-amino-propio-nitril, are described. Degradation of the elastic tissue leads to a disintegration of the elastic lamellae and finally results in necrotic foci and complete structural disorganisation of the media. The ^cOagenous-elastic fibre network of the intima disintegrates, the subendothelial intima becomes swollen; the Jftuscle fibres of the media become transformed into [fibroblasts to a far reaching extent; the Langhans cells ^{be}come activated. (German) J.E.Linder

5071. STRUCTURE AND FUNCTION OF THE SHEATHED CAPILLARIES IN THE SPLEEN. L.O.Zwillenberg and H.H.L.Zwillenberg: *Z. Itselforsch.*, 1963, 59, 908-921 (Anat. Inst., Univ., Bern, Switzerland)

The fine structure of the sheathed capillaries in the spleen of cat and dog are described and compared; the endothelial ^{el}st lining it are supported by a fenestrated framework of ⁿ elastin-like intercellular substance. Non-myelinated ^{er}ve fibres and Schwann cells are present. The filtering ^a vasomotor functions of the sheathed capillaries are ^cussed. (German) J.E.Linder

5072. ORIGIN OF MYOBLASTS AND PROBLEM OF DIFFERENTIATION. B.E.Walker: *Exp. Cell Res.*, 1963, 30, 80-92 (Ddpt. Anat., Univ. Texas Med. Branch, Galveston, Tex., U.S.A.) The origin of

myoblasts was studied in mice by injuring the connective tissue and muscle. The results showed that the myoblasts regenerate from cells which form within injured muscle fibres. Results of expt. on muscle regeneration are discussed in relation to dedifferentiation and redifferentiation. It is concluded that cells in the adult are irreversibly differentiated in respect to being members of a particular cell population even though the morphol. of a cell might vary due to various environmental influences. K.Jones

5073. STAINING OF VASCULAR ELASTIC FIBRES IN MUMMIFIED AND DRIED HUMAN TISSUES.

A.T.Sandison: *Nature, Lond.*, 1963, 198, 597 (Univ. Pathol. Dept., Western Infirmary, Glasgow, Scotland) In Egyptian mummy tissue and in human tissues dehydrated and preserved by treatment with natron, elastic fibres markedly resist change and can be satisfactorily stained and studied microscopically in vascular tissues.

G.M.Lewis

5074. POST-MORTEM CHANGES IN THE COLOUR OF PIG LONGISSIMUS DORSI MUSCLE. J.V.McLoughlin and G.Goldspink: *Nature, Lond.*, 1963, 198, 584-585 (Agric. Inst., Animal Production Divn.,

Beaumont Rd., Dublin, Eire) The pale colour of exudative longissimus dorsi muscles in pigs occasionally observed after onset of rigor is shown to be due to a rapid fall in pH while the temp. was still high, causing rapid post-mortem glycolysis and pptn. of previously sol. sarcoplasmic protein, which adsorbed myoglobin and masked its colour.

G.M.Lewis

5075. E.M. OBSERVATIONS OF A DENSE, IRREGULARLY BANDED MATERIAL OCCURRING IN SOME PORCINE MUSCLE FIBRES. R.G.Cassens, E.J.Briskey and W.G.* Hoekstra: *Nature, Lond.*, 1963, 198, 1004-1005 (Dept. Meat and Animal Sci., Univ. Wisconsin, Madison, Wis., U.S.A.) Prelim. comm.

G.M.Lewis

5076. ON THE ALLEGED PRESENCE OF NON-ARGYROPHILE ARGENTAFFIN CELLS IN THE HUMAN GASTRO-INTESTINAL TRACT. I. Singh: *Z. Zellforsch.*, 1963, 59, 615-624 (Anat. Sch., Univ., Cambridge, England)

Foetal and adult human gastrointestinal material was used to study the precise relationship between argentaffin and argyrophile cells. Sections were stained by the Gomori hexamine-, Schmorl- or diazonium methods; after recording all reacting cells the sections were bleached and restained by the Bodian technique. Comparison of cells demonstrable by both methods show that all argentaffin cells of the human gastrointestinal tract are also argyrophilic.

J.E.Linder

5077. ACTION OF 2,4-DINITROPHENOL AND IODOACETATE ON ULTRASTRUCTURE OF OXYNTIC CELLS. J.D.Vial and H.Orrego: *Exp. Cell Res.*, 1963, 30, 232-235 (Dept. Anat., Univ. Catolica, Santiago, Chile)

The effects of some inhibitors of HCl secretion on the structure of the oxyntic cell in the albino rat were studied, to explore one of the hypotheses further.

K.Jones

5078. BEHAVIOUR OF SUCCINIC AND LACTIC DEHYDROGENASE IN HUMAN LARGE INTESTINE.

P.Gentilili, K.V.Mallegni, R.Dominici and G.Bufalini: *Sperimentale*, 1962, 112, 485-495 (1st. Semeioticci, Med. Univ. Firenze, Italy) The distribution of succinic dehydrogenase [SA] and lactic dehydrogenase [LA] was studied in a biopsy sample of normal human large intestine by the diformazone staining method. SA activity of the lining epithelium was

ANATOMY

intensely localised in the basal zone of the cells and less so in the apical zone. In the interstitial glands the SA was almost exclusively located at the basal zone, particularly near the fundus of the tubules. This distribution correlates with that of mitochondria on the cell. The caliciform cells, lamina propria, lymphatic follicles and muscularis mucosa show very little SA activity. The LA was distributed equally throughout the cytoplasm of most of the cells. (Italian) G.N.Godson

5079. FINE STRUCTURAL LOCALISATION OF ATPase IN SMALL INTESTINE, KIDNEY AND LIVER OF RAT. C.T.Ashworth, F.J.Luibel and S.C.Stewart: J. cell Biol., 1963, 17, 1-18 (Dept. Pathol., Univ. Texas Southwestern Med. Sch., Dallas, Tex., U.S.A.)

The best localisation was obtained with tissue quenched with liquid N₂, sectioned at 25 μ in a cyostat, fixed in formalin-sucrose at pH 7² followed by incubation in the substrate medium of Wachstein and Meisel and osmication. ATPase was demonstrated in the nuclei and within the nucleoli of all tissues. Localisation occurred on cell membranes at sites where active transport mechanisms are suspected, such as the microvilli of intestinal epithelium, bile canaliculi and proximal convoluted tubular epithelial cells, endothelial linings of capillaries, glomerular epithelial cell membranes and on mitochondrial cristae. P. Barrow

5080. LYSOSOMES AND VACUOLATION OF THE LIVER CELL. D.B.Brewer and D.Heath: Nature, Lond., 1963, 198, 1015-1016 (Dept. Pathol., Univ., Birmingham, England) Vacuolation of liver cells was produced by injecting adult rats with 6-8 ml. 50% sucrose. Histochem. studies by E.M. and light microscopy showed that the acid¹phosphatase-containing lysosomes develop into the vacuoles. G.M.Lewis

5081. HISTOCHEMICAL DISTRIBUTION OF LIPIDS IN THE LIVER OF NEW BORN MICE (0-60 HOURS). P. Malet, R.Lagarde and J.P.Turchini: C.R. Soc. Biol., Paris, 1962, 156, 2058-2060 (Lab. d'Histol., Fac de MSD., Clermont-Ferrand, France) At birth, the liver of mice contained a low concn. of lipids which disappeared in 8-10 hr. After 18 hr. there was a considerable accumulation of lipids throughout the hepatic parenchyma. From the 24th-60th hr. after birth the level of lipids remained high. (French) M. A.Price

5082. DEPHOSPHORYLATION OF DEOXYADENOSINE MONOPHOSPHORIC ACID BY LIVER AND KIDNEY OF MICE. P.Turchini, P.Bastide, J.C.Marcheix and G.Dastugue: C.R. Soc. Biol., Paris, 1962, 156, 2063-2064 (Lab. d'Histol., Fac. Méd., Clermont-Ferrand, France) Histochem. study showed that dephosphorylating activity was localised in the region of the parenchymatous nuclei and bile ducts of the liver and in nuclei and endothelium of the convoluted tubules of the kidney. Biochem. estimations of dephosphorylating activity showed an equal distribution of activity in the homogenate and supernatant of liver. (French) M. A.Price

5083. CARBOHYDRATES OF HUMAN VAGINAL TISSUE. A.T.Gregoire: Nature, Lond., 1963, 198, 996 (Strickler Root Lab., Dept. of Obst., Jefferson Med. Coll., Philadelphia, Pa., U.S.A.) Carbohydrates were extracted from normal human vaginal tissue obtained from surgical patients. Glucose*, maltose, maltotriose and maltotetraose were identified by paper chromatography. G.M.Lewis

5084. EFFECT OF OESTROGEN ON HISTOLOGY OF UTERINE EPITHELIUM OF MOUSE. E. CHANGES OF PA-SCHIFF-REACTIVE STRUCTURES IN BASEMENT MEMBRANE AND GLANDULAR CELL SURFACE. A.Nilsson and C.Wirsén: Exp. Cell Res., 1963, 29, 144-152 (Dept. Histol., Karolinska Inst., Stockholm, Sweden)

The basement membrane and glandular cell surface of the uterine epithelium of mice were PA-Schiff-reactive, the intensity of the reaction varying at different functional stages, as demonstrated histochem. E.M. revealed that the variations in staining intensity of the membrane were due to different degrees of folding with const. thickness, and that the length of microvilli increased together with the deposition of dense strands of an amorphous substance between them. K.Jones

5085. E.M. APPEARANCE OF THE MYOMETRIUM OF CERVIX UTERI IN CASTRATED GUINEA-PIGS TREATED WITH SEX HORMONES. O.H.Iversen and H.E.Christensen: Acta path. microbiol. scand., 1963, 57, 404-414 (Rheu. Res. Lab., Univ. Inst. Path. Anat., Copenhagen, Denmark) Treatment with oestrogen hormones increases the total amount of collagen. L.Friedmann

5086. LIGHT- AND ELECTRON-MICROSCOPIC INVESTIGATIONS OF THE UTERINE CONNECTIVE TISSUE IN PREGNANT GUINEA-PIGS. O.H.Iversen and H.E. Christensen: Acta path. microbiol. scand., 1963, 57, 415-426 (Rheu. Res. Lab., Univ. Inst. Path. Anat., Copenhagen, Denmark) There was a gradual increase of collagen in the interstitial spaces, partly due to the widening of these spaces and partly to the structural alteration of collagen which was loosely arranged. L.Friedmann

5087. ENZYMIC HISTOCHEMISTRY OF HUMAN PROSTATE. M.Niemi, M.Harkonen and T.K.Llarmi: Arch. Path. Chicago, 1963, 75, 528-537 (Dept. Anat., Univ., Helsinki, Finland) Eight tetrazolium reductase systems, non-sp. esterase and leucine aminopeptidase were studied in normal and hyperplastic human prostates. R.Mitchell

5088. SEASONAL VARIATION IN THE ADRENAL CORTEX* COMPARATIVE STUDY OF GENITALIA. H.Planel, A.Guilhem, J.F.David and R.Tixadom: C.R. Soc. Biol., Paris, 1962, 156, 2138-2142 (Lab. d'Histol., Fac. MSD., Toulouse, France) The seminiferous, epididymal, and prostatic epithelia of guinea-pig increased in thickness during the months September to June. These variations were observed in animals maintained at const. temp. No seasonal variations were found in the adrenal cortex of guinea-pigs kept under similar conditions. (French) M.A.Price

5089. GERMINAL CENTRES IN HUMAN THYMUS. M.Kostowiecki: Z. Zellforsch., 1963, 59, 790-803 (Dept. Anat., Graduate Sch. Med., Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) During histol. examination of a normal thymus of a 3 yr. old girl, 4 germinal centres were found; they were situated in the medulla; 3 of them on the cortico-medullary junction. The germinal centres were composed of reticular cells, lymphocytes, reticular macrophages and large no. of thymocytes of various degrees of maturity. J.E.Linder

5090. USE OF LEAD CITRATE AT HIGH pH AS AN ELECTRON-OPAQUE STAIN IN E.M. E.S.Reynolds: J. cell Biol., 1963, 17, 208-212 (Dept. Anat., Harvard Med. Sch., Boston, Mass., U.S.A.) Cellular and extracellular structures have a higher affinity for lead citrate dissolved in NaOH at pH 12*0 than for lead citrate

ANATOMY

493

ions. High intensity staining of cytoplasmic membranes, ribosomes, glycogen and nuclear material of rat tissue embedded in Aralftite or Epon illustrates the procedure.

P.Barrow

5091. USE OF BISMUTH AS ELECTRON STAIN FOR

NUCLEIC ACIDS. P.Albereheim and V.Killias: *J. cell Biol.*, 1963, 17, 93-103 (Biol. Lab., Harvard Univ., Cambridge, Mass., U.S.A.) The phosphate of nucleic acids, particularly DNA, binds with Bi to provide an electron opaque stain. Bi has a low affinity for proteins and thus could be used to study the ultrastructure of chromatin in the presence of histones. P.Barrow

5092. RED-BLUE STAINING OF HYDROLYSED NUCLEIC ACIDS IN PARAFFIN SECTIONS. D.W.Menzies:

Stain Technol., 1963, 38, 157-160 (Dept. Pathol., Univ., Melbourne, Victoria, Australia) The author has overcome some of the difficulties met with in the use of basic fuchsin-Methylene Blue staining for nucleic acids by increasing the affinity of the nucleus for basic fuchsin. This is done using acid hydrolysis, but with the HCl dissolved in the hydrophilic organic solvent tetrahydrofuran instead of water; this allows the hydrolysis of DNA and increased intensity of basic fuchsin staining of nuclei before an appreciable amount of RNA is dissolved from the cytoplasm. M.J.Bell

5093. FEULGEN STAIN STABILITY IN RELATION TO THREE MOUNTING MEDIA AND EXPOSURE TO LIGHT.

F.J.Swartz and E.R.Nagy: Stain Technol., 1963, 38, 179-185 (Dept. Anat., Univ., Sch. Med., Louisville, Ky., U.S.A.) For DNA quantitation by microdensitometry, fading of Feulgen staining must be minimal. Microdensitometric measurements of rat liver nuclei mounted in Eukitt, Clearmount and Permount all showed fading over a post-staining period of 160 days. Dark storage decreased fading in all cases. Though none of these media is considered ideal for quantitation of Feulgen staining, Eukitt is the nearest to satisfactory with least fading, though it requires longer to reach stability. M.J.Bell

5094. CYTOCHEMISTRY AND E.M. THE PRESERVATION OF CELLULAR ULTRASTRUCTURE AND ENZYMIC ACTIVITY BY ALDEHYDE FIXATION. D.D.Sabatini,

K.Bensch and R.J.Barnett: *J. cell Biol.*, 1963, 17, 19-58 (Rockefeller Inst., New York, U.S.A.) Several tissues from adult rats were used to demonstrate the combination of the enzyme histochemical technique with electron microscopy. The tissues were fixed for 0-5-24 hr. in different aldehydes prep, as cacodylate or phosphate buffered soln. of 0-1-0-2M and pH 6-5-7-6. Post fixation in OsO₄ preserved the cellular fine structure. Cytochrome oxidase, succinic dehydrogenase and glucose-6-phosphatase activity were localised after hydrazyl-aliphatic aldehyde fixation. Some esterase and phosphatase, ³⁵U²-labeled eotidase, ATPase and NADH and NADPH diaphorase activities survived fixation in the 7 fixatives. P. Barrow

5095. TANNIC ACID, IRON HAEMATOXYLIN, ALCIAN BLUE AND BASIC FUCHSIN FOR STAINING ISLETS AND RETICULAR FIBRES OF THE PANCREAS.

J.W.Monroe and B.Specton: Stain Technol., 1963, 38, 187-192 (Dept. Bioanatomy, Tufts Univ. Sch. of Med., Boston, Mass., U.S.A.) The authors give on the basis of a method developed to stain pancreas, tested on the Pancreatic tissue of rat, rabbit, dog, hamster, and man. & the technique alpha cells are stained with basic fuchsin, beta cells by iron hematoxylin, reticular

fibres by ferric tannate and mucin by Alcian Blue. Of 6 common fixatives, Bnuin's fluid proved the most reliable.

M.J.Bell

5096. FIXATION FOR E.M. S.K.Malhotra: *Nature*, Lond., 1963, 198, 611-612 (Cytol. Lab., Dept.

Zool., Univ., Oxford, England) Techniques of fixation for E.M. are discussed. Adequate preservation of pancreatic exocrine cells and convoluted tubule cells of the kidney has been obtained by fixation in simple unbuffered soln. of OSO₄ and embedding in Epikote 812 or methacrylate. Satisfactory fixation of tube feet of the sea urchin for E.M. was obtained by use of aq. soln. of OSO₄ or KM1104. G.M.Lewis

5097. EGG ALBUMIN EMBEDDING: A PROCEDURE COMPATIBLE WITH NEUROLOGICAL STAINING TECHNIQUES. A.B.Snodgress and C.H.Dorsey:

Stain Technol., 1963, 38, 149-155 (Naval Med. Res. Inst., Nat. Naval Med. Cent., Bethesda, Md., U.S.A.)

When frozen sections of the c.n.s. and peripheral nerves are dehydrated and cleared for use with resinous mounting media, gelatin, a satisfactory embedding medium for sections to be mounted in water sol. mountant, has proved unsatisfactory as an embedding medium. The authors have worked out an alternative method using egg albumin solidified by formaldehyde which will tolerate on-the-slide alcohol dehydration, xylene clearing and synthetic resin mounting with a minimal shrinkage and distortion. Embedding in albumin takes place in a two layered box, (inner layer of vegetable parchment paper, outer supporting layer, perforated aluminium foil), the tissue albumin block being hardened by formalin dialysis through the parchment paper. M.J.Bell

5098. TECHNICAL MODIFICATIONS IN MARAGLAS EMBEDDING. B.O.Spurlock, V.C.Kattine and J.A.

Freeman: *J. cell Biol.*, 1963, 17, 203-207 (Dept. Pathol., Louisiana State Univ. Sch. Med., New Orleans, La., U.S.A.) Complete hardening of tissue blocks combined with dehydration is achieved by passing fixed tissue through abs. alcohol, pure propylene oxide, 1:1 propylene oxide: Maraglas mixture and finally for 8-12 hr. at 10° in pure Maraglas mixture. Sections of 1-2 µ of Maraglas embedded tissue may be stained with the resin in situ for E.M. and light microscope comparison.

P. Barrow

5099. AN ELECTRICALLY CONTROLLED DRIVE WITH A SLOW CUTTING, FAST-RETURN CYCLE FOR

ROTARY MICROTOMES. P.F.Elbers: Stain Technol., 1963, 38, 173-178 (Centrum voor Submicroscopisch Onderzoek van Biologische Objecten der Rijks-Universiteit, Utrecht, Netherlands) The construction of a microtome drive, suitable for use with ultramicrotome, which gives a low cutting speed for the specimen (2-10 mm./sec.) and a fast return to cutting position (60 mm./sec.) is described in detail. Movement is vibration free; transition between high and low speeds is smooth; speed variation is governed by electric control giving a completely automatic operation especially useful for thermal feed microtomes. M.J.Bell

TISSUE CULTURE

5100. ISOLATION AND GROWTH OF ENDOTHELIAL CELLS IN TISSUE CULTURE. C.M.Pomerat and

ANATOMY

W.C.Slick: *Nature, Lond.*, 1963, 198, 859-861
 (Pasadena Foundn. Med. Res., Pasadena, Calif., U.S.A.) A procedure is described for the establishment of cultures of rabbit endothelium using die cells released by treatment with trypsin of the interior of the dorsal aorta. Characteristics of the cells in culture, which maintain the euploid chr. no. 44, are described.

G.M.Lewis

5101. INFLUENCE OF GLUCOSE ON THE GROWTH OF TISSUE CULTURE. L.Polna and H.Leszczyńska: *Med. dosw. Mikrobiol.*, 1962, 14, 365-377 (Zal'fad Wirusologii, Państwowy Zakład Higieny, Warszawa, Poland) The highest glucose utilisation by the cells of human kidney was observed in the initial stage of growth up to 72 hr. of incubation. Regenerated media can be used for cultures provided calf serum is added. pH of media depended upon glucose utilisation. The titre of poliomyelitis virus grown in cultures on various media did not show significant differences.

(Polish) H.Osowiecki

5102. EFFECT OF DEXTRAN ON EARLE'S L929 STRAIN OF MOUSE FIBROCYTES. A.R.Milnen *Brit. J. Cancer*, 1963, 17, 149-152 (Mount Vernon Hosp., Northwood, Middx., England) Soln. of dextran had been shown to damage HeLa cells undergoing mitosis in vitro. Cells of strain L929 were found to have greater resistance to dextran and there was no evidence of delayed toxicity. Addition of isotonic soln. of glucose produced severe damage to cells undergoing division at time of treatment, addition of dextran did not limit this effect. D.Hamer

5103. LOSS OF RADIOACTIVITY FROM LABELLED DNA OF PRIMARY HUMAN AMNIOTIC CELLS. R.S.Chang and H.Vetrov: *Science*, 1963, 139, 1211 (Dept. Iviicrobiol., Harvard Sch. Publ. Hlth., Boston, Mass., U.S.A.) After incubation of primary human amniotic cell cultures with [14C]glycine or [14C]thymidine, more radioactivity was released into the medium than could be accounted for by cell death and replacement. It was concluded that DNA or some related acid-insol. polydeoxyribonucleotides are being degraded in the living cells.

G.M.Lewis

5104. X-IRRADIATION SENSITIVITY OF NITROGEN MUSTARD-RESISTANT MAMMALIAN CELLS IN VITRO. A.G.Lewis: *Nature, Lond.*, 1963, 198, 498-499 (Inst. Zool., Univ., Padua, Italy) A guinea-pig cell strain resistant to N-mustard showed increased resistance to this agent at all concn. tested compared with the parent strain. Its resistance to X-rays, however, was the same as in the parent strain, indicating no cross resistance phenomena between these agents.

G.M.Lewis

5105. IN VITRO ACTION OF DIETHYLSTILBOESTROL ON GROWTH AND KINETIC ACTIVITY OF HUMAN CANCER CELLS. H.Planet, J.F.David and J.P.Soleilhavoue C.R. Soc. Biol., Paris, 1962, 156, 2142-2145 (Lab. d'Histol., Fac. Méd., Toulouse, France) 0*02 fig. diethylstilboestrol/ml. decreased the cell density of HeLa tumour cells in culture, with complete disappearance of cells at a concn. of 50 fig./ml. A marked decrease in cell density of KB tumour cells occurred with concn. of 5-50 pg. diethylstilboestrol/ml. Diethylstilboestrol increased the mitotic index of both tumour strains in concn. above 0*8 fig./ml.

(French) M. A. Price

5106. BEHAVIOUR OF TWO CELL STRAINS DERIVED FROM RAT RABDOMYOSARCOMAS. P.K.Basrur and J.P.W.Gilman: *J. nat. Cancer Inst.*, 1933, 30, 163-

201 (Anat. Dept., Ontario Veterin. Coll., Guelph, Canada) The cultural characteristics of the strains are described. The difference in the morphol., chromosomal and malignant traits and the possible mechanisms involved in the evolution of a normal* cell strain from rhabdomyosarcomatous tissue are discussed.

J.G.Bennette

5107. ORIENTATION BEHAVIOUR OF CHICK LEUCOCYTES IN TISSUE CULTURE AND THEIR INTERACTIONS WITH FIBROBLASTS. F.E.Oldfield: *Exp. Cell Res.*, 1963, 30, 125-138 (Dept. Anat. EmbryoL, Univ. Coll., London, England) Some chick w.b.c., polymorphonuclears and probably monocytes, showed neg. mutual chemotaxis, repelling each other by mechanisms involving a response to diffusion gradients. Polymorphonuclears and monocytes exhibited contact inhibn. between themselves, but both types failed to show contact inhibn. when confronted with fibroblasts. No influence on either the area or the mitotic index of growing fibroblast populations by cells from buffy coat, could be detected after 36 hr.

K.Jones

5108. EFFECTS OF PHYTOHAEMAGGLUTININ [PHA] ON NORMAL AND LEUKAEMIC LEUCOCYTES WHEN CULTURED IN VITRO. M.W.Elves and J.F.Wilkinson: *Exp. Cell Res.*, 1963, 30, 200-207 (Dept. Haematol., Royal Infirmary, Manchester, England) The transition from the small lymphocyte to a large more primitive cell is described in cultures of normal and leukaemic peripheral w.b.c. These results indicated that it is these large primitive cells which then divide, making this culture method so useful in the study of human chr. In all cultures the granulocytic cells degenerated whether PHA was present or not. Possible mechanisms for the action of PHA in this type of culture are discussed.

K.Jones

5109. IN VITRO STUDIES OF ULCERATIVE COLITIS. [U.C.]. I. REACTIONS OF PATIENTS' SERUM WITH HUMAN FOETAL COLON CELLS IN TISSUE CULTURES. O.Broberger and P.Perlmann. II. CYTOTOXIC ACTION OF WHITE BLOOD CELLS FROM PATIENTS ON HUMAN FOETAL COLON CELLS. P.Perlmann and O.Broberger *J. exp. Med.*, 1963, 117, 705-716. 717-733 (Wenner-Gren Inst. Expt. Biol., Stockholm, Sweden)

I. Immunofluorescent techniques showed that sera from children with u.c. contain Ab which react with foetal colon cells in tissue culture. Sera from healthy individuals failed to react. Inhibn. expt. confirmed the specificity of the reaction and the staining capacity of various sera could be correlated with their haemaggl. titre against phenol-water extracts of human colon. Blood group substances of the ABO system were shown to be present on the cells by fluorescent H agglutinins from eelf but these were different from the Ag reacting with Ab of u.c. sera. The cells showed optimal staining 4 to 5 days after culturing. Visible cytotoxic damage of cells in the presence of u.c. serum and C* was not obtained. Absence of cytotoxic activity in u.c. sera was confirmed by the more sensitive technique utilising die release of 32p from colon cells labelled with [32P]orthophosphate in the presence of cytotoxic factors.

II. Freshly isolated foetal human colon cells labelled with [32P]orthophosphate or 14c-amino acids were exposed to w.b.c. obtained from u.c. patients or healthy subjects. A higher release of 32p was obtained with the patients' w.b.c. than with the control cells. W.b.c. allowed to stand in nutrient soln. overnight, consisting of lymphocytes and large mononucle^r cells only, were also capable of releasing more ³²P than normal w.b.c. Sp cyt.

toxic activity could not be conferred on normal w.b.c. incubated with u.c. serum. The w.b.c. from die patients exerted no cytotoxic effect on labelled cells grown from other human tissues. The presence of 10 to 20% fresh guinea-pig serum in the incubation medium was necessary for a cytotoxic action by w.b.c. to be observed.

H.E.H.Jones

5110. REVERSIBLE ARREST OF GROWTH OF L-CELLS UNDER WEIGHTED AGAR. K.Nilausen and H. Green: *Exp. Cell Res.*, 1963, 30, 248-252 (Dept. Pathol., New York Univ. Sch. Med., New York, U.S.A.)

Under agar weighted with sterile glass beads agar cultures of L-cells were maintained in a reversible, non-growing state for a period of 8 days; during this time the cells remained fully viable.

KJJones

5111. EXAMINATION OF ROLLER-TUBE CULTURES BY E.M. S.Heyner and M.S.Israel: *Exp. Cell Res.*, 1963, 30, 236-238 (Dept. Anat., Royal Coll. Surg. England, London, England) A method is described for embedding roller-tube cultures in Araldite.

KJJones

5112. SIMPLE METHOD FOR SHORT TERM CULTURES FROM SMALL BIOPSIES. P.K.Basrur, V.R.Basrur and J.P.W.Gilman: *Exp. Cell Res.*, 1963, 30, 229-232 (Div. Microscopic Anat., Ontario Vet. Coll., Guelph, Ont., Canada) Two 11 x 35 mm. coverslips were used to hold the fragments of tissue; the advantages of this method are discussed.

KJJones

EMBRYOLOGY

5113. PRE-OVULATORY CHANGES IN THE OOCYTE OF THE ADULT RAT. A.M.Mandb Proc. roy.SocB, 1963, 158, 105-118 (Dept. Anat., Univ., Birmingham, England) The sequence of nuclear changes in adult rat oocytes, especially the pre-ovulatory stages, has been investigated in relation to both natural and artificial diurnal rhythms of light and darkness. An attempt was made to determine the time of diakinesis and the duration of each stage of division up to second metaphase.

G.M.Lewis

5114. RADIOSENSITIVITY OF OOCYTES AT DIFFERENT STAGES OF MATURATION. A.M.Mandt Proc. roy. Soc. B, 1963, 158, 119-141 (Dept. Anat., Univ., Birmingham, England) The viability of the zygote after fertile mating has been used as an index to assess radiosensitivity of oocytes in Graafian follicles at different times before ovulation and at known stages of maturation process. Radiosensitivity increases as the interval between irradiation and ovulation decreases; after fertilisation the radiosensitivity of the zygote progressively decreases. Oocytes in 'medium sized' follicles are highly radioresistant. X-irradiation is followed by superovulation and a decrease in the mean size of corpora lutea.

G.M.Lewis

5115. VITELLINE MEMBRANE OF HEN'S EGG: CHEMICAL AND E.M. STUDY. R.Bellairs, M.Harkness SS, R.D.Harkness: *J. ultrastructure Res.*, 1963, 8, 339-359 (Anat. and EmbryoL Dept., Univ. College, London, England) The inner of the two layered vitelline membrane of the hen's egg has a three dimensional network of fibres and fibrils. The outer layer

consists of fibrils formed into sublayers. A thin membrane is present between the two layers. The outer layer is lost prior to ovulation. Both layers consist of protein, the structure of which is different in the two layers. The types of protein in the vitelline membrane are discussed.

H.B.Waynfirth

5116. E.M. OF CHORIOALLANTOIC PLACENTA OF RABBIT, n. DECIDUA AND MATERNAL VESSELS.

J.F.Larsen: *J. ultrastructure Res.*, 1963, 8, 327-338 (Anat. Dept., Washington Univ. Med. Sch., St. Louis, Mo., U.S.A.)

Decidual cells of the rabbit placenta are formed from perivascular cells about the 8th day of gestation. Their ultrastructure, resembles that of foetal liver cells. Multinucleated cells of unknown origin line the maternal vessels during the latter part of pregnancy. The degeneration of the multi-nucleated giant cells of the 'intermediate zone*' forms the 'separation zone' at parturition.

H. B. Waynfirth

5117. THE MATRIX CELL AND CYTOGENESIS IN THE DEVELOPING C.N.S. S.Fujita: *J. comp. Neurol.*, 1963, 120, 37-42 (Dept. Pathol., Kyoto Fritsu Med.

Coll., Kawaramachi, Kyoto, Japan) By autoradiography of cumulative labelling with ^{3}H -thymidine, it was shown that the matrix cells in the neural tube of the 6-day-old chick embryo become labelled at a linear rate, reaching 100% in about 10 hr. It is suggested that the matrix cells form a functionally homogeneous population and give rise to the nerve cells, neuroglia and ependymal cells.

G.M.Lewis

5118. MITOTIC ACTIVITY IN INDIVIDUAL REGIONS OF THE C.N.S., AS WELL AS IN THE LENS AND THE VESTIBULO-COCHLEAR ORGAN IN THE CHICKEN-EMBRYO; A CONTRIBUTION TO THE QUANTITATIVE EVALUATION OF GROWTH PROCESSES. K.Goerttler and K.Wegener. *Z. Zellforsch.*, 1963, 59, 771-789 (Path. Inst., Univ., Kiel, Germany) Mitotic growth-activity in parts of the c.n.s. as well as the lens and the vestibulo-cochlear organ in the chick embryo has been evaluated; the mitotic index for all the examined sections of the c.n.s. was very high; maxima of the mitotic index curves extend over a comparatively short time and are found during the first days of incubation; the mesencephalon and spinal cord have only one period of max. activity whilst retina and vestibulo-cochlear organ show two max. phases of mitotic activity. The importance of the evaluated findings for the analysis of developmental disturbances is discussed.

(German) J.E.Linder

5119. HUMAN FOETAL KIDNEY. H. PERMEABILITY CHARACTERISTICS OF DEVELOPING GLOMERULUS.

R.L.Venier and A.Birch-Andersen: *J. ultrastructure Res.*, 1963, 8, 66-88 (Biophysics Dept., Statens Serum Institut, Copenhagen, Denmark) Young human foetuses were inj. with C or ferritin and renal biopsies were obtained 2-12 min. later. By E.M. it was shown that the lamina densa of the basement membrane of the glomerular capillaries functions as a filter. Pinocytosis of the inj. particles was observed in the endothelium of the capillaries. It is likely also that free diffusion of particles takes place. The probable mechanism of formation of the basement membrane of renal tubules is described.

H.B.Waynfirth

5120. HORMONAL CONTROL OF THE METABOLISM OF CHOLESTEROL IN THE RABBIT FOETUS. J.G.Bearn

and T.R.E.Pilkingtons *Nature*, Lond., 1963, 198, 1005-1006 (Dept. Anat., Middlesex Hosp. Med. Sch.,

ANATOMY

London, England) Injn. of 100-150 fig. L-thyroxine into rabbit foetuses at the 22nd-23rd day of development prevents the increase in blood cholesterol produced by decapitation. The foetal thyroid is essential for normal regulation of the cholesterol metabolism. G.M.Lewis

5121. EFFECTS OF EXTRA-EPITHELIAL FACTORS ON INCORPORATION THYMIDINE BY EMBRYONIC EPIDERMIS. N.K.Wessells: *Exp. Cell Res.*, 1963, 30, 36-55 (Dept. Biol. Sci., Univ., Stanford, Calif., U.S.A.) Cells in explants of 11-day chick epidermis rapidly lost their ability to incorporate ^{3}H thymidine, and epidermal basal cells lost their columnal shape. Both prop, reappeared if dermis was combined with such epidermis. Thymidine incorporation freq. in epidermis could be influenced by the kind or age of dermis present, or by muscle opposed to dermis. The results are discussed in relation to the hypothesis that cellular incorporation of thymidine is dependent on conditions in the epidermis as a whole. K.Jones

5122. STUDIES ON THE ABILITY OF EMBRYONIC MESONEPHROS EXPLANTS TO FORM CARTILAGE. J.W.Lash: *Develop. Biol.*, 1963, 6, 219-232 (Dept. Anat., Sch. Med., Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) Chondrogenesis in explanted chick mesonephros was restricted to areas adjacent to limb primordia, proceeded independently of neighbouring tissues, and did not appear to affect somite chondrogenesis. When cultured with 2-3 day limb primordia, chondrogenic regions of the mesonephros appeared to enhance limb cartilage formation and it is suggested that cells associated with the mesonephros may participate in development of limb or girdle cartilage. J.W.S.Harris

5123. TERATOGENIC INTERACTION OF INSULIN AND 2-DEOXY-D-GLUCOSE [2-DG] IN CHICK DEVELOPMENT. W.Landauer and E.M.Clark: *J. exp. Zool.*, 1962, 151, 245-248 (Storrs Agric. Expt. Stat., Univ. Connecticut, Storrs, Conn., U.S.A.) Injn. into the yolk sac of 500 pg. or more 2-DG at 96 hr. of incubation and of 100 fig. at 24 hr. was highly toxic to embryos of White Leghorn fowls. 2-DG was not teratogenic at either stage. The toxicity to 2-DG was overcome by supplementary glucose. The teratogenic effects of die administration of one unit insulin at the 96 hr. stage were potentiated by addition of 500 pg. 2-DG. One unit of insulin plus 100 fig. 2-DG at 24 hr. led to a significant rise in the incidence of rumplessness. In addition to this, 2-DG was also responsible for abnormalities of the tibiotarsal joints, the tarsometatarsus and toes. Glucose reduced the toxicity of insulin to embryos at 24 and 96 hr. without affecting its teratogenic activity. The intracellular entry of glucosamine, 0-hydroxybutyric acid, galactose and N-acetylglucosamine is enhanced by insulin but none of these compounds potentiate the teratogenic action of insulin. 2-DG also potentiated the effects of 6-aminonicotinamide and of pilocarpine in a way similar to that of insulin. The synergism of 2-DG and insulin and the teratogenic activity of insulin itself are clearly intracellular events. R.J. Walker

5124. THE INTERACTION IN TERATOGENIC ACTIVITY OF THE TWO NIACIN ANALOGUES 3-ACETYL PYRIDINE [3-AP] AND 6-AMINONICOTINAMIDE [6-AN]. W.Landauer and E.M.Clark: *J. exp. Zool.*, 1962, 151, 253-258 (Storrs Agric. Expt. Stat., Univ. Connecticut, Storrs, Conn., U.S.A.) In this study, the interaction in die teratogenic activity of 3-AP and 6-AN following

simult. injn. into the yolk sac of 96 hr. White Leghorn chick embryos was observed. The dwarfing, micromelia and parrot beak effects with 6-AN are almost completely prevented in the presence of 3-AP. When 2*5-5 fig. of 6-AN were added to the administration of 375 or 500 pg. 3-AP, the teratological effects of the 3-AP were exaggerated. The addition of 10 fig. 6-AN failed to produce a similar effect. The beneficial effects of 3-AP on 6-AN are interpreted in terms of the ability of 3-AP pyridine nucleotide to substitute partially for the metabolic functions of NAD. The responses of maxilla and mandible to combined administration of the 2 nicotinamide analogues differ from those of the long bones and of the musculature. R.J. Walker

5125. ACTION OF THYROXINE ON TERATOGENIC ACTIVITY OF RADIOMIMETIC SUBSTANCE. R.Stoll, M.Bernes-Lasserre and R.Maraud: *C.R. Soc. Biol., Paris*, 1962, 156, 2032-2034 (Lab. Biol., Fac. Méd., Bordeaux, France) 1-10 /ig. di-(n-propoxy)-2,5-di(ethylene-imino)-3,6-benzoquinone-1,4 induced malformations of the limbs in chick embryos. 3 fig. thyroxine increased the toxic and teratogenic action of the ethylene-imine. Mortality at 9th day of incubation increased from 17% to 47% when both compounds were administered. (French) M.A.Price

5126. EXPERIMENTAL PRODUCTION OF MAMMARY MALFORMATIONS IN THE RAT FOETUS BY INJECTION OF OESTRADIOL TO THE MOTHER AT THE 14TH DAY OF GESTATION. P.Delost, C.Jean and C.Jean: *C.R. Soc. Biol., Paris*, 1962, 156, 2048-2052 (Lab. Physiol. animale, Fac. Sci., Clermont-Ferrand, France) Injn. of 10 mg. oestradiol to rats at the 14th day of gestation induced mammary malformations in foeti of both sexes at term. The malformations appeared as suppression of total mammary gland with premature development and hypertrophy of the nipple. (French) M.A.Price

5127. A STEREOTAXE ATLAS OF THE BRAIN OF THE GOLDEN HAMSTER (MESOCRICETUS AURATUS). O.A.Smith JUIL and CN.Bodem: *J. comp. Neurol.*, 1963, 120, 53-63 (Dept. Physiol., Univ. Washington Sch. Med., Seattle, Washington, D.C., U.S.A.) G.M.Lewis

5128. THE NUCLEI GEMINI TWO HITHERTO UNDESCRIBED NERVE CELL COLLECTIONS ON THE HYPOTHALAMUS OF THE RABBET. P.O.Lundberg: *J. comp. Neurol.*, 1962, 119, 311-316 (Dept. Anat., Univ., Uppsala, Sweden) Two nerve cell groups in the rabbit hypothalamus have definite cytol., cytoarchitectonic and myeloarchitectonic characteristics and receive communications from regio prepyriformis and tuberculum olfactorium. Central vegetative regulation is ascribed to the nuclei. G.M.Lewis

5129. EFFERENT CORTICO-NUCLEAR PATHWAYS IN THE CEREBELLUM OF THE CAT. R.P.Eagen J. coinP-Neurol., 1963, 120, 81-103 (Dept. Anat., Univ. Pennsylvania Sch. Med., Philadelphia, Pa., U.S.A.) Small, well-defined lesions were placed in the cerebellar

ANATOMY

497

cortex of cats limited to 1 of 3 longitudinal cortico-nuclear zones. The resulting degenerating axons were stained by a Ag technique and the pattern of cortico-nuclear projections plotted at representative cerebellar levels. The results indicated that concepts of a simple radial projection system from cortex to specific cerebellar nuclei are not valid in all respects. A correlation¹⁵ made between anat. results and recent physiol. investigations.

G.M.Lewis

5130. A STUDY OF THE COCHLEAR NUCLEI AND ASCENDING AUDITORY PATHWAYS OF THE MEDULLA.
J.M.Harrison and W.B.Warn J. comp. NeuroL, 1962, 119, 341-379 (Psychol. Inst., Univ., Boston, Mass., U.S.A.) The synaptic morjihol. and ascending fibre connections of the cochlear nuclei and the sup. olivary complex were examined in the albino rat using the Protargol silver method of Bodian. The results of unilat. damage to the cochlea producing degeneration of the acoustic nerve were studied.

5133. MEAN FORMATION TIME OF HUMAN OSTEONS.

H.M.Frost: Canad. J. Biochem., 1963, 41, 1307-1310 (Dept. Orthopaedic Surg., H.Ford Hosp., Detroit, Mich., U.S.A.* With the aid of 19 dôubly tetric cycline-labelled human bones the mean daily linear decrease in the radius of Haversian canals of newly forming osteons was measured. The mean outside diam. of the Haversian canals were measured on a larger no. of human bones. From these measurements the calc. mean time of Haversian system formation in ribs is 46 ± 37 days, at age 7 yr. and 79 ± 63 days at age 43. Compared with those for ribs, the formation times seemed to be longer in the long bones of the appendicular skeleton.

A.M.Gibbins'

ODONTOLOGY

5134. DENTAL OBSERVATIONS ON AUSTRALIAN ABORIGINES: MESIODISTAL CROWN DIAMETERS OF PERMANENT TEETH. MJ.Barrett, T.Brown and M.R. MacDonald: *Aust. dent. J.*, 1963, 8, 150-155 (Dept. Sch., Univ. Adelaide, S. Australia) Mesiodistal crown diam. of permanent teeth were obtained from record casts of 251 Australian aborigines. They are analysed statistically and compared with similar measurements from other populations. **J.H.P.Main**

5135. AUSTRALIAN CHILDREN WITH EXCELLENT OCCLUSION. R.G.Henry: *Aust. dent. J.*, 1963, 8, 123-126 (229 Macquarie St., Sydney, N.S.W., Australia) Plaster casts of the dentitions and cephalometric radiographs of 60 Australian children of 12 yr. with excellent occlusions were studied under the following headings:- (1) Pont's index, (2) occlusal pattern, (3) cephalometric analysis. The results are presented and compared with previous studies. **J.H.P.Main**

5136. EFFECT OF EXTRACTION OF DECIDUOUS MOLARS ON THE ERUPTION OF BICUSPID TEETH. L.M.Carn: *Aust. dent. J.*, 1963, 8, 130-136 (Dept. Health, Canberra, Australia) From a survey of records in the Commonwealth Dept. of Health, the effect of extraction of deciduous molars, either before age 7 yr.; between 7 and 10 yr.; or after 10 yr. of age, on the time of eruption of the premolars was assessed statistically. The results indicate that extraction of mandibular deciduous molars before 7 yr. causes delayed eruption of the succeeding premolars; the extraction of maxillary deciduous molars between 7 and 10 yr. causes earlier eruption of the succeeding premolars. The reasons for this are discussed. **J.H.P.Main**

5137. GROWTH AND FUNCTION OF MANDIBLE. G.Cimasoni: *Schweiz. Mschr. Zahnheilk.*, 1963, 73, 507-513 (Inst. Méd. dent., 30 rue Lombard, Genève, Switzerland) The right upper molars were removed at 40 days of age from 8 normal and 13 hypophysectomised rats. Apart from elongation of the lower molars, there was no significant difference in dimensions between the 2 sides. **C.P.Wallis**

5138. CROWN DEVELOPMENT IN HUMAN DECIDUOUS MOLAR TEETH. E.P.Turner: *Arch. oral Biol.*, 1963, 8, 523-540 (Turner Dent. Sch., Univ., Manchester, England) Reconstructions were prep. from serial sections of the jaws of foetuses ranging in age from 8 weeks to full term. In the upper deciduous molars the cusps developed and calcified in the order of paracone, protocone, metacone and hypocone; in the lower deciduous molars this order was protoconid, metaconid, hypoconid, entoconid and hypoconulid. *

5139. DISTINCTIVE AUTORADIOGRAPHIC PATTERNS OF GLYCINE INCORPORATION IN RAT ENAMEL AND DENTINE MATRICES. R.W. Young and R.C.Greulich: *Arch. oral Biol.*, 1963, 8, 509-521 (Dept. Anat., Univ. of California Med. Center, Los Angeles, Calif., U.S.A.) [3H]Glycine was first localised in odontoblasts and ameloblasts, reflecting intracellular synthesis of the respective matrix proteins, but was rapidly transferred to the adjacent matrices. In dentine matrix, the labelled material appeared as a discrete, intensely reactive band, which did not decrease in intensity with time. Dentine matrix present prior to the time of [³H]glycine administration did not become labelled. Although enamel matrix labelling also appeared initially

as a band, it soon spread through the thickness of the matrix layer, including that which was present prior to treatment. The mechanism by which this redistribution of enamel matrix protein occurs is not known. The resulting diffuse reaction in enamel matrix was maintained during the time when definitive enamel mineralisation begins, i.e. at the same time that an absolute reduction of enamel matrix mass is assumed to occur.

5140. LIFE CYCLE OF GINGIVAL EPITHELIAL CELLS OF MICE AS REVEALED BY AUTORADIOGRAPHY. G.S.Beagrie and M.R.Skougaard: *Acta odont. scand.*, 1962, 20, 15-31 (Sch. Dent. Surg., Univ., Edinburgh, Scotland) Cells of the gingival epithelium were labelled with [3H]thymidine. Labelled cells were first seen in the basal layer, from which they migrated to the surface. This movement was complete in oral epithelium and in downgrowing oral epithelium by 10-12 days and in epithelial attachment by 1-5 days, depending on the distance between the basal and surface layer.

5141. STRUCTURE OF PULP IN UNERUPTED TEETH. K.Zajusz and W.Zaleski: *Czas. stomat.*, 1962, 15, 261-270 (ZaHlad Stomatol Zachowawczej, Slaska Akad. Med., Zabrze, Poland) 20% of unerupted teeth showed normal pulp. In the remaining cases vacuolar degeneration of odontoblasts, reticular atrophy, pulp ischaemia and deposition of Ca salts were observed; no inflammation or fibrous changes were noted. (Polish) **M.Góra**

5142. EFFECT OF LEMON JUICE ON DIFFERENT TYPES OF TOOTH SURFACE. REPLICA STUDY IN VIVO. F.Mannerberg: *Acta odont. scand.*, 1962, 20, 153-164 (Royal Dent. Sch., MalmB S, Sweden) Different types of tooth surfaces, distinguished by shadowed replicas taken in vivo, react differently after exposure to the juice of lemon. *

5143. PAIN THRESHOLD OF NORMAL HUMAN ANTERIOR TEETH. J.M.Mumford: *Arch. oral Biol.*, 1963, 8, 493-501 (Sch. Dent. Surg., Univ., Liverpool England) When the stimulus had a duration of 10 msec, and a freq. of 50 per second the pain threshold values of normal upper anterior teeth were in the range 0.7-4.5 mAmp. The effect on the current reading of different resistances in the external circuit was determined for different stimulus durations and also the effect on the pain threshold of using different areas of electrode contact.

5144. RELATIVE PROPORTIONS OF SODIUM, POTASSIUM AND CALCIUM IN GINGIVAL POCKET FLUID. B.Krasse and J.Egelberg: *Acta odont. scand.*, 1962, 20, 143-152 (Royal Dent. Sch., MalmB, Sweden) In comparison with blood plasma, an increased content of K was found in pocket fluid from clinically healthy gingivae.

5145. GINGIVAL POCKET: OCCURRENCE, COMPOSITION AND EFFECT. N.Brlik: *Acta odont. scand.*, 1962, 20, Suppl. 32, 1-115 (Royal Dent. Coll., Copenhagen, Denmark) Step-serially sectioned material from gingival pockets previously traversed by fluorescein sodium, was obtained from 2 dogs. No ulcerations could be found, although inflammatory changes were always present. It is concluded that fluid can escape through pocket epithelium formed by a complete sheet of contiguous cells. Extensive review. 196 ref. *

- 5146. THE FAILURE OF A HUMAN SALIVARY MUCIN PREPARATION TO ALTER γ -GLOBULIN MOBILITY.** G.T.Raust and H.M.Myers: Arch, oral Biol., 1963, 8, 587-588. Shoft comm. *
- 5147. HUMAN SALIVA WITH NUCLEAR MAGNETIC RESONANCE. I. PROTON LINE WIDTHS AND SPIN-SPIN RELAXATION TIMES.** E.Odeblad and R.S8remark: Acta odont. scand., 1962, 20, 33-42 (Sabbatsberg Sjukhus, Karolinska Inst., Stockholm 60, Sweden) The line-width was proportional to the concn. of solids in saliva, largely due to the mucin Present. *
- 5148. PROTON MAGNETIC RESONANCE OF HUMAN GINGIVAL TISSUE.** G.Forsslund, E.Odeblad and A.Bergstrand: Acta odont. scand., 1962, 20, 121-126 (Sabbatsberg Sjukhus, Karolinska Inst., Stockholm, Sweden) Prelim, report on the nature and strength of water binding in normal and diseased gingiva. *
- 5149. CYTOCHEMISTRY OF HUMAN ORAL MUCOSA DETERMINATION OF PHOSPHOLIPIDS, PROTEIN-BOUND HEXOSES, MUCOPROTEINS, COLLAGENOUS AND NON-COLLAGENOUS PROTEINS.** D.E.Flieden J. dent. Res., 1962, 41, 112-116 (Dept. Pathol., St. Louis Univ. Sch. Dent., St. Louis, Mo., U.S.A.) Analysis of human oral mucosa revealed no significant changes in the ratios of the components with increasing ^{38}Se . Protein-bound hexoses and mucoproteins were Educated in amount with advancing age. *
- 5150. EFFECTS OF PROCaine CONCENTRATION AND DURATION OF CONTACT ON OXYGEN CONSUMPTION IN BOVINE DENTAL PULP.** A.K.Fisher and C.Schwabe: J. dent. Res., 1962, 41, 484-490 (Coll. Dent., State Univ. Iowa, Iowa City, Iowa, U.S.A.) Aspiration was depressed approx. in proportion to the c_2 ncn. of the drug. The continuing decline in respiration throughout the 5 hr. period suggests that procaine can be Δ thal to tissues if sufficient time is allowed for its a^2 ction. *
- 5151. X-RAY DIFFRACTION ANALYSIS OF EFFECT OF FLUORIDE ON HUMAN BONE APATITE.** A.S.Posner, E.D.Eanes, R.A.Harper and L.Zipkin: Arch. oral. Biol., 1963, 8, 549-570 (Nat. Inst. of Dent. Res., Bethesda, Md., U.S.A.) X-ray diffraction studies were performed on a series of human bones containing varying amounts of F^- . A rise in F^- content was accompanied by an increase in bone apatite crystal size and/or a decrease in C_7 stal strain in a direction perpendicular to the \pm -axis, with no changes in the c -axis direction. Details of criticism of the X-ray methods are given and a new Δ uplate X-ray method is described for obtaining an Δ txrnate of crystallinity of oporly cryst. apatite samples. In Δ ence is furnished to show that F^- substitutes for OH^- in bone apatite phase. It is suggested that the movement of crystallinity results from the increased crystal growth rate due to the higher supersatn. resulting from the presence of F^- in the serum and the final cryst. Phase.
- 5152. UPTAKE AND RELEASE OF VANADIUM FROM γ -ACT HUMAN ENAMEL FOLLOWING $^{48}\text{V}_2\text{O}_5$ APPLICATION IN VITRO.** R.S8remark and N.Andersson: &ta odont. scand., 1962, 20, 81-93 (Kungl. Tandstdf *? r^h gskolan, Stockholm, Sweden) Uptake was studied by autoradiography and scintillation counting.

Release was studied by washing in tap water, physiological saline, 0*05, 0*1 and 10 p.p.m. stable V_2O_5 soln. and dil. H_3PO_4 . *

- 5153. FLUORINE RELEASE FROM ENAMEL.** H.V.LotC Helv. odont. Acta, 1962, 6, 10-14 (ZahnSrztliches Inst., Zttrich, Switzerland) Intact enamel was treated with $O^{\prime}NaF$, pH 4. Fluorine release in subsequent demineralisations was greater in pH 6 buffer than in pH 4 buffer, irrespective of the anion used. Fluorine release increased with temp, and was most rapid at the beginning of exposure.

- 5154. ACTIVITY OF ACID PHOSPHATASES IN SALIVA AND CAVIES PROBLEM.** L.Kozlowska and S.Opaiko: Czas. stomat., 1962, 15, 621-626 (I Klinika Chorob Wewnetrznych, Warszawa, Poland) No correlation was found between the occurrence of caries and the activity of acid phosphatase in saliva of 62 individuals 23-26 yr. old. (Polish) M.Gora

- 5155. EVALUATION OF LABORATORY TESTS FOR ESTIMATION OF CAVIES ACTIVITY: CORRELATION WITH SPECIFIC SURFACES.** M.L.Snyder, D.R.Porter, C.K.Claycomb, W.Sims and F.R.Macho: Arch, oral Biol., 1963, 8, 541-547 (Univ. Oregon Dent. Sch., Portland, Ore., U.S.A.) Two groups of children having high and low caries prevalence were studied for up to 4 yr. Paraffin stim. saliva specimens collected monthly during school year. Correlations made between clinical change and laboratory data from salivary lactobacillus count, Snyder test, Rickles test, (X-amylase and acid buffering capacity. No reliable estimation or prediction of new caries for any of the five surfaces recorded by any of these tests possible for individual. * Group significance was frequently obtained for lactobacillus counts and Snyder tests. *

- 5156. DENTAL CAVIES IN GROUP OF WESTERN AUSTRALIAN CHILDREN. II. INCIDENCE OF DENTAL CAVIES IN CHILDREN AGED 2-6 YEARS.** S.E.Halikis: Aust. dent. J., 1963, 8, 114-122 (6 Hale Str., North Beach, Australia) The incidence and distribution of dental caries is described in a group of 361 children who presented for treatment at the Gustafson Dent. Clinic, Fremantle. J.H.P.Main

- 5157. DENTAL CAVIES IN TWINS. I. COMPARISON OF CAVIES EXPERIENCE OF MONOZYGOTIC TWINS, DIZYGOtic TWINS AND UNRELATED CHILDREN.** S.B.Finn and R.C.Caldwell: Arch, oral Biol., 1963, 8, 571-585 (Univ. Alabama Sch. Dent., Ala., U.S.A.) A study of 35 pairs of monozygotic twins, 31 pairs of dizygotic twins and 25 pairs of unrelated children indicates that there is a genetic component which influences the occurrence of dental caries. Dizygotic twin pairs show a greater variance than monozygotic twin pairs. Unrelated children show a greater variance than either the monozygotic or dizygotic twin pairs, but not significantly so when comparing the latter two groups. There is a greater variance between the dizygotic twin pairs than the monozygotic twin pairs in approximal lesions but not in the pit and fissure type, indicating that there may be a greater genetic component involved with the former type of lesions.

- 5158. RECENT MARINE SOILS AND RESISTANCE TO DENTAL CAVIES.** T.G.Ludwig: Aust. dent. J., 1963, 8, 109-113 (Dent. Res. Unit, N.Z. M.R.C., P.O.

ODONTOLOGY

Box 3155, Wellington, New Zealand) An enhanced resistance to dental caries in children resident in Napier, N.Z. is described as compared to adjoining towns Hastings and Palmerston North. It is suggested that the resistance is due to a caries reducing factor in diet, resulting from an increased intake of vegetables grown on recent marine soils.

J.H.P.Main

5159. INHIBITION OF CARIES IN CHILDREN AFTER 51 YEARS USE OF FLUORIDATED TABLE SALT.

T.M.Marthalen and C.Schenardu: *Helv. odont. Acta*, 1962, 6, 1-6 (ZahnSrztliches Inst., Zflrich, Switzerland)

The DMF surfaces were recorded in 918 children who had consumed fluoridated table salt containing 200 mg./kg. NaF. In children 5-7 yr. old consuming fluoridated salt regularly, the DMF surfaces were significantly lower than in controls. The inhibn. was most pronounced in the prox. and bucco-lingual surfaces, while the occlusal surfaces showed only a small effect.

5160. EFFECT OF LYSOZYME ON EXPERIMENTAL CARIES. H.R.MQhlemann and K.G.KOnig: *Helv. odont. Acta*, 1962, 6, 33-37 (ZahnSrztliches Inst., Zflrich, Switzerland)

Lysozyme at 10, 100 or 1000 p.p.m. in a high sucrose diet, and in the same diet mixed with half its wt. of wheat flour or stock diet was without inhibitory effect on the incidental & initial fissure lesions in 2 independent expt. on rats of 15 and 25 days duration.

5161. ANTISEPTIC COMPOUNDS AND THEIR INTEREST TO ODONTOSTOMATOLOGIA. C.Zearo: *Atti. Acad. med. Lombarda*, 1962, 17, 431-440 (Clinica Odontoiatrica, Univ. Milano, Italy)

A survey of chemotherapeutic compounds used in stomatology is given. Expt. results are also given to show that the 'rinse method' of sampling and counting oral bacteria is better than most other methods in current use.

(Italian) G.N.Godson

5162. THE FREQUENCY DISTRIBUTION OF THE P-M-A INDEX OF GINGIVITIS. K.A.Rosenzweig and Y.Molk: *Arch. oral Biol.*, 1963, 8, 487-492 (Hebrew Univ.-Hadassah Sch. of Dent., Jerusalem, Israel)

The freq. distributions of the factors P^f and M^f of the P-M-A index from a survey of various ethnic groups of school children were compared by rank correlation. The significance of the difference between these non-normal distributions was as a rule identical with that between their means. A non-parametric test was applied to compare the distributions of the weighted P-M-A index ($P+2M+3A$) of Jewish and Arab children, with and without mal-occlusion. It is concluded that for distributions deviating very much from normal the application of non-parametric tests is more adequate and facilitates a more refined analysis.

5163. BLOOD SUPPLY OF PERIODONTAL TISSUE IN CHRONIC MARGINAL GINGIVITIS STUDIED WITH ^{24}Na . V.Doktorov and J.Vitek: *Csl. Stomat.*, 1963, 63, 225-229 (Státne sanatorium, Bratislava, Czechoslovakia)

The clearance of ^{24}Na was followed for 25 min. after injn. into the labial marginal gingiva. In 5 subjects with normal gingivae, the half-time of disappearance was 4-22 min.; in 7 subjects with recent gingivitis, 6-30 min. In 3 subjects with gingivitis of over 4 yr. standing the clearance was very slow.

(Slovakian, English summary) C.P.Wallis

5164. HISTOCHEMICAL TESTS FOR ENZYMES IN HYPERTROPHIC GINGIVITIS. J.Zdenek and P.Milan:

Czas. stomat., 1962, 15, 179-184 (Univ. Karola w Hradcu Kralove, Czechoslovakia)

No significant differences were revealed on histochem. examination of various forms of gingival hypertrophy. Inflammation or a generally intensified metabolism is responsible for the observed changes. The activities of alk. phosphomonoesterase and leucine aminopeptidase are increased whereas that of acid phosphomonoesterase was pronounce only in the case of marked proliferation of epithelium. The activity of non-sp. esterases was observed only in the cells.

(Polish)

5165. INITIAL CALCULUS FORMATION RATE ON FOB

H.E.Schroeder and T.M.Marthalen: *Helv. odont. ACE*, 1962, 6, 38-41 (ZahnSrztliches Inst., ZOrich, Switzerland)

The formation of calculus deposits was studied with the aid of foils attached to the lower central incisors of 5 students for periods of 4 or 12 days. The mean calculus formation rate was the same in each case. In individuals the rate was both increased and decreased by changing foils every 4 days. Both ash and total P content of dried deposits increased when calculus formation was left undisturbed for 12 days.

5166. EFFECTS OF POTENTIAL INHIBITORS ON EARLY CALCULUS FORMATION. H.E.Schroeder, T.M.

Marthalen and H.R.MQhlemann: *Helv. odont. Acta*, 1962, 6, 6-9 (ZahnSrztliches Inst., Zflrich, Switzerland)

Summary of earlier paper in German (see I.A.B.S., 1962, 27, 2087).

C.P.Wallis

5167. DENTAL CALCULUS IN GERM-FREE RATS.

B.E.Gustafsson and B.Krasse: *Acta odont. scand.*, 1962, 20, 135-142 (Karolinska Inst., Stockholm, Sweden)

Germ-free and conventional rats on a sterilised cake-type diet showed roughly the same amount of calculus-like deposit. Conventional animals on non-sterilised mash-type diet had considerably more deposit*

5168. BIOPHYSICAL STUDIES ON DENTAL CALCULUS FROM GERM-FREE AND CONVENTIONAL RATS.

J.-E.Glas and B.Krasse: *Acta odont. scand.*, 1962, 2, 127-134 (Dept. Med. Physics, Karolinska Inst., Stockholm, Sweden)

Calculi were investigated by light microscopy, microradiography, and X-ray diffraction. Deposits of germ-free origin showed a well-ordered internal structure of thin lamellar sheets of varying mineral content running approx. parallel to the enamel surface. Calculi from conventional rats had essentially the same internal structure, but a less regular appearance. The inorg. fraction was apatite in all cases.

5169. HISTOLOGICAL EFFECTS OF COLLAGEN AND CHONDROITIN SULPHATE AS CAPPING AGENT IN AMPUTATED RAT MOLAR PULPS. B.LJohansson,

L.Persson and P.Manera: *Arch. oral Biol.*, 1963, 8, 503-507 (Forsyth Dent. Infirmary, Boston, Mass., U.S.A.)

Collagen and chondroitin sulphate were tested for their ability to stimulate healing and bridge formation when applied to an exposed rat molar pulp. They produced some retardation in the bridge formation compared to $\text{Ca}(\text{OH})_2$.

5170. CLOSURE OF SECONDARY PALATE. V. TERAT^O GENIC ACTION OF CORTISONE IN MICE.

K.S.Larss^O: *Acta odont. scand.*, 1962, 20, 1-13 (Dept. Anat., Karolinska Inst., Stockholm, Sweden)

Cleft palate without cleft lip was induced in mouse embryos of the A/Jax strain by injecting cortisone into the mothers on

11th-14th days of pregnancy. Methylandrostenediol, given concurrently caused all die embryos to be resorbed. Methylandrostenediol alone resulted in cleft palate of the same type as that produced by cortisone, but in only 5-7% of the embryos judged to have been alive on the 18th embryonic day. Administration of vit. B6 reduced the incidence of resorption but not of cortisone-induced cleft Palate. •

5171. VARIATION OF DEFICIENCY OF TOOTH GERMS.

A.Masztalerz: Czas. stomat., 1962, 15, 855-859
 (Katedra Ortodoncji, Akad. Med., Wroclaw, Polish)
 Examination of 100 neolithic skulls, 147 skulls from XVn-XVm century, 59 Australian skulls, 46 skulls of black and 25 of yellow race did not show any significant difference in the freq. of tooth germ deficiency. Reduction in no. of teeth took place a long time ago and is probably not connected with civilisation process or lipitation in the use of maxilla. (Polish) M.Gora

5172. INTERNAL RESORPTION OF TOOTH ⁵INTERNAL ODONTOLYSIS¹. R.Zofia: Czas. stomat., 1962, 15, 603-611 (Klinika Stomatologii Zachowawczej, Akademia Medyczna, Warszawa, Poland) 10 cases of internal resorption of tooth were revealed on examination of 50000 radiograms. Histopathological examination showed fibrous pulp granuloma in areas of focal resorption. Ossecus or osseous-like tissue was deposited on the

walls of resorption lacunae. The less advanced cases could be cured by the conventional methods. The traumatic aetiology of the process seems to be the most probable. (Polish) M.Gora

5173. MORPHOLOGICAL AND FUNCTIONAL STUDIES OF MUSCLES OF MASTICATION IN VARIOUS MALOCCLUSIONS. G.H. Schumacher: Dtsch. Zahn-, Mund-u. Kieferheilk., 1963, 39, 177-207, 272-297, 360-376, 376-392 (Gertrudenstr. 9, Rostock, Germany) Dissections of the muscles of mastication and temporomandibular joint of 5 subjects of 50-72 yr. and one of 9 yr. with various malocclusions are described. In 10 adults the cross sectional area, length and wt. of each muscle were measured, and the relative contributions to movements of the mandible were estimated.

5174. PROSPECTS AND REALITIES IN ANTI-ENZYME THERAPY IN ODONTOSTOMATOLOGIA. CZearo: Atti. Acad. med. Lombarda, 1962, 17, 423-430 (Clinica Odontoiatrica Uiiiv. Milano, Italy)
 Review. 37 ref. (Italian) G.N.Godson

5175. ACETYLCHOLINESTERASE ACTIVITY IN THE MASSETER OF THE RAT. G.Cimasoni, J.W.Smudski, H.M.Myers and G.L.Ellman: Arch. oral Biol., 1963, 8, 467-469 (Dent. Sch., Univ. Geneva, Switzerland)
 Short comm. r ***

BIOCHEMISTRY

CARBOHYDRATES

- 5176. PHOSPHATE COMPOUNDS OF THE CANINE ERYTHROCYTES AS THE INTERMEDIATES AND CO-ENZYMES OF CARBOHYDRATE METABOLISM.** J.Chmiel: Pozn. Towarzy. Przyjac. nauk. Wydz. Iek., 1962, 22, 5-60 (ZaK*ad Chemii Fizjol., Akad. Med., Poznai, Poland) It was found that 2,3-glyceric acid diphosphate constitutes *SQPo* of all phosphate compounds in the dog r.b.c. In high amounts occur also ATP, inorg. phosphates and hexose diphosphates. The adenine nucleotides dominate among free nucleotides. Neither sedoheptulose nor ribose 5-phosphate can be revealed. Comparing with human erythrocytes dog r.b.c. contain less ATP and more NADP; lactic acid could not be detected. The modified Bartlett method was used for chromatographic separation of phosphate compounds on Dowex I using formate buffer. (Polish) T.GJfebicki
- 5177. REOXIDATION OF NADPH₂ IN MUSCLE WITH INCREASED G 6-P-DEHYDROGENASE AND 6 PG-DEHYDROGENASE ACTIVITIES.** F.Rossi, M.Zatti and A.Tartarini: Sperimentale, 1963, 113, 15-23 (Ist. Patol. Gen., Univ. Podova, Italy) It was previously shown that in atrophic muscles (denerveved) there was an increase in glucose 6-phosphate dehydrogenase and 6-phosphogluconate-dehydrogenase. It is now shown that atropic muscles have an increased rate of incorporation of [¹⁴C]acetate into lipid. This suggested a correlation between the activity of the pentose phosphate pathway and the synthesis of fat which stimulates glucose oxidation by way of NADP dependent dehydrogenases, by utilising the reduced NADPH₂*. It was shown that lactic dehydrogenase with pyruvic acid acting as NADPH₂ hydrogen acceptor does not provide the driving force whereby more glucose 6-phosphate can be oxidised. (Italian) G. N. Godson
- 5178. MOVEMENT OF WATER-SOL. MATERIAL IN MAYER'S ALBUMIN AND A SIMPLIFIED DRY-MOUNTING METHOD FOR AUTORADIOGRAPHY.** T.C.Smitherman, A.F.Debons, J.A.Pittman and V.Stephens: Nature, Lond., 1963, 198, 499-500 (V.A.Hosp., Radioisotope Service, Univ. Alabama Med. Center, Birmingham, Ala., U.S.A.) The distribution of sucrose labelled with ¹⁴C in thyroid slices was investigated by an autoradiographic technique involving a mounting procedure without exposure to water or water-miscible material. Sucrose appeared in the extrafollicular spaces. G.M.Lewis
- 5179. SEPARATORY DETERMINATION OF ALDONO-OR URONO-LACTONE AND THE CORRESPONDING ACID IN THEIR MIXTURE.** M.Kawada: J. Biochem., Tokyo, 1963, 53, 323-325 (Dept. Biochem., Fac. Med., Univ. Tokyo, Japan) The difference in the speeds of periodate oxidation of acids and their lactones was used. B.M. Stevens
- 5180. INTERACTION OF CARBOHYDRATES WITH HYDROGEN PEROXIDE AT LOW TEMPERATURE.** G.J.Moody: Nature, Lond., 1963, 198, 781-782 (Dept. Chem., Welsh Coll. Advanced Technol., Cardiff, Wales). G.M.Lewis
- 5181. METABOLISM OF ACETATE AND GLUCOSE BY THE ISOLATED PERFUSED UDDER. II. THE CONTRIBUTION OF ACETATE AND GLUCOSE TO CARBON DIOXIDE AND MILK CONSTITUENTS.** D.CHardwick,

J.L.Linzell and T.B.Mepham: Biochem. J., 1963, 88, 213-220 (A.R.C. Inst. Animal Physiol., Babraham, Cambridge, England) Glucose, acetate and amino acids with [^{U-14}C]glucose or [2-¹⁴C]acetate were infused for 6-9 hr. into four perfused goat udders. Of the expired CO₂, 39% came from added glucose and 14% from acetate. In the milk 77% of lactose, 23% of triglyceride glycerol, 0.5% of triglyceride fatty acids and 41% of citrate came from added glucose, whereas 0.3% of lactose, 2% of glycerol, 48% of fatty acids and 33% of citrate came from added acetate. Milk fat was labelled later than other constituents. The different extent of labelling of citrate and fatty acids from glucose is discussed. *

5182. TIME COURSE OF UTILISATION OF RADIO-GLUCOSE BY TISSUE IN CULTURE. W.Rficker, E.Broda, G.Kellner and J.Frimmel: Exp. Cell. Res., 1963, 29, 17-30 (Inst. Phys. Chem., Univ. Vienna, Austria) The utilisation of glucose/cell and hr. for glycolysis decreased, and for respiration increased, with increasing no. of cells/roller tube and with increasing time, as studied with chick mesenchyma cells and HeLa cells. The amount of free energy available to the single cells of mesenchyma/hr. did not change, while the total supply of free energy to the single HeLa cell fell off with time. A possible explanation is given for the fact that HeLa relies for its energy supply on aerobic glycolysis rather than on respiration to a higher extent.

KJones
5183. FERMENTATION OF LACTOSE BY CELL-FREE EXTRACTS OF BACILLUS ANTHRACIS. B.R.Chatterjee and R.P. Williams: Nature, Lond., 1963, 198, 909-91* (Dept. Microbiol., Baylor Univ. Coll. Med., Houston, Tex., U.S.A.) Cell-free extracts of *B. anthracis* showed α -galactosidase activity when tested against lactose and α -nitrophenyl- β -galactopyramoside, although the intact cells cannot hydrolyse lactose. *Salmonella typhosa* and *Pseudomonas aeruginosa* showed no β -galactosidase activity in cell-free extracts, and presumably do not synthesise the enzyme. G.M.Lewis

5184. METABOLIC INTERRELATIONS OF GLUCOSE AND LACTATE IN SHEEP. E.F.Annison, D.B.Lindsay and R.R. White: Biochem. J., 1963, 88, 243-248 (Sch. Rural Sci., Univ. New England, Armidale, N.S.W., Australia) An isotope-diln. technique was used to measure entry rates of lactate in sheep after the const. infusion of L-(+)-[¹⁴C]lactate. Values were 1.2 ± 0.14 (five animals) mg./min./kg. in sheep starved for 24 hr. and 1.7 ± 0.14 (four animals) mg./min./kg. in the period 2-4 hr. after feeding. There was a significant correlation between entry rate and blood lactate concn. Comparison of the sp. radioactivities of blood lactate and plasma glucose during the infusion of [¹⁴C]glucose or [¹⁴C]lactate indicated that about 6% of glucose was recycled through glucose-lactate interconversion, and this value was supported by a study of the relocation of ¹⁴C during the infusion of [6-¹⁴C]glucose. From the low labelling of liver and muscle glycogen after the infusion of [¹⁴C]-glucose or [¹⁴C]lactate it was suggested that glucose-lactate interconversion was not by the Cori cycle. It is concluded that glucose-lactate interconversion does not affect previous estimates of carbohydrate requirement in sheep, based on the measurement of the entry rate of glucose. *

5185. SOME EXPERIENCE WITH A COLORIMETRIC METHOD FOR THE DETERMINATION OF GLUCOSE &

BIOLOGICAL FLUIDS. J.A.P.Stroes, H.A.Zondag and Pj.H.C.Cornelissen: Clin. chim. Acta, 1963, 8, 152-154 (Clin.<:hem. Lab., St. Elizabeth's Hosp., Haarlem, Netherlands) The phenylhydrazine method for determination of glucose in biol. fluids is recommended for routine analysis because of its rapidity.

K.Brew

5186. HEXOSAMINE CONTAINING COMPOUNDS IN PLANT LEAVES. B.N.Gladyshev: Biokhimiia, 1963, 28, 210-215. Hexosamine containing compounds of Uropolysaccharide type were isolated from the leaves of haricot beans and potato plants. A method was developed for isolation of lipopolysaccharides in higher plants, involving extraction of dry leaves with boiling acidified ^a0% ethanol, pptn. of a composite complex of substances ^bY cooling at 4-6°, and isolation of lipopolysaccharides ^bY treating this complex with a mixture of water and Phenol. (Russian) BJ.Cooper

5187. SEVERAL NEW SUGARS IN THE VINE AND IN WINE. M.J.Carles: C.R. Acad. Sci., Paris, 1962, 255, 4, 761-763 (Lab. Physiol. vegetale, Inst. Catholique, Toulouse, France) Expt. on the vine showed that besides glucose, fructose and sucrose, raffinose and stachyose occurred regularly and in relative Sundance. Expt. with wine showed that besides fructose and glucose, ribose, galactose, xylose, etc. also were Present. (French) J.M.Thomas

5188. NOTE ON SEASONAL OCCURRENCE OF FORBITOL (D-GLUCITOL) IN BUDS AND LEAVES OF MALUS. J-M.Whetter and C.D.Taper: Canad. J. Bot., 1963, 41, 175-177 (Dept. Hort., Macdonald Coll, Quebec, Canada). A.Meany

5189. DETERMINATION OF SORBITOL AS ITS HKA-ACETATE BY GAS LIQUID CHROMATOGRAPHY USING IONISATION DETECTOR. J.A.Hause, J.A. Hubicki and G.G.Hazerc: Analyt. Chem., 1962, 34, 1567-1570 (Process Devel. Labs., Merck Chem. Div., ^ Merck and Co. Inc., Danville, Pa., U.S.A.) This Method is simple and reliable for the determination of ^snitol in mixtures. Mannitol was used as an internal standard which minimised the variable detector response. The error was about 1%. The method could be used for simultaneous determination of mannitol and sorbitol by use of another standard. L.G.Gilnes

5190. BIOSYNTHESIS OF PARAMYLON IN EUGLENA GRACILIS. S.H.Goldemberg and L.R.Marechal: Buchim. biophys. Acta, 1963, 71, 743-744 (Inst. Invest. Bioqufm. Fund. Campomar, Buenos Aires, Argentina) An enzyme extracted from E^{gracj} synthesized paramylon from UDP glucose. Prelim. comm. B.M. Stevens

5191. PAPER CHROMATOGRAPHIC ESTIMATION OF [^]ASCORBIC AND D-ARABOASCORBIC ACIDS. T.Miki, N.Kikuchi and Y.Sahashi: J. Vitaminol., 1962, 8, 279-285 (Dept. Agric. Chem., Fac. Agnc. Kyōto Agric. Univ., Chitose, Tokyo, Japan)

5192. A chromatographic separation (ascending method) at [^]ture of L-ascorbic and D-araboascorbic acids was carried out using papers impregnated with 37° metapnosic acid and water-sat, methyl ethyl ketone as a solvent system. After spraying with indophenol soln. 3-40 min. Per spot of each isomer became clearly distinguishable per spot. of each isomer. Neglecting both acids being ^aed, the difference in Rf values for both acids liquids approx. 0.1. The effects of moisture and partition in the stationary phase were studied, also the

influence of some carbohydrates and their deriv. on the separation of the isomers. After separation, the isomers were estimated using 2:4-dinitrophenyl hydrazine.

E.Parkinson

5192. GLUCOSE TOLERANCE AND SYNTHESIS OF HEPATIC GLYCOGEN FROM GLUCOSE AND [1-14C]-GLYCINE IN TUBERCULOUS GUINEA-PIGS. V.N.Singh, T.A.Venkatasubramanian and R.Viswanathan: Arch. Biochem., 1963, 101, 229-233 (Vallabhbhai Patel Chest Inst., Univ. Delhi, India) Tuberculous animals showed a marked depletion of hepatic glycogen, an appreciable decrease in hepatic glycogenesis and a lowered glucose tolerance. In vivo incorporation of ¹⁴C from [1-14c]glycine into hepatic glycogen tended to be increased. B.M. Stevens

5193. GLYCOGEN SYNTHESISING AND DEGRADING ENZYMES OF GUINEA-PIG LIVER IN EXPERIMENTAL TUBERCULOSIS. V.N.Singh, U.Bhargava, T.A.Venkatasubramanian and R.Viswanathan: Arch. Biochem., 1963, 101, 234-239 (Vallabhbhai Patel Chest Inst., Univ. Delhi, India) UDP-glucose-glycogen transglucosylase, phosphorylase and phosphoglucomutase activities were decreased and glucose 6-phosphatase activity was increased in tuberculous animals. The decrease in UDP-glucose-glycogen transglucosylase activity was sufficiently great to account for the depletion of hepatic glycogen. B.M.Stevens

5194. GLYCOGEN METABOLISM IN EMBRYONIC CHICK AND NEONATAL RAT LIVER. F.J.Ballard and I.T. Oliver: Biochim. biophys. Acta, 1963, 71, 578-588 (Dept. Biochem., Univ. Western Australia, Nedlands, Australia) UDP-glucose [UDPG] a-glucan glucosyl transferase, a-glucan phosphorylase, glucose 1-phosphate uridyl transferase and phosphoglucomutase activities increased throughout the glycogen synthesis period in embryonic chick and foetal rat livers. UDPG a-glucan glucosyl transferase activity in rats appeared when glycogen synthesis began, a-glucan phosphorylase increased 2-fold in the 24 hr. after birth when liver glycogen was utilised. Phosphoenolpyruvate was synthesised from malate in embryonic chick and postnatal rat liver but not in foetal rat liver. Incorporation of [14c]glucose and [¹⁴C]pyruvate into glycogen in liver slices also indicated that rats developed glycogenetic activity only after birth. In chicks, glycogenetic enzymes were present by the eleventh day of incubation.

B.M.Stevens

5195. URIDINE DIPHOSPHATE GLUCOSE [UDPG] MECHANISM OF GLYCOGEN SYNTHESIS IN HUMAN LEUCOCYTES. LF.Seits, LS.Luganova and A.D.Vladimirova: Biokhimiia, 1963, 28, 295-302. UDPG was detected in human w.b.c: up to 0.1 jmol./ml. wet cells. Active UDPG-pyrophosphorylase and UDPG-glycogen transferase were also found in the cells, as were active hexokinase, phosphoglucomutase and glucose 6-phosphate dehydrogenase. Similar results were obtained in the study of human platelets.

(Russian) BJ.Cooper

5196. PARTICIPATION OF SARCOTUBULAR SYSTEM IN GLYCOGEN METABOLISM. E.Andersson-Cedergren and U.Muscatillo: J. ultrastructure Res., 1963, 8, 391-401 (Anat. Dept., Karolinska Inst., Stockholm, Sweden) The fraction of frog skeletal muscle homogenate which was derived from the sarcotubular system contained much protein-bound glycogen. Aggregates of glycogen particles were also found after EDTA treatment of the sarcotubular fraction. This fraction also contained UDPG-glycogen

BIOCHEMISTRY

synthetase. It was concluded that the sarcotubular system was directly involved in the glycogenogenesis of the muscle cell.

H. B. Waynfirth

5197. PHYSICOCHEMICAL PROPERTIES OF OX-BRAIN GLANGLIOSIDES. D.B.Gammack: Biochem. J., 1963, 88, 373-383 (Dept. Biochem., Inst. Psychiatry, Maudsley Hosp., London, England) Gangliosides isolated from ox-brain grey matter in a high state of purity were separated into 5 components on thin-layer chromatography. They formed micelles in aq. soln. with micellar weights of about 300000 determined from sedimentation, diffusion and viscosity data. In the ultracentrifuge isolated fractions behaved differently from the whole prep. A critical micelle concn. of 0*015% was observed from surface-tension measurements. A minimum mol. wt. of 1500 was estimated from sedimentation in NN-dimethylformamide and an equiv. wt. of 1520 was obtained by titration. Interaction of ganglioside micelles with small ions, dyes and other lipid micelles was observed.

5198. CONTENT OF EXTRACTABLE GLANGLIOSIDES IN RAT BRAIN DURING ETHANOL INTOXICATION.

H.-M.H2kkinen and E.Kulonen: Nature, Lond., 1963, 198, 995 (Res. Lab. the St. Alcohol Monopoly, Helsinki, Finland) The content of extractable N-acetylneuraminic acid in rat brains during ethanol intoxication increased from 0.188 to 0*211 pmoles/100 mg. fresh wt.

G.M.Lewis

5199. OCCURRENCE OF INORGANIC POLYPHOSPHATE HEXOKINASE IN SOME MICRO-ORGANISMS.

M.Szymona and S.Kulesza: Acta microbiol., pol., 1962, 11, 287-300 (Akad. Med., Lublin, Poland) A new type of kinase, phosphorylating glucose at the expense of inorg. phosphate, has been revealed in the following 7 strains of Mycobacterium: tuberculosis, H37Ra[#] BCG, smegmatis, phlei, tTilmrgensis, pelligri_{no}, atypicum 410. Specific activity of the kinase varied from 5 to about 30 $\mu\text{M}/\text{hr.}/\text{mg}$. of protein. Phosphorylation of glucose in the presence of ATP was less effective. The acetone powders and the cell-free extracts from S. cerevisiae, Aspergillus niger, E. coli and Aerobacter aerogenes were inactive towards inorg. polyphosphates.

M.Korbecki

5200. HEXOKINASE IN HEALTHY AND IN DIABETIC RABBITS. M.P.Fomina: Biokhimiia, 1963, 28, 232-237. Approx. 10-15% of the total homogenate hexokinase activity was found in isolated rabbit hepatic mitochondria. The enzyme was mainly localised in the hyaloplasm (85-90%). However, the ratio of hexokinase activity to protein content in isolated mitochondria was about 1*5 times lower than in the fraction of hyaloplasm plus microsomes. Inhibn. of the hexokinase reaction in liver extracts of rabbits with alloxan diabetes was mainly due to inhibn. in the hyaloplasm; its depression in the mitochondria was much less marked. 1 $\frac{1}{2}$ -2 hr. after administration of insulin to the diabetic rabbits there was a slight increase in hexokinase activity in the hyaloplasm, while it was almost completely restored in the mitochondria.

(Russian) B.J.Cooper

5201. COMPARATIVE STUDY OF GLUCOSE 6-PHOSPHATE DEHYDROGENASE IN MAMMALS. B.Ramot and S.Baumingen: Biochim. biophys. Acta, 1963, 73, 186-192 (Dept. HaematoL, Tel-Hashomer Government Hosp., Tel-Hashomer, Israel) Neutralising Ab against human r.b.c. glucose 6-phosphate dehydrogen-

ase were produced in rabbits by 2 immunisation techniques. Differences in amount of cross reaction between these antisera and enzymes from different sources were found. An enzymically inactive glucose 6-phosphate dehydrogenase fraction¹ obtained from r.b.c. of enzyme 'deficient' human subjects absorbed the Ab. Electrophoresis on starch gel indicated differences in glucose 6-phosphate dehydrogenases from different spp. No differences in kinetic prop. were found amongst the various glucose 6-phosphate dehydrogenases.

B.M.Stevens

5202. AN IMPROVED MICROMETHOD FOR DETERMINATION OF GLUCOSE 6-PHOSPHATASE ACTIVITY. T.R.Ricketts: Clin. chim. Acta, 1963, 8, 160-162 (Dept. Chem. Pathol., Leeds Univ., England).

K.Brew

5203. ALTERATION OF FRUCTOSE-t6-DIPHOSPHATASE ACTIVITY IN CALF KIDNEY CELLS IN TISSUE CULTURE. H.Friedrich-Freksa, H.Kneser and P.Bbrner: Z. Naturforsch. B, 1963, 18, 224-228 (Max-Planck-Inst. Virusforsch., Ttlbingen, Germany) The fructose t6-diphosphatase [FDP] activity of calf kidney cells in tissue culture fell by 1/100 during 4-7 days; aldolase activity fell only slightly. The ratio of FDPase activity to aldolase activity was about 1:1 again after 3 months and about 1:2 after 6 months whereas the ratio in mouse fibroblast cells and HeLa was about 1:30.

(German) J.C.Crawhall

5204. ENZYMIC DEPHOSPHORYLATION OF SOME PHOSPHORIC ESTERS. P.Segni: Biochim. appl., 1962, 9, 283-302 (1st. Chim. Biol., Univ. Genoa, Italy) The dephosphorylation of G-I-P, F-I, 6-diP and sedoheptulose-1,7-diPhosphate [S-I, 7-diP] was studied with various enzyme prep. obtained from the rat. G-I-P was converted to G-6-P before dephosphorylation. F-I, 6-diP was first converted to F-6-P. A specific enzyme for conversion of S-I, 7-diP to S-7-P was isolated from yeast and its prop. studied.

(Italian) J.C.Crawhall

5205. ELECTROPHORETIC LOCALISATION OF AMYLASES & BY TWO DIMENSIONAL TECHNIQUES. D.Vincent and G.Segonzac: C.R. Soc. Biol., Paris, 1962, 156, 2133-2135 (Lab. Matière méd., Fac. Méd., Toulouse. France) Amylases were separated by continuous 2 dimensional electrophoresis on paper at pH 8*6, 120-230 V and 5-10 mA. The delivery rate of samples was 0*07 ml./hr. The amylases studied (human serum and saliva, pancreatin and standard amylases) migrated between & -globulins and y-globulins.

(French) M.A.Price

5206. ENZYMIC DIGESTION OF FIBRE IN COCONUT CAKE. K.Ramamurti and D.S.Johan: Nature, Lond., 1963, 198, 481-482 (Central Food Technol. Res. Inst" Mysore, India) The enzymic digestion of fibre in coconut cake through the action of cellulases from Myrothecium verrucaria, Stachybotrys atra and "Takamine cellulase" was studied! About 40% decomposition was the max. attained under the expt. conditions studied.

G.M.Lewis

5207. STUDIES ON GALACTOSIDASES. XI. SIZE AND SHAPE OF 3-GALACTOSIDASE FROM E. COLI.

H.Sund and K.Weber: Biochem. Z.f 1963, 337, 24-34 (Chem. Lab., Univ. Freiburg i.Br., Germany) The mol. wt. of 3-galactosidases from 2 mutants of E. coli were determined. The sedimentation coeff.

$D_0^{(S)} = 201w$ and the diffusion coeff. D_{201w}^0 are 16.14S and 3.13F for the enzyme from the mutant NiL35 ($i^+y^-z^+$) and 15.93jS and 3.12F for the enzyme from the mutant

($i''y+z+$). The mol. wt. of ML35 was calc. to be 521000 and that of ML309 to be 516000. The enzyme from *E. coli* was thought to have an average mol. wt. of 518000 and to possess an oblate shape with an axial ratio of 5²4-5²9.

(German) L.Cohn

5208. DEGRADATION OF COTTON CELLULOSE BY THE EXTRACELLULAR CELLULASE OF MYROTHECIUM VERRUCARIA. II. THE EXISTENCE OF AN 'EXHAUSTIBLE' CELLULASE. K.Selby, C.C.Maitland and K.V.A. Thompson: *Biochem. J.*, 1963, 88, 288-289 (Shirley Inst., Didsbury, Manchester, England) The cellulolytic activity of cell-free culture filtrates from *M. verrucaria* has been measured by their ability to weaken and to solubilise unswollen cotton. A single application of filtrate could only produce a limited loss of strength but repeated applications caused complete loss and substantial (27%) solubilisation. This was shown to be due to the renewal of a cellulase which is necessary for the extensive degradation of unswollen cotton but is lost during attack. Another more stable 'cellulase' could attack cotton but to a very limited extent, its action being otherwise restricted to swollen or sol. cellulosic materials.

5209. POLYSACCHARIDES OF YEAST-LIKE ORGANISMS. N.P.Elinov and G.A.Vitovskia: *Biokhimiia*, 1963, 28, 312-315. The composition of polysaccharides of 15 spp. of yeast-like organisms was studied. The prep. isolated from non-pigmented organisms contained mostly β -mannose and smaller amounts of glucose, while those from pigmented organisms contained galactose, and to a lesser extent glucose and mannose.

(Russian) B.J. Cooper

5210. SLIME POLYSACCHARIDES OF THE ENTEROBACTERIACEAE. E.S.Anderson and A.H.Rogers: *Nature*, Lond., 1963, 198, 714-715 (Enteric Reference Lab., Publ. Hlth. Lab. Serv., Colindale Ave., London, England) Slime polysaccharides were prep. and purified from *Salmonella paratyphi B*, *S. dublin*.

^Jeversoir and *E. coli*. They were similar in composition, consisting of glucose, galactose, fucose and an α -diblouronic acid and were serol. related. Slime production appeared to be stimulated by a high external P_2O_5 and varied inversely with humidity; it may be a protective mechanism.

G.M.Lewis

5211. SYNTHESIS OF CHITIN IN CELL-FREE EXTRACTS OF PRODENIA ERIDANIA. E.Jaworski, L.Wang and G.Marco: *Nature*, Lond., 1963, 198, 790 (Agric. Chem. Div., Monsanto Cem. Co., St. Louis, Mo., U.S.A.) [¹⁴C]Uridine-diphospho-N-acetylglucosamine was incorporated by chitin synthetase in cell-free extracts of *P. eridania* at various stages of development. Peak of activity coinciding with the prepupal stage at which substantial amounts of chitin would be required for the pupal casing.

G.M.Lewis

5212. SOME BIOCHEMICAL CHANGES IN BLOOD AFTER DEXTRAN ADMINISTRATION. L.Triner and M.Mráz: *Physiol. Bohem.*, 1963, 12, 128-135 (Inst. Pharm., Charles Univ., Prague, Czechoslovakia) The blood levels of proteins, neutral lipids, non-esterified fatty acids and Ca in rats, and protein and Ca level in rabbits after i.v. injection of dextran (2.5 ml./100 g. S.). This diminution is accentuated by previous withdrawal of 15 ml. of blood from the expt. animal. The dextran-induced fall of Ca can be prevented by i.v. injn. of Ca^{2+} .

M.S.Laverack

5213. CHARACTERISATION OF CARBOHYDRATE SULPHATES BY ACID HYDROLYSIS. D.A.Rees:

Biochem. J., 1963, 88, 343-345 (Dept. Chem., University, Edinburgh, Scotland) The rates of acid hydrolysis have been compared under standard conditions for a no. of carbohydrate sulphates. A wide range of values is found, suggesting that this rate might be useful for characterisation purposes. It appears that the esters of axial secondary hydroxyl groups are more stable than those derived from equatorial secondary hydroxyl groups, and that the sulphates of primary alcohols are more stable than those of either class of secondary alcohol.

5214. PURIFICATION AND PROPERTIES OF AVIAN NEURAMINIDASE. G.L.Ada: *Biochim. biophys. Acta*, 1963, 73, 276-284 (Hall Inst., Royal Melbourne Hosp., Melbourne, Australia) Washed chorioallantois from 19 day old chick embryos were subjected to mild extraction, heat treatment, $(\text{NH}_4)_2\text{SO}_4$ pptn. and column chromatography on hydracylapatite. The final neuraminidase prep. was approx. 200-fold purer than the starting fluid. The prep. was stable at 0° but not at 37°. j^2 was approx. 3*3. SH reactants inactivated. Optimum pH for activity on sialyl lactose, fetuin and ovine submaxillary gland mucin was between 4 and 5. Km and max. rates of action on these substrates were determined.

B.M.Stevens

5215. STAINING OF SULPHATED POLYSACCHARIDES BY MEANS OF ALCIAN BLUE. K.Yamada: *Nature*, Lond., 1963, 198, 799-800 (Dept. Anat., Nagoya Univ., Nagoya-Shi, Japan) The stainability by Alcian Blue of films of chondroitin sulphate C, heparin, glycogen sulphate, amylose sulphate, cellulose sulphates and glycogen was compared. The degree of staining depended largely on the sulphate groups and was decreased by methylation or acetylation.

G.M.Lewis

5216. N-ACETYLATION OF GLUCOSAMINE 6-PHOSPHATE IN EPIPHYSEAL PLATE HOMOGENATES. V.Pedrini, L.Lenzi and V.Zambotti: *G. Biochim.*, 1962, 11, 287-294 (Inst. Chim. Biol., Univ. Milan, Italy) Acetylation of glucosamine, glucosamine 6-phosphate and galactosamine by extracts of epiphyseal cartilage from new born pigs was studied, and only occurred on addition of acetyl CoA. The extracts acetylated glucosamine 6-phosphate mainly, (which the tissue synthesised from glucose 6-phosphate and glutamine) glucosamine in smaller amounts, and galactosamine was not acetylated in detectable amounts.

B.Payne

5217. EFFECT OF GLUTAMIC AND GLUCOSE 6-PHOSPHATE ON THE INCORPORATION OF $^{35}\text{SO}_4^{2-}$ IN CHONDROITIN SULPHATE. A.A.Castellani, C.Ferrari, S.Ronchi, A.Crespi and V.Zambotti: *G. Biochim.*, 1962, 11, 317-325 (Inst. Chim. Biol., Univ. Pavia, Italy) Homogenates of metaphysis cartilage of new-born pig containing ATP, cysteine and MgCl_2 synthesised chondroitin sulphate, addition of glutamine or glucose 6-phosphate stimulated incorporation of $^{35}\text{SO}_4^{2-}$. Simult. addition of both compounds produced further increase in incorporation. It is concluded that glutamine stim. incorporation of $^{35}\text{SO}_4^{2-}$ by increasing biosynthesis of hexosamine 6-phosphate which in turn increased formation of chondroitin sulphate.

B.Payne

5218. IDENTIFICATION OF URONIC ACIDS IN MUCO-POLYSACCHARIDES. B.Radhakrishnamurthy and G.S. Berenson: *Arch. Biochem.*, 1963, 101, 360-362 (Dept. Med., Louisiana State Univ. Sch. Med., New Orleans, La., U.S.A.) Isolation and identification of uronic acids from acid mucopolysaccharides was achieved

BIOCHEMISTRY

by hydrolysis with formic acid and chromatography of the hydrolysates. B.M. Stevens

5219. PURIFICATION AND PROPERTIES OF 3-1,3-GLUCANASE FROM THE 'LYTIC ENZYME OF BACILLUS CIRCULANS. K.Horikoshi, H.Koffler and K.Arima: *Biochim. biophys. Acta*, 1963, 73, 268-275 (Dept. Agric. Chem., Univ. Tokyo, Japan)

The enzyme was separated from the culture fluid by column chromatography on CG-50 resin followed by column chromatography on DEAE-cellulose. The optimum pH for laminarin hydrolysis was 5*8. Laminaritriose, laminaritetraose and laminaripentaose were also hydrolysed, but not dimers of glucose and other sugars. Glucose, laminaribiose, laminaritriose and higher oligosaccharides were released on laminarin hydrolysis.

B.M.Stevens

LIPIDS AND STEROIDS

5220. STABILITY AND PROPERTIES OF BIMOLECULAR LIPID LEAFLETS IN AQUEOUS SOLUTIONS. D.A.Haydon and J.Taylor: *J. theor. Biol.*, 1963, 4, 281-296 (Dept. Colloid Sci., Univ. Cambridge, England) Consideration is given to the energetics of bimolecular lipid leaflet formation and stability in terms of the nature of the lipid molecules, ionisation etc., and the effect of lytic substances on the stability of such leaflets is discussed. It is suggested that some proposed mechanisms of protein-lipid interaction in the formation of cell membranes are energetically unfavourable and must be discarded.

G.F.Blane

5221. FIRMLY BOUND LIPIDS OF HUMAN TUBERCLE BACILLUS. II. ISOLATION OF ARABINOSE MYCOLATE AND IDENTIFICATION OF ITS CHEMICAL STRUCTURE. L.Azuma and Y.Yamamura: *J. Biochem.* Tokyo, 1963, 53, 275-281 (Third Dept. Int. Med., Sch. Med., Univ. Osaka, Japan) Arabinose mycolate was isolated from the B fraction of strain Aoyama B after treatment with O'IN HC1 at 37° for 72 hr. Mycolic acid and D-arabinose were obtained by acid or alk. hydrolysis of the glycolipid. Reductive cleavage with LiAlH₄ yielded mycoloyl alcohol. Methylation expt. showed that 1 mol. of mycolic acid and 1 mol. of D-arabinose were joined by an ester linkage at the D-arabinose OH-5.

B.M.Stevens

5222. BROWNIAN MOVEMENT IN COLOUR PHOTO-MICROGRAPHY. H.F.Sassoon and M.H.C.Parsons: *Science*, 1963, 139, 1285-1286 (Dept. Animal Husbandry, Univ. Bristol, Langford, England)

Crystals less than 1 μ and stained fat globules in cows milk in Brownian movement have been photographed in colour. G.M.Lewis

5223. EFFECT OF ASPERGILLOMARASMIN B ON THE FORMATION OF LIPID PEROXIDES IN LIVER HOMOGENATES. M.Robert: *C.R. Soc. Biol.*, Paris, 1963, 157, 103-107 (Serv. Microbiol. du Sol, Inst. Pasteur, Paris, France) 1 μM aspergillomarasin B inhib. the formation of peroxides by 68% during oxidation in the presence of 5 μM ascorbic acid by guinea-pig liver homogenates incubated at 37° and by 75% during irradiation with u.v. light. This inhibn. was equiv. to that given by an equal dose of EDTA. (French) M. A. Price

5224. SOME LIPID CONSTITUENTS OF NORMAL AND QUARTZ-DUSTED GUINEA-PIG LUNGS. P.Baily, T.A.Kilroe-Smith and J.S.Harington: *Nature*, Lond., 1963, 198, 856-861 (Chamber Mines Res. Lab., S.African C.S.I.R., Johannesburg, S. Africa) Lungs from dusted animals contained a higher proportion of lecithin and lysolecithin and a lower proportion of sprung^ myelin and cholesterol than lungs from normal animals. Dusting also caused a decrease in the neutral lipid fraction of lungs. J.R. Sargent

5225. NON-PHOSPHATIDE FATTY ACYL ESTERS OF ALKENYL AND ALKYL ETHERS OF GLYCEROL. J.R.Gilbertson and M.L.Karnovsky: *J. bioL Chem.*, 1963, 238, 893-897 (Dept. Biol. Chem., Harvard Med. Sch., Boston, Mass., U.S.A.) The neutral lipid fraction of lipids from diverticulum of the starfish contains glyceryl alkenyl ether diesters. The previously known glyceryl alkyl ethers actually exist in nature as glyceryl alkyl ether diesters. Lipid extracts of ox brain and bone marrow, calf heart, rat brown fat and adipose tissue, guinea-pig w.b.c., and human chylomicrons contain glyceryl ethers of alkyl and alkenyl types; together these comprise 0*1 to 2*9% of the neutral lipid calc. as fatty acid diesters. The alkenyl ethers form 29-82% of the total glyceryl ethers in the neutral lipids of these mammalian tissues. The lipid from rat epididymal fat pads also contains a glyceryl alkenyl ether mono-ester. , J.N.Ashley

5226. LONG CHAIN FATTY ACID ACYL CoA SYNTHETASE IN BACILLUS MEGATERIUM [AND SOME OF ITS PROPERTIES]. W.J.Lennarz: *Biochim. biophys. Acta*, 1963, 73, 335-337 (Dept. Physiol. Chem., Johns Hopkins Univ. Sch. Med., Baltimore, Md., U.S.A.) Prelim, comm. B.M. Stevens

5227. METABOLISM OF HYDROXY FATTY ACIDS. I. METABOLIC CONVERSION OF RICINOLEIC ACID BY A CERTAIN MICRO-ORGANISM TO 8-D-(+)-HYDROXY TETRADEC-ck-5-ENOIC ACID. S.Okui, M.Uchiyama and M.Mizugaki: *J. Biochim.*, Tokyo, 1963, 53, 265-270 (Inst. Pharmacy, Sch. Med., Tohoku Univ., Sendai, Japan) Some *E. coli* strains and an unidentified Gram-neg. coccus produced 3 metabolites from ricinoleic acid. 60% or more was converted to 8-D-hydroxy tetradec-*cis*-5-enoic acid which was a colourless liquid with an optical rotation of 6 • 82° in ethanol. The p- bromophenacyl ester melted at 47° 5'. The other 2 components were concluded to be 10-hydroxy hexadec-7-enoic acid and 6-hydroxy dodec-3-enoic acid. Silicic acid column chromatography, reversed phase column chromatography and thin layer chromatography were used to isolate the acids. The last with a 70:30:1 hexane:ethyl acetate:acetic acid solvent system was found very useful for the detection of hydroxy acids and dicarboxylic acids. , „ B.M. Stevens

5228. ABSORPTION OF [*I*-14c]LIGNOCERIC ACID IN THE RAT. M.Fields (Gellei) and S.Gatt: *Nature*, Lond., 1963, 198, 994-995 (Dept. Biochem., Hebrew Univ.-Hadassah Med. Sch., Jerusalem, Israel)

[*I*-14c]Lignoceric acid was administered by stomach tub⁶ or intraduodenally to rats. Fractionation of the lymph lipids showed that 85-95% of the radioactivity was in neutral glycerides, 3% in phospholipids and 3-107° in *i**⁶* fatty acid. It is suggested that lignoceric acid is trans* ported to the liver, released from its linkage to glycerol, then either oxidised or again incorporated into the sphinx lipids or glycerides. G.M.Lewi

5229. BIOSYNTHESIS OF BRANCHED CHAIN AMINO ACIDS FROM BRANCHED CHAIN FATTY ACIDS BY RUMEN BACTERIA. M.J.Allison and M.P.Bryant: Arch. Biochem., 1963, 101, 269-277 (Dairy Cattle Res. Branch, Animal Husbandry Res. Div., Beltsville, Md., U.S.A.) When *Ruminococcus flavefaciens* was cultured with isobutyrate, isovalerate, 2-methylbutyrate and 14cO₂, the carboxyl C of valine, leucine and iso-leucine became labelled. Formate C was incorporated into various cellular components but not into branched chain amino acids. 14c from [2-¹⁴C]acetate was incorporated into several amino acids but leucine was not appreciably labelled. When whole rumen contents were incubated with [¹-14c]isovalerate for 2 hr., most of the ¹⁴C in the 'bacterial fraction*' was in leucine. With [¹-14c]isobutyrate most of the 14c was in valine.

B.M.Stevens

5230. SYNTHESIS OF FATTY ACIDS BY TESTICULAR TISSUE IN VITRO. P.F.Hall, E.E.Nishizawa and K.B.Eik-Nes: Canad. J. Biochem., 1963, 41, 1267-1274 (Biol. Chem. Dept., Univ. Utah Coll. Med., Salt Lake City, Utah, U.S.A.) Evidence was obtained for the synthesis of palmitic and stearic acids de novo from Cl-14c3acetate in rabbit testes. ICSH did not simulate such synthesis in vitro, but stim. [14C]testosterone production. Adrenal tissue was shown to contain Palmitic, stearic and oleic acids, but ACTH did not increase incorporation of [1-¹⁴C]acetate into them. It was suggested that fatty acid biosynthesis was not influenced by the mechanisms by which tropic hormones increase steroid formation.

A.M.Gibbins

5231. THE METABOLISM OF ACETIC ACID, PROPIONIC ACID AND BUTYRIC ACID IN SHEEP. E.F.Annison, R.A.Leng, D.B.Lindsay and R.R. White: Biochem. J., 1963, 88, 248-252 (Sch. Rural Sci., Univ. New England, Armidale, N.S.W., Australia) Soln. of ¹⁴C-acetate, [2-14C]acetate, [¹-14C]propionate, [¹-14C]propionate, [¹-14C]butyrate, [2-14C]butyrate, or [¹-14C]butyrate were infused into anaesthetised sheep via Portal vein. Liver and muscle glycogen were only slightly labelled in all cases. Radioactivity of blood glucose was appreciable only after the infusion of [14C]-¹⁴COMonate. The distribution of 14c in glucose and acetate molecules was in all cases in accordance with well-known pathways, and indicated no net synthesis of carbohydrate from acetate and butyrate. B-Hydroxy-¹⁴C-Wrate was labelled heavily after the infusion of [¹-14C]butyrate but only slightly after the infusion of [¹⁴C]-¹⁴Wtate or of [14c]propionate. There was slight labelling innate after the infusion of [14C]acetate, [14C]propionate or [14c]butyrate, but only a trace of labelling of ¹⁴cate after infusion of [14c]propionate or of [14c]-¹⁴Wtate.

5232. LONG CHAIN FATTY-ACIDS FROM THE ORGUEIL METEORITE. B.Nagy and M.C.Bitzi: Arch. Biochem., 1963, 101, 240-248 (Dept. Chem., Fordham Univ., New York, U.S.A.) A series of C14-C30 fatty acids isolated and analysed by vapour phase chromatographic fractions of the urea adducts of methyl esters of the acids obtained by solvent extraction. The relative abundance of even numbered and apparently odd numbered chain acids resembled that of fatty acids in ancient sediments on earth.

B.M. Stevens

5233. LIPOAMINO-ACIDS FROM BACILLUS MEGATERIUM. G.D.Hunter and A.T.James: Nature, Lond., 1963, 198, 789 (A.R.C. Dist. Res. Animal Dis.)

Compton, Newbury, Berks., England) Some lipo-amino-acids extracted from *B. megaterium* appear to be O-amino-acid esters of phosphatidyl glycerol.

G.M.Lewis

5234. FATTY ACID COMPOSITION OF MILK PHOSPHOLIPIDS OF MICE WITH AND WITHOUT THE MAMMARY TUMOUR VIRUS. R.F.McGregor, J.Newland and W.E.Comatzen: Nature, Lond., 1963, 198, 482-483 (Ireland Res. Lab., Dept. Biochem., Univ. North Dakota Med. Sch., Grand Forks, N.Dak., U.S.A.) The free fatty acid and neutral fat fractions of mouse milk analysed by gas liquid chromatographic methods showed the same composition in Ax (without mammary tumour virus) and A strains (with virus). In the phospholipid fraction, however, A strain mice contained linoleic acid and an unidentified acid not found in the Ax strain. This may be due to viral stimn. of phospholipid metabolism in the mammary gland. G.M.Lewis

5235. QUANTITATIVE PREPARATION OF METHYL ESTERS OF FATTY ACIDS FOR GAS CHROMATOGRAPHY. C.W.Gehrke and D.F.Goerlitz: Analyt. Chem., 1963, 35, 76-80 (Dept. Agric. Chem., Univ. Missouri, Columbia, Mo., U.S.A.) Quantitative macro and micro gas chromatographic methods were developed for the determination of carboxylic acids in biological materials. The reaction of iodomethane with the Ag salts of the acids was used in esterification. The main advantage of the method was in quant. ester formation with little or no undesirable side reactions or loss of the more volatile methyl esters. The method was used routinely for the quant. determination of the component fatty acids in milk fat and also for fatty acids in bovine semen and human blood serum.

L.G.Gillies

5236. FATTY-ACID COMPOSITION OF PLASMA, AORTA AND LIVER LIPIDS IN COCKERELS WITH STILBOESTROL- OR CHOLESTEROL-INDUCED HYPERLIPIDAEMIA. R.Bломstrand and S.Christensen: J. Atheroscler. Res., 1963, 3, 142-152 (Dept. Clin. Chem., Karolinska Inst., Serafimerlasarettet, Stockholm, Sweden) Birds were made hyperlipaemic either by the addition of 1% cholesterol plus 3% of peanut oil to the diet, or by s.c. implantation of stilboestrol tablets. Both treatments provoked similar changes in the fatty-acid patterns, the most dramatic of which was a great increase in the % of oleic acid. The suggestion is made that hormonal imbalance provoked by cholesterol feeding may be responsible for the observed changes in fatty-acids.

G.F.Blane

5237. OCCURRENCE OF trans-OCTADEC-16-ENOIC ACID IN SHEEP AND OX PERINEPHRIC FATS. R.P.Hansen: Nature, Lond., 1963, 198, 995 (Fats Res. Lab., D.SLR*, Wellington, New Zealand).

G.M.Lewis

5238. GAS-LIQUID CHROMATOGRAPHY OF FATTY ACIDS OF LIPIDS OF CRYSTALLINE LENS. E.Turchetto, M.Sola and G.Lenaz: Exp. Eye Res., 1963, 2, 160-162 (1st. Chim. Biol., Univ. Bologna, Italy) The fatty acid composition of the cryst. lenses of dogs and rabbits has been studied by means of gas-liquid chromatography. The lipids amounted to 0.52 mg./100 mg. lens in rabbits and 0.403 mg./100 mg. lens in dogs. In both rabbit and dog lenses large amounts of sat. and mono-unsat. fatty acids, and smaller quantities of poly-unsat. acids were found. The spectrum of the fatty acids found in the lens is similar to that of those found in the brain.

J. Whiting

BIOCHEMISTRY

5239. NEUTRAL GLYCOLIPIDS OF HUMAN BLOOD SERUM, SPLEEN AND LIVER. E.Svennerholm and L.Svennerholm: *Nature*, Lond., 1963, 198, 688-689 (Dept. Med. Biochem., Univ. Gothenberg, Sweden)

Four neutral glycolipid fractions have been isolated from human serum, liver and spleen and analysed by thin layer chromatography. They have been tentatively identified as ceramide-monohexosides (cerebrosides), -dihexosides, -trihexosides and -trihexoside-N-acetylhexosamine. The cerebrosides contain glucose, the -dihexosides, lactose, -trihexosides, galactose and lactose. The distribution of the glycolipids from these sources differs. G.M.Lewis

5240. STUDIES ON PHOSPHOLIPIDS. DC. THE COMPOSITION OF RAT-LIVER LECITHINS. F.D.Collins: *Biochem. J.*, 1963, 88, 319-324 (Dept. Biochem., Univ., Melbourne, Australia) The liver lipids were obtained from a rat that had been inj. with inorg. [32p]-phosphate 1 hr. before death. The lipids were dinitrophenylated and by the use of cold acetone and a DEAE-cellulose column were divided into 3 fractions: (1) the triglycerides and other acetone-sol. lipids, (2) the neutral acetone-insol. lipids (lecithins and sphingomyelins), and (3) the acidic lipids retained on the column. The lecithin fraction was subjected to countercurrent distribution in Carbon tetrachloride-methanol-water. The fractions were analysed for phosphorus and radioactivity, and fatty acids were determined by gas-liquid chromatography. A mathematical analysis of the results showed the probable presence of 32*3% of stearoyl arachidonoyl lecithin, 21*0% of palmitoyl arachidonoyl lecithin, 15 • 8% of palmitoyl linoleoyl lecithin, 13*2% of stearoyl linoleoyl lecithin, 9*8% of stearoyl oleoyl lecithin, 8*6% of palmitoyl oleoyl lecithin and 3*7% of stearoyl docosahexaenoyl lecithin. The stearoyl lecithins averaged 81 ± 32 counts/min./fig. atom of P as compared with 756 ± 24 counts/min./jjg. atom of P for the palmitoyl lecithins.

5241. CEREBRAL PHOSPHOLIPID METABOLISM DURING ONTOGENESIS. K.G.Manukian, A.A.Smirnov and E.V.Chirkovskaya: *Biokhimiia*, 1963, 28, 246-252. A study was made of the rate of ^{32}P incorporation into individual phospholipids of various parts of the c.n.s. and the myocardium of rats during ontogenesis. In vivo investigations were made by means of chromatography on silicic acid impregnated paper. The changes during ontogenesis are discussed in relation to the growth and differentiation of nervous tissue and the formation of myelin sheaths. (Russian) B.J.Cooper

5242. METABOLISM OF PHOSPHOLIPIDS. VH. LIPID REQUIREMENT FOR PHOSPHATIDIC ACID PHOSPHATASE ACTIVITY. R.Coleman and G.Hilbschen: *Biochim. biophys. Acta*, 1963, 73, 257-266 (Dept. Med. Biochem. and Pharmacol., Med. Sch., Univ. Birmingham, England) Treatment of phosphatidic acid phosphatase with a variety of org. solvents reduced enzymic activity. Under specified conditions addition of lipid prep, almost completely reactivated. B.M. Stevens

5243. ISOLATION OF NATIVE PLASMALOGENS. O.Renkonen: *Acta chem. scand.*, 1963, 17, 634-640 (Dept. Serol. and Bacteriol., Univ. Helsinki, Finland) A method for the isolation of native plasmalogens from ox tissues is described based on selective deacylation of natural mixtures of the plasmalogens and the corresponding diacyl phosphatides by mild alk. treatment. Fairly

pure choline and ethanolamine plasmalogens from partial alk. hydrolysates of *lecithin^f of heart and 'ethanolamine cephalin' of brain were prep. G.F.Blane

5244. METABOLISM OF BLOOD PHOSPHOLIPIDS. VE. IN VITRO INCORPORATION OF 32p PHOSPHATE INTO RED BLOOD CELL PHOSPHOLIPIDS. M.Paysant, B.Maupin and J.Polonovski: *Bull. Soc. Chim. bioL*, Paris, 1963, 45, 247-252 (Lab. Chim. BioL, Fac. Méd., 45, rue des Sts.-Pères, Paris, France) The incorporation of [32p]phosphate into human r.b.c. in vitro occurred almost exclusively into the phosphatidic acids. The incorporation occurred faster with saline medium than with plasma. No labelled phospholipid passed from die r.b.c. to the plasma. The radioactivity rapidly decreased from the cells on further incubation with unlabelled serum. (French) J.C.Crawhall

5245. INFLUENCE OF MYOCARDIAL PHOSPHATIDE EXTRACT ON THE OXIDATIVE RECOVERY OF ANOXIC CARDIAC MUSCLE. G.Pellegrini: *Biochim. Appl.*, 1962, 9, 276-282 (Lab. Biochim. Appl., 1st. Chim. Biol., Univ. Milano, Italy) With the use of a Warburg microspirometer it was shown that the O₂ uptake of rat cardiac muscle damaged by anoxia could be increased by addition of a myocardial muscle extract. A similar increase was obtained by adding cytochrome c but not by digitalis or strophanthidin.

(Italian) J.C.Crawhall
5246. PHOSPHATIDES IN MYELIN SHEATHS AND REPARTITION OF SPHINGOMYELIN IN THE BRAIN. J.L.Nussbaum, R.Bieth and P.Mandek: *Nature*, Lond., 1963, 198, 586-587 (Inst. Chim. Biol., Faculté de Méd., Strasbourg, France) Adult rat brain was fractionated by ultracentrifugation in sucrose and the distribution of phosphatides determined by chromatographic fractionation. 50% of the phosphatides was found in the myelin sheaths, 29% in mitochondria, 16% in microsomes 2*5% in nuclei and 2-5% in cytoplasmic liquid. Myelin sheaths contain 38% of the sphingomyelin. G.M.Lewis

5247. CONSTITUTION OF CEREBRIN FROM THE YEAST TORULOPHIS UTILIS. N.Z.Stanacev and M. Kates: *Canad. J. Biochem.*, 1963, 41, 1330-1334 (Div. Appl. BioL, Nat. Res. Council, Ottawa, Canada) Cerebrin obtained from *T. utilis* was acid hydrolysed, and the long-chain bases released were oxidised, the aldehydes thus formed being identified as pentadecanal and heptadecanal, in the ratio 5:1, corresponding to Ci8 and C20 phytosphingosine, respectively. 3% of hexadecanal was also detected and probably corresponds to Ci8-dfliydrosphingosine. The major fatty acid component of the cerebrin was shown to be a-hydroxy-hexacosanoic acid? # small amounts of jj-hexacosanoic, a-hydroxytetracosanoic, jQ-tetracosanoic, (X-hydroxy stearic, stearic, and olelic acids were also present. A.M.GibbinS

5248. STUDIES OF THE CATIONIC, AND ACh STIMULATION OF PHOSPHATE INCORPORATION INTO PHOSPHOLIPIDS IN RAT BRAIN CORTEX IN VITRO. M.Brossard and J.H.Quastel: *Canad. J. Biochem. Physiol.*, 1963, 41, 1243-1256 (Biochem. Dept., Univ. of Rochester Sch. Med. and Dent., Rochester, N.Y., U.S.A.) When 0.1M KCl was added to, or Ca²⁺ omitted from, incubation media in which rat brain cortex slices were respiring, there was stimm. of the incorporation of 32p into phospholipids, primarily into phosphatidic acid and phosphoinositide but not into phosphatidyl choline and phosphatidyl ethanolamine. 7-mifl-

hydrolysable nucleotide phosphate labelling was stim., but their levels were decreased. Succinate and *y*-amino^b butyrate inhibited, but ACh stim.. the labelling of phospholipids. ACh *ami* K⁺ stimn. was dependent on Na⁺ and atropine and hyoscine inhibited ACh_f but not K⁺, stimn. It was suggested that stimn. due to ACh was mediated by cationic changes at the nerve cell membrane.

A.M.Gibbins

- ^{5249.} INCORPORATION OF INORGANIC PHOSPHORUS-32 INTO PHOSPHOLIPIDS OF BRAIN SLICES. EFFECT OF CERTAIN TRANQUILLISING DRUGS. W.L.Magee and R.J.Rossiter. *Canad. J. Biochem.*, 1963, 41, 1155-1162 (Biochem. Dept., Univ. Western Ontario, London, Ont., Canada) Four tranquillising drugs at 0.1mM concn., promazine, promethazine, tetrameprazine, and WY 1172, resembled chlorpromazine in stimulating the incorporation of inorg. 32P into the phospholipids of guinea-pig brain slices respiring in a suitable medium. 0.1mM promethazine caused no significant increase in Aspiration, aerobic glycolysis, or phosphocreatine concn., but 0.1mM of all the compounds inhibited phospholipid labelling. Azacyclonol, pipradol, mepazine, and benzhydrol also stimulated labelling only in low concn., and Methylene Blue, meprobamate, and phenaglycodol had little or no effect. Piperidine and benzhydrol did not stimulate phospholipid labelling at the most effective concn. for azocyclonol. A.M.Gibbins

- ^{5250.} HYPERLIPAEMIA ACCCOMPANIED BY LIPOPROTEIN OF HIGH ELECTROPHORETIC MOBILITY IN ROOKS. LLélek, B.L.T5th, J.Nicsovics and A.Pálfy: *J.Atheroscler. Res.*, 1963, 3, 137-141 (State Sanatorium, Sopron, Hungary) Very high serum lipid values were found in the rook, *roryus furileaus*, with no sign of spontaneous atherosclerosis. Details are given from electro-phoretic studies on rook serum, including the cholesterol/Phospholipid ratio which is abnormally low. The possible reasons for absence of atherosclerosis in this species are discussed. G.F.Blane

- ^{5251.} IDENTIFICATION AND SIGNIFICANCE OF DESMESTEROL IN DEVELOPING HUMAN AND ANIMAL BRAIN. R.Fumagalli and R.Paoletti: *Life Sci.*, 1963, No. 5, 291-295 (Inst. Pharmacol., Univ. Milan, Italy) The largest amount of desmosterol in brain was found before the period of myelination in man, pinea-pig, rabbit and rat. During the period of myelin formation desmosterol rapidly disappeared and was absent when myelination was complete. It is suggested that desmosterol has an important role in sterol synthesis and metabolism during development, differentiation and myelination in the c.n.s. K.-J.Jones

- ^{5252.} ISOLATION OF SQUALENE FROM HUMAN BRAIN. M.Proštenik and M.Munk-Weinert: *Biochim. biophys. Acta*, 1963, 71, 732-733 (Dept. Chem., Med. Fac., Univ. Zagreb, Croatia, Yugoslavia). B.M.Stevens

- ^aPURIFICATION OF 3a-HYDROXYSTEROID DEHYDROGENASE OBTAINED FROM THE SOLUBLE FRACTION OF RAT LIVER. S.S.Koide: *Arch. Biochem.*, 1963, 101, 278-285 (Div. Clin. Invest., Sloan-Kettering Inst., New York, U.S.A.) The dehydrogenase was partially purified by centrifugation, (NH4)2SO₄ precipitation, Y-alumina adsorption and hydroxyapatite-dieurylaminoethylcellulose column chromatography. Repeated hydroxyapatite-diethylaminoethylcellulose column chromatography and starch block electrophoresis failed to separate transhydrogenase and dehydrogenase

activities. Attempts at further purification failed owing to the instability of the purified enzyme prep.

B.M.Stevens

- ^{5254.} CHROMATOGRAPHIC SEPARATION OF STEROIDS FROM TOTAL LIPID EXTRACTS. R.Hernandez, jun. and L.R.Axelrod: *Analyt. Chem.*, 1963, 35, 80-83 (Dept. Biochem., Southwest Foundn. Res. Educ, San Antonio, Tex., U.S.A.) The technique consisted of a column chromatographic separation utilising standardised silicic acid and developed with benzene to remove fats, fatty acids, sterols including cholesterol and cholesterol esters, followed by acetone/chloroform (2:1, v/v) to remove steroids and finally absolute alcohol to remove the majority of the phospholipids for further analysis if desired. Recovery of the steroids was measured by using 14C-labelled steroids and micro-organic reactions (spot tests).

L.G. Gillies

5255. ON STEROID CONJUGATES IN PLASMA.

- VH. EXTRACTION OF 17-KETOSTEROID CONJUGATES. G.W.Oertel: *Clin. chim. Acta*, 1963, 8, 154-157 (Dept. Endocrinol., Dept. Hyg. Microbiol., Saarland Univ., Hamburg/Saar, Germany) Methods involving extraction with org. solvents and chromatography on DEAE cellulose for the separation of 17-ketosteroid conjugates are compared.

K.Brew

- ^{5256.} CHROMATOGRAPHIC SEPARATION OF 17-KETO-STEROIDS. T.Seki and K.Matsumoto: *J. Chromatography*, 1963, 10, 400-404 (Dept. Genet., Osaka Univ. Med. Sch., Osaka, Japan) Notes.

P.D.Dawkins

- ^{5257.} A MICROMETHOD FOR LABELLING STEROIDS AND ECDYSON WITH TRITIUM. P.Karlson, R.Maurer and M.Wenzel: *Z. Naturforsch. B*, 1963, 18, 218-222 (Physiol.-Chem. Inst., Univ. München, Germany)

The metamorphosis hormone, ecdyson was labelled with tritium by the Wilzbach technique. Various polyhydroxy-steroids were also labelled as model substances. The substances were absorbed on to activated charcoal and exposed to tritium of high activity in nylon bags at room temp. The products were purified by thin layer chromatography and analysed for radioactivity by a special flow counter whilst on the chromatoplates.

- ^{5259.} USE OF NUCLEAR INDICATORS IN THE STUDY OF THE ORIGIN OF CHYLE CHOLESTEROL.

F.Chevallier and M.Vyas: *Bull. Soc. Chim. biol.*, Paris, 1963, 45, 253-275 (Dép. Biol., Commissariat à l'Energie Atomique, Saclay(S.-et-O.), France)

Rats with abdominal lymph fistulae were fed oleic acid by gastric tube. They were then submitted to (a) s.c. [14C]cholesterol, (b) perfusion of [14C]acetate or (c) [14C]cholesterol by mouth. It was shown that some cholesterol of the chylomicrons arose from intestinal absorption pathways and some by a peripheral contribution from the serum.

- ^{5260.} ISOLATION OF A NEW BILE STEROL 30L, 70,120L, 245,26-PENTAHYDROXYBISHOMOCHOLANE FROM BULL FROG BILE. T.Kazuno, T.Masui, T.Nakagawa and K.Okuda: *J. Biochem. Tokyo*, 1963, 53, 331-332 (Dept. Biochem., Hiroshima Univ. Sch. Med.,

BIOCHEMISTRY

Hiroshima, Japan) 30, 7a, 12a, 24?, 26-pentahydroxybishomocholane was the main component of a TCA hydrolysate of bile; 3a, 7a, 12(X-trihydroxy-A?4-homo-cholene, 3a, 7a, 12a, 26-tetrahydroxy-A?3-bishomo-cholene and 30C,70,12a-trihydroxy-A24-homo-5a-cholene were absent. Prelim, comm. B.M.Stevens

- 5261. STEROBILE ACIDS AND BILE STEROLS.**
XLD_C SYNTHESIS OF 3d,70,12O,26,27-PENTA-HYDROXYCOPROSTANE. T.Hoshita, M.Kouchi and T.Kazuno. **L. METABOLISM OF LITHOCHOLIC ACID IN HOG LIVER.** Y.Kurata: *J. Biochem., Tokyo*, 1963, 53, 291-294, 295-298 (Dept. Biochem., Hiroshima Univ. Sch. Med., Hiroshima, Japan)
 L. [24-14c]Lithocholic acid was incubated with liver homogenate. Radioactive hyodeoxycholic and cheno-deoxycholic acids were isolated from the reaction mixture. B.M. Stevens

AMINO ACIDS, PEPTIDES AND PROTEINS

- 5262. AUTOMATIC COLUMN CHROMATOGRAPHY OF ETHER AND WATER-SOLUBLE DNP-DERIVATIVES OF AMINO ACIDS, PEPTIDES AND AMINES.** L.Kesner, E.Muntwyler, G.E. Griffin and J.Abrams: *Analyt. Chem.*, 1963, 35, 83-89 (Dept. Biochem., State Univ. New York, Downstate Med. Cent., Brooklyn, N.Y., U.S.A.) The separation of over 35 deriv. of D³P was accomplished in one column in 22 hr. A gradient elution system composed of n-heptane, t-amyl alcohol and methyl ethyl ketone was deaerated, sat. with water and pumped through a hydrated silica gel column. The effluent was passed through a flow cell from which the absorbance was continuously recorded. An identifiable peak was obtained with 0.01μM of DNP-amino acid. The technique was adaptable to the fractionation of mixtures of DNP-peptides. L.G.Gillies

- 5263. RAPID ESTIMATION OF AMINO ACIDS.** B.Orchard: *Nature, Lond.*, 1963, 198, 688 (Rothamstead Expt. Sta., Harpenden, Herts., England) The time taken for appearance of the colour reaction with ninhydrin at 100° may be used for a rapid estimate of the concn. of amino acid. This time was linearly related to the product of the concn. of ninhydrin and glycine over an 8-fold range of concn. G.M.Lewis

- 5264. SPECIFIC ENZYMIC DETERMINATION OF SOME α-AMINO ACIDS BY AUTOMATIC SPECTROPHOTOMETRIC REACTION RATE METHOD.** H.V.Malmstadt and T.P.Hadjioannou: *Analyst. Chem.*, 1963, 35, 14-16 (Dept. Chem., Univ. Illinois, Urbana, IL, U.S.A.) An automatic spectrophotometric reaction rate method was described for the selective enzymic determination of about 10⁻⁷ equiv. of some amino acids. The method was based on the coupled enzyme reaction in which oxidative deamination of certain L-α-amino acids was sp. catalysed by L-amino acid oxidase to form H₂O₂ which reacts with o-dianisidine in the presence of horseradish peroxidase to form a coloured product which has its absorption max. at 440 mji. The time required for the reaction to produce a small fixed amount of the coloured product, and therefore for the absorbance to change by

a preselected amount was measured automatically and related directly to the amino acid concn. L.G.Gillies

- 5265. ELUTION BEHAVIOUR OF NATURAL OCCURRING I LIHYDRIN-POSITIVE COMPOUNDS DURING ION EXCHANGE CHROMATOGRAPHY.** R.M.Zacharius and E.A.Talley: *Analyst. Chem.*, 1962, 34, 1551-1556 (East Regional Res. Lab., U.S. Dept. Agric, Philadelphia, Pa., U.S.A.) The elution behaviour of over 90 ninhydrin-reacting compounds, including some geometrical isomers, was studied with the automatic amino acid analyser employing the conditions of Spackman, Moore and Stein. Several compounds overlapped, often forming a sharp, symmetrical peak. Some such peak mixtures were resolved with a change in the temp. of operation. Identification of the components might be possible where sufficient differences occur in the 440-570 mjj absorption ratio of the ninhydrin reaction products L.G. Gillies

- 5266. BINDING OF γ-AMINOBUTYRIC ACID BY MOUSE BRAIN PREPARATIONS.** K.Sano and E.Roberts: *Biochem. Pharmacol.*, 1963, 12, 489-502 (Dept. Biochem., City of Hope Med. Cent., Duarte, Calif., U.S.A.) Procedures were described for the study of the binding of [¹I-14c]GABA in prep. of brain but not of several other tissues. All the non-enzymic binding activity was found in the sedimentable fractions of sucrose homogenates. The pH optimum was about 7.4 and the binding was Na⁺-dependent. Expt. with surface-active materials and with -SH reagents led to the suggestion that the binding capacity was associated with osmotically sensitive macromol. structural elements, among the components of which might be proteins with reactive -SH groups. L.G. Gillies

- 5267. STUDIES OF SUBCELLULAR DISTRIBUTION OF γ-AMINOBUTYRIC ACID AND GLUTAMIC DECARBOXYLASE IN MOUSE BRAIN.** H.Weinstein, E.Roberts and T.Kakefuda: *Biochem. Pharmacol.*, 1963, 12, 503-509 (Dept. Biochem., City of Hope Med. Cent., Duarte, Calif., U.S.A.) A study was made of GABA content and glutamic acid decarboxylase activity of various subcellular fractions prep. from homogenates of mouse brain in a sucrose density gradient. Portions of the fractions studied chem. were also examined morphologic* ally by E.M. The largest proportions which were sedimentable were associated with fractions consisting predominantly of nerve ending fragments. The distribution of the two substances did not coincide among these morphologically heterogeneous fragments. L.G. Gillies

- 5268. METABOLISM OF e-N-METHYL-L-LYSINE BY RAT KIDNEY HOMOGENATE.** S.Kim, L.Benoit and W.K.Paik: *Biochim. biophys. Acta*, 1963, 71, 745-747 (Dept. Biochem., Sch. Med., Univ., Ottawa, Canada) Kidney homogliates made in water or iso* tonic sucrose soln. and incubated with very low ionic strength buffer and e-N-methyl-L-lysine, consumed O₂¹ released lysine and formed formaldehyde stoichiometrically; the enzyme system responsible was in mitochondria and differed from 'demethylase*' and sarcosine oxidase. B.M. Steven

- 5269. DETERMINATION OF ORNITHINE, LYSINE, ARGININE, CITRULLINE, HISTIDINE.** I. Stewart: *J. Chromatography*, 1963, 10, 404-407 (Citrus Exp. Stat., Univ. Florida, Lake Alfred, Fla., U.S.A.) Notes. P.D.Dawktf

5270. TRANSPORT OF HISTIDINE AND METHIONINE IN RAT BRAIN SLICES. R.Nakamura: *J. Biochem. Tokyo*, 1963, 53, 314-322 (Div. Metabolism, Inst. Protein Res., C.Ka Univ., Osaka, Japan) Slices cone. L-histidine and, to a slightly lesser extent, D-histidine from the medium. Urocanic acid was not cone. Active histidine uptake was inhibited by DNP or a glucose free medium. L- and D-methionine inhibited histidine uptake but L-histidine stim. DL-methionine uptake. Slices preincubated with L-histidine released the histidine very rapidly on incubation with DL-methionine, uptake of the latter being stim. Exchange diffusion between L-histidine in slices and DL-methionine in the Medium occurred in a mole to mole ratio. The efflux rate of DL-methionine was much greater than those of & L-histidine. Histidine uptake by rat brain in vivo was stereoselective. **B.M. Stevens**

5271. METABOLIC REGULATIONS OF METHIONINE AND THREONINE BIOSYNTHESIS IN *S. CEREVIAE*. L REPRESSION AND RETROINHIBITION OF ASPARTOKINASE. H.De Robichon-Szulmajster and D.Corrivaux: *Biochim. biophys. Acta*, 1963, 73, 248-256 (Lab. d'Enzymol.. C.N.R.S.. Gif-sur-Yvette. S.-et-O.. France) Threonine repressed aspartokinase formation and inhib. 85-100% of the enzyme formed under different conditions. Homoserine also repressed and inhib. Lysine ^pressed but did not inhibit "normal" enzyme. Methionine also did not inhibit "normal" enzyme but after growth in the presence of methionine or ethionine, ^Partokinase was partly inhib. by methionine and lysine. Sensitivity to homoserine inhibn. was increased by growth in the presence of homoserine and reduced by growth in ^e presence of lysine. The existence of at least 3 aspartokinases, all sensitive to threonine, but with other different ^*tes of inhibn. is postulated. (French) **B.M.Stevens**

5272. DISTRIBUTION OF [3H]METHIONINE AND CETHYL-3HJETHIONINE IN MATERNAL AND FOETAL RAT TISSUES. W.R.Proffit and L.E.Edwards: *J. exp. ZooL*, 1962, 151, 53-59 (Sch. Deat., Univ. Washington, Seattle, Wash.. U.S.A.) Each animal Received either 200 μ ic[3H]methionine or 200 μ ic [ethyl-^ethionine. The highest concn. of methionine in Maternal tissues was in the intestinal glands and oral Pithelium. Ethionine autoradiographs showed little or ^o activity in the gut and oral tissues, having max. activity in renal proximal tubules. In foetal tissues, ^ethionine was cone, in the liver and other developing epithelial structures while the distribution of ethionine ^as random. Administration of 200 mg. ethionine prior ^o methionine did not alter the pattern of distribution of ^e latter in either maternal or foetal tissue. **R.J.Walker**

5273. ION-EXCHANGE CHROMATOGRAPHY OF SULPHUR AMINO ACIDS AND THE SEPARATION OF DIESTEREOISOMERS. G.F.W.Frimpter, S.Ohmon and S.Mizuhara: *J. Chromatography*, 1963, 10, 439-442 (Dept. Med., New York Hosp.-Cornell Univ. Med. Center, N.Y., U.S.A.) The technique of ion-^change chromatography, has been used for the separata of s-amino acids. Double peaking has been taken ^o indicate the separation of diastereoisomers. **P.D.Dawkins**

5274. ADAPTIVE CONTROL OF TRYPTOPHAN AND TYROSINE METABOLISM IN ANIMALS. W.E.Knox: *Trans. N.Y. Acad. Sci.*, 1963, 25, 503-512 (Dept. Biol. Chem., Harvard Med Sch., Boston, Mass., U.S.A.) The adaptations of tryptophan pyrolase and

tyrosine-a-oxoglutarate transaminase of liver are discussed in relation to the two known mechanisms of enzymic adaptation in animal tissues i.e., substrate-type and hormone-type inductions. The complexity of these systems involving endocrine and nervous communication chains is indicated. **R.H.Kimberlin**

5275. L-PHENYLALANINE: AN ORGAN SPECIFIC, STEREOSPECIFIC INHIBITOR OF HUMAN INTESTINAL ALKALINE PHOSPHATASE. W.H.Fishman, S.Green and N.L.Inglis: *Nature*, Lond., 1963, 198, 685-686 (Tufts Univ. Sch. Med., Boston, Mass., U.S.A.) Human alk. phosphatase of intestine, but not of liver, bile, bone, lung, kidney and spleen in 78% inhib. by L-phenylalanine but not by D-phenylalanine (both at 0'005M). **G.M.Lewis**

5276. FLUORESCENCE OF TYROSINE IN ALKALINE SOLUTION. J.L.Cornog, jun. and W.R.Adams: *Biochim. biophys. Acta*, 1963, 66, 356-365 (Dept. Pathol., Yale Univ. Sch. Med., New Haven, Conn., U.S.A.) Tyrosine in 0-12N NaOH had a measurable fluorescence. Determinations of the relative quantum yield of this sp. are given. Tyrosine, insulin and RNase showed a shift in the peak of their fluorescence spectra from 315 mji in water at pH 7 to 345 mji in 0*12 N NaOH. At pH 7 the quantum yield of tyrosine in a protein was less than that of free tyrosine in soln., but this was not the case in 0*12 N NaOH. **B.M.Stevens**

5277. ALKALINE LABILE D-ALANINE IN CELL WALLS. G.D.Shockman: *Nature*, Lond., 1963, 198, 997-998 (Dept. Microbiol., Temple Univ. Sch. Med., Philadelphia, Pa., U.S.A.) The time course of extraction of D-alanine from walls of freeze-dried *Streptococcus faecalis* and *Staphylococcus aureus* by ammonium was followed by a microbiol. assay. The amounts found were in agreement with the total amount of alanine that can be calc. to be present in teichoic acid. **G.M.Lewis**

5278. PURIFICATION AND PROPERTIES OF CERTAIN GLUTAMIC ACID METABOLISING ENZYMES FROM COCKROACH MUSCLE MITOCHONDRIA. R.R.Mills and D.G.Cochran: *Biochim. biophys. Acta*, 1963, 73, 213-221 (Dept. Biochem. and Nutr., Virginia Polytechnic Inst., Blacksburg, Va., U.S.A.) Glutamic dehydrogenase, GOT and glutamic alanine transaminase were partially purified from thoracic muscle mitochondria. The dehydrogenase appeared to be NAD sp. while the 2 transaminases required pyridoxal phosphate. Substrate specificities, pH optima and several other characteristics were determined. **B.M. Stevens**

5279. GLUTAMINE SYNTHETASE ACTIVITY IN RAT BRAIN. Z.S.Gershovich, A.A.Krichevskaja and Ia.Koloushek: *Biokhimiia*, 1963, 28, 303-307. Both O₂ under pressure and methionine sulphoximine had the effect of inhibiting glutamine synthetase activity, both singly and synergistically. (Russian) **BJ.Cooper**

5280. ERYTHROCYTE GLUTATHIONE REDUCTASE. E.Beutler and M.K.Y.Yeh: *Blood*, 1963, 21, 573-585 (Med. Dept., City Hope Med. Centre, Duarte, Calif., U.S.A.) Chromatographic procedures for the purification of glutathione reductase are described. During purification, no change in ratio of activity of enzyme with NAD was found. KCl and NaCl increased the enzyme activity only when NADPH₂ served as a hydrogen donor. The NAD linked system did not result in glutathionine reduction when lactate served as a substrate in intact r.b.c. **H.B.Waynforth**

BIOCHEMISTRY

5281. ISOLATION OF A HOMOLOGUE OF GLUTATHIONE FROM BEAN SEEDLINGS. P.R.Carnegie: Arch. Biochem., 1963, 101, 364-365 (Dept. Biochem., Fac. Med., Univ., Singapore, Malaya) Homoglutathione was observed in 4 day old etiolated Phaseolus aureus seedlings. Prelim, comm. B.M.Stevens
5282. USE OF AZOPHENYL α -DIISOCYANATE IN PEPTIDE ANALYSIS. H.Fasold and F.Turba: Biochem. Z., 1963, 337, 80-87 (Physiologisch-chemisches Inst., Univ., Wurzburg, Germany) Azophenyl ω -diisocyanate, prep, by condensing 4-acetaminonitroso-benzene with acetyl ω -phenylene-diamine, was used to prepare azophenyl ω -diureido amino acids. Starting with leucine or a mixture of benzoyllysine and benzoyllysine-amide the reaction products were isolated by passing diem through a cellulose column and detected by their optical prop, or separated by paper electrophoresis after reduction with dithionite. (German) L.Cohn
5283. DISTINCTION BETWEEN PEPTIDASE ACTIVITY AND PEPTIDE TRANSPORT. D.Kessel and M.Lubin: Biochim. biophys. Acta, 1963, 71, 656-663 (Dept. Pharmacol., Harvard Med. Sch., Boston, Mass., U.S.A.) A mutant of a glycine requiring E. coli strain, which lacked the glycylglycine transport system but possessed the peptidase, grew well in media with high glycylglycine levels but failed to grow at low levels. A second mutant, lacking the peptidase but possessing the transport system, failed to grow on glycylglycine at any level. Intracellular glycylglycine reached levels up to 100 times the extracellular level. Expt. on competition between peptides showed that glycylglycine was carried by a transport system with broad specificity. B.M.Stevens
5284. CHROMATOGRAPHIC SEPARATION OF PEPTIDES ON ION EXCHANGE RESINS. SEPARATION OF PEPTIDES FROM ENZYMIC HYDROLYSATES OF O, 3 AND YCHAINS OF HUMAN HAEMOGLOBINS. W.A.Schroder, R.T.Jones, J.Cormick and K.McCalla: Analyt. Chem., 1962, 34, 1570-1575 (California Inst. Technol., Pasadena, Calif., U.S.A.) Isolation of components in a mixture was most effectively accomplished by great alterations of conditions from step to step in the separation. This was applied to complex mixtures of peptides in protein hydrolysates. Good results were obtained by chromatographing first on the cation-exchanger Dowex-50 and then on the anion-exchanger Dowex-1. Volatile developers were used throughout. The results are presented of the application of the method to human haemoglobins A and F. L.G. Gillies
5285. HAEMAGGLUTININS IN LUPINUS LUTEUS. E.KqIyaj: Acta microbiol., pol., 1962, 11, 335-340 (Uniw. Marii Curie-SKłodowskiej, Lublin, Poland) Haemagglutinins were found in the germinating seeds of yellow lupins, and did not occur in stems, leaves and nodules. Human r.b.c. of O, A and B groups, r.b.c. of rabbit, cells of rabbit, guinea-pig, mo use,frog and hen reacted also with the seed extracts. (Polish) M.Korbecki
5286. EFFECTS OF PHYTOHAEMAGGLUTININ IN VIVO IN RATS. M.W.Elves, S.Roath and M.C.G.Israels: Nature, Lond., 1963, 198, 494 (Dept. Clin. Haematol., Univ. Manchester, England) Phytohaemagglutinin inj. s.c. or i.p. into rats was not toxic, produced no haemolysis or agglutination of r.b.c., and did not produce significant lymphoproliferation. G.M.Lewis

5287. BASIC AND OTHER PROTEINS IN MICROSOMES OF RAT LIVER. P.Cohn and P.Simson: Biochem. J., 1963, 88, 206 (C.Beatty Res. Inst., London, England) Microsomes and various prep, of RNP particles from rat liver were extracted with 0'2N-HCl, and the amino acid compositions of the protein in a dialysed extract and of the HCl-insol. residue were determined by the fluorodinitrobenzene method. The HCl-sol. proteins, which amounted to 40% in purified ribosome prep., contained 24% of basic and 18% of acidic amino acid residues. Alanine, glycine, proline and serine were the principal N-terminal groups found; the basic and HCl-insol. proteins differed in the proportions of alanine and glycine present. •
5288. SEPARATION OF IRON-CONTAINING FERRITIN FROM HORSE SPLEEN INTO THREE DISTINCT FRACTIONS BY STARCH GEL ELECTROPHORESIS. R.Kopp, A.Vogt and G.Maass: Nature, Lond., 1963, 198, 892-893 (Hg. Inst., Univ., Freiburg/Br., Germany) These 3 possibly 4 fractions were not dimers or polymers but were ferritin mol. which were serol. identical though differing in sedimentation coeff. and possibly in iron content. G.M.Lewis
5289. THERMAL ELECTROPHORETIC HOMOGENISATION OF BLOOD SERUM PROTEINS. V.LOkulov and G.V. Troitskii: Biokhimiia, 1963, 28, 277-284. The degree of electrophoretic homogenisation [EH] of bovine serum proteins was assayed at various temp. (60-100°) and exposures to heat (15 sec-10 hr.). The effect on EH of pH, ionic strength of soln., and protein concn. was studied. No connection could be found between aggregation of protein mol. and EH. Individual serum proteins differed in their stability to coagulation and EH in purified prep, and in fractions of the total serum, but protein fractions of a native mixture influenced each other's stability. (Russian) BJ.Cooper
5290. CONTRACTILE PROTEINS IN MUSCLES OF CRAYFISH. V.V.Oppel¹ and T.P.Serebrenikova: Biokhimiia, 1963, 28, 224-231. The contractile muscles of Astacus astacus were studied. The salting-out curves showed a large peak of actomyosin, and minor peaks within the salting-out zones of actin, myosin and tropomyosin. Actomyosin obtained for the claws showed a greater mol. aggregation and less easy disintegration into its components by pyrophosphate than actomyosin from the tail. (Russian) BJ.Cooper
5291. ELECTROPHORETIC STUDIES OF BLOOD AND EGG PROTEINS IN AUSTRALORBIS GLABRATUS (GASTROPODA, PLANORBIDAE). C.A.Wright and G.C.Ross: Ann. trop. med. Parasitol., 1963, 57, 47-51 (Dept. Zool., Brit. Museum (Nat. Hist.), London England) The blood proton pattern alters with the degree of sexual maturity of the snail. Young snails have at least six separate protein fractions in the blood, but in adults there is only one, a single large Hb fraction. The qual. protein pattern of the egg contents remains unchanged during embryonic development. Taxonomic implications of the results are discussed. P.J.Baron
5292. PURIFICATION AND PROPERTIES OF CYTOCHROME b₁ FROM E. COLI. T.Fujita, E.Itagaki and R.Satoh: J. Biochem. Tokyo, 1963, 53, 282-290 (in** for Protein Res., Univ., Osaka, Japan) Cytochrome⁶_{b₁} was solubilised from the particulate fraction using snake venom and deoxycholate and was purified by

(NH₄)₂SO₄ fractionation and hydroxylapatite column chromatography. The prep. was 50-70% pure, being contaminated by a colourless substance which sedimented more slowly on ultracentrifugation. From the JS the mol. wt. of cytochrome b₁ was 600000-800000. From the haem content the molar mol. wt. was approx. 160000. Acid acetone split the cytochrome into protohaem and apoprotein. Recombination was observed spectrophotometrically the recombined product, unlike the native cytochrome, combined with CO. The oxidation-reduction potential of the cytochrome was approx. +20 mV at pH 7.0 and 25°. Spectral prop., reactivity and chemical composition were also examined.

B.M.Stevens

5293. CL2-MACROGLOBULIN. L METHOD FOR THE ISOLATION OF RABBIT (X2-MACROGLOBULIN).

J.J.Picard and J.F.Heremans: *Biochim. biophys. Acta*, 1963, 71, 554-561 (Med. Dept. A, Clin. Univ. St.

Pierre, Louvain, Belgium) A protein fraction was salted out from serum using (NH₄)₂SO₄ at pH 6-8 between 1.9M and 2.4M. The (X2-globulins of this fraction were isolated by preparative electrophoresis in agar gel at pH 8-6. Eluted proteins were ultracentrifuged in a sucrose P gradient. The bottom fraction was shown to be pure 0.2-macroglobulin by electrophoresis on paper, agar gel 2nd starch gel, by analytical ultracentrifugation and by immunol. tests. Recovery was almost quant.

B.M.Stevens

5294. ISOLATION AND CHARACTERISATION OF AN UNUSUAL" PROTEIN FROM THE CELL NUCLEUS.

L.R.Kuehk: *Biochim. biophys. Acta*, 1963, 71, 531-543 (Virus Lab., Univ. California, Berkeley, Calif., U.S.A.) A protein, isolated from chicken r.b.c.

Nuclei, was insol. in water and dil. salt soln. at pH above 6 but sol. at lower pH. The protein was partially purified by chromatography on phosphorylated cellulose. The Protein contained high proportions of both acidic and basic amino acids. The mol. wt. was relatively low. No terminal NH₂ groups were detected by the fluorodinitrobenzene method.

B.M. Stevens

5295. POLYMERISATION-DEPOLYMERISATION OF TMV PROTEIN. I. KINETICS.

A.T.Ansevin and M.A.Lauffen: *Biophys. J.*, 1963, 3, 239 (Dept. Biophys., Univ. Pittsburgh, Pa., U.S.A.)

A reversible endothermic association of TMV protein subunits (A protein) can take place at pH values below the isoelectric point as well as at pH 6.5. The polymerisation occurring below the isoelectric point is more complex than that at pH 6.5 probably because products other than the usual TMV-like rods are formed in addition to those rods and also because side-to-side aggregation of the rods takes place readily. Kinetic studies indicate that polymerisation can be treated as a second-order linear condensation. The rate of polymerisation is a critical function of pH, having a SS value near pH 4.3. This behaviour is at variance with the hypothesis that hydrogen-bonded carboxyl pair jfeka dom pt rate-determining role in the association. The dependence of the rate on pH indicates electrostatic forces between subunits are a significant controlling factor in the polymerisation of TMV protein.

>2. ELECTROPHORESIS OF LIPOPROTEINS; USING STAINED SERUM.

L.P.Ribeiro and H.J.McDonald: *[•]Chromatography*, 1963, 10, 443-449 (Biochem.

Ui's t * «• Oswaldo Cruz, Rio de Janeiro, Brazil) >a S^{P1} ei expensive and time-saving method for Ae fS^r electrophoresis of serum lipoproteins, 1p--'ained IU^f a sat. soln. of Acetylated Sudan Black B in propylene

glycol is described. Macherey and Nagel No. 2214ff filter paper, in veronal buffer, pH 8[#]6, ionic strength of 0.05 and potential gradient of 8V/cm. was used for a 2 hr. period.

P.D.Dawkins

5297. STARCH ELECTROPHORESIS OF SOLUBLE

TUMOUR PROTEINS. E.M.Pantelouris: *Brit. J. Cancer*, 1963, 17, 179-182 (Zool. Dept., Queens Univ.

Belfast, N. Ireland) Electrophoretic comparison was made of extracts obtained by different techniques from tumour and brain tissues with the patterns obtained from blood plasma. C3H mice were used, the tumours being spontaneous mammary ones. No zones were found in extracts not present in plasma though there was a predominance of albumin and haptoglobin zones in tumour patterns. A characteristic foetal plasma fraction, absent from maternal plasma, was observed in 16-day old foetuses.

D.Hamer

5298. HETEROGENEITY OF MEROMYOSIN OF CARP.

A.Stainier-Lambrecht: *Arch. int. Physiol.*, 1962, 70, 682-710 (Lab. Gen. Biol., Fac. Sci., Univ., Liège, Belgium) Controlled trypsin hydrolysis of carp

myosin is more rapid than that of rabbit. Ultracentrifugation and electrophoresis show that the products of hydrolysis are more homogeneous in the rabbit. L-meromyosins of carp and rabbit have been isolated. Carp meromyosin is made up of several constituents which differ in electrochemical prop., aromatic amino acid content and asymmetry. These differences are much less marked in rabbit meromyosin. They may explain the low stability of carp myosin. (French)

M.E.Nutt

5299. TRACE PROTEINS IN CEREBROSPINAL FLUID AND OTHER BIOLOGICAL FLUIDS. I. EFFECT OF VARIOUS FRACTIONATION PROCEDURES ON g-trace AND Vtrace PROTEINS AND METHODS FOR ISOLATION OF BOTH PROTEINS. G.M.Hochwald and G.J.

Thorbecke: *Arch. Biochem.*, 1963, 101, 325-334 (Dept. Pathol., New York Univ. Sch. Med., New York, U.S.A.) Salt fractionation, starch block electro-

phoresis and column chromatography were applied to the P-trace and Y-trace Proteins from cerebrospinal fluid and urine. Results were analysed by immuno-electrophoresis and double diffusion in agar using rabbit antisera to c.s.f. and to human serum. A portion of the 3-trace protein was isolated by a 1 step procedure using DEAE-cellulose. Both proteins were isolated when starch block electrophoresis or diethylaminoethylcellulose chromatography was followed by hydroxyapatite chromatography.

B.M. Stevens

5300. FOETAL-HAEMOGLOBIN-CONTAINING ERYTHROCYTES. I. COUNTS OF CELLS STAINED BY ACID ELUTION METHOD COMPARED WITH ALKALI DENATURATION MEASUREMENTS. K.A.Kiossoglou, I.J.Wolman and M.Garrison jun.: *Blood*, 1963, 21, 553-560 (Children's Hosp., Philadelphia, Pa., U.S.A.)

The results of a comparison between the acid elution method and alkali denaturation technique in a quant. study of peripheral smears for r.b.c. containing foetal Hb gave a correlation of only 0.79. The acid elution method seemed more sensitive in most cases.

H.B.Wayforth

5301. EMBRYONIC HAEMOGLOBIN OF BUFO VULGARIS.

Y.Kurata and W.Arakawa: *Blut*, 1963, 9, 1, 42-43 (Dept. Pathol., Med. Sch., Univ., Kanazawa, Japan)

The difference in prop. from human and foetal Hb appeared to be related to O₂ storage. A.J.Wansbrough

BIOCHEMISTRY

5302. REACTIONS OF CYANAMIDE WITH METHAEMOGLOBIN AND SOME OTHER HAEMATIN COMPOUNDS. J.Keilin: *Biochim. biophys. Acta.* 1963, 71, 621-631 (Sch. Vet. Med., Univ., Cambridge, England)

Cyanamide reacted with methaemoglobin to give a red compound with a characteristic absorption spectrum. Cyanamide also combined with whale metmyoglobin and *Tubifex* metHb. Reaction was best in alk. soln., 1 mol. of cyanamide combining/haematin Fe atom. Cyanamide inhibited cytochrome oxidase but was 300 times less effective than cyanide or N₃⁻. No compound was formed between cyanamide and free haematin, haems or their deriv.

B.M.Stevens

5303. MYOGLOBIN AND THE STRUCTURE OF PROTEINS. J.'c.Kendrew: *Science*, 1963, 139, 1259-1266 (M.R.C. Lab. Mol. Biol., Cambridge, England) Nobel Prize lecture.

G.M.Lewis

5304. DIFFERENTIATION OF MYOGLOBINS AND HAEMOGLOBINS. C.L.Walters and A.McM.Taylor: *Nature*, Lond., 1963, 198, 996-997 (Brit. Food Manufacturing Industries Res. Assocn., Leatherhead, Surrey, England) Oxymyoglobin and oxyHb in pig blood can be differentiated by the ratio of optical densities at 577 mji before and after alk. denaturation.

G.M.Lewis

5305. RATE OF RENEWAL OF PLASMA HAPTOGLOBIN IN THE RABBIT. J.Borel, W.Dobryszycka, J.Moretti and M.-F.Jayle: *Bull. Soc. Chim. biol.*, Paris, 1963, 45, 203-210 (Lab. Biochim., Fac. Méd., 45, rue des Sts.-Pères, Paris, France) Rabbits were inj. with 131I-haptoglobin. The halMife of the labelled circulating protein was 3-4 days compared with 13-14 days in a similar expt. with [131I]albumin.

(French) J.C.Crawhall

5306. COMPARISON OF METHODS OF PREPARATION OF RAT SERUM ALBUMIN AND CHARACTERISATION OF A PURE SAMPLE. P.W.Jungblut and F.Turba: *Biochem. Z.*, 1963, 337, 88-103 (Physiol. Chem. Inst., Univ., Wurzburg, Germany)

A pure sample of albumin from the plasma of <? Wistar rats was prep, by subjecting the fraction V of Cohn to continuous electrophoresis in 0.025M barbitone buffer pH 8*6. If such a sample of albumin was re-cycled under the above conditions in 0.025M citric acid-phosphate buffer pH 4*1 and again in the barbitone buffer the purity of the albumin was shown to be 0*1% by immunoelectrophoresis. A mol. wt. of 64500 was calc from S const, the diffusion const, and the apparent spec. vol. The N-terminal amino acid is glutamic acid. The C-terminal sequence is either ala.alala.ser. or ala.leu.alala.ser., the second sequence is more likely to be correct. A complete amino acid analysis is also given.

(German) L.Cohn

5307. MICROHETEROGENEITY OF ALBUMIN. J.Rejnek, T.Bednarik and J.Kocj: *Clin. chim. Acta*, 1963, 8, 116-126 (Inst. Haematol. and Blood Transfusion, Prague, Czechoslovakia)

Very pure prep, of human serum albumin prep, by electrophoresis or ethanol fractionation were subjected to chromatographic analysis and individual fractions analysed by immunoelectrophoresis or agar gel electrophoresis. Two distinct fractions were separated, the larger of which can probably be further subdivided. An incomplete pptn. reaction was given by some chromatographic fractions. It is concluded that albumin contains molecules with different antigenic structures.

K.Brew

5308. DISTRIBUTION OF FOREIGN SERUM PROTEINS IN SERUM AND LYMPH. L.Varga, R.Backhaus and M.F.Bldi: *Z. Ges. exp. Med.*, 1963, 136, 547-551 (II. Med. Univ. Clin. Szeged and Fortchungsinstiut

"Human", Budapest, Hungary) The distribution of albumin and yglobulin in blood and thoracic lymph of dogs after i.v. injn. of 16-20 ml. cockerel serum was followed by an immunol. gel-diffusion method using rabbit serum. Albumin tended to appear in lymph more readily than globulin.

(German) P.F.Meyer

5309. DISTRIBUTION OF THE SERUM PROTEINS OF SYRIAN HAMSTER AS REVEALED BY STARCH GEL ELECTROPHORESIS. A.Amin and K.D.Shamloo:

Nature, Lond., 1963, 198, 485-486 (Lab. Chim. Biol., Inst. d'Etat des Serum et Vaccins Razi, Hessarek, Iran) Starch gel electrophoretic patterns of hamster sera differ considerably from human sera. The paper electrophoretic pattern appeared to contain bands corresponding to albumin, (X-1), (X-2 and a-3 globulin, @and a y-globulin.

G.M.Lewis

5310. ELECTROPHORETIC ANALYSIS OF THE NON-HAEMOGLOBIN PROTEINS OF HUMAN RED CELLS.

E.Bottini and E.R.Huehns: *Clin. chim. Acta*, 1963, 8, 127-132 (Med. Unit, Univ. Coll. Hosp., London, England) A chromatographic method for the separation of non-haemoglobin proteins from haemoglobin of red cells is reported. The pattern obtained on electrophoresis of this fraction on cellulose acetate, and starch gel is described and a new two dimensional system of starch gel electrophoresis which defines at least 20 different proteins is described.

K.Brew

5311. PAPER ELECTROPHORESIS OF SERUM PROTEINS OF THE GRASS-SNAKE, NATRK NATRK (L.).

A.Seni5w: *Comp. Biochem. Physiol.*, 1963, 9, 137-149 (Lab. Gen. Zool., Zool. Inst., Univ. Wroclaw, Poland) Electrophoretic separation of serum albumin from N. natrix resolves only 2 a fractions (a,j, a,2) on paper, but 3 fractions (<x1, (X2.03) on cellulose acetate. The p-globulins are the largest fraction of proteins separated by electrophoresis, separating into two fraction (3lt 32)- Y~Globulins are subject to considerable seasonal variation.

M.S.Laverack

5312. AMINO ACID COMPOSITIONS OF HUMAN AND RABBIT Y-GLOBULINS AND OF THE FRAGMENTS PRODUCED BY REDUCTION. M.J.Crumpton and J.M. Wilkinson: *Biochem. J.*, 1963, 88, 228-234 (Dept. Immunol., St. Mary's Hosp. Med. Sch., London, England)

Amino acid compositions determined with the Spinco model 120 Amino Acid Analyzer are reported for human and rabbit yglobulins, the chains A and B produced by reduction of some of the disulphide bonds of human and rabbit y-globulins, and for the A and B piece* obtained from piece n formed by papain digestion of rabbit y-globulin. The compositions of the rabbit V-globulin chain B and B piece were not significantly different. Cystine was determined as cysteic acid after oxidation of the proteins with performic acid. Tryptopk*¹ was determined spectrophotometrically. Hydroxylysine could not be detected in either human V"globulin or rabbit y-globulin.

5313. MOLECULAR WEIGHTS OF THE PEPTIDE CHAI[§] OF Y-GLOBULIN. R.H.Pain: *Biochem. J.*, 1963, 88, 234-239 (Dept. Immunol., St. Mary's Hosp. Med. Sch., London, England) Mol. wt. of the component

fragments of Y-globulin have been determined, namely chain A(50300), chain B (19400), piece I (40700) and A piece (21600). The sedimentation equilibrium method was used to detect and eliminate the effect of small amounts of sol. aggregate that caused the Trautman plot of Archibald data to yield spuriously high values. j_s and diffusion (Gouy) coefficients, extrapolated to zero concn., with $V=0.738$, give a mol. wt. of 151000 for horse Y-globulin.

5314. IMMUNOLOGICAL INVESTIGATION OF HUMAN Y-GLOBULIN DEGRADED BY CHYMOTRYPSIN.

C.Cederblad, L.A.Hanson and B.G.Johansson: Clin. chim. Acta, 1963, 8, 78-85 (Dept. Med. Biochem., Univ. Goteborg, Sweden) Separation of chymotryptic digest of human Y-globulin was achieved using Sephadex gels with a low degree of cross-linking (G-75, £-100) and components with pptn. prop. separated. The fragments were studied by immunoelectrophoresis and compared with fragments of y-globulin isolated after "Yptic degradation." K.Brew

5315. ISOLATION OF IMMUNOLOGICALLY ACTIVE FRAGMENTS OF NORMAL HUMAN y-GLOBULIN AFTER TRYPTIC DEGRADATION. L.A.Hanson and B.G.Johansson: Clin. chim. Acta, 1963, 8, 66-78 (Dept. Bacteriology, Univ. Goteborg, Sweden)

Several products with retained pptn. prop. in a tryptic digest of human y-globulin were demonstrated by immunoelectrophoresis. A group separation of these products was obtained by gel filtration and Sephadex p-75. Further purification of 2 fragments was attained by column electrophoresis and ion exchange chromatography. One fragment shows retained Ab activity.

K.Brew

5316. N-TERMINALS OF PORCINE ^GLOBULIN.

G.Colacicco: Nature, Lond., 1963, 198, 784-785 (American-Standard Res. Div., Union, N.J., U.S.A.) Porcine y-globulin appears to contain submolar quantities of N-terminals; the significance of this finding is discussed.

G.M.Lewis

5317. INTERACTIVE POWER OF SOME RED CELLS STRUCTURES AND BASIC PROTEINS. II. INTERACTION BETWEEN SALMIN, LYSOZYME AND THYMUS HISTONE AND BOVINE RED CELL STROMA AND THEIR PROTEIN EXTRACTS. A.Brusca, D.Patrono and A.Ardoino: Sperimentale, 1963, 33, 24-40 (1st. Patol. Gen., Univ., Palermo, Italy)

The effect of protein on suspensions of bovine red cell stroma was studied by measuring the changes in turbidity. Basic proteins, lysozyme (0.03tfo final concn.), calf thymus histone (0.0075%) and salmin (0.0037%) agglutinated a 1:10 su

"Gelatin," serum albumin and ovalbumin did not show the effect. The $(\text{NH}_4)_2\text{SO}_4$ fraction 0.2% did not affect the interaction between salmin and histone. The importance of this interaction in anti-viral activity is discussed. (Italian) G.N.Godson

5318. USE OF SPECIFIC AMINO ACID DECARBOXYLASES FOR THE IDENTIFICATION OF C-TERMINAL GROUPS. M.J.Hill, A.M.James and W.R.Maxted:

Biochim. biophys. Acta, 1963, 71, 740-742 (Dept. Chem., Chelsea Coll. of Sci. and Technol., London, England) A method was developed for detecting C-terminal groups at the surface of bacteria by using bacterial α -carboxypeptidases in which Ca^{2+} with electrophoresis. J.M.Cohill and J.C.Crawhall

5319. PURIFICATION AND ANALYSIS OF LYSOZYME ISOLATED FROM HUMAN PLACENTA. J.-F.Petit, M.Panigel and P.Jolles: Bull. Soc. Chim. biol., Paris, 1963, 45, 211-217 (Lab. Chim. Biol., Fac. Sci., 96, Boulevard Raspail, Paris, France) A lysozyme

was extracted from human placenta and purified by chromatography on Amberlite CG50 and CM-cellulose. The amino acid composition was determined by automatic chromatographic analysis and a min. mol. wt. of 15000 was obtained by calc. (French) J.C.Crawhall

5320. KINETIC STUDY OF A LIMITED PROTEOLYSIS: ACTION OF RENNIN ON K-CASEIN. J.Garnien

Biochim. biophys. Acta, 1963, 66, 366-377 (Stat. Cen. Microbiol. et Rech. Laitières, I.N.R.R., Jouy-en-Josas, S.-et-O., France) K_m in 0.1M NaCl at pH 6.9 did not vary between 25° and 40° and was 3.3 ± 0.3 10-5M being practically equal to the dissociation const. of the rennin-ft-casein complex. The rate const. of decomposition of this complex was $36 \pm 4/\text{sec.}$ at 35°. The change in enthalpy of activation of the complex was $6300 \pm 400 \text{ cal./mol.}$ At 35°, the changes in free energy and entropy of activation of the complex were $15800 \pm 100 \text{ cal./mole}$ and $-31 \pm 1^{\circ}5 \text{ cal./mole}$ respectively. (French) B.M.Stevens

5321. METABOLIC ASPECTS OF THE UPTAKE OF OXYGEN BY Hb IN ERYTHROCYTES. J. A. Sirs:

Biochim. biophys. Acta, 1963, 66, 378-385 (Phys. Dept., St. Mary's Hosp. Med. Sch., Univ. of London, London, England) Spectrophotometric measurements showed that O₂ uptake by Hb in intact human r.b.c. was initially fast but slowed with time, the decay varying with temp., storage and the presence of O₂. No such "decay" occurred in rate of CO uptake unless O₂ was also present. The fast rate of O₂ uptake was inhibited by lowering the pH, but cyanide, N₃⁻, F⁻, iodoacetate and Methylene Blue were ineffective. After decay began, adenosine addition temporarily increased the rate.

B.M. Stevens

5322. COMPARATIVE BIOCHEMICAL STUDIES.

H. AMINO ACID COMPOSITION AND SOME PROPERTIES OF HUMAN CYTOCHROME £. H.Matsubara, R.L.Ochu and K.T.Yasunobu: Arch. Biochem., 1963, 101, 209-214 (Dept. Biochem. and Biophys., Univ. Hawaii, Honolulu, Hawaii, U.S.A.) The cytochrome contained 18 Lys., 3 His., 2 Arg., 1 Try., 8 Asp., 7 Thr., 2 Ser., 10 Glu., 4 Pro., 13 Gly., 6 Ala., 2 (CyS)_t 3 Val., 3 Met., 8 lieu., 6 Leu., 5 Tyr., 3 Hie. and 7 NH₃. Some physicochemical prop. are reported. B.M. Stevens

5323. ACTIVATION OF PLASMINOGEN. I. PREPARATION AND PROPERTIES OF AN INSOLUBLE DERIVATIVE OF STREPTOKINASE. A.Rimon, M.Gutman and S.Rimon: Biochim. biophys. Acta, 1963, 73, 301-310 (Marcus Mem. Blood Inst., Magen David Adom, Tel Aviv, Israel)

The deriv., prep. by coupling streptokinase to a diazotised copolymer of γ -aminophenylalanine and leucine, was functionally identical to sol. streptokinase. Some proteins, especially casein, accelerated the activation of plasminogen by bound streptokinase. Other proteins, such as albumins, had no effect, while tosyl-L-argininemethyl ester inhibited the activation. Using bound streptokinase the activation phase of the plasmin system could be separated from the caseinolytic Phase.

B.M. Stevens

5324. COLUMN CHROMATOGRAPHY OF HUMAN

PLASMINOGEN ON DEAE-CELLULOSE. M.J.Cohill and

BIOCHEMISTRY

S.Shulman: *Biochim. biophys. Acta*, 1963, 73, 293-300 (Dept. Biophys., Univ. Sch. Med., Buffalo, N.Y., U.S.A.) Acid extracted samples chromatographed at 0°-4° using stepwise elution appeared grossly heterogeneous. Quant. analysis indicated complete recovery of total protein but only 60-80% of the caseinolytic units were recovered. When NH₄ acetate buffers containing 0.01M L-lysine were used, 6 peaks were obtained. Proteolytic assays indicated that approx. 40% of the original prep. was plasminogen. If the L-lysine concn. was raised to 0.05M, the chromatogram was changed, the sp. activity being increased 5-10 times in 1 fraction. Chromatography in 6M urea produced 3 peaks with complete recovery of total protein but partial loss of caseinolytic activity.

B.M.Stevens

5325. 14C-LABELLING AND MAKING OF PEPTIDE CHARTS OF THE SH-REGIONS OF ACTOMYOSIN, MYOSIN, ACTIN AND H-MEROMYOSIN. U.Groeschel-Stewart and F.Turba: *Biochem. Z.*, 1963, 337, 104-108 (Physiol.-chem. Inst., Univ., Wurzburg, Germany)

Actomyosin, myosin, actin and H-meromyosin were reacted with N-[¹⁴C]ethylmaleimide in the presence of 2M guanidinium chloride. Tryptic digests were subjected to paper electrophoresis, and spots were located by autoradiography. From the position of the radioactive spots it was concluded that since the fingerprints of the sub-units were additive, characteristic amino acid sequences surrounded each reactive cysteine residue.

(German) L.Cohn

5326. EFFECT OF DENATURING AGENTS OF UREA-GUANIDINIUM CLASS ON SOLUBILITY OF ACETYL-TETRAGLYCINE ETHYL ESTER AND RELATED COMPOUNDS. D.R. Robinson and W.P.Jencks: *J. biol. Chem.*, 1963, 238, PC 1558-1560 (Grad. Dept. Biochem., Brandeis Univ., Waltham, Mass., U.S.A.)

The solubility of N-acetyltetraglycine ethyl ester in water is increased 3.35 and 7.7 times in 8M-urea and 7M-guanidinium chloride, respectively. Formamide and acetamide also increase the solubility of the peptide. These agents exert their effect mainly on the amide chain of the mol., and it is not a simple 'hydrophobic' effect. The bearing of the results on denaturation of proteins is discussed.

J.N.Ashley

5327. THERMAL TRANSITIONS IN COLLAGEN [-SALINE SYSTEMS PARTICULARLY IN THE VICINITY OF 40°]. P.Mason and B.J.Rigby: *Biochim. biophys. Acta*, 1963, 66, 448-450 (Div. Textile Phys., C.S.I.R.O., Wool Res. Lab., Ryde, Sydney, Australia) Prelim. comm.

B.M.Stevens

5328. PHYSICOCHEMICAL STUDIES ON CYTOCHROME b₂*, SOME PROPERTIES OF MODIFIED FORMS OF THE ENZYME AND OF THE DNA COMPONENT.

J.McD.Armstrong, J.H.Coates and R.K.Morton: *Biochem. J.*, 1963, 88, 266-276 (Dept. Agric. Chem., Waite Inst., Univ. Adelaide, S. Australia) Type n cytochrome b₂ was obtained from cryst. Type I cytochrome b₂ by removal of the DNA component of the cryst. enzyme with (NH₄)₂SO₄. Type II cytochrome b₂ sedimented as an apparently single component; $\text{f}_{\text{X}_0}^{\text{w}}$ is 8.56 JS. There is a linear relationship between $\text{j}_{\text{20}}^{\text{w}}$ and protein concn., but the proportional change of $\text{f}_{\text{SgO}_2}^{\text{w}}$ with change of protein concn. is about 33% of that of type I cytochrome b₂. Exposure of Type I cytochrome b₂ to O₂ and to chloromercurobenzene-g-sulphonate caused dissociation of enzyme-bound flavin. In the presence of lactate, exposure to air caused the formation

of aggregates that had sedimentation coefficients of about 10-14 j_{E} , 15-17 j_{E} and 20-22 f . Chloromercurobenzene-g-sulphonate prevented the formation of these aggregates on exposure to air. It was estimated that there are 4-6 thiol groups/haem group in Type I cytochrome b₂; at least one of these appears to be at the active centre of the enzyme. Treatment with urea caused dissociation of flavin and inactivation of the enzyme. No new sedimenting components were observed after treatment of the enzyme with 2.7M- or 5M-urea, before or after removal of the urea by dialysis. The sedimentation coefficient of the DNA isolated from Type I cytochrome b₂ was $5.8 \pm 0.2 \text{ JS}$. The mol. wt. was calc. to be $1.2 \times 10^5 \pm 0.4 \times 10^5$.

5329. SOME FEATURES OF THE ASSOCIATION OF β -CASEIN. T.A.J.Payens and B.W.VanMarkwijk: *Biochim. biophys. Acta*, 1963, 71, 517-530 (Netherlands Inst. Dairy Res., Ede, Netherlands) Ultracentrifugation and viscometry indicated that, at 4°, β -casein was a monomer with a min. mol. wt. of approx. 25000. At 8.5° and 13.5°, thread like polymers were formed which were firmly interlinked. The association rate appeared to be quite low. At 8.5° the degree of polymerisation was approx. 22; at 13.5° it appeared to be considerably higher. The second virial coeff. of the polymers, deduced from Archibald's method, was $7.80 \times 10^{-6}/(\text{g./100 m}_1)$. The pool equilibration of the system is discussed.

B.M.Stevens

5330. STRUCTURE OF POLY-L-PROLINE I. W.Traub and U.Shmueli: *Nature*, Lond., 1963, 198, 1165-1166 (Dept. X-ray Cryst., Weizmann Inst. Sci., Rehovoth, Israel) Structure of form I of poly-L-proline (sp. optical rotation $[\alpha]_{\text{D}}^{25} = +50^\circ$) was studied by X-ray diffraction analysis and model building. The mol. exists as a right-handed helical structure with peptide bonds in the cis configuration. 10 residues of proline exist per unit cell of the astal, these 10 residues comprising 3 helical turns. The helical screw axis has a translation of 1.90A and a rotation of 108°.

J.R. Sargent

5331. CHARACTERISATION OF HUMAN LIVER FERRITIN BY STARCH GEL ELECTROPHORESIS. J.J.Theron, A.O.Hawtrey and V.Schirren: *Clin. chim. Acta*, 1963, 8, 165-167 (Nat. Nutrit. Res. Inst., C.S.I.R., Pretoria S. Africa) Starch gel electrophoretic patterns of purified ferritin from normal and high iron, human liver were shown to be similar.

K.BreW

5332. BOHR EFFECT: ABSENCE IN A MOLLUSCAN HAEMOCYANIN. J.R.Redmond: *Science*, 1963, 139, 1294-1295 (Dept. Zool., Iowa State Univ., Ames, Iowa, U.S.A.) Haemocyanin of *Diodora aspera* shows no Bohr effect within the pH range 6.88 to 7.84. At 10° the pressure of half-satn. is 5 mm. Hg of O₂. A moderately pos. interaction occurs among the oxygen-combin. sites during oxygenation. The heat of oxygenation is approx. -12.6 kcal./mole oxygen. The pH of normal blood is lower than that of other marine molluscs.

G.M.Lewis

5333. ESTIMATION OF SIZE AND SHAPE OF Y-GLOBULIN MOLECULES BY SMALL ANGLE X-RAY ANALYSIS. O.Kratky, L.Pilz, P.J.Schmitz and R.Oberdorfer: *Z. Naturforsch. B*, 1963, 18, 180-188 (Inst. physikal. Chem., Univ., Graz, Austria) The results of small angle X-ray analysis of y-globulin in 5.0-5% soln. extrapolated to zero concn. corresponded to a mol. wt. of 1.59×10^5 with an elliptical shape having half-axes of 10.9 and 25A respectively.

(German) J.C.Crawha^{lt}

5334. UREA CATION IN THE MECHANISM OF DENATURATION OF PROTEINS. G. Colacicco: Nature, Lond., 1963, 198, 583-584 (American-Standard Res. Un., Union, N.J., U.S.A.) The structure of urea and guanidinium is discussed in relation to their denaturation of proteins. From spectroscopic evidence and consideration of physical prop., it is concluded that the urea cation is a zwitterion with a pos. head charge, G.M.Lewis

Q335. DIFFERENCE SPECTRUM OF DHEOPROPYLPHOSPHORYLTRYPSIN [DIPT] VERSUS TRYPSIN. H.L.Oppenheimer and G.P.Hess: Nature, Lond., 1963, 198, 689-690 (Dept. Biochem., Cornell Univ., Ithaca, New York, U.S.A.) The DIPT versus trypsin difference spectrum exhibits a max. at 285-287 m μ , probably due to tyrosyl residues. G.M.Lewis

5336. INTENSIFICATION OF ABSORPTION SPECTRA. W.B.Elliott and G.F.Doeblen: Nature, Lond., 1963, 198, 690 (Dept. Biochem., Sch. Med., State Univ. New York, Buffalo, N.Y., U.S.A.) A 40-fold intensification of the absorption spectrum of cytochrome c may be achieved by freezing the aq. soln. into very small ice pellets by forcing it through a 22 gauge needle into liquid N₂. G.M.Lewis

5337. EFFECT OF DIALYSIS AND FERRICYANIDE ON THE RED&X TITRATIONS OF Hb. K.Abeh: Arch. Biochem., 1963, 101, 286-291 (Chem. Dept., Utah State Univ., L. 5^{an}, Utah, U.S.A.) Dialysis effected the shape of the redox titration curves leading to different terminations. At pH 7.9 the oxidation of ferrohaemoglobin by ferricyanide appeared to proceed through an irreversible stepwise mechanism. B.M.Stevens

5338. PROTEIN DENATURATION BY HIGH PRESSURE MEASUREMENTS OF TURBIDITY OF ISOELECTRIC FVALBUMIN AND HORSE SERUM ALBUMIN UNDER HIGH PRESSURE. K.Suzuki, Y.Miyosawa and C.Suzuki: Arch. Biochem., 1963, 101, 225-228 (Dept. Chem., Fac. Sci. and Engineering, Ritsumeikan Univ., Kyoto, Japan) Turbidity was measured directly in an apparatus with optical windows able to withstand pressure up to 10000 kg./sq. cm. Ovalbumin soln. became turbid when compressed to 4000 kg./sq. cm. and showed no change when pressure was released. The albumin soln. also became turbid when compressed to 4000 kg./sq. cm. and turbidity disappeared when the pressure was released. B.M.Stevens

5339. ULTRAVIOLET FLUORESCENCE OF PROTEINS. * INFLUENCE OF pH AND TEMPERATURE. R.F.Steiner and H.Edelhoch: Biochim. biophys. Acta, 1963, 66, 355 (Naval Med. Res. Inst., Natl. Naval Med. Sch., Bethesda, Md., U.S.A.) In highly purified proteins with structures apparently invariant to pH, pH effects were generally small at values acid to the ionization of tyrosyl groups. At high pH, all proteins show significant quenching, presumed to result from ionization transfer of energy from tryptophanyl to tyrosyl residues. All proteins examined showed reversible fluorescence intensity in pH zones where been demonstrated by various procedures. The influence of temperature on fluorescence in pH zones of thermal stability varied in several proteins. Deviations from a characteristic temp. dependence were observed in pH denatured. B.M.Stevens

5340. FURTHER EVIDENCE ON THE IDENTITY OF CYSTATHIONASE AND CYSTEINE DESULPHYDRASE. B.Mondovi, A.Scioscia-Santoro and D.Cavallini: Arch. Biochem., 1963, 101, 363-364 (Inst. Biol. Chem., Univ., Rome, Italy) The enzyme activities were always associated in the protein fractions obtained by column chromatography and electrophoresis of rat liver extracts. B.M.Stevens

5341. INDUCIBLE ENZYME SYSTEM IN LARVAL CELLS OF DROSOPHILA MELANOGASTER. T.M.Rizki and R.M.Rizki: J. cell Biol., 1963, 17, 87-92 (Dept. Zool., Univ. Michigan, Ann Arbor, Mich., U.S.A.) Tryptophan pyrrolase activity in the fat body is related to the distribution of the autofluorescent kynurenone patterns which spread to the cells beyond the ant. region in tryptophan fed larvae. Cell free extracts of the Ore-R-wild type strain and the unsuppressible vermilion mutant U 38f were treated with phenylthiourea to inhibit trypsinase activity and incubated in Vgo L-tryptophan for 3 hr. and optical density readings between 300-400 mp taken. Tissues incubated for 30 min. were examined with a Zeiss fluorescence microscope. The differentiation of kynurenone cells is controlled by a genetic mechanism operating through the inducible tryptophan pyrrolase system.

P.Barrow

5342. EFFECT OF AMINO ACIDS ON PROTEOLYTIC ACTIVITY OF TRYPSIN AND CHYMOTRYPSIN. M.P.Chernikov: Biokhimiia, 1963, 28, 285-287. A study was made of the effect of amino acids (concen. 0.05M) on the hydrolysis of serum albumin by trypsin and chymotrypsin. Trypsin was inhibited by the following, in decreasing order of efficiency: Try., His., Arg., Lys., Phe., Leu., Isoleu. and Thr. For chymotrypsin: Try., Arg., Leu., Pro., Phe., His., Isoleu., Thre., Cit., Ser., Met. and Asp. Pro., Cit., Ser., Mec, Ala. and Asp. had no effect on the activity of trypsin. Gly., Val., Tyr., Hydrol., Asp. and Glu. acids were ineffective for both enzymes. Cys. activated chymotrypsin and trypsin. (Russian) B.J.Cooper

5343. ACTIVATION OF CHYMOTRYPSINOGEN-A BY A PROTEASE FROM STREPTOMYCES GRISEUS. W.M.Awad, jun. and P.E.Wilcox: Biochim. biophys. Acta, 1963, 73, 285-292 (Dept. Biochem., Univ. Washington, Seattle, Wash., U.S.A.) The rate and extent of the activation were comparable to tryptic activation of the zymogen. Studies of the N-terminal amino acid groups suggested that, during rapid activation, 6-chymotrypsin was the main product. B.M.Stevens

5344. L-AMINO ACID OXIDASE FROM SILKWORM EGGS (BOMBYX MORI L). S.Kotaka: J. gen. Physiol., 1963, 46, 1087-1094 (Air Ion Lab., Dept. Bacteriol., Univ. California, Berkeley, Calif., U.S.A.) An enzyme which catalyses the oxidation of L-amino acids was isolated from silkworm eggs. The activity of the purified enzyme prep. was 1584 times as strong as that of the crude prep. Methods of purification of the enzymes are described and certain physicochem. prop. of the enzyme are reported. K.Jones

5345. D-AMINO ACID OXIDASE ACTIVITY IN HUMAN TISSUES. J.T.Dunn and G.T.Perkoff: Biochim. biophys. Acta, 1963, 73, 327-331 (Dept. Med., Univ. Utah Coll. Med., Salt Lake City, Utah, U.S.A.) Kidney, brain stem and liver contained appreciable levels of the enzyme. B.M.Stevens

BIOCHEMISTRY

5346. ABSENCE OF AMINO ACID DECARBOXYLASE IN CERTAIN STRAINS OF E. COLI DEMONSTRATION BY ELECTROPHORETIC TECHNIQUES. H.Leclerc, R-Osteux and J.Guillaume: Ann. Inst. Pasteur, 1963, 104, 477-487 (Inst. Pasteur, Lille, France)

A method is described for incubation of E. coli cultures followed by extraction and electrophoresis for demonstration of products of amino acid decarboxylation. The technique has shown the absence of amino acid decarboxylase in certain atypical E. coli strains, and it is suggested this should be the criterion for establishing a new strain. (French) B.Payne

5347. ARGINASE IN YOUNG CHICK EMBRYOS.
m. REGULATION OF ARGINASE SYNTHESIS.

E.Eliasson: Exp. Cell Res., 1963, 30, 74-79 (Wenner-Gren Inst. Expt. Biol., Univ., Stockholm, Sweden)

Effect of addition of arginine and urea on the synthesis of arginase in young chick embryo was studied. An increase in arginase activity could be induced by increasing the substrate concn., although the effect was only transient*. The results supported the view that arginase accumulation is regulated by a neg. feedback mechanism. K.Jones

5348. STAPHYLOCOCCAL 5-HAEMOLYSIN. I. PURIFICATION AND CHEMICAL PROPERTIES. A.Yoshida: Biochim. biophys. Acta, 1963, 71, 544-553 (Dept. Pub. Hlth. and Preventive Med., Sch. Med., Univ. of Pennsylvania, Philadelphia, Pa., U.S.A.) The

5-haemolysin was purified by column chromatography on Ca phosphate gel and triethylaminoethylcellulose and cryst. Sedimentation expt. showed a high degree of homogeneity. η_S was $6^{\circ}1$. The intrinsic E was $5^{\circ}5$ ml./g. The toxin contained 74 Asp., 47 Thr., 40 Ser., 42 Glu., 3 Pro., 45 Gly., 39 Ala., 31 Val., 25 Met., 59 lieu., 45 Leu., 7 Tyr., 48 Phe., 10 Try., 88 Lys., 2 His. and 4 Arg. The mol. wt. was 68230. The toxin was heat labile. It was easily digested by trypsin and lost its haemolytic activity as a result. B.M.Stevens

5349. GENERAL METHOD FOR THE DETERMINATION OF TRANSAMINASE ACTIVITY. EFFECTS OF HYPOGLYCIN A. S.J.Patrick: Canad. J. Biochem., 1963, 41, 1163-1167 (Biochem. Dept., Dalhousie Univ., Halifax, Nova Scotia, Canada) After incubating a [14 C]amino acid, a non-radioactive a-keto acid, and the appropriate transaminase together, the radioactivity of the combined, isolated dinitrophenylhydrazones of the a-keto acids was determined, thus giving a measure of the extent of transamination. Hypoglycin A was a competitive inhibitor for various liver transaminases, the greatest inhibn. being found with L-leucine transaminase. A.M.Gibbins

5350. PARTIAL RECOVERY OF GLUTAMIC-CXALOACETIC TRANSAMINASE [GOT] ACTIVITY IN THE INFARCTED AREAS OF THE MYOCARDIUM IN RABBITS DURING STIMULATION OF PROTEIN SYNTHESIS. Yu.W.Bukin: Nature, Lond., 1963, 198, 692-693 (Inst. Cardiovasc Surg., Acad. Med. Sci., Moscow, U.S.S.R.) Cardiac infarction was produced

in rabbits by ligation of the left coronary artery; 5 days later, the GOT activity and protein level in the infarcted area was markedly reduced. Treatment with a mixture of methionine, ATP, vitamins B₆ and Bi_{2t} RNA and DNA inj. s.c. caused intensified protein synthesis and promoted formation of the GOT apo-enzyme, restoring its activity to normal. G.M.Lewis

5351. AN ALTERNATIVE COUPLING REACTION OF MITOCHONDRIA BOUND TRANSAMINASE AND TRICARBOXYLIC ACID CYCLE AND ITS METABOLIC ROLE. N.Katunuma and M.Okada: J. Vitaminol., 1962, 8, 309-314 (Dept. Enzyme Chemistry, Inst. Enzyme Res., Sch. Med., Univ., Tokushima, Japan)

In isolated rat mitochondrial systems stoichiometric interconversion of glutamate and aspartate was found to occur by the coupling reaction between the tricarboxylic acid cycle [TCA] and mitochondrial bound glutamic-oxaloacetic transaminase [GOT]. This GOT cycle for amino acid metabolism is thought to be concerned with the anabolism and catabolism of non-essential amino acids and with the effective pathway through which the amino groups of glutamate may be converted into urea without the liberation of ammonia. The elementary reactions of GOT were found to occur in mitochondria but their physiol. significance is unknown.

E.Parkinson

5352. ORNITHINE TRANSAMINASE IN THE RAT.

I. ASSAY AND SOME GENERAL PROPERTIES.

C.Peraido and H.C.Pitot: Biochim. biophys. Acta, 1963, 73, 222-231 (McArdle Mem. Lab., Med. Sch. Univ. Wisconsin, Madison, Wis., U.S.A.) The

enzyme was assayed by estimating the glutamic semi-aldehyde formed, by reacting it with iD-aminobenzaldehyde to give a product with an absorption max. at 440 m μ . Kidney had most activity of the tissues examined, follow by liver. Heart, spleen and brain had approx. equal activities while skeletal muscle had least. The enzyme was located almost exclusively in the mitochondrial fraction. A 7-fold purification was achieved by subjecting isolate* liver mitochondria to ultrasonic vibration followed by (NH₄)₂SO₄ fractionation. The enzyme was sp. for ornithine and a-ketoglutarate. jg-Chloromercuribenzoat inhibited; mercaptoethanol was required for max. acti* vity. Dialysed enzyme prep, required pyridoxal phospha The pH optimum was approx. 7 $^{\circ}4$. B.M.Stevens

5353. REPRESSION OF TRANSAMINASE A BY TYROSIN

IN E. COLI. D.F.Silbert, S.E.Jorgensen and E.C.C.Lifl: Biochim. biophys. Acta, 1963, 73, 232-240 (Dept. Biol. Chem., Harvard Med. Sch., Boston, Mass., U.S.A.) Transaminase A formation was repressed approx. 5-fold in E. coli K12, B and W by tyrosine, but not by other amino acids. The cells were able to utilise tyrosine as sole N source; the activity of transaminase f was not the rate limiting factor for growth. Various JLSqJyi strains contained another transaminase, tthich acted on phenylalanine but not on tyrosine. This enzy* contributed approx. 20% of the total activity on phenyl* alanine in crude extracts of cells grown on simple gluc* media. Its formation was not repressed by any particular amino acid. • B.M.Stevens

NUCLEIC ACIDS, NUCLEOPROTEINS AND NUCLEOTIDES

5354. EFFECT OF CYTIDINE ON PURINE NUCLEOTH* FORMATION IN ASCITES TUMOUR CELLS IN VITRO. H. Harrington: Biochim. biophys. Acta, 1963, 68, 509-518 (Div. Rad. Biol., Dept. Radiol., Western Reserve Univ., Cleveland, Ohio, U.S.A.) Stimm. of purine nucleotide formation by cytidine and glucose in

Ehrlich cells was apparently due to ribose utilisation. Nucleotide formation from precursors requiring linkage to pentose was stim., but not formation from precursors already linked to pentose. ^{14C} from uniformly labelled cytidine was incorporated into the ribose or deoxyribose moiety of purine nucleotides of acid-sol. RNA and DNA. Incorporation of ^{14C} from uniformly labelled [^{14C}]cytidine into ATP ribose was sufficient to account for the increase in [^{14C}]adenine incorporation into ATP when cytidine was added. On incubation of high speed supernatant from cell homogenates with cytidine and phosphate, uridine, uracil and orcinol reacting, non-pyrimidine linked ribose were produced.

B.M.Stevens

5355. CONVERSION OF GUANINE TO HYPOXANTHINE IN MAMMALIAN R.B.C. A.Hershko, E.Wind, A.Razin and J.Mager: *Biochim. biophys. Acta*, 1963, 71, 609-620 (Dept. Biochem., Hebrew Univ., Jerusalem, Israel) Human and rabbit r.b.c. appeared capable of converting exogenously supplied guanine to hypoxanthine. The system appeared to involve transformation of guanine to guanosine 5'-phosphate, followed by reductive deamination to inosine 5'-phosphate. The enzyme catalysing the reductive deamination specifically required NADPH₂ and also an SH compound.

B.M.Stevens

5356. THYMIDINE DEGRADATION PRODUCTS IN PLANT TISSUES LABELLED WITH [3H] THYMIDINE. S.T.Takats and R.M.S.Smellie: *J. cell Biol.*, 1963, 17, 59-66 (Dept. Biol., Temple Univ., Philadelphia, Pa., U.S.A.) Growing buds of *Lilium longiflorum* were incubated in Bonner's soln. with [3H] thymidine, fixed in ethanol-acetic acid and infiltrated with paraffin. Sections and the fixative were analysed for radioactivity. [3H]ureidoisobutyric acid and 3-aminoisobutyric acid present in the fixative accounted for most of the 3H. A course expt. with *Vicia faba* root-tips grown under similar conditions showed that these products appear rapidly in the tissue and [3H]thymidine was recovered from the incubation medium.

P. Barrow

5357. MINERALISING ACTION OF UTP. I. IN VITRO OSSIFICATION OF NORMAL AND RACHITOGENIC CARTILAGE. A.Lanzetta: *Atti. Acad. med. Lombarda*, 1962, 17, 317-320 (Clinica Ortopedica, Univ., Milano, Italy) The process of mineralisation and ossification of tibial cartilage for normal and rachitogenic rats, was studied in vitro. Rachitogenic cartilage behaved similarly to normal cartilage, except for a greater uptake of orthophosphate, a lower respiration rate and a more labile Ca content. ATP and UTP were essential for ossification and it is suggested that the UTP generates the phosphate for mineralisation while the ATP generates the lost phosphate of the UTP.

(Italian) G.N.Godson

5358. MINERALISING ACTION OF UTP. II. IN VIVO OSTEOGENESIS OF BONE AND CARTILAGE. A.Lanzetta and G.Questa: *Atti. Acad. med. Lombarda*, 1962, 17, 321-331 (Clin. Ortopedica, Univ., Milano, Italy) Osteogenesis was studied by radiographical methods in rabbits treated with 1 mg./day i.v. for 10, 20, 30 and 40 days. UTP stim. osteogenesis i.e., UTP participates in the mechanism of ossification, most probably in the synthesis of mucopolysaccharide.

(Italian) G.N.Godson

5359. SOME OBSERVATIONS ON THE INOTROPIC ACTION OF ATP ON THE HEART OF THE FROG. P.Ottolenghi: *Canad. J. Biochem.*, 1963, 41, 1389-

1397 (Physiol. Dept., Fac. Med., Univ., Ottawa, Ont., Canada) The sites of the initial, short-lived inotropic effect (response I), produced when ATP was added to the perfusion fluid of an isolated frog ventricle, became blocked to further ATP action once the response had been elicited, and they had to be reactivated, by washing, to become available again. Response I was separated from response II, the secondary, more prolonged inotropic action, by using low concn. of ATP to block response I. Expt. suggested that the 6-amino group of the adenine of ATP or ADP was necessary to elicit response I, but not response II.

A.M.Gibbins

5360. ADP AS A POSSIBLE HYDROGEN CARRIER IN THE RESPIRATORY CHAIN. V.P.Skulachev. *Nature*, Lond., 1963, 198, 444-446 (Dept. Animal Biochem., Moscow St. Univ., U.S.S.R.) Pigeon breast muscle mitochondria aged in the presence of glucose, hexokinase and DNP for 30-120 min. lose ability to oxidise succinate and malate, which is restored by addition of ATP or ADP but not GDP, CDP, EDTA or serum albumin. AMP and inorg. phosphate do not restore activity. A difference spectrum for adenine and its nucleotides was obtained by electrochem. reduction in 0.1N perchloric acid. Some features of this spectrum can be identified in the difference spectrum of respiratory particles. J.R. Sargent

5361. ENZYMIC AMINOHYDROLYSIS OF 4-AMINO-PYRIMIDINE DEOXYRIBONUCLEOTIDES. IV. POSSIBILITY OF OCCURRENCE OF ALLOSTERIC SITE ON 2'-DEOXYRIBOSYL 4-AMINOPYRIMID-2-ONE 5'-PHOSPHATE AMINOHYDROLASE; E.Scarano, G.Geraci, A.Polzella and E.Campanile: *J. biol. Chem.*, 1963, 238, PC1556-1557 (Internat. Lab. of Genetics, Naples, Italy) Deoxycytidine triphosphate overcomes die inhibn. of the enzyme caused by deoxycytidine triphosphate and chloromercuribenzoate, but not the inhibn. caused by the rnonophosphate. The results obtained so far suggest that the enzyme has 2 active sites: a catalytic site and an allosteric site. The enzyme may have the allosteric site unoccupied, occupied by deoxycytidine triphosphate, or occupied by compounds such as deoxycytidine triphosphate, chloromercuribenzoate, etc. The deoxycytidine triphosphate complex has a higher affinity for the substrate, whereas the other complexes have an affinity for the substrate which is far less than that of the enzyme alone.

J.N.Ashley

5362. BIOSYNTHESIS OF URIDINE NUCLEOTIDES BY CRISTALLIN. P.Mandel, N.Virmaux and J.Klethi: *C.R. Soc. Biol.*, Paris, 1962, 156, 2123-2126 (Clin. Ophthalmol., Fac. de Méd., Strasbourg, France)

Cristallin of young ox possessed marked enzyme activity for the production of UTP from orotic acid with low production of UDP and UMP. 37.8% of [14C]orotic acid was converted to UTP. 17% of total UTP was converted to UDP-hexoses.

(French) M.A.Price

5363. COMPARATIVE STUDY OF FREE URIDYLIC NUCLEOTIDES IN NORMAL LIVER, REGENERATING LIVER AND ZAJDELA HEPATOMA. M.Wintzerith, N.Klein-Pete and L.Mandel: *C.R. Soc. Biol.*, Paris, 1962, 156, 2114-2118 (Centre de Recherches Nucleates, Strasbourg, France) The free uridyllic nucleotide content of rat liver was lower in regenerating liver than in normal liver or hepatoma. The highest levels were found during hepatoma. The level of UDP-hexoses and UDP-hexosamines was lower in hepatoma cells than normal and regenerating liver.

(French)

M.A.Price

BIOCHEMISTRY

5364. SOLUBLE FACTOR FROM MITOCHONDRIA STIMULATING THE RATE OF THE ENERGY REQUIRING PYRIDINE NUCLEOTIDE REDUCTION. F.A.Hommes: *Biochim. biophys. Acta*, 1963, 71, 595-603 (Johnson Foundn. for Med. Phys., Univ. Pennsylvania. Philadelphia, Pa., U.S.A.) The factor was partially purified from sonic particles from beef heart mitochondria. The factor appeared to make cytochrome *b* more accessible to reducing equiv. when succinate or *ig*-phenylene-diamine were used as electron donors. B.M.Stevens

5365. DETERMINATION OF ADENINE NUCLEOTIDES BY PAPER ELECTROPHORESIS. Z.Stránský: *J. Chromatography*, 1963, 10, 456-462 (Inst. Med. Chem., Med. Fac. of Charles Univ., Hradec Králové, Czechoslovakia) Adenine nucleotides from r.b.c. were separated by low voltage paper electrophoresis, eluted and determined by measuring their u.v. absorption. P.D.Dawkins

5366. CHANGES IN CONTENT OF ADENINE NUCLEOTIDES UPON AEROBIC INCUBATION OF SEA URCHIN SPERMATOZOA. S.Taguchi, I.Yasumasu and H.Mohri: *Expt. Cell Res.*, 1963, 30, 218-223 (Div. Biol., Nat. Inst. Rad. Sci., Chiba, Japan) In *Pseudocentrotus* spermatozoa, the proportion of AMP was highest and that of ATP lowest, while in *Hemicentrotus* spermatozoa, the content of ADP was somewhat higher than that of AMP. When the extensive exhaustion of endogenous substrates was allowed, die content of ADP and ATP decreased on aerobic incubation of sperm suspensions of both spp. However, when the utilisation of endogenous substrates was low, their contents did not show changes even after prolonged incubation. K.Jones

5367. COMPARATIVE INVESTIGATION OF THE FREE NUCLEOTIDES OF AN ASCITIC HEPATOMA AND OF NORMAL OR REGENERATING LIVER. P.Mandel, M.Wintzerith, N.Klein-Pete and L.Mandeb: *Nature*, Lond., 1963, 198, 1000-1001 (Centre Rech. Nucléaires, Strasbourg-Cronenbourg, Strasbourg, France) The amount of AMP, NAD, NADP and UDP-saccharides is lower in rat hepatoma than in normal or regenerating rat liver. Values of the triphosphates of guanosine, uridine and cytidine are significantly higher in hepatoma. It is suggested that in tumour cells, as nucleotides required in RNA synthesis are used more actively, there is lower production of nucleoside diphosphate compounds which play a part in the synthesis of polysaccharides and phosphatides. G.M.Lewis

5368. URIDINE NUCLEOTIDE AND RNA METABOLISM IN THE MORRIS 5123 HEPATOMA. E.Reid and H.P. Morris: *Biochim. biophys. Acta*, 1963, 68, 647-650 (Chester Beatty Res. Inst., Royal Cancer Hosp., London, England). B.M.Stevens

5369. NUCLEOTIDES OF MICRO-ORGANISMS. VH. STEREOCHEMISTRY OF ADENOSINE SUCCINIC ACID. A.Ballio, S.Barcellona and V.Di Vittorio: *Arch. Biochem.*, 1963, 101, 311-315 (1st. Sup. Sanità, Int. Centre Microbiol. Chem., Rome, Italy) Comparison of the optical rotation of adenosinesuccinic acid from *Penicillium chrysogenum* with those of the 2 synthetic diastereoisomers showed that the natural ribotide was N-(9-|3-D-ribofuranosylpurin-6-yl)-L-aspartic acid. B.M.Stevens

5370. NUCLEOTIDE INTERCONVERSIONS. X. DEOXYRIBO- AND REBONUCLEOSIDE 5"-PHOSPHATE

SYNTHESIS VIA A PHOSPHOTRANSFERASE REACTION IN CHICK EMBRYO EXTRACTS. G.F.Maley and F.Maley: *Arch. Biochem.*, 1963, 101, 342-349 (Dil Lab. and Res., New York State Dept. Health, Albany N.Y., U.S.A.) The extracts promoted phosphate transfer from nucleoside 5'-phosphates to nucleoside 5'-hydroxymethyl groups. Pyrimidine ribonucleosides were the preferred acceptors of pyrimidine ribonucleotid phosphate but transfer between pyrimidine deoxyribonucleotides and pyrimidine deoxyribonucleosides appeared to be most efficient. Such deoxyribonucleotide synthesis was more active in vitro than syntheses by ATP kinases. Dialysing the extracts sharply reduced phosphotransferase activity but only affected the distribution of kinase reaction products. Deoxycytidylic acid was primarily formed from thymidylic acid [dTMP] and deoxycytidine whereas reaction of ATP with deoxycytidine gave deoxy uridylic acid [dUMP] and deoxyuridine as major products. Adult chicken liver extracts primarily produced dUMP from deoxycytidine and dTMP. Deoxyuridine was apparently formed first. B.M. Stevens

5371. INFLUENCE OF STRONG SOLUTIONS OF UREA AND POLY ALCOHOLS ON THE SPECTROSCOPIC BEHAVIOUR OF RNA AND NUCLEOTIDES. J.StuctoC: *Biochim. biophys. Acta*, 1963, 68, 535-546 (Lab. Fysiolog. Scheikunde, Rijksuniv., Ghent, Belgium) Cone, urea soln. induced hypochromism around 260 mp and hyperchromism around 300 m/j in mononucleotides in adenosine and possibly other nucleosides, in purines and in pyrimidines in neutral or acid media. Neither Mg²⁺ nor HPO₄²⁻ affected this spectral behaviour. TW chromicity change was additive in nucleotide mixtures*. Glucose, glycerol and sucrose induced analogous although less intense phenomena in nucleotides. B.M.Steven*

5372. SEQUENCE DISTRIBUTION AND NEIGHBOUR EFFECTS OF VARIOUS ORDERS IN POLYNUCLEOTIDES. R.Simha and J.M. Zimmerman: *J. theor. Biol.*, 1** 2, 87-104 (Chem. Dept., S. California Univ., Los Angeles, Calif., U.S.A.) A mathematical frame** is developed for the description and evaluation of prevW described non-random effects in two- and four-compo^ copolymers. In calf thymus comparison is made of ob*^ served and computed pyrimidine sequences, and a sea^ made for inconsistencies in calcn. of pyrimidine runs*. J.A.DW

5373. RNA IN VIRUS-INFECTED SILKWORM. LP.K*^ and LN.Skuratovskaja: *Biokhimiia*, 1963, 28, 258' 264. *Bombyx mori* silkworms were infected with nuclear polyhedrosis virus containing protein and DNA. The phenol method was used for extracting high-polymer RNA from the silkworms and such prep. were infective, being capable of causing the formation of DNA-contaJ¹ virus in silkworms. The prcfj contained less than 0% DNA (in relation to RNA) and traces of protein; their absorption spectrum was characteristic of purified na& RNA. The V₁ of this RNA increased with temp. Under different incubation conditions the infective capacity disappeared much sooner than the temp. effect. (Russian) B.J.Cooper

5374. PSEUDOURIDYLIC ACID IN RNA OF INSECT^A N.A.Gumilevskaja and N.M.Sisakian: *Dokl. Akad. Nauk*, 1962, 144, 223-225. RNA of insects co^{frac} pseudouridyllic acid and its content in the NaCl-sol. fraction was considerably higher than in the NaCl-insol. fraction. (Russian) B.J.Cooper

5375. CHROMATOGRAPHY OF RNA OF HIGH MOLECULAR WEIGHT FROM FL CELLS INFECTED WITH ECHO 7 VIRUS. T. Fukada and Y. Kawade: Virology, 1963, 19, 40S-411 (Virus Res. Inst., Kyoto Univ., Japan) Prelim, comm. J.G.Bennette

5376. FRACTIONATION OF INFECTIOUS RNA ISOLATED FROM TMV. K.I.Miura, T.Miura, C.Hiruki, Z.Hidaka and LWatanabe: Virology, 1963, 19, 140-146 (Biophys. Dept., Univ. Tokyo, Japan)

Purified TMV-RNA extracted by phenol proved to be heterogeneous on ultracentrifugal analysis. Various methods of prep, also gave heterogeneous products. Since the heterogeneity of cellular RNA has been shown by fractional ptn. at high salt concn. in the cold, this method was used. The breakdown of TMV-RNA by heat treatment is also described. J.G.Bennette

5377. IN VITRO TRANSFER OF MACROPHAGE RNA TO LYMPH NODE CELLS. M.Fishman, ^A; ^{TM!116**TM111} and V.P.Bond: Nature, Lond., 1963, 198, 549-551 (Med. Res. Center, Brookhaven Nat. Lab., Upton, New York, U.S.A.) Rabbit macrophages were incubated with [3H]cytidine and their RNA extracted. This labelled RNA was taken up by isolated lymph node cells. Only a relatively low mol wt. RNA was absorbed, a fraction possibly associated with antibody synthesis. The relation of these findings to the observation in immunised animals of 'clones', of lymphocytic cells surrounding a macrophage is discussed. G.M.Lewis

5378. ISOLATION AND ANALYSIS OF THE DNA OF MYCOPLASMA MYCOIDES VAR. CAPRI. A. & Jones and R.T.Walken: Nature, Lond., 1963, 198, 588-589 (Dept. Chem., Univ., Birmingham, England) Pure, highly polymerised DNA was isolated from M.mycoides var. capri. Base analysis showed this material to have a very HgJ adenine and thymine content and pairing typical of a double-stranded DNA. The analytical results do not support the theory that Mffijppjasmataei, e L forms of bacteria. dwUewis

5379. STUDY OF DNA IN ACTINOMYCSES. DNA IN CORYNEBACTERIUM. L.Boutet, J.BwnillMdani G.Michel: Ana Inst. Pasteur, 1963, 104, 488-495 (Ub. deMicrobiol.. Fac. deMed... Toulouse, France) The ratio of adenine + thymine/guanine + cytosine of genus Conmetacterium was studied. Although the total amoffiSSfeaHebNA varied considerably, *k ratio was characteristic of the sp. and has been used as a ratio WJZSSBSfIS3Jff C. parvum and C. equi Group II ratio 0.95 includes C. xerosis, C. cutis communis and C. humiferum. Group III ratio 0.85 to 0.90 includes C. diphtheriae, C. michiganense and C. fascians. Group IV ratio 0.89-0.95 includes C. hoagii, C. aydum, C. anaerobium and C. pseudotuberculosis. Group V ratio 1.02 to 1.08 includes C. acnes and C. D. French. B.Payne

5380. NUCLEIC ACID METABOLISM IN WJgKAL MUCOSA. EL LOSS OF NUCLEIC ACIDS FROM INTESTINAL MUCOSA OF THE RAT DURING INCUBATION IN VITRO. B.E.Stewart and S. ^a ^b f S. em. 1963, 41, 1483-1490 (Canad. J. Biochem., British Columbia, Vancouver 8, B.C., Canada) Rat intestinal mucosal scrapings were incubated with 14C-uridine phosphate buffer, pH 7.8. for 2 hr. Only 25% of the RNA and 5% of the DNA present at zero time remained, there was a

rise in orcinol and diphenylamine pos. material in the acid sol. fraction and supernatant soln. The latter also contained much pos. reacting material not related necessarily to nucleic acids. The removal of Mg²⁺ from the buffer, or presence of O'M arsenate, did not prevent the loss of nucleic acids. The possibility was investigated that this loss was due to physical disruption of the cells.

A.M.Gibbins

5381. NUCLEIC ACID CONTENT OF EQUINE ABORTION VIRUS. R.W.Darlington and C.C.Randall: Virology, 1963, 19, 322-327 (Microbiol. Dept., Mississippi Univ. Med. Sch., Jackson, Miss., U.S.A.) A purification procedure is described that yields virus of high enough purity for the determination of nucleic acid composition. A single visible band was produced in sucrose and tartrate density gradients. E.M. data on dimensions of the infective particles are presented. An estimate of the DNA content is based on particle counts and colorimetric determinations. Chromatograms of hydrolysed viral material showed only the major constitutive bases of DNA. The bases were paired, adenine approx. equal to thymine and guanine to cytosine. The molar dissymmetry ratio of the viral DNA was 0.78 in contrast to the ratio for host cell DNA of 1.40. J.G.Bennette

5382. INFECTIVITY EXPERIMENTS WITH NUCLEIC ACIDS OF SHOPE PAPILLOMA AND DERIVED CARCINOMAS. M.E.Hodes, C.G.Palmer, L.E.Beatty, M.K.Swenson and J.D.Hubbard: J. nat. Cancer Inst., 1963, 30, 1-15 (Pathol. Dept., Indiana Univ. Med. Center, Indianapolis, U.S.A.) Phenol extraction of Shope papilloma extracts gives a product that induces papillomas in wild or domestic rabbits in the absence of DNase. The infective DNA has been partially purified. Its thermostability is quoted. Infectious DNA has been isolated only from tumours yielding virus. It has not been obtained from Vx2 or Vx7 carcinomata.

J.G.Bennette

5383. POSSIBLE ROLE FOR WATER AND INOSITOL IN THE STRUCTURE OF NUCLEOPROTEINS. SJ.Webb: Nature, Lond., 1963, 198, 785-787 (Dept. Bacteriol., Univ. Saskatchewan, Sask., Canada) An aerosol of Rous sarcoma virus showed a rapid increase in sensitivity to u.v. irradiation as the relative humidity was lowered from 70-50%. If the virus was aerosolised from inositol, u.v. had no lethal action at any relative humidity. Inositol appears to be able to replace and act like water mol. when a cell or virus is subject to partial desiccation.

G.M.Lewis

5384. HYDROLYSIS OF CALF THYMUS DEOXYRIBONUCLEATE BY PANCREATIC DEOXYRIBONUCLEASE. H. ISOLATION AND ANALYSIS OF THE MONONUCLEOTIDES AND DINUCLEOTIDES OBTAINED BY ENZYMIC DEGRADATION IN THE PRESENCE OF MANGANOUS IONS. G.C.Becking and R.O.Hurst: Canad. J. Biochem., 1963, 41, 1433-1447 (Biochem. Dept., Queen's Univ., Kingston, Ont., Canada) Mononucleotides and dinucleotides were found to comprise 5 and 49%, respectively, of the total calf thymus DNA phosphorus. The relative amounts of isomeric dinucleotides released enzymically by pancreatic DNase at pH 6.6 differed for Mn²⁺ and Mg²⁺ activation. Results indicated a random attack by the enzyme at multiple points in an endonuclease action with certain linkages being more susceptible than others. It appeared that the pPu-pPu linkage was stable and that increased liberation of purine nucleotides occupying the 5'-terminal phosphate position was due to hydrolysis of pPy-pPu linkages.

BIOCHEMISTRY

- 5385. FORMATION OF ARTIFICIAL RNase COMPLEX WITH DNA.** T.N.Kopylova-Sviridova: piokhimiiia, 1963, 28, 353-360. A study was made of the effect of the wt. ratio of the components in the initial mixture, the ionic strength and the pH of the soln. on the formation of an artificial RNase-DNA complex. In the "saturated" complex there was an average of one protein mol. per turn of the helix in the DNA mol.
 (Russian) B.J.Cooper
- 5386. CORN MEAL AS A SOURCE OF RNase.** J.Ingle: Biochim. biophys. Acta, 1963, 73, 331-334 (Dept. Agronomy, Univ. Illinois, Urbana, 111., U.S.A.) Commercial corn meal had a high RNase activity and a prep. of relatively high activity could be produced from it by a very simple procedure. B.M.Stevens
- 5387. EFFECT OF RNase ON THE RNA, ATP AND CATECHOLAMINE CONTENT OF MEDULLARY GRANULES.** A.Phillippu and H.J.Schumann: Nature, Lond., 1963, 198, 795-796 (Dept. Pharmacol., Univ., Frankfurt, Germany) When chromaffin granules from cattle suprarenal medulla are incubated at 37°, RNA, catecholamines and ATP are released spontaneously in equiv. amounts. The rate of release is markedly increased by addition of exogenous RNase. It is suggested that RNA has an important role in the storage of ATP and catecholamines in these granules. G.M.Lewis
- 5388. DISTRIBUTION OF DNase IN ANTI-R PNEUMOCOCCAL SERA AND ITS RELATION TO TRANSFORMATION REACTION.** M.Kohoutová and H.Kopecká: Nature, Lond., 1963, 198, 711-712 (Dept. Microbial Genet., Inst. Microbiol., Czechoslovak Acad. Sci., Prague, Czechoslovakia) The effect of the temp. of inactivation of anti-R pneumococcal sera on the distribution of DNase in the different electrophoretic protein fractions is examined. DNase activity is most resistant to high temp. in the albumin fraction, then the CL-globulin and least in the 3" and Y"globulins. G.M.Lewis
- 5389. INDEPENDENCE FROM PRESENCE OF RELAXING FACTORS OF SUBSTRATE INHIBITION OF MYOFIBRILLAR ATPase.** A.Mffilrad, SJáky and N.A.Biró: Acta physiol. Acad. Sci. hung., 1962, 23, 101-104 (Inst. Phylogenics and Genet., Biochem. Group, Lorand Eotvos Univ., Budapest, Hungary) Substrate inhibn. of myofibrillar ATPase is not influenced by excessive washing of the myofibrils or by treatment with deoxycholate and thymol. Since the latter treatment destroys "relaxing granule" activity the substrate inhibn. must be a prop. of the actomyosin. H.G.Bevan
- 5390. EFFECT OF THIOLS ON ADENOSINE TRIPHOSPHATASE ACTIVITY OF CELLS OF VARIOUS ORIGIN.** S.Akerfeldf. Acta chem. scand., 1963, 17, 769-774 (E.Pennsylvania Psychiatric Inst., Philadelphia, Pa., U.S.A.) Thiol stim. ATPases in human red blood cells, mouse liver, mouse liver mitochondria, ox brain and certain vegetables were studied in vitro. No evidence could be found to support a suggestion that the stimulatory effect of thiols on ATPases might be due to the intermediary formation of S-phosphorylated thiols. G.F.Blane
- 5391. LOCALISATION OF ATPase ACTIVITY AND OF ACTIN BINDING IN SPECIFIC THIOL GROUP OF H-MEROMYOSIN.** U.Groschel-Stewart and F.Turba: Biochem. Z., 1963, 337, 109-114 (Physiol.-chem. Inst., Univ., Wurzburg, Germany) The activities of ATPases dependent on Ca^{2+} and on EDTA were each found

to be associated with distinct cysteine peptides of a tryptic digest of H-meromyosin. Similarly, the ability to bind actin resided in peptides which had reacted with N-[14C]ethylmaleimide. (German) * L.Cobi

BIOSYNTHESIS OF PROTEINS AND NUCLEIC ACIDS

- 5392. BIOCHEMISTRY OF VACCINIA-INFECTED MOUSE FIBROBLASTS (STRAIN L-M).** HI. RADIOAUTOGRAPHIC AND BIOCHEMICAL STUDIES OF [3H]THYMIDINE UPTAKE INTO DNA OF L-M CELLS AND RABBIT CELLS IN PRIMARY CULTURE.
- S.Kit, D.R.Dubbs and T.C.HSIK: Virology, 1963, 19, 13-22 (Tumour Inst., Texas Univ., Houston, Tex., U.S.A.) In uninfected cultures, approx. 1/3 to 1/2 of the L-M cells and about 10% of young rabbit kidney cells were labelled in their nuclei after 1 hr. incubation with [3H]thymidine. After vaccinia infection, thymidine uptake into DNA, measured biochem., was reduced in L-M and young rabbit cell cultures. In older rabbit cell cultures, incorporation was increased at 5-7 hr. post-infection. Radioautographic evidence, however, showed that the freq. of labelled nuclei was not increased in any of the infected cell populations, and under certain conditions was definitely decreased. Thymidine uptake was temporarily inhibited when L-M cells were centrifuged and washed. J.G.Bennette,
- 5393. SYNTHESIS OF DNA IN ISOLATED PERFUSED RAT LIVER. I. INCORPORATION OF [3H]THYMIDINE IN NORMAL LIVER AND IN LIVER AFTER PARTIAL HEPATECTOMY.** G.B.Gerber and J.Remy-Defraigne: Z. Naturforsch. B, 1963, 18, 215-217 (Euratom Dei* Radiologie, Mol-Belgien, Belgium) [3H]Thymidine was added to the perfusate in expt. with isolated normal rat liver after 60% hepatectomy. The highest incorporation occurred 48 hr. after hepatectomy. Under the conditions described only 0-7% of [³H]thymidine was incorporated into the DNA of normal rat liver whereas 13% was incorporated into the DNA of liver after partial hepatectomy. (German) J.C.Crawhall
- 5394. BIOCHEMICAL STUDIES ON ADENOVIRUS MULTIPLICATION, II. REQUIREMENTS FOR DNA SYNTHESIS.** M.Green: Virology, 1962, 18, 601-613 (Microbiol. Dept., St. Louis Univ. Med. Sch., Mo., U.S.A.) T₁² metabolic inhibitor 5-fluorodeoxyuridine was used in a study of the role of DNA synthesis in the multiplication of type 2 adenovirus in suspension cultures of KB cells. DNA synthesis is essential for adenovirus multiplication. The time course of viral DNA synthesis was examined by ^{expt} involving the time addition of the inhibitor after infection, and by the reversal of irinibn. by the addition of thymidine. DNA synthesis is not required for viral development during the first 7 hr. of the eclipse period, synthesis of viral DNA begins at 7 hr. after infection, about 7 hr. of DNA synthesis is required before virus maturation is initiated. J.G.Bennette

- 5395. EFFECTS OF OXIDISED LIPOIC ACID ON THE SYNTHESIS OF DNA IN BATRACIAN AND CHICK EMBRYOS.** V.Pohl and J.Quertien: Biochim. biophys.⁸ Acta, 1963, 68, 651-653 (Lab. Morphol. animale, Fac. Sci., Univ. Libre, Bruxelles, Bruxelles, Belgia) Prelim, comm. (French) B.M.Steve**

5396. DNA NUCLEOTIDYLTRANSFERASE IN NUCLEI AND CYTOPLASM PREPARED FROM THYMUS TISSUE IN NON-AQUEOUS MEDIA. M.J. Smith and H.M. Kein. *Biochim. biophys. Acta.* 1963, 68, 578-588 (Dept. Biochem., Univ., Glasgow, Scotland)

Rabbit and calf thymus nuclei isolated in non-aqueous media in a high degree of purity contained DNA nucleotidyltransferase as also did corresponding calf thymus cytoplasmic prep. The relationship between nucleotidyltransferase and DNase I activities in nuclear and cytoplasmic fractions is described. The activity of both enzymes with respect to the physical condition of primer and substrate DNA was examined. High nucleotidyltransferase sp. activities were obtained after partial Purification of extracts of calf thymus nuclei.

^{o*}M^s oievens

5397. CHARACTERISTICS OF THE ?NA NDCMOTnjrL-TRANSFERASE ACTIVITY IN NON-AQUEOUS TYPE CALF THYMUS NUCLEI. H.M. Kein and M.J. Snutt. *Biochim. biophys. Acta.* 1963, 68, 589-598 (Dept. Biochem., Univ., Glasgow, Scotland) Nuclear

tracts were fractionated with acid and $<\text{NH}_4\text{SO}_4$ and Fe^{2+} fractions assayed for DNA nucleotidyltransferase activity with and without cysteine and in the presence of 1 S of Fe^{2+} deoxyribonucleoside 5'-triphosphates. Patterns of $\text{P}_2\text{p}^3\text{H}$ thymidylic acid incorporation indicated that nuclei contained both DNA nucleotidyltransferase and a physico-chemical distinct nucleotidyltransferase described by Kracow et al. overall deoxyribonucleotide incorporation catalyzed by the latter was approx. 1/27 of that at $[C]^{32}\text{P}^{32}$ the former. The sum of the total no. of units of DNase I in each fraction was 16 times the total units found in the thymus extract. A non-enzymic incorporation of ^{32}P thymidine 5'-triphosphate into thermally denatured DNA appeared to occur in certain control reaction fixtures.

B.M. Stevens

5398. RNA-PRIMED SYNTHESIS OF RNA FOLLOWING VIRAL INFECTION. R.Eason. M.J. Cune and R.M.S. Smellie. *Nature. Lond.* 1963, 198, $^{479}\text{I}_{\text{e}}^{1}\text{re}^{1}\text{w}^{1}\text{a}^{1}$. *Biochem., Univ., Glasgow, Scotland*) There was no significant difference in the activity of DNA "nucleoadyl transferase" in normal

cells infected with encephalomyocarditis virus, but significant increases in RNA-primed RNA and nucleotidyltransferase were observed in infected cells, beginning at intervals of 1-3 hr. after infection. These increases were more pronounced in enzyme prep. nuclear than cytoplasmic fractions.

from

G.M. Lewis

Virology, 1963, 19, 400-408 (Biol. Dept., Mass. Inst. Technol., Cambridge, Mass., U.S.A.) Evidence is presented indicating that only one type of A. the entire RNA molecule of mature virus particles, made in large amounts in poliovirus-infected cells. Viral RNA is expressed at the time of onset whereas cellular protein synthesis is interrupted earlier.

J.G. Bennette

5400. INFLUENCE OF FOUOVIRUS INFECTION ON RNA SYNTHESIS IN MAMMALIAN CELLS. M.L. Fenwick. *Virology*, 1963, 19, 241-249 (Virus Res. Unit, M.R.C. Lab., Carshalton, Surrey, England) Sucrose density gradient centrifugation was used to study the effect of fowlpoxvirus on the incorporation of ^{32}P phosphate into high mol. wt. RNA in ERK cells. Background

of normal cell RNA was reduced by treatment with Mitomycin C or u.v. irradiation. No increase in infective RNA was found during the 2 hr. immediately after infection. By 4 hr. post-infection, RNA with a sedimentation const. of 33-35 S, the same as that of purified virus RNA, appeared. 20 S and 7 S labelled RNA components, observable in uninfected cells, remained depressed at this stage. When the incubation temp. was raised to 40°, infected cells died without producing infective progeny. At 40° cell RNA synthesis was depressed soon after infection, but was not followed by synthesis of 33-35 S RNA.

5401. NUCLEOPROTEINS IN REGENERATING RAT LIVER.

I. INCORPORATION OF $[32\text{p}]$ INORGANIC PHOSPHATE $[32\text{p}_f]$ INTO THE RNA OF LIVER DURING THE EARLY STAGES OF REGENERATION. A.H. McArdle and E.H. Creaser. *H. RAPIDLY LABELLED RNA.* A.H. McArdle: *Biochim. biophys. Acta.* 1963, 68, 561-568. 569-577 (McGill-Montreal Gen. Hosp. Res. Inst., Montreal, Canada)

I. Nucleoproteins were reproducibly separated by differential centrifugation of homogenates followed by chromatography on ECTEOLA cellulose. The fractions differed in $^{32}\text{P}_f$ incorporation into RNA over the first 12 hr. of regeneration. However, all fractions showed incorporation during 0-4 and 8-12 hr. Between hr. 4 and 8 a loss of radioactivity occurred.

II. A highly metabolically active RNA appeared to be synthesised first in 1 of the nuclear fractions. This appeared to be rapidly transferred to the cytoplasm where it appeared first in the deoxycholate sol. fraction of microsomes and was apparently later transferred to the supernatant. In short term expt. the bulk of the ^{32}p incorporated into ribosomes is suggested to be derived from the supernatant.

B.M. Stevens

5402. DNase SENSITIVITY OF RNA SYNTHESISING SYSTEM FROM TOBACCO LEAVES. J.G. Shaw: *Science.* 1963, 139, 924-925 (Plant Res. Inst., Res. Branch, Canada Dept. of Agric. Ottawa, Canada)

A fraction from tobacco leaf cells, containing nuclei and capable of synthesising RNA in the presence of the 4 ribonucleoside triphosphates, was inactivated by incubation with DNase, even when less than half the DNA was removed. A requirement for DNA in RNA synthesis is thus demonstrated.

G.M. Lewis

5403. NEW HYPOTHESIS FOR NUCLEIC ACID REPLICATION. A.L. Dounce: *J. theor. Biol.*, 1962, 2, 152-158 (Biochem. Dept., Rochester Univ., New York, U.S.A.)

It is proposed that the mechanism of replication of DNA involves the exact copying of one strand of the DNA double helix followed by complementary replication of this exact copy to form a new mol. of double-stranded DNA.

T.A. Dawson

5404. BIOSYNTHESIS OF NUCLEIC ACIDS IN BACILLUS MEGATERIUM. H. THE FORMATION OF RIBONUCLEIC ACID BY NUCLEAR MATERIAL IN VITRO. G.C. Barr and J.A.V. Butler: *Biochem. J.* 1963, 88, 252-259 (C. Beatty Res. Inst., Fulham Rd., London, England)

RNA synthesis has been investigated in isolated cell fractions of *B. megaterium* by incubation in vitro with ribonucleoside triphosphates. The conditions in which synthesis occurs have been investigated and it was shown that RNA synthesis occurred only in the nuclear fraction, which was shown to contain a DNA-dependent RNA polymerase. The RNA formed was transferred from nuclear material to the nuclear ribosomes in vitro. The nature of the RNA formed by the enzyme has been investigated.

BIOCHEMISTRY

5405. BIOSYNTHESIS OF NUCLEIC ACIDS IN BACILLUS MEGATERIUM. IE- BIOSYNTHESIS OF RNA IN VIVO. G.N.Godson and J.A.V.Butler: Biochem. J. 1963, 88, 259-266 (C.Beatty Res. Inst., Fulham Rd., London, England) When protoplasts of B. megaterium are incubated with a medium containing [³H]uridine for short times the RNA of the nuclear fraction has the highest sp. radioactivity. Both components of this fraction, namely DNA-containing material and nuclear ribosomes, become highly labelled within about 1 min. The cytoplasmic ribosomal RNA is labelled more slowly and approx. linearly with time, and this RNA may have an independent origin. Considerable conversion of uridine into cytidine takes place in the cell, and some terminal labelling, mainly as cytidine, occurs in all RNA fractions, but the amount falls with time. CsCl-gradient analysis of the nuclear material shows that most of its radioactivity is associated with the DNA band. After 'starvation' of the protoplasts, addition of inactive precursor causes a displacement of radioactivity from the nuclear material. *

5406. BREAKDOWN OF RNA IN THE CELL NUCLEUS. H. Harris: Proc. roy. Soc. B, 1963, 158, 79-87 (Dept. Cell Biol., J.Innes Inst., Bayfordbury, Hertford, Herts., England) The enzyme responsible for the breakdown of rapidly labelled RNA in HeLa cell nuclei has the properties characteristic of a polynucleotide phosphorylase and produces nucleoside-5'-diphosphates. The release of radioactivity from nuclear RNA in the intact cell and the degradation of rapidly labelled RNA by the polynucleotide phosphorylase in isolated nuclei have the same unusual temp. profile. Both RNA and enzyme are attached to the chr. It is suggested that during interphase, RNA is continuously synthesised and degraded on the chr. itself. G.M.Lewis

5407. NUCLEAR RNA FROM RAT KIDNEY. M.Revel, M.Delemen and P.Mandeb: Biochim. biophys. Acta, 1963, 68, 547-553 (Inst. de Chim. Biol. de la Fac. de Méd., Strasbourg, France) Several types of nuclear RNA were separated by chromatography on methylated albumin columns. Sol. RNA 20 S ribosomal RNA and an RNA rapidly labelled after ³²P administration were found. The last was a nucleolar RNA which could be extracted by the phenol method only if Na dodecyl sulphate was added. It corresponded in chromatographic behaviour to the cytoplasmic 30 S ribosomal RNA. It represented no more than 5% of the total nuclear RNA and appeared to be synthesised independently from ribosomal RNA. Its possible identity with messenger RNA was examined. (French) B.M.Stevens

5408. PRESENCE OF RNA OF LOW MOLECULAR WEIGHT IN THE RIBOSOMES OF E. COLI [ML308]. R.Rosset and R.Monien: Biochim. biophys. Acta, 1963, 68, 653-656 (Inst. Chim. Biol., Fac. des Sci., Marseille, France) Detailed study of the RNA extracted with phenol from ribosomes and washed with a medium containing 0.01M Mg²⁺ showed that about half the low mol. wt. RNA associated with ribosomes under these conditions had prop. clearly distinct from those of transfer RNA. Prelim, comm. (French) B.M.Stevens

5409. LACK OF MESSENGER RNA IN RETICULOCYTE CELL-SAP. AJ.Munro and A.Kornen: Nature, Lond., 1963, 198, 891-892 (Dept. Biochem., Univ., Cambridge, England) Expt. on the incorporation of [¹-¹⁴C]leucine into Hb by ribosomes and cell sap of rat

liver and reticulocytes do not provide evidence for messenger RNA in the cell sap. G.M.Lewis

5410. DISSOCIATION OF YEAST RIBOSOMES BY PAPAIN. R.S.Morgan, C.Greenspan and B.Cunningham: Biochim. biophys. Acta, 1963, 68, 642-644 (Grad. Dept. Biochem., Brandeis Univ., Waltham, Mass., U.S.A.) The bonds cleaved by papain united 60 S to 40 S ribosomes. B.M. Stevens

5411. POSSIBLE NATURE OF 85 S RIBOSOMES OF BACTERIA. R.E.Ecker and M.Schaechten: Biochim. biophys. Acta, 1963, 68, 645-647 (Dept. Microbiol., Coll. Med., Univ. Florida, Gainesville, Fla., U.S.A.) B.M.Stevens

5412. PREPARATION AND PROPERTIES OF GOAT BRAIN CORTEX RIBOSOMES. R.K.Datta and J.J.Ghosh: J. Neurochem., 1963, 10, 363-372* (Dept. Biochem., Univ. Coll. Sch. Technol., Calcutta, India) Ribosomes were prep. by homogenising tissue at <F in a Mg-cacodylate buffered sucrose soln. The microsome-containing supernatant was made to 0.5% with deoxycholate and spun at 80000 jg for 2 hr. Composition of the pellet was 30% RNA and 70% protein free of lipid, hexose or DNA. Evidence is presented for this prep, being pure RNP. R.Woodman

5413. LIPIDS IN PROTEIN BIOSYNTHESIS. N.'M.Sisalda* E.N.Bezinger, A.S.Marchukaitis, M.L.Molchanov, V.& Chigirev and A.P.Kotovskaya: Biokhimia, 1963, 28, 326-333. Certain lipids from isolated chloroplasts of haricot bean leaves were found to actively incorporate labelled amino acids. (Russian) B.J.Cooper

5414. GLYCYL-RNA SYNTHETASE OF RAT LIVER: PARTIAL PURIFICATION AND EFFECTS OF SOME METAL IONS ON ITS ACTIVITY. M.J.Frasen: Canad. J. Biochem., 1963, 41, 1123-1133 (Biochem. Dept., Univ. of Manitoba Med. Sch., Winnipeg, Manitoba, Canada) Glycyl-RNA synthetase was purified 40-fold from a 105000 JJ supernatant of an homogenate of rat liver by successive pptn. at pH 5.0, heat treatment at 55° for 3.0 min. in the presence of 1.0mM ATP, and (NH₄)₂SO₄ fractionation. The purified fractions catalyzed glycine-dependent ATP-32P exchange. The effect of some metal ions on glycine activation was studied. Activation occurred in the presence of either Mg²⁺ or Mn²⁺. The apparent stimn. of glycine activation by Co²⁺ was found to be an artefact. A.M.Gibb*¹

5415. INCORPORATION OF [¹⁴C]GLYCINE AND [¹⁴C]LEUCINE INTO THE SOLUBLE RNA OF THE POSTERIOR SILKGLAND. K.Matsuzakfc: J. Biochem-t Tokyo, 1963, 53, 326-327 (Dept. Chem., Sericul. Expt. Stn., Sugihama, Tokyo, Japan) Prelim. comm. B.M. Stevens

5416. INCORPORATION OF [¹⁴C]LEUCINE INTO NUCLEAR PH 5 FRACTION AND ITS TRANSFER TO NUCLEAR RIBOSOMES. T.-Y.Wangs: Biochim. biophys. Acta, 1963, 68, 633-639 (H.Shaw Sch. Botany, Washington Univ., St. Louis, Mo., U.S.A.) & g*f¹ ² ³ ⁴ ⁵ ⁶ ⁷ ⁸ ⁹ ¹⁰ ¹¹ ¹² ¹³ ¹⁴ ¹⁵ ¹⁶ ¹⁷ ¹⁸ ¹⁹ ²⁰ ²¹ ²² ²³ ²⁴ ²⁵ ²⁶ ²⁷ ²⁸ ²⁹ ³⁰ ³¹ ³² ³³ ³⁴ ³⁵ ³⁶ ³⁷ ³⁸ ³⁹ ⁴⁰ ⁴¹ ⁴² ⁴³ ⁴⁴ ⁴⁵ ⁴⁶ ⁴⁷ ⁴⁸ ⁴⁹ ⁵⁰ ⁵¹ ⁵² ⁵³ ⁵⁴ ⁵⁵ ⁵⁶ ⁵⁷ ⁵⁸ ⁵⁹ ⁶⁰ ⁶¹ ⁶² ⁶³ ⁶⁴ ⁶⁵ ⁶⁶ ⁶⁷ ⁶⁸ ⁶⁹ ⁷⁰ ⁷¹ ⁷² ⁷³ ⁷⁴ ⁷⁵ ⁷⁶ ⁷⁷ ⁷⁸ ⁷⁹ ⁸⁰ ⁸¹ ⁸² ⁸³ ⁸⁴ ⁸⁵ ⁸⁶ ⁸⁷ ⁸⁸ ⁸⁹ ⁹⁰ ⁹¹ ⁹² ⁹³ ⁹⁴ ⁹⁵ ⁹⁶ ⁹⁷ ⁹⁸ ⁹⁹ ¹⁰⁰ ¹⁰¹ ¹⁰² ¹⁰³ ¹⁰⁴ ¹⁰⁵ ¹⁰⁶ ¹⁰⁷ ¹⁰⁸ ¹⁰⁹ ¹¹⁰ ¹¹¹ ¹¹² ¹¹³ ¹¹⁴ ¹¹⁵ ¹¹⁶ ¹¹⁷ ¹¹⁸ ¹¹⁹ ¹²⁰ ¹²¹ ¹²² ¹²³ ¹²⁴ ¹²⁵ ¹²⁶ ¹²⁷ ¹²⁸ ¹²⁹ ¹³⁰ ¹³¹ ¹³² ¹³³ ¹³⁴ ¹³⁵ ¹³⁶ ¹³⁷ ¹³⁸ ¹³⁹ ¹⁴⁰ ¹⁴¹ ¹⁴² ¹⁴³ ¹⁴⁴ ¹⁴⁵ ¹⁴⁶ ¹⁴⁷ ¹⁴⁸ ¹⁴⁹ ¹⁵⁰ ¹⁵¹ ¹⁵² ¹⁵³ ¹⁵⁴ ¹⁵⁵ ¹⁵⁶ ¹⁵⁷ ¹⁵⁸ ¹⁵⁹ ¹⁶⁰ ¹⁶¹ ¹⁶² ¹⁶³ ¹⁶⁴ ¹⁶⁵ ¹⁶⁶ ¹⁶⁷ ¹⁶⁸ ¹⁶⁹ ¹⁷⁰ ¹⁷¹ ¹⁷² ¹⁷³ ¹⁷⁴ ¹⁷⁵ ¹⁷⁶ ¹⁷⁷ ¹⁷⁸ ¹⁷⁹ ¹⁸⁰ ¹⁸¹ ¹⁸² ¹⁸³ ¹⁸⁴ ¹⁸⁵ ¹⁸⁶ ¹⁸⁷ ¹⁸⁸ ¹⁸⁹ ¹⁹⁰ ¹⁹¹ ¹⁹² ¹⁹³ ¹⁹⁴ ¹⁹⁵ ¹⁹⁶ ¹⁹⁷ ¹⁹⁸ ¹⁹⁹ ²⁰⁰ ²⁰¹ ²⁰² ²⁰³ ²⁰⁴ ²⁰⁵ ²⁰⁶ ²⁰⁷ ²⁰⁸ ²⁰⁹ ²¹⁰ ²¹¹ ²¹² ²¹³ ²¹⁴ ²¹⁵ ²¹⁶ ²¹⁷ ²¹⁸ ²¹⁹ ²²⁰ ²²¹ ²²² ²²³ ²²⁴ ²²⁵ ²²⁶ ²²⁷ ²²⁸ ²²⁹ ²³⁰ ²³¹ ²³² ²³³ ²³⁴ ²³⁵ ²³⁶ ²³⁷ ²³⁸ ²³⁹ ²⁴⁰ ²⁴¹ ²⁴² ²⁴³ ²⁴⁴ ²⁴⁵ ²⁴⁶ ²⁴⁷ ²⁴⁸ ²⁴⁹ ²⁵⁰ ²⁵¹ ²⁵² ²⁵³ ²⁵⁴ ²⁵⁵ ²⁵⁶ ²⁵⁷ ²⁵⁸ ²⁵⁹ ²⁶⁰ ²⁶¹ ²⁶² ²⁶³ ²⁶⁴ ²⁶⁵ ²⁶⁶ ²⁶⁷ ²⁶⁸ ²⁶⁹ ²⁷⁰ ²⁷¹ ²⁷² ²⁷³ ²⁷⁴ ²⁷⁵ ²⁷⁶ ²⁷⁷ ²⁷⁸ ²⁷⁹ ²⁸⁰ ²⁸¹ ²⁸² ²⁸³ ²⁸⁴ ²⁸⁵ ²⁸⁶ ²⁸⁷ ²⁸⁸ ²⁸⁹ ²⁹⁰ ²⁹¹ ²⁹² ²⁹³ ²⁹⁴ ²⁹⁵ ²⁹⁶ ²⁹⁷ ²⁹⁸ ²⁹⁹ ³⁰⁰ ³⁰¹ ³⁰² ³⁰³ ³⁰⁴ ³⁰⁵ ³⁰⁶ ³⁰⁷ ³⁰⁸ ³⁰⁹ ³¹⁰ ³¹¹ ³¹² ³¹³ ³¹⁴ ³¹⁵ ³¹⁶ ³¹⁷ ³¹⁸ ³¹⁹ ³²⁰ ³²¹ ³²² ³²³ ³²⁴ ³²⁵ ³²⁶ ³²⁷ ³²⁸ ³²⁹ ³³⁰ ³³¹ ³³² ³³³ ³³⁴ ³³⁵ ³³⁶ ³³⁷ ³³⁸ ³³⁹ ³⁴⁰ ³⁴¹ ³⁴² ³⁴³ ³⁴⁴ ³⁴⁵ ³⁴⁶ ³⁴⁷ ³⁴⁸ ³⁴⁹ ³⁵⁰ ³⁵¹ ³⁵² ³⁵³ ³⁵⁴ ³⁵⁵ ³⁵⁶ ³⁵⁷ ³⁵⁸ ³⁵⁹ ³⁶⁰ ³⁶¹ ³⁶² ³⁶³ ³⁶⁴ ³⁶⁵ ³⁶⁶ ³⁶⁷ ³⁶⁸ ³⁶⁹ ³⁷⁰ ³⁷¹ ³⁷² ³⁷³ ³⁷⁴ ³⁷⁵ ³⁷⁶ ³⁷⁷ ³⁷⁸ ³⁷⁹ ³⁸⁰ ³⁸¹ ³⁸² ³⁸³ ³⁸⁴ ³⁸⁵ ³⁸⁶ ³⁸⁷ ³⁸⁸ ³⁸⁹ ³⁹⁰ ³⁹¹ ³⁹² ³⁹³ ³⁹⁴ ³⁹⁵ ³⁹⁶ ³⁹⁷ ³⁹⁸ ³⁹⁹ ⁴⁰⁰ ⁴⁰¹ ⁴⁰² ⁴⁰³ ⁴⁰⁴ ⁴⁰⁵ ⁴⁰⁶ ⁴⁰⁷ ⁴⁰⁸ ⁴⁰⁹ ⁴¹⁰ ⁴¹¹ ⁴¹² ⁴¹³ ⁴¹⁴ ⁴¹⁵ ⁴¹⁶ ⁴¹⁷ ⁴¹⁸ ⁴¹⁹ ⁴²⁰ ⁴²¹ ⁴²² ⁴²³ ⁴²⁴ ⁴²⁵ ⁴²⁶ ⁴²⁷ ⁴²⁸ ⁴²⁹ ⁴³⁰ ⁴³¹ ⁴³² ⁴³³ ⁴³⁴ ⁴³⁵ ⁴³⁶ ⁴³⁷ ⁴³⁸ ⁴³⁹ ⁴⁴⁰ ⁴⁴¹ ⁴⁴² ⁴⁴³ ⁴⁴⁴ ⁴⁴⁵ ⁴⁴⁶ ⁴⁴⁷ ⁴⁴⁸ ⁴⁴⁹ ⁴⁵⁰ ⁴⁵¹ ⁴⁵² ⁴⁵³ ⁴⁵⁴ ⁴⁵⁵ ⁴⁵⁶ ⁴⁵⁷ ⁴⁵⁸ ⁴⁵⁹ ⁴⁶⁰ ⁴⁶¹ ⁴⁶² ⁴⁶³ ⁴⁶⁴ ⁴⁶⁵ ⁴⁶⁶ ⁴⁶⁷ ⁴⁶⁸ ⁴⁶⁹ ⁴⁷⁰ ⁴⁷¹ ⁴⁷² ⁴⁷³ ⁴⁷⁴ ⁴⁷⁵ ⁴⁷⁶ ⁴⁷⁷ ⁴⁷⁸ ⁴⁷⁹ ⁴⁸⁰ ⁴⁸¹ ⁴⁸² ⁴⁸³ ⁴⁸⁴ ⁴⁸⁵ ⁴⁸⁶ ⁴⁸⁷ ⁴⁸⁸ ⁴⁸⁹ ⁴⁹⁰ ⁴⁹¹ ⁴⁹² ⁴⁹³ ⁴⁹⁴ ⁴⁹⁵ ⁴⁹⁶ ⁴⁹⁷ ⁴⁹⁸ ⁴⁹⁹ ⁵⁰⁰ ⁵⁰¹ ⁵⁰² ⁵⁰³ ⁵⁰⁴ ⁵⁰⁵ ⁵⁰⁶ ⁵⁰⁷ ⁵⁰⁸ ⁵⁰⁹ ⁵¹⁰ ⁵¹¹ ⁵¹² ⁵¹³ ⁵¹⁴ ⁵¹⁵ ⁵¹⁶ ⁵¹⁷ ⁵¹⁸ ⁵¹⁹ ⁵²⁰ ⁵²¹ ⁵²² ⁵²³ ⁵²⁴ ⁵²⁵ ⁵²⁶ ⁵²⁷ ⁵²⁸ ⁵²⁹ ⁵³⁰ ⁵³¹ ⁵³² ⁵³³ ⁵³⁴ ⁵³⁵ ⁵³⁶ ⁵³⁷ ⁵³⁸ ⁵³⁹ ⁵⁴⁰ ⁵⁴¹ ⁵⁴² ⁵⁴³ ⁵⁴⁴ ⁵⁴⁵ ⁵⁴⁶ ⁵⁴⁷ ⁵⁴⁸ ⁵⁴⁹ ⁵⁵⁰ ⁵⁵¹ ⁵⁵² ⁵⁵³ ⁵⁵⁴ ⁵⁵⁵ ⁵⁵⁶ ⁵⁵⁷ ⁵⁵⁸ ⁵⁵⁹ ⁵⁶⁰ ⁵⁶¹ ⁵⁶² ⁵⁶³ ⁵⁶⁴ ⁵⁶⁵ ⁵⁶⁶ ⁵⁶⁷ ⁵⁶⁸ ⁵⁶⁹ ⁵⁷⁰ ⁵⁷¹ ⁵⁷² ⁵⁷³ ⁵⁷⁴ ⁵⁷⁵ ⁵⁷⁶ ⁵⁷⁷ ⁵⁷⁸ ⁵⁷⁹ ⁵⁸⁰ ⁵⁸¹ ⁵⁸² ⁵⁸³ ⁵⁸⁴ ⁵⁸⁵ ⁵⁸⁶ ⁵⁸⁷ ⁵⁸⁸ ⁵⁸⁹ ⁵⁹⁰ ⁵⁹¹ ⁵⁹² ⁵⁹³ ⁵⁹⁴ ⁵⁹⁵ ⁵⁹⁶ ⁵⁹⁷ ⁵⁹⁸ ⁵⁹⁹ ⁶⁰⁰ ⁶⁰¹ ⁶⁰² ⁶⁰³ ⁶⁰⁴ ⁶⁰⁵ ⁶⁰⁶ ⁶⁰⁷ ⁶⁰⁸ ⁶⁰⁹ ⁶¹⁰ ⁶¹¹ ⁶¹² ⁶¹³ ⁶¹⁴ ⁶¹⁵ ⁶¹⁶ ⁶¹⁷ ⁶¹⁸ ⁶¹⁹ ⁶²⁰ ⁶²¹ ⁶²² ⁶²³ ⁶²⁴ ⁶²⁵ ⁶²⁶ ⁶²⁷ ⁶²⁸ ⁶²⁹ ⁶³⁰ ⁶³¹ ⁶³² ⁶³³ ⁶³⁴ ⁶³⁵ ⁶³⁶ ⁶³⁷ ⁶³⁸ ⁶³⁹ ⁶⁴⁰ ⁶⁴¹ ⁶⁴² ⁶⁴³ ⁶⁴⁴ ⁶⁴⁵ ⁶⁴⁶ ⁶⁴⁷ ⁶⁴⁸ ⁶⁴⁹ ⁶⁵⁰ ⁶⁵¹ ⁶⁵² ⁶⁵³ ⁶⁵⁴ ⁶⁵⁵ ⁶⁵⁶ ⁶⁵⁷ ⁶⁵⁸ ⁶⁵⁹ ⁶⁶⁰ ⁶⁶¹ ⁶⁶² ⁶⁶³ ⁶⁶⁴ ⁶⁶⁵ ⁶⁶⁶ ⁶⁶⁷ ⁶⁶⁸ ⁶⁶⁹ ⁶⁷⁰ ⁶⁷¹ ⁶⁷² ⁶⁷³ ⁶⁷⁴ ⁶⁷⁵ ⁶⁷⁶ ⁶⁷⁷ ⁶⁷⁸ ⁶⁷⁹ ⁶⁸⁰ ⁶⁸¹ ⁶⁸² ⁶⁸³ ⁶⁸⁴ ⁶⁸⁵ ⁶⁸⁶ ⁶⁸⁷ ⁶⁸⁸ ⁶⁸⁹ ⁶⁹⁰ ⁶⁹¹ ⁶⁹² ⁶⁹³ ⁶⁹⁴ ⁶⁹⁵ ⁶⁹⁶ ⁶⁹⁷ ⁶⁹⁸ ⁶⁹⁹ ⁷⁰⁰ ⁷⁰¹ ⁷⁰² ⁷⁰³ ⁷⁰⁴ ⁷⁰⁵ ⁷⁰⁶ ⁷⁰⁷ ⁷⁰⁸ ⁷⁰⁹ ⁷¹⁰ ⁷¹¹ ⁷¹² ⁷¹³ ⁷¹⁴ ⁷¹⁵ ⁷¹⁶ ⁷¹⁷ ⁷¹⁸ ⁷¹⁹ ⁷²⁰ ⁷²¹ ⁷²² ⁷²³ ⁷²⁴ ⁷²⁵ ⁷²⁶ ⁷²⁷ ⁷²⁸ ⁷²⁹ ⁷³⁰ ⁷³¹ ⁷³² ⁷³³ ⁷³⁴ ⁷³⁵ ⁷³⁶ ⁷³⁷ ⁷³⁸ ⁷³⁹ ⁷⁴⁰ ⁷⁴¹ ⁷⁴² ⁷⁴³ ⁷⁴⁴ ⁷⁴⁵ ⁷⁴⁶ ⁷⁴⁷ ⁷⁴⁸ ⁷⁴⁹ ⁷⁵⁰ ⁷⁵¹ ⁷⁵² ⁷⁵³ ⁷⁵⁴ ⁷⁵⁵ ⁷⁵⁶ ⁷⁵⁷ ⁷⁵⁸ ⁷⁵⁹ ⁷⁶⁰ ⁷⁶¹ ⁷⁶² ⁷⁶³ ⁷⁶⁴ ⁷⁶⁵ ⁷⁶⁶ ⁷⁶⁷ ⁷⁶⁸ ⁷⁶⁹ ⁷⁷⁰ ⁷⁷¹ ⁷⁷² ⁷⁷³ ⁷⁷⁴ ⁷⁷⁵ ⁷⁷⁶ ⁷⁷⁷ ⁷⁷⁸ ⁷⁷⁹ ⁷⁸⁰ ⁷⁸¹ ⁷⁸² ⁷⁸³ ⁷⁸⁴ ⁷⁸⁵ ⁷⁸⁶ ⁷⁸⁷ ⁷⁸⁸ ⁷⁸⁹ ⁷⁹⁰ ⁷⁹¹ ⁷⁹² ⁷⁹³ ⁷⁹⁴ ⁷⁹⁵ ⁷⁹⁶ ⁷⁹⁷ ⁷⁹⁸ ⁷⁹⁹ ⁸⁰⁰ ⁸⁰¹ ⁸⁰² ⁸⁰³ ⁸⁰⁴ ⁸⁰⁵ ⁸⁰⁶ ⁸⁰⁷ ⁸⁰⁸ ⁸⁰⁹ ⁸¹⁰ ⁸¹¹ ⁸¹² ⁸¹³ ⁸¹⁴ ⁸¹⁵ ⁸¹⁶ ⁸¹⁷ ⁸¹⁸ ⁸¹⁹ ⁸²⁰ ⁸²¹ ⁸²² ⁸²³ ⁸²⁴ ⁸²⁵ ⁸²⁶ ⁸²⁷ ⁸²⁸ ⁸²⁹ ⁸³⁰ ⁸³¹ ⁸³² ⁸³³ ⁸³⁴ ⁸³⁵ ⁸³⁶ ⁸³⁷ ⁸³⁸ ⁸³⁹ ⁸⁴⁰ ⁸⁴¹ ⁸⁴² ⁸⁴³ ⁸⁴⁴ ⁸⁴⁵ ⁸⁴⁶ ⁸⁴⁷ ⁸⁴⁸ ⁸⁴⁹ ⁸⁵⁰ ⁸⁵¹ ⁸⁵² ⁸⁵³ ⁸⁵⁴ ⁸⁵⁵ ⁸⁵⁶ ⁸⁵⁷ ⁸⁵⁸ ⁸⁵⁹ ⁸⁶⁰ ⁸⁶¹ ⁸⁶² ⁸⁶³ ⁸⁶⁴ ⁸⁶⁵ ⁸⁶⁶ ⁸⁶⁷ ⁸⁶⁸ ⁸⁶⁹ ⁸⁷⁰ ⁸⁷¹ ⁸⁷² ⁸⁷³ ⁸⁷⁴ ⁸⁷⁵ ⁸⁷⁶ ⁸⁷⁷ ⁸⁷⁸ ⁸⁷⁹ ⁸⁸⁰ ⁸⁸¹ ⁸⁸² ⁸⁸³ ⁸⁸⁴ ⁸⁸⁵ ⁸⁸⁶ ⁸⁸⁷ ⁸⁸⁸ ⁸⁸⁹ ⁸⁹⁰ ⁸⁹¹ ⁸⁹² ⁸⁹³ ⁸⁹⁴ ⁸⁹⁵ ⁸⁹⁶ ⁸⁹⁷ ⁸⁹⁸ ⁸⁹⁹ ⁹⁰⁰ ⁹⁰¹ ⁹⁰² ⁹⁰³ ⁹⁰⁴ ⁹⁰⁵ ⁹⁰⁶ ⁹⁰⁷ ⁹⁰⁸ ⁹⁰⁹ ⁹¹⁰ ⁹¹¹ ⁹¹² ⁹¹³ ⁹¹⁴ ⁹¹⁵ ⁹¹⁶ ⁹¹⁷ ⁹¹⁸ ⁹¹⁹ ⁹²⁰ ⁹²¹ ⁹²² ⁹²³ ⁹²⁴ ⁹²⁵ ⁹²⁶ ⁹²⁷ ⁹²⁸ ⁹²⁹ ⁹³⁰ ⁹³¹ ⁹³² ⁹³³ ⁹³⁴ ⁹³⁵ ⁹³⁶ ⁹³⁷ ⁹³⁸ ⁹³⁹ ⁹⁴⁰ ⁹⁴¹ ⁹⁴² ⁹⁴³ ⁹⁴⁴ ⁹⁴⁵ ⁹⁴⁶ ⁹⁴⁷ ⁹⁴⁸ ⁹⁴⁹ ⁹⁵⁰ ⁹⁵¹ ⁹⁵² ⁹⁵³ ⁹⁵⁴ ⁹⁵⁵ ⁹⁵⁶ ⁹⁵⁷ ⁹⁵⁸ ⁹⁵⁹ ⁹⁶⁰ ⁹⁶¹ ⁹⁶² ⁹⁶³ ⁹⁶⁴ ⁹⁶⁵ ⁹⁶⁶ ⁹⁶⁷ ⁹⁶⁸ ⁹⁶⁹ ⁹⁷⁰ ⁹⁷¹ ⁹⁷² ⁹⁷³ ⁹⁷⁴ ⁹⁷⁵ ⁹⁷⁶ ⁹⁷⁷ ⁹⁷⁸ ⁹⁷⁹ ⁹⁸⁰ ⁹⁸¹ ⁹⁸² ⁹⁸³ ⁹⁸⁴ ⁹⁸⁵ ⁹⁸⁶ ⁹⁸⁷ ⁹⁸⁸ ⁹⁸⁹ ⁹⁹⁰ ⁹⁹¹ ⁹⁹² ⁹⁹³ ⁹⁹⁴ ⁹⁹⁵ ⁹⁹⁶ ⁹⁹⁷ ⁹⁹⁸

5417. ACTIVATION OF GLUTAMIC ACID AND GLUTAMINE IN MAMMALIAN TISSUES. M.A.Alford.

M.Brotman, M.A.Chudy and MJ.Frasen Canad. J. Biochem., 1963, 41, 1135-1145 (Biochem. Dept.. Univ. Manitoba Vied. Sch.. Winnipeg. Manitoba.

Canada) Measurements of a-glutamyl-RNA synthetase and glutaminyl-RNA synthetase activities have been made in fractions derived from 105000 & supernatant of homogenates of rat liver and mouse Ehrlich ascites carcinoma cells. It was indicated that each amino acid was activated by a sp. enzyme, I^{Kin}-enzymes catalysed amino acid dependent ATP-WR exchange. The a-glutamyl-RNA synthetase * » £ ». 42-fold from rat liver 105000 & supernatant was free of tufutamine synthetase.

A.M.Gibbins

5418. SYNTHESIS OF Y-GLOBULINI IN THE NEW-BORN RABBIT. A.Wainer, J.Robbins, ^{ff} and R.T. Smiths Nature, Lond., 1963, 198, 4» / «JB

(Dept. Biochem., Univ. of Florida Coll. Mea.. Gainesville, Flat. U.S.A.) Examination of sera of new-born rabbits by immunoelectrophoresis after i.p. injn. of [35S]methionine showed that Y-globulins » synthesised by the new-born animals although in much smaller amounts than other serum proteins.

5421. PLASMA PROTEIN SYNTHESIS IN THE LIVER: METHOD FOR MEASUREMENT OF ALBUMIN FORMATION IN VIVO. E.B.Reeve, J.R.Pearson and D.C. Marts Science, 1963, 139, 914-916 (Dept. Med.. Univ. Colorado Med. Center, Denver, Colo., U.S.A.)

L-Arginine labelled with 14C in the guanido group was inj. into neomycin-treated rabbits, and the ratio of the rates of entry of radioactivity into protein and urea determined. This ratio, multiplied by the rate of arginine utilisation in urea synthesis and by the ratio of protein to protein arginine wt. gives the rate of protein synthesis. The method applies to albumin and should apply to any plasma protein synthesised in those liver cells which also synthesise urea.

G.M.Lewis

5422. SERUM PROTEIN SYNTHESIS BY THE FOETAL RAT. P.C.Kellener, CD.Kenyon and C.A.Villee:

Science, 1963, 139, 839-840 (Dept. Biol. Chem., Harvard Med. Sch., Boston, Mass., U.S.A.) When [14C]methionine or [14C]leucine were inj. i.p. into rat foetuses in utero at 20-22 days gestation, significantly greater labelling of foetal serum proteins occurs than when the amino acids are inj. into die maternal circulation. Maternal partial hepatectomy had little effect on the synthesis of foetal serum proteins.

G.M.Lewis

5423. PROTEIN CRYPTOGRAM: I. NON-RANDOM OCCURRENCE OF AMINO ACID 'ALLELES'. R-V.Eck:

J. theor. Biol., 1962, 2, 139-151 (Biol. Lab., Nat. Cancer Inst., N.L.H., Bethesda, Md., U.S.A.) Some complications of the 'overlapping' hypothesis of nucleic acid-protein coding are discussed, and a procedure outlined for elucidating such a code. The first result of such an approach shows that the reported 'alleles' do not occur at random.

J.A.Dawson

5424. SIGNIFICANCE OF ENDOPLASMIC RETICULUM MEMBRANES FOR PROTEIN BIOSYNTHESIS IN RAT LIVER AND YOSHIDA HEPATOMA ASCITES CELLS.

G.P.Barbieri and A.di Marco: Exp. Cell Res., 1963, 30, 193-199 (Farmitalia Lab. Richerche Microbiol.

Chemoterap., Milano, Italy) The amino acid incorporation activity of several microsomal fractions from rat liver and rat hepatoma ascites cells, was determined. The light portion from each microsomal fraction showed a higher content of lipid P and the heavy portion presented a higher content of RNA. In liver the light microsomes always incorporated amino acids into proteins more actively than the heavy ones, while in hepatoma, the light ones presented a lower amino acid incorporation activity.

K.Jones

5425. AMINO ACID INCORPORATION BY IN VITRO TUMOUR AND LIVER SYSTEMS AND THEIR RESPONSE TO EXOGENOUS RNA. M.A.O'Neal and A.C. Griffin: Cancer Res., 1963, 23, 628-633 (Dept.

Biochem., Univ. Texas M.D.Anderson Hosp., Houston, Tex., U.S.A.) A procedure for isolating amino acid incorporating systems from Novikoff ascites tumour and rat liver is described. The tumour system incorporated approx. 30-70 umoles of amino acid/mg. ribosomal protein when [14C]valine, [14C]phenylalanine or [14C]lysine was supplied. Addition of RNA prep. from tumour and liver nuclei, tumour ribosomes or TMV to the tumour system increased incorporation by 16-45%. Addition of polyuridylic acid to the tumour system with [14C]phenylalanine caused a 7-10-fold increase in incorporation.

B.M.Stevens

BIOCHEMISTRY

5426. PROTEIN SYNTHESIS AND METABOLISM OF TUMOUR AND EMBRYO CELLS.

T.Terranova, F.Feo, L.Gabriel and E.Gravela: Sperimentale, 1962, 112, 429-438 (Ist. di Patologia Gen., Univ., Torino, Italy) The aerobic respiration, aerobic and anaerobic glycolysis and the rate of incorporation of [¹⁴C]glycine into TCA precipitable protein, of 10 day old chick embryo cells and hepatic ascites cells (Yoshida) was studied at the same time, under the same conditions. During anaerobiosis in tumour cells, the glycolytic reactions were very active and the rate of protein synthesis very high. In chick embryo cells the rate of protein synthesis is high only during aerobiosis and very low during anaerobiosis. The relatively high efficiency of the energetic metabolism of tumour cells under anaerobic conditions suggested a 'facultative anaerobiosis'. (Italian) G.N.Godson

5427. STRUCTURAL ALTERATIONS OF PHAGE PROTEINS SYNTHESISED IN PRESENCE OF PANCREATIC RIBONUCLEASE. R.Jenner and G.Vansanten: Virology, 1963, 19, 169-178 (Animal Physiol. Lab., Univ., Brussels, Belgium)

The addition of pancreatic RNase to a lysogenic culture of *B. megaterium*, induced by u.v. irradiation, leads to the formation of non-infectious phage particles of normal DNA content. The stability of the tail structure is sharply decreased, and head proteins fail to react with the sp. Ab of control phage. Abnormal chromatographic and electrophoretic patterns are produced from tryptic digests. It is suggested that RNase acts by modifying the specificity of the ribonucleic acids involved in the ordering of amino acids along the genetic messenger. J.G. Bennette

5428. FORMATION OF TRYPTOPHAN SYNTHETASE ENZYME BY CELL-FREE EXTRACTS OF MYCELIUM OF NEUROSPORA CRASSA. S.D.Wainwright: Canad. J. Biochem., 1963, 41, 1327-1329 (Biochem. Dept., Dalhousie Univ., Halifax, Nova Scotia, Canada) ATP (for which hexose diphosphate could not serve as a source) and polyvinyl acetate were required in the medium to induce increased tryptophan synthetase activity with cell-free extracts of *N. crassa*? mycelium. Reduction in amino acid concn., Mg²⁺*, or omission of NAD markedly reduced activity, and no stimm. of enzyme formation was obtained by adding 30 fig./ml. of 'messenger RNA'. 10 " 3M ethionine, £-fluorophenylalanine, or 3-2-thienylalanine inhibited activity increase, as did 20 fig./ml. chloramphenicol or cryst. DNase and 1 rng./ml. pancreatic RNase. There was no correlation between increase in tryptophan synthetase activity and net synthesis of protein* A.M.Gibbins

5429. INCORPORATION OF [¹⁴C]LEUCINE INTO THE PROTEIN OF RAT HEART SARCOSOMES: INVESTIGATION OF OPTIMAL CONDITIONS. G.F.Kalfc: Arch. Biochem., 1963, 101, 350-359 (Dept. Biochem., Seton Hall Coll. Med., Med. Center, Jersey City, N.J., U.S.A.) Incorporation was dependent on ATP generated within the sarcosome by oxidative phosphorylation. Puromycin and chloramphenicol suppressed incorporation almost completely. RNase, DNase and the sol. fraction of the cell had little effect. Leucine incorporation appeared to be a property of the mitochondria per se and not a result of microsomal or bacterial contamination. Treatment of labelled protein with 1-fluoro-2,4-dinitrobenzene indicated that the [¹⁴C]leucine was probably incorporated into the interior of the peptide chain. B.M.Stevens

MINERAL METABOLISM

5430. EFFECTS OF VITAMIN D AND PARATHYROID HORMONE ON CALCIUM AND PHOSPHORUS METABOLISM OF BONE IN VITRO. G.Nichols, jun., S.Schartum and G.M.Vaes: Acta physiol. scand., 1963, 57, 51-60 (Med. Dept., Harvard Med. Sch., Boston, Mass., U.S.A.) Bone from mice was incubated in vitro until an equilibrium for Ca and P ions between the bone and the medium was reached simulating the situation in vivo. Bone from animals pretreated with vitamins had a greater concn. of these ions in the medium than bones from vit. D-deficient controls. Vit. D also increased the passive solubility of the bone mineral and lactate production by bone cells. Parathyroid hormone had the same action as did vit. D in the absence of the latter. H. Wayforth

5431. CALCIUM RETENTION FROM THE COMMONLY USED SALTS: LACTATE, GLUCONATE, DIBASIC PHOSPHATE AND CARBONATE. M.Rakowska: Roczn. Panst. Zatyl. Hig., 1962, 13, 399-407 (Państwowy Zakład Higieny, Warszawa, Poland) No significant changes were observed in the utilisation of Ca or mineralisation of bones when Ca-gluconate, Ca-phosphate or Ca carbonate were alternatively administered to young rats by means of a stomach tube in 10-20 mg. doses of Ca. (Polish) T.Qfebicki

5432. SENSITIVE METHODS FOR TITRIMETRIC MICRODETERMINATION OF BIOLOGICAL CALCIUM AND MAGNESIUM. R.N.Beale and J.O.Bostrom: J. clin. Path., 1963, 16, 252-255 (Inst. Clin. Path., Public Health Dept., Sydney, Australia) Reagents containing high concn. of urea were used in microtitrations of Ca and Mg in serum and urine, with EDTA as titrant and Corinth Ca as indicator. Mg concn. was calculated by subtracting the Ca from the Ca plus Mg concn. The sensitivity of the methods was investigated by recovery expt., and the mean values obtained on 39 normal subjects were compared with published values based on flame emission or flame absorption spectrophotometry, or on 2 other titrimetric methods. J.B.Derbyshire

5433. CRYSTALLINE STRUCTURE OF CALCIUM CARBONATE IN AVIAN EGG SHELL. E.M. STUDY. A.N.J.Heyn: J. ultrastructure Res., 1963, 8, 176-188 (Physics Dept., Auburn Univ., Auburn, Ala., U.S.A.) The shell of the bird, as studied by E.M. of surface replicas consists of very large crystals of closely-packed calcite. Their transverse fracture structure shows a controlled cleavage pattern similar to that found in some metal alloys. At the inside of the shell randomly orientated microcrystals of calcite occur forming the protruding knobs of the mammilla layer. H.B. Wayforth

5434. IN VITRO BINDING OF TETRACYCLINE S TO CALCIUM. G.A.M.Finerman and R.A.Milclu: Nature, Lond., 1963, 198, 486-487 (Divn. Orthopaedic Surg., Dept. Surg., Johns Hopkins Univ., Baltimore, Md., U.S.A.) Sheep or cattle cortical bone powders adsorbed tetracyclines; this adsorption was increased by removal of org. material by treatment with ethylene diamine. Treatment with EDTA to remove Ca²⁺ prevented adsorption of tetracycline. Tetracycline mol. interact primarily if not only with Ca ions in at least hydroxyapatite seeded nucleation sites on collagen fibrils. G.M.Lewis

5435. CHELATION OF CALCIUM BY LACTOSE: ITS ROLE IN TRANSPORT MECHANISMS. P.Charley and P.Saltman: *Science*, 1963, 139, 1205-1206 (Dept. Biochem., Univ⁸ S.California, Los Angeles, Calif., U.S.A.) An uncharged complex between lactose and ⁴⁵Ca was demonstrated by paper electrophoretic techniques. Such a complex may account for the known enhancement of intestinal absorption of Ca by lactose. G.M.Lewis

5436. STRUCTURE AND CALCIFICATION IN AVIAN EGG SHELL. A.R.Terepka: *Exp. Cell Res.*, 1963, 30, 171-182 (Dept. Rad. Biol., Univ. Rochester Sch. Med. Dent., Rochester, N.Y., U.S.A.) The hen's egg shell was a highly ordered structure throughout its entire thickness, as studied optically and radiographically. There was a fibrous ring within the calcified tip of each shell mammilla, and these rings are suggested to serve as initial nucleation centres during egg shell formation. While X-ray microdiffraction showed that the mineral component of the shell was calcite, the presence of keratin in shell membrane could not be ascertained. K.Jones

5437. ORGANIC-INORGANIC INTERRELATIONSHIPS IN AVIAN EGG SHELL. A.R.Terepka: *Exp. Cell Res.*, 1963, 30, 183-192 (Dept. Rad. Biol., Univ. Rochester, Sch. Med. Dent., Rochester, N.Y., U.S.A.) An orderly arranged shell matrix found throughout the entire egg shell was correlated with the distribution of shell mineral, suggesting a close association of matrix and mineral deposition. Concn. of matrix material present at the tips of the shell mammillae appeared to serve to facilitate diffusion of a physiol. decalcifying agent elaborated during embryonic development of the chick. It is suggested that the easily decalcified mineral core is of different cryst. size and/or composition from the remainder of the shell mammilla. K.Jones

5438. CALCIUM DETERMINATION IN SERUM. ni. MICROMETHOD SUITABLE FOR SERUM CONTAINING EDTA. H.Pfordte and W.Ponsold: *Z. Ges. exp. Med.*, 1963, 136, 543-546 (Pharmac. Inst., M.Luther Univ., Halle-Wirtenberg, Germany) A micromethod for Ca determination in 0*1-0*2 ml. serum is described. Ca is ppt. as Ca chloranilate, with subsequent soln. of the ppt. in 5% EDTA and spectro-Dhotometric analysis. (German) P.F.Meyer

5439. SYNTHETIC HYDROXY APATITE CRYSTALS. II. AGEING AND Sr INCORPORATION. W.F.Neuman, R.Bjomerstedt and BJ.Mulryan: *Arch. Biochem.*, 1963, 101, 215-224 (Dept. Rad. Biol., Univ. Rochester, N.Y., U.S.A.) Ageing involved both a successive transport of Ca to fill out vacancies in the crystal interior and a decrease in sp. surface area probably due to recryst. The Ca/P ratio rose from 1 to 1.66 over approx. 2 days. The hydration decreased 20% in 2 days and continued to decrease somewhat further. It was shown that Sr uptake could be preferentially limited to column positions and that Ca discriminated against Sr in this process. Ageing was shown to decrease the amount of exchangeable Sr and to increase Ca/Sr discrimination. B.M.Stevens

5440. EFFECT OF AZIDE AND Ca ION ON REVERSIBLE CHANGES OF PROTEIN CONFIGURATION IN STIMULATED NERVES. M.Luxoro, E.Rojas and E.Wittig: *J. gen. Physiol.*, 1963, 46, 1109-1121 (Dept. Biophys., Sch. Chem. and Pharmacy, Univ. Chile, Santiago, Chile) Ungar's finding that nerve proteins undergo a reversible denaturation concomitant with a

train of nerve impulses, was substantiated in sciatic nerves from *Calyptocephalella gavi*. 0<3mM Na azide impaired the reversibility of those changes, and 10 mequiv./l. of Ca applied to extracts of resting nerves induced configurational rearrangements in the proteins similar to those produced during stimn. It is tentatively concluded that the configurational changes are a consequence of the extra influx of Ca due to nerve impulse propagation. K.Jones

5441. INHIBITION OF MITOCHONDRIAL ADENOSINE TRIPHOSPHATASE. EFFECTS OF ALKALI-METAL IONS. F.Ulrich: *Biochem. J.*, 1963, 88, 193-206 (Dept. Physiol., Yale Univ. Sch. Med., New Haven, Conn., U.S.A.) The alkali-metal ions Na, K, Li, Rb, Cs and NH₄ inhibited the ATPase in membrane suspensions from deoxycholate-disrupted rat-liver mitochondria. Concn. of Na⁺ and K⁺ as low as 10mM were effective. NO₃⁻ caused a greater inhibn. than Cl⁻, but both inhibited more than did SO₄²⁻. Despite large differences in ATPase activity in the absence of alkali-metal ions, the inhibn. of ATPase was similar (a) over the pH range 5-10, (b) with ATP, UTP, GTP, or ITP as substrates and (c) with various activating divalent cations. Activation of the enzyme by DNP was diminished by alkali-metal ions. *

5442. EFFECT OF ALKALI METALS ON GROWTH OF STAPHYLOCOCCUS PYOGENES. H.V.Wyatt: *Exp. Cell Res.*, 1963, 30, 56-73 (Dept. Biol. Sci., Bradford Inst. Technol., Bradford, England) Li was unable to replace K for the growth of *S. pyogenes*, while Rb could replace K with an efficiency of 20 to less than 3% depending on the concn. of the 2 cations. Higher concn. of Rb inhibited growth and glucose uptake. When K was present, Cs had an efficiency of about 0*1%. K.Jones

5443. UPTAKE OF K AND Rb BY STAPHYLOCOCCUS PYOGENES. H.V.Wyatt: *Exp. Cell Res.*, 1963, 30, 62-73 (Dept. Biol. Sci., Bradford Inst. Technol., Bradford, England) The uptake of K and Rb by *S. pyogenes* was logarithmic during log. growth, the 2 metals competing for both entry and efflux. In the presence of Rb, there was biphasic log. growth. The uptake of Rb was dependent on its external concn., and was in excess of K normally taken up. A model is proposed for the flux of Rb and K. K.Jones

5444. SELENIUM CONCENTRATION IN KIDNEYS OF NORMAL PIGS AND PIGS AFFECTED WITH NUTRITIONAL MUSCULAR DYSTROPHY AND LIVER DYSTROPHY (HEPATOSIS DIAETETICA). P.Lindberg and M.Siren: *Life Sci.*, 1963, No. 5, 326-330 (Dept. Med., Royal Vet. Coll., Stockholm, Sweden) The Se content of normal pigs was 10*978 ± 0*568 p.p.m. of dry wt., while pigs affected with muscular dystrophy showed 3*397 ± 0*290 p.p.m. Pigs affected with liver dystrophy showed a value of 3*325 ± 0*567 p.p.m. K.Jones

5445. PARATHYROID HORMONE AND MAGNESIUM HOMOEOSTASIS. LMacIntyre, S.Boss and V.A. Troughton: *Nature*, Lond., 1963, 198, 1058-1060 (Postgrad. Med. Sch., London, England) Results are presented which support the hypothesis that a rise in plasma Mg inhibits secretion of parathyroid hormone resulting in increased excretion of Mg²⁺ in urine and a return of Mg levels in plasma to normal. A fall in plasma Mg stimulates production of parathyroid hormone resulting in increased renal conservation of Mg. J.R.Sargent

BIOCHEMISTRY

5446. ROLE OF MOLYBDENUM IN NITRATE ASSIMILATION BY AGROBACTERIUM TUMEFACIENS.

C.K.R.Kurup and C.S.Vaidyanathan: Biochem. J., 1963, 88, 239-242 (Dept. Biochem., Indian Inst. Sci., Bangalore, India) WO₄ is inhibitory to the growth of the crown-gall-initiating plant pathogen *A. tumefaciens* when grown in a synthetic medium with NO₃⁻ as the sole source of N. With NH₃ as the source of N this inhibitory effect was not apparent. The effect of WO₄ was completely reversed by the simult. presence of M064 in the culture medium. When the medium was purified and made deficient in M004 the growth of the organism was depressed. Nitrate-reductase activity of the cells also was depressed by the deficiency. The activity of the preformed enzyme was not increased by the addition of M004.

5447. EFFECTS OF COBALT ON MITOCHONDRIAL RESPIRATION. E.H.Strickland and C.R.Gouchen Nature, Lond., 1963, 198, 790-791 (U.S. Army Med. Res. Lab., Fort Knox, Kans., U.S.A.) Addition of Cobalt (II) A DP to rat liver mitochondria stim. succinate oxidation; EDTA stim. it further, but this stimn. was reversed by Co. G.M.Lewis

5448. INFLUENCE OF AMINO ACIDS ON IRON ABSORPTION. D.Kroe, T.D.Kinney, N.Kaufman and J.V. Klavins Blood, 1963, 21, 546-552 (Path. Dept., Duke Univ. Med. Center, Durham, N.C., U.S.A.) It was shown by introducing amino acids plus ⁵⁹Fe into isolated intestinal loops and measuring the label in the serum and in the liver, that all the amino acids increased the serum Fe and Fe deposition in the liver.

H.B.Waynfirth

5449. CHEMICAL CONSTITUTION OF HAEMIN. M.Grassl, G.Augsburg, V.Coy and F.Lyneic Biochem. Z., 1963, 337, 35-47 (M.Planck-Inst. fur Zellchemie, MQnchen, Germany) It is postulated that haemin prep, from ox heart is derived from protohaemin by changing the side groups on rings A and C. According to this scheme die vinyl group in position 2 of the porphyrin ring is alkylated by farnesyl pyrophosphate while the methyl group in position 8 is oxidised to an aldehyde. It was shown by oxidative degradation of hydrogenated or unchanged haemin that rings B and C had remained unchanged. (German) L.Cohn

5450. A GEL FILTRATION METHOD FOR STUDIES ON PROTEIN IRON-BINDING. A.A.Barber, C.Demiuwer and N.G.Anderson: Clin. chim. Acta, 1963, 8, 143-145 (Dept. Zool., Univ. California, Los Angeles, Calif., U.S.A.) Gel filtration on Sephadex G-50 and ⁵⁹Fe are used for rapid determination of protein-iron binding in complex mixtures. K.Brew

5451. IRON, PORPHYRINS AND CHLOROPHYLL. E.F.Karali and C.A.Price: Nature, Lond., 1963, 198, 708 (Dept. Plant Physiol., Rutgers, State Univ., New Brunswick, N.J., U.S.A.) *Euglena gracilis* incubated with porphobilinogen showed decreased rates of coproporphyrinogen formation with decreasing levels of cell Fe. Fe-deficient cells, though deficient in their capacity to form chlorophyll, produced protoporphyrin at rates equal to or greater than the iron-sufficient controls. Theories of chlorophyll synthesis are discussed. G.M.Lewis

5452. MECHANISM OF HYDROGEN TRANSFER BY PYRIDINE NUCLEOTIDES. XII. N-TERMINAL GROUPS AND ZINC CONTENT OF ALCOHOL DEHYDROGENASE

FROM YEAST. A.Arens, H.Sund and K.Wallenfels: Biochem. Z., 1963, 337, 1-23 (Chem. Lab., Univ., Freiburg, L Br., Germany) Pure cryst. alcohol dehydrogenase from bakers' yeast was recryst. in the presence of EDTA by adding (NH₄)₂SO₄ to a final satn. of 0⁰36. After the second recrystn. 13*24 mole. N-terminal amino acids, determined as their DNP deriv. were found for each mol. of protein, after the 19th recrystn. this value had dropped to 1*86. The Zn content of once cryst. enzyme was 5[#]2 atoms/mole enzyme, after the 19th recrystn. it had decreased to 3*2. It was concluded that the enzyme protein possessed no N-terminal groups but that Zn was essential for its bioL activity. (German) L.Cohn

5453. DISTRIBUTION OF RADIozINC IN RAT PLASMA. J.P.Okunewick, O.A.Schjeide, E.N.Carlsen and T.G. Hennessy: Nature, Lond., 1963, 198, 966-968 (Lab. Nuclear Med., Sch. Med*, Univ. California, Los

Angeles, Calif., U.S.A.) Loosely bound Zn is distributed among all proteins of rat plasma strictly on a per wt. basis. InjL of individual protein fractions labelled with Zn resulted in the same clearance pattern for Zn as that of the whole plasma, further indicating that none of the inj. fractions shows a greater affinity for Zn than any other fraction or whole plasma. J.R. Sargent

5454. FLUORIMETRIC MICRODETERMINATION OF THALLIUM [Th] WITH RHODAMINE B[Rh]. W.Kisser. Arch. Toxicol., 1963, 20, (2), 108-113 (Inst. Med. Univ., Vienna, Austria) The method can be applied to both org. and inorg. materials. After soln. in acid the Rh-Th complex is extracted and its absorption measured at 590 mji. 0¹ fig. is die lower limit and the error for 5 jig. is 5% (relative). (German) LCornish

5455. DISTRIBUTION AND EXCRETION OF RADIOACTIVE RARE EARTH COMPOUNDS IN MICE. B.Rosoff, E.Siegel, G.L.Williams and H.Spencer. Int. J. appl. Radiat., 1963, 14, 129-135 (Montefiore Hosp., New York, U.S.A.) The distribution and excretion of radioactive rare-earth Sc, Y, La, Sm injn. i.v. in ionic or chelated form was studied. The strong rare earth chelates were well excreted and little was retained, the weaker chelates were largely deposited in liver and spleen, and intermediate chelates were found in bone. B.Payne

OTHER BODY CONSTITUENTS

5456. MOLECULAR VIBRATION AND INSECT SEX ATTRACTANTS. R.H.Wright: Nature, Lond., 1963, 198, 455-459 (Brit. Columbia Res. Council, Vancouver, Canada) Study of the chem. structure of a variety of insect sex attractants, revealed the wide chem. diversity of these attractants. A feature of the attractants was die presence in each mol. of characteristic low-frequency vibrational movements. The results are consistent with the theory that odour is due to these vibrational movements. J.R.Sargent

5467. ATTRACTIVE SUBSTANCE OF THE COTTON WORM (PRODENIA LITURA F). S.M.A.D.Zayed, T.M.Hussein and L.M.LFakhn Z. Naturforsch. B, 1963, 18, 264 (Nat. Res. Centre Dokki, Cairo, U.A.R.) Note* (German) J.C.Crawhall

5458. METABOLISM OF INDOLE-3-CARBOXYLIC ACID BY THE RAT. R.M.Acheson and L.J.King: *Biochim. biophys. Acta*, 1963, 71, 643-649 (Dept. Biochem., Univ., Oxford, England) Extracts of urine, after indole-3-carboxylic acid had been fed or inj. i.p. confined approx. 20% of the original acid, the corresponding glucuronide and 6-hydroxyindole-3-carboxylic acid. N-(indole-3-carbonyl)glycine was synthesised and was shown to be absent from urine extracts. Oxidation of indole-3-carboxylic acid by Udenfriend's method gave the 5- and 6-OH deriv., indole, anthranilic acid and N-formylanthranilic acid. B.M. Stevens

5459. O-METHYLATION IN THE CONVERSION OF TYROSINE TO MELANIN. J.Axelrod and A.B.Lerner: *Biochim. biophys. Acta*, 1963, 71, 650-655 (Nat. Inst. Mental Hlth., Bethesda, Md., U.S.A.) Catechol-O-methyl transferase catalysed methylation of ⁵-dihydroxyindole and 5,6-dihydrodihydroxyindole. Primarily at *C*⁶. Hydroxyindole-O-methyl transferase catalysed methylation of 5,6-dihydroxyindole mainly at ⁵; 5,6-dihydrodihydroxyindole was not methylated. B.M.Stevens

5460. RHODOPSIN: AN ENZYME. D.G McConnell and D.G.Scarpelli: *Science*, 1963, 139, 848 (Inst. Res. Vision, Ohio State Univ., Columbus, Ohio, U.S.A.) Digitonin extracts of frog rhodopsin show ATPase activity; the activity is greatest in light of the wavelength ^{2*} at which rhodopsin shows max. absorption. Hydroxylamine inhibits the enzyme by removing retinine, which is essential for activity. G.M.Lewis

5461. EYE PIGMENT OF COCKROACH. JJ.Wolken and I.J.Scheer. *Exp. Eye Res.*, 1963, 2, 182-188 (Biophys. Res. Lab., Eye and Ear Hosp., Univ. Pittsburgh Sch. Med., Pittsburgh, Pa., U.S.A.) The visual cells from the eye of the cockroach (*Blatta orientalis*) were separated by grinding the heads in 45% sucrose-phosphate buffer soln. followed by differential and high-speed centrifugation. The rhabdomere fraction was thus eluted and extracted with 1.8% aq. digitonin. This suited in a photo-sensitive pigment complex with absorption max. at approx. 500 mp, typical of rhodopsin. The bleaching and difference spectra indicate that ¹retinene is part of the complex. The reaction rate const. for bleaching the complex was 6.1×10^{-5} sec.⁻¹ at 25°. ²* Etone extraction of the heads followed by chromatography on alumina columns eluted a fraction identified spectroscopically as retinene. J. Whiting

5462. ULTRAVIOLET SPECTRAL DISPLACEMENTS OF CATTLE RHODOPSIN. M.Takagi: *Biochim. biophys. Acta*, 1963, 66, 328-340 (Dept. Biol. Fac. Sci., Univ. Osaka, Japan) On illumination the absorption max. at 231, 278, 286-5 and 292 mji shifted towards shorter ¹ by approx. 1 mji. Changes in pH between 4-7 and 9-7, in ionic strength between 0 and 5, in digitonin concn. between 0.1 and 2flo₉, in glycerol concn. between 80% w/v and in age of prep, did not affect the displacements. Displacements were reduced to 10% of control values in cone, sucrose soln. and increased to 160% in urea. Rhodopsin in rod outer segments showed similar spectral changes to rhodopsin in soln. Results of SP* on low temp, illumination indicated that the displacements occurred in the change from metarhodopsin to indicator yellow, but not earlier in the rhodopsin cycle. B.M.Stevens

5463. SHUNT BILIRUBIN: EVIDENCE FOR TWO COMPLEXES. L.G.Israels, T.Yamamoto, J.Skanderbeg and A.Zipursky: *Science*, 1963, 139, 1054-1055 (Med. Coll., Univ. Manitoba, Winnipeg, Manitoba, Canada) Studies with ¹⁴C-labelled glycine and 6-aminolaevulinic acid as haem-bilirubin precursors in man indicate that the early labelled or shunt bilirubin consists of 2 fractions. One requires 1-24 hr. for max. synthesis, is not dependent on marrow erythropoietic haem synthesis, and is possibly of anabolic origin (formed by a direct pathway from haem precursors). The other fraction requires 3-4 days for max. production, is dependent on haem synthesis, and probably has its origin in the bone marrow as a degradation product of red cell haem. G.M.Lewis

5464. INVESTIGATIONS ON THE INFLUENCE OF HAEMIN AND HAEMIN DERIVATIVES ON THE NUCLEAR MAGNETIC RESONANCE OF WATER PROTONS. W.Schelen: *Biochim. biophys. Acta*, 1963, 66, 424-433 (Ftiaermakol. Inst. der E.M.Arndt-Univ., Greifswald, Germany) Effectiveness in influencing the relaxation increased in the order neutral ferricytochrome *c*, horse methaemoglobin, horse metmyoglobin, *Cheirognomus* metahaemoglobin, acidic ferricytochrome *c* and haematin. Haematin effectiveness was decreased by adsorptive bonding to polyvinylpyrrolidone. Influence on relaxation had magnetic and steric components, the latter being suggested to be a relative measure of accessibility of prosthetic groups in haemin deriv. Haemin groups in cytochrome *c* and *Cheirognomus* methaemoglobin were shown to be nearer the surface than those of horse methaemoglobin or metmyoglobin. By bonding ligands, especially F⁻, to horse methaemoglobin the influence of the Fe on relaxation was shown to depend on both magnetic moment and steric arrangement.

(German) B.M. Stevens
5465. SYNTHESIS OF UREA IN HUMAN FOETAL LIVER. G.La Torretta, D.Di Martino, C.Del Bianco, F.Colucci and V.Capano: *Biochim. appl.*, 1962, 9, 344-348 (Ist. Chim. Biol., Univ., Napoli, Italy) Human foetal liver at 7 months was able to synthesise urea from (a) carbamyl phosphate +ornithine +aspartic acid, (b) citrulline and aspartic acid and (c) carbamyl-aspartic acid and ornithine. (Italian) J.C.Crawhall

5466. OPHIDINE AND CARNOSINE ISOLATED FROM WHALE MUSCLE. K.Horisaka and A.Musashi: *J. Biochem.*, Tokyo, 1963, 53, 271-274 (Pharmacol. Inst., Schowa Med. Sch., Tokyo, Japan) 1.4 g. of cryst. carnosine and 4.4 g. of cryst. ophidine were prep, from 10 kg. of whale muscle. These substances were identified by means of salt formation, analysis and paper chromatography. The paper chromatogram showed that lysine, glutamic acid, aspartic acid, glycine, serine, threonine, proline, valine, alanine, 0-alanine, phenylalanine, leucine and creatine occurred in the free form.

(German) B.M.Stevens

ENZYMES

5467. COMPARISON OF NON-ENZYMIC AND ENZYMIC REACTION VELOCITIES. D.E.Koshland: *J. theor. Biol.*, 1962, 2, 75-86 (Brookhaven Nat. Lab., Upton, N.Y., U.S.A.) It is assumed that the

BIOCHEMISTRY

function of a hypothetical enzyme is to bring together substrates and catalysts. Equations are derived and applied to measured values in sp. cases. If the function of an enzyme were an oriented juxtaposition of 2 substrate mol. only a small acceleration would occur. But if 2 substrates plus 3 catalysts are brought together, the ratio of enzymic to non-enzymic velocity is 10^{18} . J.A.Dawson

5468. QUANTITATIVE POTENTIALITIES IN ENZYME CYTOCHEMISTRY. MODIFIED MICHAELIS-MENTEN RATE LAW APPLICABLE WHEN A SUBSTRATE DIFFUSES SLOWLY INTO AN ENZYME SITE. D.G.O'Sullivan
J. theor. Biol., 1962, 2, 117-128 (Courtauld Inst. Biochem., Middx. Hosp. Med. Sch., London, England)

The theoretical possibility is discussed of eliciting information on kinetics of artificial substrate enzyme reactions *in situ*. Instruments enable accurate physical measurements of rates to be made. A process which rapidly attains a steady state can give quant. information. By modifying the Michaelis-Menten rate law, a slow penetration reaction with homogeneous distribution of enzyme, can also give information. J.A.Dawson

5469. LOCALISATION OF ENZYME ACTIVITY IN ELECTRIC ORGAN OF ELECTROPHORUS ELECTRICUS (L). A.G.E.Pearse and D.F.de Almeida: Exp. Cell Res., 1963, 30, 1-7 (Dept. Pathol., Postgrad. Med.

Sch., London, England) The main oxidative enzyme activities in the Sachs organ were cone, in the post, portion of the electroplate, and phosphorylase was present only in the ant. portion. It is suggested that the neutral polysaccharide (glycogen) in the ant. portion of the electroplate acts as the main source of energy for maintenance of electrical potential in the membrane, its breakdown product diffusing from the ant. portion across the electroplate to be utilised at the active post, membrane. K.Jones

5470. COMPUTER PROGRAMMES FOR PROCESSING ENZYME KINETIC DATA. W.W.Cleland: Nature, Lond., 1963, 198, 463-465 (Dept. Biochem., Univ. Wisconsin, Madison, Wis., U.S.A.) Enzyme kinetic data were analysed by the method of least square fits using a computer whose programmes were written in Fortran language to make least square fits to enzymic equations. Brief descriptions of the various programmes and their uses are presented. The method yields max. velocity values and K_m with standard errors of about 5-10% of the values themselves. Standard errors of inhibitor const. tend to be up to 20% of the const. values. J.R.Sargent

5471. PARAMAGNETIC RESONANCE OF FLAVO-ENZYMES. H.Kubo, T.Shiga, M.Uozumi and A.Isomoto: Bull. Soc. Chim. biol. Paris, 1963, 45, 219-231 (Lab. Physiol. physico-chim., Fac. Méd., Univ., Osaka, Japan) The electron spin resonance [ESR] of the flavo-enzymes D-amino acid oxidase and xanthine oxidase were determined. The ESR signal of flavins and flavo-enzymes was derived from the unpaired electrons of the isoalloxazine nucleus. Various synthetic model isoalloxazines were studied. Photochemical reduction of D-amino acid oxidase yielded a free radical. Reduction of xanthine oxidase gave rise to ESR signals from FAD free radical, Mo and Fe. The oxidation level of Mo was not altered during the oxidation of hypoxanthine. (French) j.C.Crawhall

5472. PREVALENCE AND SIGNIFICANCE OF THE PRODUCT INHIBITION OF ENZYMES. E.Frieden and

C.Walter. Nature, Lond., 1963, 198, 834-837 (Dept. Chem. and Inst. of Mol. Biophys., Florida State Univ., Tallahassee, Fla., U.S.A.) The frequency and importance of product inhibn. of numerous enzymes is emphasised. Product inhibn. was found to be usually of a non-competitive nature, a result which was predictable from kinetic analysis of the reactions involved. Non-competitive nature of product inhibn. causes an exaggerated quant. effect of products on enzyme reactions.

J.R.Sargent

5473. D-GLYCERALDEHYDE 3-PHOSPHATE DEHYDROGENASE. XDC. EFFECT OF SODIUM DODECYL SULPHATE [NaDS] ON ENZYME ACTIVITY AND STRUCTURAL PROPERTIES OF DEHYDROGENASES. P.ElBdi, G.Jécsai and P.Tóth: Acta physiol. Acad. Sci. hung., 1963, 23, 87-99 (Inst. Biochem., Hungarian Acad. of Sci., Budapest, Hungary)

NaDS inhibits both phosphoglyceraldehyde dehydrogenase and lactic dehydrogenase of muscle. NaDS inhibits the denaturing effects of urea and heat on the enzymes as measured by change in optical rotation. Absorption spectrum measurements at 220-245 my reveal that NaDS causes disorganisation of the protein structures with £ indicating an increase of vol. and hydration of the proteins. The role of hydrophobic factors in the maintenance of the native structure and biol. activity of the enzymes is discussed.

H. G. Bevan

5474. MULTIPLE MOLECULAR FORMS OF MALATE DEHYDROGENASES IN ECHINODERM EMBRYOS.

R.O.Moore and C.A.Villee: Comp. Biochem. Physiol., 1963, 9, 81-94 (Dept. Biol. Chem., Harvard Med. Sch., Boston, Mass., U.S.A.) The eggs of *Arbacia punctulata*, and the ovaries of *Asterias forbesi* or Teleophoretic analysis show 5 separate protein components differing in mobilities but all with 1-malic dehydrogenase activity. Further differences between these proteins are found to exist in their rates of reaction with pyridine analogues, with d- and 1-malate, in sensitivity to heat and in solubility in $(NH_4)_2SO_4$. After fertilisation 2 of these enzymes disappear, but one reappears after 12 hr. development. Malic dehydrogenase activity is also shown by other proteins with regard to d-malate but not 1-malate utilising the analogues of NAD, but not NAD alone.

M.S.Laverack

5475. STARCH GEL ELECTROPHORESIS OF MALATE DEHYDROGENASE. C.J.R.Thome, L.I.Grossman and N.O.Kaplan: Biochim. biophys. Acta, 1963, 73, 193-203 (Grad. Dept. Biochem., Brandeis Univ., Waltham, Mass., U.S.A.) Purified prep. of mitochondrial enzyme existed in up to 6 forms separable by electrophoresis at pH 7.0. The distribution pattern was unaffected by the age of the tissue of origin, the purification procedures and a no. of degradative treatments. Treatment with methyl iodide and urea did have some effect. After elution the components were shown to be relatively similar by catalytic criteria, but all differed from the pig heart supernatant¹ enzyme.

B.M.Stevens

5476. SUCCINOXIDASE SYSTEM OF BEGONIA LEAVES.

K. Sasaki: Bot. Mag. Tokyo, 1962, 75, 428-435 (Dept. Bot. Fac. Sci., Hokkaido Univ., Sapporo, Japan) The oxidising capacities of various fractions of leaf homo* genate of *Begonia sempervirens* on succinate, fumarate, malate and (X-ketoglutarate were investigated. An optimum pH for oxidation of these substances was 5.0. Succinoxidase activity in the paniculate fractions increased on ageing and was stim. by cytochrome c but strongly inhibited by azide and cyanide. Solubilisation

and activation of succinoxidase in the chloroplast fraction was effected by lipase treatment. Enzyme activity in the sol. fraction was less sensitive to the effects of azide and cyanide* N.J.Pinfield

5477. SUCCINATE TETRAZOLIUM REDUCTASE ACTIVITY IN DEVELOPING RAT THYMUS. A.L.Kahri, M.Hannuksela and E.O.Karharju: *Acta endocr. Kbh.*, 1963, 42, 564-570 (Anat. Dept., Univ., Helsinki, Finland) No change in the succinate tetrazolium reductase activity measured by optical density and histo-chem. methods was observed in the thymus of rats up to the 294th day after birth. H.B.Wayforth

5478. CYTOCHROME c-CYTOCHROME OXIDASE IN BIOLUMINESCENT FUNGI. E.A.Botan: *Nature, Lond.*, 1963, 198, 479 (AVCO Res. Divn., Med. Sci. Dept., Wilmington, Mass., U.S.A.) A pos. G-Nadi reaction for cytochrome oxidase is given by cultures of the bioluminescent fungi, *Panus stipticus*, *Armillaria mellea*, *A. fusipes*, *Mycena polygramma*, *ggocySe illudens* and *Collybia velutipes*. The reaction was inhibited by KCN or by heating the fungi to 60° for 15 min. G.M.Lewis

5479. SUCCINOXIDASE ACTIVITIES AND CYTO-CHROME OXIDASE OF EXTRACTS OF ASCARIS EGGS. E.Kmetec, P.C.Beaver and E.Bueding: *Comp. Biochem. Physiol.*, 1963, 9, 115-120 (Dept. Pediatrics, Western Res. Univ., Cleveland, Ohio, U.S.A.) Extracts were prepared from *A. lumbricoides* eggs homogenised in 0.1N H₂SO₄ after aerobic incubation for up to 120 days, or after anaerobic incubation in N₂ for up to 64 days. These extracts oxidised reduced cytochrome $\frac{1}{2}$ by a cyanide-sensitive pathway. In the presence of succinate these extracts also catalysed the reduction of added cytochrome $\frac{1}{2}$. The concn. of enzymes in extracts is sufficiently high to account for the rate of O₂ uptake in intact eggs. M.S.Laverack

5480. VALIDITY OF ELECTROPHORETIC DETERMINATION OF LACTIC DEHYDROGENASE ISOZYMES. N.Ressler, J.L.Schulz and R.R.Joseph: *Nature, Lond.*, 1963, 198, 888-889 (Dept. Med., Wayne County Gen. Hosp., Eloise, Mich., U.S.A.) Starch gel electrophoresis of kidney and liver homogenates was studied in buffers of different ionic strengths. Interactions between lactic dehydrogenase isoenzymes produced distorted patterns unless sufficiently concentrated, buffers were used. G.M.Lewis

^{81.} **AGAR-GEL EVIDENCE FOR ISOENZYMES OF DEHYDROGENASES USING NAD AND NADP.** G. Broun and S.Avrameas: *Bull. Soc. Chim. biol.*, Paris, 1963, 45, 233-245 (Inst. Rech. Sci. sur le Cancer, Villejuif (Seine), France) Dehydrogenase activity was determined by coupling the substrate reaction with NAD or $\frac{1}{2}$ ADP followed by the formation of formazans. Separation of the coenzymes was carried out by electrophoresis on agar gel. Various human plasma lactic dehydrogenases were demonstrated. Isoenzymes of lactic, malic, $\frac{1}{2}$ ocitric and p-hydroxybutyric acids were demonstrated in rat liver and the variation of pattern after hepatectomy and with hepatomas was studied. (French) J.C.Crawhall

^{82.} **ANAEROBIC REDUCTION OF BOVINE MILK XANTHINE OXIDASE.** D.A.Gilbert: *Nature, Lond.*, 1963, 198, 1175-1177 (Chester Beatty Res. Inst., Royal Cancer Hosp., London, England) Anaerobic reduction of milk xanthine oxidase depends on (1) the enzyme sample, (2) the enzyme concn., (3) the presence

of inhibitors such as ascorbate, sulphite, 8-hydroxy-quinoline, cyanide, (4) pH, (5) substrate concn. The finding that the anaerobic reduction of xanthine oxidase takes place in 2 stages is considered to reflect different reactivities of the 2 FAD groups in the enzyme, rather than the presence of active and inactive forms of the enzyme. J. R. Sargent

5483. [PURIFICATION AND SOME PROPERTIES OF] HYPOXANTHINE OXIDASE FROM BOVINE SMALL INTESTINE. G.G.Roussos: *Biochim. biophys. Acta*, 1963, 73, 338-340 (Res. Dept., V.A. Hosp., Kansas City, Mo., U.S.A.) Prelim, comm. B.M.Stevens

5484. OXIDATION OF ETHANOL BY A PEROXIDASE SYSTEM IN HOMOGENATES OF LIVER FROM RATS RECEIVING I.P. INJECTION OF ETHANOL. G.Griffaton and R.Lowy: *C.R. Soc. Biol.*, Paris, 1962, 156, 1982-1987 (Inst. Nat. d'Hyg., Hôp. Bichat, Paris, France) Rats received 1^{1/2}, 3 and 4^{1/2} g. ethanol/kg. 15 min. before killing. Ethanol and O₂ consumption of liver homogenate was measured for 1 hr. at 37° and pH 7^{1/2}. In rats receiving ethanol there was an increase in O₂ consumption compared with normal animals. 10mM AMP activated the system while 1mM CN⁻ inhibited it. (French) M.A.Price

5485. DENATURATION AND INACTIVATION OF ENZYME PROTEINS. XIII. KINETIC STUDIES ON THE HEAT DENATURATION OF BACTERIAL PROTEINASE N* AND ITS COMPLEX WITH DFP. L.Fuke: *J. Biochem.* Tokyo, 1963, 53, 304-313 (Dept. Biol., Fac Sci., Univ., Osaka, Japan) The heat denaturations did not follow simple first order kinetics. Expt. on the effects of NaCl soln, ionic strength on the denaturation indicated that the ionic process was an ion-ion reaction of ions with opposite signs*. Effects of ionic strength of phosphate soln. indicated that phosphate had a sp. effect as well as the ordinary ionic reaction. During denaturation the change in the heat of activation was small and the change in the entropy of activation quite large. B.M.Stevens

5486. CATALYTICALLY ACTIVE CENTRE OF LYSOZYME. N.A.Kravchenko, G.V.Kleopina and E.D. Kaverzneva: *Dokl. Akad. Nauk*, 1962, 144, 118-121. Lysozyme was extracted from the white of hens' eggs by direct crystn. It seemed certain that histidine does not enter into the content of the catalytically active centre of lysozyme. The mechanism of the action of 3-glucosidase, to which lysozyme is related, was found to differ from that of ribonuclease and enzymes of the protease and esterase type. (Russian) B.J.Cooper

5487. ACID HYDROLASES OF BEEF HEART MUSCLE, m. INTRACELLULAR DISTRIBUTION OF β -GLUCURONIDASE AND CATHEPSIN. N.Stagni, D.Romeo, G.L.Sottocasa and M.C.Pugliarello. IV. β -GALACOSIDASE ACTIVITY ASSOCIATED WITH BEEF HEART SARCOMAS. D.Romeo, N.Stagni, G.L.Sottocasa and B.De Bernard. V. CATHEPSIN, (3-GALACTOSIDASE AND 3-GLUCURONIDASE DISTRIBUTION IN SUBCELLULAR FRACTIONS SEPARATED BY CENTRIFUGATION OF HEART HOMOGENATES. G.L.Sottocasa, N.Stagni, D.Romeo and B.De Bernard: *G. Biochim. Biol.*, Univ., Trieste, Italy) m. The distribution of β -glucuronidase and cathepsin in nuclear, mitochondrial and supernatant fractions of beef heart homogenates was studied. The highest sp. activity for both enzymes was

BIOCHEMISTRY

found in mitochondrial fractions, but expressed as a % of total enzymic activity, there was more (3-glucuronidase in nuclear fraction and more cathepsin in mitochondrial fraction. The enzymic activity of both nuclear and mitochondrial fractions was sensitive to Triton X-100, but in contrast the supernatant activity was not modified by addition of Triton X-100.

IV- 3^{Galactosidase} was present in beef heart homogenates and mitochondrial suspensions although the catalytic activity was partially masked, and was liberated by addition of Triton X-100. The enzyme was more sensitive to Triton X-100 than p-glucuronidase or cathepsin.

V. The sp. activity of 0-galactosidase was higher in mitochondrial suspensions than in the original homogenate. The distribution of these enzymes in nuclear and mitochondrial fractions after differential centrifugation showed a distribution pattern characteristic of each enzyme and distinct from succinoxidase a typical mitochondrial enzyme. It was concluded that the particles to which cathepsin, (3-galactosidase and g-glucuronidase were linked were distinct from mitochondria and probably their population was not homogeneous. B.Payne

5488. HISTOCHEMICAL STUDY OF HYDROLASES AND OXIDATIVE ENZYMES IN THE DEVELOPING RAT LIVER. W.Rossowski: Pozn. Towarz. Przyjaci. nauk, Wydz. lek., 1962, 22, 191-232 (Zatfad Histol. Prawitfowej i Embriologii Akad. Med., Poznań, Poland)

Lactic dehydrogenase [fl.succinic dehydrogenase [ID] and diaphorase [IE] were found in the liver mitochondria of the 12-14 day old rat foetus; at the same time acid phosphatase [IV] and non-sp. esterase [V] were revealed in the cytoplasmic granules. After the J.4th day of pregnancy the activity of ATPase [VI] and alk. phosphatase [VE] gradually increase with simult. increase in concn. of PAS-pos. compounds. Differential distribution of enzymes took place in the liver lobule 2-3 weeks after birth. The highest activity of H, IV, VI and VII was observed in the peripheral parts of the lobule. The cells close to the central vein were rich in I, III and V. (Polish) T.Qtebicki

5489. WHEAT LEAF PHOSPHATASES. VI SOME PROPERTIES OF THE ENZYME SYSTEM HYDROLYSING ADENOSINE 5'-PHOSPHATE AND PHENOLPHTHALEIN DIPHOSPHATE IN CRUDE JUICE PREPARATIONS.

D.W.A.Roberts: Canad. J. Biochem., 1963, 41, 1275-1281 (Plant Pathol. Section, Canada Agric. Res. Stn., Lethbridge, Alberta, Canada) In wheat leaf juice, an enzyme was demonstrated that hydrolysed p-glycerophosphate, together with another [E] that hydrolysed phenolphthalein diphosphate and AMP liberating orthophosphate. E was inhibited by 0.005M adenosine but not by 0.02M phosphate, and its inhibition by F" was smaller than the F" irihbn. of g-glycerophosphatase. E transferred phosphate from phenolphthalein diphosphate to adenosine to form AMP, and expt. indicated that there may have been more than one enzyme with different pH optima acting on these 2 substrates. A.M.Gibbins

5490. ENZYMIC HYDROLYSIS OF SODIUM PHENYL-PHOSPHATE. N.LRzhekhina: Biokhimia, 1963, 28, 321-325. Kinetics of Na phenylphosphate hydrolysis by alk. phosphatase from dog intestinal mucosa at 3 pH values (8.8, 9.4, 10.0) showed that a decrease in the pH of the reaction mixture was accompanied by a drastic decrease in the substrate concn. corresponding to the max. rate of hydrolysis. The expt. data were subjected to mathematical treatment, and kinetic equations were obtained. (Russian) B.J.Cooper

5491. EFFECT OF UNDERCUTTING ON THE AChase AND CHOLINE ACETYLTRANSFERASE ACTIVITY IN THE CAT *S CEREBRAL CORTEX. CO.Hebb, K.Krnjević and A.Silver: Nature, Lond., 1963, 198, 692 (A.R.C. Inst. Animal Physiol, Babraham, Cambridge, England) Slabs of cat cerebral cortex in the suprasylvian and pericruciate areas was undercut in such a way that the blood supply was not abolished. After 1-5 weeks, AChase and choline acetyltransferase activity of the fibres in the isolated area was markedly reduced, indicating that cholinergic fibres innervate cortical cells and probably travel from deep nuclei or cortical regions. G.M.Lewis

5492. ACETYLCHOLINESTERASE ACTIVITY OF MICE BRAIN TISSUE IN VITRO. E.Moerman: Arch. int. Pharmacodyn., 1963, 143, 287-297 (J.F. and C.Hermans Inst. Pharmacol., Univ. Ghent, Belgium) An automated potentiometric titration method is employed and described in detail. Enzyme inactivation by parathion deriv. is dependent on temp, and incubation time. S.E.Smith

5493. SPECIFIC ACh ACYL-HYDROLASES OF SHEEP BRAIN. K.Got and J.B.Polya: Nature, Lond., 1963, 198, 884-885 (Dept. Chem., Univ. Tasmania, Hobart, Australia) A procedure for the partial purification of cholinesterases from sheep brain is described*. The activity towards ACh, acetyl-3-methyl choline and benzoyl choline was in the ratio 1>0.04:0.01. After adsorption on diethylamine-cellulose ion exchange column* 2 active protein fractions were observed. Ultracentrifugation indicated a heterogeneous material. G.M.Lewis

5494. ENZYMIC PRODUCTION OF (+)-YTHREO-9,10-DIHYDROXYOCTADECANOIC ACID IN THE SPORES OF PLANT RUSTS. A.P.Tulloch: Canad. J. Biochem., 1963, 41, 1115-1121 (Nat. Res. Council Canada, Prairie Regional Laboratory, Saskatoon, Sask., Canada) An epoxide-hydrolysing enzyme system is present in the uredospores of Puccinia graminis Pers. f. sp. tritici Erikss. and Henn. race 15B and in the teliospores of Gymnosporangium clavigeriforme (Pers.) DC. Incubation of the spores results in a partial conversion of cis-9,10-epoxy octadecanoic acid, which is present in the spore oil as a glyceride, to (+)-threo-9,10-dihydroxyoctadecanoic acid*. A.M.Gibbons

5495. SOME PHYSICO-CHEMICAL PROPERTIES OF SULPHITE MODIFIED UREASE. L.W.Nichol and J.M.Creeth: Biochim. biophys. Acta, 1963, 71, 509-516 (Dept. of Phys. and Inorg. Chem., Univ. Adelaide, S. Australia) Urease in buffered SO₃²⁻ soln. sedimented as 1 boundary on ultracentrifugation. Analysis of die boundary shape showed the material to be essentially homogeneous in terms of S distribution. On electrophoresis, marked heterogeneity was apparent, -SSO₃²⁻ groups apparently being introduced on to the monomer. Unsymmetrical scission of S-S bonds. A cyclic mechanism was also indicated, whereby urease in SO₃²⁻ could be converted to an electrophoretically homogeneous modified form with a high mobility. Additional sedimentation velocity expt. confirmed the function of dissolved O₂ in this respect and in polymer formation in SO₃²⁻-free soln. B.M.Stevens

5496. INCREASED PLASMA ISOMERASE AND TRANSMINASE ACTIVITY IN MICE INFECTED WITH LA^ATIC DEHYDROGENASE-ELEVATING VIRUS. B.W.J.Mahy, C.W.Parr and K.E.K.ROWSOK: Nature, Lond., 1963, 198, 885 (Dep. Cancer Res., London Hosp. Med. Coll., London, England) Mice infected

with Riley virus showed a marked increase in plasma lactic dehydrogenase and phosphoglucose isomerase, a smaller increase in SGOT and SGPT, and no elevation in alk.-phenyl phosphatase or Hb.

G.M.Lewis

5497. SYNTHESIS AND DEGRADATION OF NATURALLY OCCURRING AMINES BY ENZYMIC TRANSAMINATION. K.Hasse and G.Schmid: Biochem. Z., 1963. 337, 69-79 (Inst. fur Organische Chem., Technische Hochschule, Karlsruhe, Germany) An enzyme prep. having a transaminase activity was obtained from peas, lupins, cauliflower, *tobacco* and *Neurospora crassa* by extracting homogenised plant tissues or freeze dried cells with phosphate buffer (pH 7-7.8). In enzyme assays *a*-ketoglutarate or pyruvate acted as acceptor of the amino group from a variety of mono- and polyamines. Effective donors of the amino group were glutamate and alanine. * (German) L.Cohn

5498. FORMAMIDINE GROUP TRANSFER IN EXTRACTS OF HUMAN PANCREAS, LIVER AND KIDNEY. J.B. Walker: Biochim. biophys. Acta, 1963. 73, 241-247 (Dept. Biochem., Baylor Univ. Coll. Med., Houston, Tex., U.S.A.) Activity in transferring formamidine to hydroxylamine was approx. equal in liver and kidney; pancreas was 5 times as active. Extracts of rat, rabbit and dog livers showed no activity; monkey liver had *bH* of the activity of human liver. Arginine, guanidinoacetate, 4-guanidinobutyrate and 3-guanidino-Propionate donated formamidine in descending order of activity. L-2-Amino-4-guanidinobutyrate and L-2-amino-3-guanidinopropionate had no donor activity. Ornithine, glycine and norvaline inhibited in descending order of effectiveness. Most of the reactions are suggested to be catalysed by L-arginine: glycine amidotransferase. Several methods of assaying amidotransferase in the presence of high levels of arginase are described. Two models are suggested to explain the observed "ibn".

B.M. Stevens

5499. SEPARATION OF BOVINE LENS CARBONIC ANHYDRASE INTO TWO COMPONENTS. M.Sen. S.M.Drance and V.R.Woodford: Canad. J. Biochem., 1963, 41, 1236-1241 (Biochem. Dept., Univ. Saskatchewan, Saskatoon, Sask., Canada) Two components of carbonic anhydrase were separated m. Partially purified forms from the sol. proteins of bovine lens. During the chromatographic separation on diethylaminoethyl cellulose columns, the total carbonic anhydrase increased, on an average, 9-fold. The bovine lens carbonic anhydrase may exist in the form of 2 iso-enzymes and there may be a naturally occurring inhibitory mechanism in vivo regulating the activity of bovine lens carbonic anhydrase in situ. A.M.Gibbins

5500. PURIFICATION AND SOME PROPERTIES OF LACCASE FROM *LYCOPRUS VERSICOLOR*. R-Mosbach: Biochir. biophys. Acta, 1963. 7* 204-212 (Enzyme Chem Group Inst. Biochem., Univ., Uppsala, Sweden) Two forms, A and B, were purified from the culture medium, after induction with 2.5-xylose, by (NH₄)₂SO₄ PPtN, chromatography on hydroxylapatite to remove contaminating pigments and *z*-one electrophoresis which separated the 2 forms. The 2 forms could also be separated by chromatography on diethylaminoethylcellulose. The A form gave a single symmetrical peak on free electrophoresis and both forms gave single symmetrical peaks on ultracentrifugation. The mol. wt. of laccase > was approx. 60000. It contained 14% carbohydrates and 0.44% Cu, corresponding to

4 atoms Cu/mol. The absorption spectra of the 2 forms were almost identical but laccase B had a lower sp. activity than laccase A.

B.M.Stevens

5501. DENITRIFICATION. VII. FURTHER PURIFICATION AND PROPERTIES OF DENITRIFYING ENZYME. H.Iwasaki, S.Shidara, H.Suzuki and T.Mori: J. Biochem. Tokyo, 1963, 53, 299-303 (Biol. Inst., Fac. Sci., Univ., Nagoya, Japan) An ultracentrifugally homogeneous prep. was obtained from cells of a strain of denitrifying bacterium by (NH₄)₂SO₄ fractionation and column chromatography on Amberlite CG-50 and CMcellulose. The prep. had absorption max. at 280 and 594 mp with a shoulder at approx. 290 nm and plateaux at approx. 750-780 and 460-480 mji in the oxidised state. There was no visible absorption in the reduced state. *J₂* was 6.46 and the diffusion coeff. 4.00 x 10⁻⁷ sq. cm./sec. giving a mol. wt. of 149000. Cu seemed to be the metal constituent. B.M. Stevens

5502. VARIATION OF ENZYME ACTIVITIES IN ERYTHROCYTES AT DIFFERENT AGES. RELATION BETWEEN ENZYME ACTIVITY AND ENERGY BALANCE. G.Budillon, A.Di Simone and A.Castellana: Biochim. AppL, 1962, 9, 323-327 (Ist. Patol. Spec. Med. e Metodol. Clin., Univ. Napoli, Italy) The enzyme levels of glyceraldehyde-3-P_O dehydrogenase [GAPDfl, 3-phosphoglycerokinase [3PGAK], pyruvate kinase [PK] and creatine phosphokinase [CPK] were studied in the r.b.c. of rabbits rendered anaemic by acetylphenylhydrazine. PK and CPK were increased during reticulocytosis whilst GAPDH and 3PGAK remained unchanged. (Italian) J.C.Crawhall

NUTRITION

5503. NUTRITIONAL REQUIREMENT OF YEASTS *SCHIZOSACCHAROMYCES ACIDODEVORATUS* DECOMPOSING 1-MALIC ACID. S.Bujak and W.Dabkowski: Acta microbiol. poL, 1962, 11, 373-382 (Wyzsza Szkoła Rolnicza, Lublin, Poland) *S. acidodevoratus* decomposed malic acid in the presence of amino acids, adenine, guanine or uracil as sole N-source provided pantothenic acid was added. d-Malic acid was decomposed to a slight extent.

(Polish) M.Korbecki

5504. COMPOUND MOUSE DIETS. W.Lane-Petter and G.Porten: Nature, Lond., 1963, 198, 1013-1014 (Lab. Animals Centre, M.R.C.Lab., Carshalton, Surrey, England) Four commercially available mouse diets were assessed in CBA mice observed through 5 gestation periods. It was concluded that there is as yet no ideal standardised and efficient mouse diet. G.M.Lewis

5505. EFFECT OF ALACREATINE ON THE RAT. C.Fitch and J.S.Dinning: Nature, Lond., 1963, 198, 1003 (Dept. Biochem., Univ. Arkansas Sch. Med., Little Rock, Ark., U.S.A.) A weakness which developed in rats fed alacreatine is due to an impurity, possibly an isothiourea or guanidine deriv. G.M.Lewis

5506. CALORIFIC NUTRITIONAL STATUS OF CHILDREN AND OLDER PUPILS IN CATANIA. M.Proja and D.Marletta: Quad. Nutr., 1*63, 22, 119-126 (Clinica Pediatrica, Univ., Catania, Italy) The use of

BIOCHEMISTRY

measuring the skin-fold thickness of the right subscapular and right tricipital area with Harpenden calipers, as a measure of calorific nutrition, was evaluated using 2259 children of both sexes between 6-11 yr. old, and comparing the results with these published in the literature. The results compared well. (Italian) G.N.Godson

5507. NUTRITIONAL STATUS OF ITALIAN SCHOOL CHILDREN. IV. NUTRITIONAL STATUS OF PUPILS FROM TWO RURAL COMMUNITIES IN CENTRAL ITALY. G.Ferro-Luzzi and M.Proja: Quad- Nutr., 1963, 22, 114-118 (Ministers della Sanitos, Serv. Nutr., Rome, Italy) 589 children, 6-11 yr. old, living in 2 agricultural centres in Central Italy, were examined for their nutritional status using clinical examination and anthropometric measurement of skin thickness. The results of the anthropometric method agreed well with the clinical evaluation. The nutritional status of the communities was satisfactory. (Italian) G.N.Godson

5508. NUTRITIONAL STATE OF ITALIAN SCHOOL COMMUNITIES, m. NUTRITIONAL STATE OF CHILDREN BOARDING IN THREE PERMANENT ROMAN SCHOOLS. A.Ferro-Luzzi: Quad. Nutr., 1963, 22, 106-113 (1st. Nazionale della Nutrizione, Rome, Italy) The nutritional status and health of 596 children between 3-14 yr. old boarding in at a school in Rome was examined. Their nutritional status was satisfactory, but when compared with boarding out schools in Rome corresponded to the nutritional status of children from a group between the high and medium economic levels. Caries and cheilosis was present in a % of cases, 31% and 12% respectively of the children. Obesity was present in only 2P/o. (Italian) G.N.Godson

5509. FOOD INPUT AND ENERGY EXTRACTION EFFICIENCY IN CARASSIUS AURATUS. P.M.C.Davies: Nature, Lond., 3963, 198, 707 (Dept. Zool., Trinity Coll., Dublin, Ireland) In goldfish under controlled conditions, a pos. correlation was observed between food input and extraction efficiency, within the limits of 1-5 mg. dried worm/g./fish/day. G.M.Lewis

5510. EFFECTS OF FEEDING QXYTETRACYCLINE TO PIGS AND WHITE RATS. P.J.S.Pieterse: S. Afr. J. agric. Sci., 1963, 6, 47-53 (Agric. Res. Inst. Highveld Region, Potchefstroom, S. Africa). I.A.B.S.

5511. CHEMICAL COMPOSITION OF MACKEREL (RASTRELLIGER CANAGURTA) AND CHANGES IN THE NUTRITIVE VALUE DURING STORAGE. DJ.Nazir and N.G.Magan Indian J. Technol., 1963, 1, 247-249 (Dept. Biochem., Inst. Sci., Bombay, India). I.A.B.S.

5512. CENTRAL NERVOUS EFFECT OF CARDIOPATHOGENIC DIET. LDési, L.Nikolits and J.Sós: Acta physiol. Acad. Sci. hung., 1963, 23, 205-210 (Inst. Pathophysiol. Med. Univ., Budapest, Hungary)
Rats fed on a diet containing cholesterol, protein, vit. D2# Na, Cl, Ca and P in excess but with little K or Mg died of myocardial infarction in 5-6 weeks. From the first week on the diet the e.e.g. showed increased spontaneous and electrically evoked excitatory activity. Cond. refl. began to diminish in spite of daily reinforcements. H.G.Bevan

5513. CARBOHYDRASE ACTIVITY OF RUMEN ENTDINUM SP. FROM SHEEP ON A STARCH-FREE DIET. R.W.Bailey and R.T.J.Clarke: Nature, Lond., 1963, 198, 787 (Plant Chem. Divn., D.S.I.R., Palmerston

North, New Zealand) E.ovinum* E.lip inflatum, E.indicum, E.biconcavum and E.bicarinatum together made up 80% of the rumen protozoa in a sheep grazing rye grass. Extracts of the Entodinium hydrolysed amylose and amylopectin, xylan and arabinoxylan, laminarin and cellobextrins, maltose, laminaribiose and sucrose, but not cellobiose, g-glucosides, a- and 3-galactosides, pectin and native cellulose. G.M.Lewis

5514. INFLUENCE OF MOLASSES AND MAIZE MEAL AS SOURCES OF CARBOHYDRATE ON UTILISATION OF UREA BY BOVINES. P.J.S.Pieterse and S.A.OosthuizeB S. Afr. J. agric. Sci., 1963, 6, 149-154 (Landbouwvarsings-inst., Hoeveldstreek, Potchefstroom, S. Africa). I.A.B.S.

5515. ACTION OF HERBS AND ROOTS OF ARTICHOKE (CYNARA SCOLYMUS L.) AND CARDOONS (CYNARA CARDUNCULUS L.), ON THE DEVELOPMENT OF EXPERIMENTAL ATHEROSCLEROSIS IN WHITE RATS. L.Samochowiec: Dissert, pharm., 1962, 14, 113-122 (ZaHId Farmakologii, Słaska Akademia Medyczna, Zabrze-Rokitnica, Poland) The addition of powdered dried artichokes and cardoons to both basic and sclerogenic diets in rats decreased the serum levels of cholesterol, lipid-P, glycoproteins and 3 -globulin. The results were confirmed by the histopathological examination and post-mortem analysis. The anti-atherosclerotic action of artichokes and cardoons is probably due to the presence of cynarin. (Polish) J.Baraińska

5516. INFLUENCE OF ATHEROGENIC DIET AND ARTICHOKE (CYNARA SCOLYMUS L.) AND CARDOONS (CYNARA CARDUNCULUS L.) ON THE HISTOPATHOLOGY OF CORONARY ARTERIES AND MYOCARDIUM IN WHITE RATS. L.Samochowiec, D.Habczyńska and Cz.Wazna-Boguńska: Patol. pol., 1962, 13, 337-348 (Zaltfad Farmakologii, Słaska Akad. Med., Zabrze-Rokitnica, Poland). M.Korbecki

5517. EGG YOLK AND SERUM CHOLESTEROL LEVELS-IMPORTANCE OF DIETARY CHOLESTEROL INTAKE. V.M. Wells and B.Bronte-Stewart: Brit. med. J., 1963, i, 577-581 (Dept. Med., Univ., Capetown, S. Africa) Consumption of egg yolk lipid, which has a relatively high I2 value and polyunsat. fatty acid content, results in rapid rise of serum cholesterol in man. Activity resides in the acetone fraction, but neither the unsaponifiable nor the saponifiable fraction cause the rise when fed separately only when given together. A delay of 6 hr. between feeding the fractions much decreases their effect. The effects of the unsaponifiable fraction can be reproduced by cholesterol and that of the saponifiable fraction by fat of similar iodine value to that of egg yolk. Giving oils of high iodine value with cholesterol has no effect. The range of intake of cholesterol required to produce the effect was 40-500 mg. daily, which is below the normal intake per day in non-vegetarian diets. M.E.Nutt

5518. INFLUENCE OF INOSITOL HEXANICOTINIC ESTER ON HEPATIC NAD, IN CHOLESTEROL STEATOSIS OF THE LIVER. F.Melani, P.Chiarini and L.Donnini: Sperimentale, 1963, 113, 54-60 (1st. de Semeiotica Med., Univ., Firenze, Italy) When 1 g/day of cholesterol was added to the diet of rabbits, there was a decrease in concn. of liver NAD and NADH2- After 15 days the NAD and NADH2 had fallen by 16.6 and 8.8% respectively with no signs of "steatosis". After 90 days they had fallen by 62.2 and 50.4% respectively and signs

of steatosis had appeared. Oral administration of 1 g./day of inositol hexanicotinic ester at the same time as cholesterol feeding protected the liver from NAD and NADH₂ depletion.. This protection was complete at 15 days, but after 90 days the loss was 30% and 29*5% respectively and some signs of steatosis had appeared in the liver.

(Italian) G.N.Godson

5519. SERUM HEXOSAMINE AND HYDROXYPROLINE IN PULLETS FED AN ATHEROGENIC DIET.

K.Kowalewskfc Arch. int. Physiol., 1962, 70_f, 631-635 (Surgical-Medical Res. Inst., Univ. of Alberta, Edmonton, Alberta, Canada) Pullets aged 10 days were fed an atherogenic diet containing 2% cholesterol and 5% olive oil. Serum hexosamine increased in all birds, in comparison with controls, within 20-100 days. The hydroxyproline content of serum was lower in birds in the atherogenic diet than in controls during the first half of the 100 day expt., but later rose to a normal value. The hexosamine¹hydroxyproline ratio was elevated in all birds on the diet. Results agree with those reported on atherosclerosis in mammals.

M.E.Nutt

5520. VARIATIONS OF LIPID FRACTIONS IN THE PLASMA AND R.B.C. OF HYPERCHOLESTEROLAEMIC ANIMALS. D.Gianieri: Biochim. appl., 1962, 9, 261-267 (1st. Chim. Biol. Univ., Roma, Italy)

Rabbits fed cholesterol and Tween 80 showed an increase of total lipids and free and combined cholesterol in Plasma. R.b.c. cholesterol did not rise.

(Italian) J.C.Crawhall

5521. UPTAKE OF PHOSPHORUS-32 BY BRAIN MICROSOMAL PHOSPHATIC ACID IN RATS DEFICIENT IN ESSENTIAL FATTY ACIDS. G.G.de Pur and F.D.Collins: Nature, Lond., 1963, 198, 788-789 (Russell Grimwade Sch. Biochem., Unjy. Melbourne, Australia) ACh stim. the uptake of ³²P into phosphatidic acid in normal rat brain microsomes but not in those from rats deficient in essential fatty acids, whose rate of uptake without ACh was of the same order as that by normal microsomes with ACh. This could be due to weakening of the lipoprotein microsomal membrane in deficient animals.

G.M.Lewis

5522. ANALYSIS OF EDIBLE OILS CONTAMINATED WITH SYNTHETIC ESTER LUBRICANTS. G.B.Crumpe Analyst, 1963, 88, 456-465 (Shell Res. Ltd., Thornton Res. Cen., P.O.Box 1, Chester, England).

I.A.B.S.

5523. SKELETAL MODIFICATION IN RATS FED WITH UNBALANCED PROTEIN DIETS. E.Turolia, C.Bertazzoli and T.Chieli: Sperimentale, 1962, 112, 467-484 (Lab. di Richerche di Microbiol. and Chemothropia, 'Farmitalia', Milan, Italy) Young rats were fed on an unbalanced protein diet, either hypo-proteinic (6-7% protein or less), or hyperproteinic and hyper-slycidic (25-8% protein). The body and bone growth rate, histoenzymology, histology and the Ca and P content of the skeleton, were similar in both groups of rats, but in the hypoproteinic group there was an inhibn. of growth cartilage proliferation and endochondral and periosteal osteogenesis and a reduction in bone-turnover. These Riost probably result from a reduced protein synthesis, other than a primary endocrine change.

(Italian) G.N.Godson

5524. PROTEIN SUPPLEMENTATION OF RYE FLOURS WITH SOME OTHER FOOD PRODUCTS. W.Szktffedz-iowa: Roczn. Państ. ZaW. Hig., 1962, 13, 415-425 (ZaWad Higieny Zywienia PZH, Warszawa, Poland)

Addition of meat or milk increased satisfactorily the nutritive value of rye flour, in white rats. No such results were observed upon the addition of vegetables. The results of the growth test were confirmed by the chem. determination of amino acid composition of the diets, performed after Block and Mitchell.

(Polish) T.Qlewicki

5525. INHIBITION OF ERYTHROPOIESIS AFTER DEPRIVING MALE RATS OF VARIOUS ESSENTIAL AMINO ACIDS. A.Aschkenasy: OR. Soc. Biol., Paris, 1962, 156, 1971-1976 (H6p. de la Pitie, Paris, France)

Rats deprived of essential amino acids for 7 days showed a reduction in erythropoiesis as shown by a comparative study of blood reticulocytosis and ⁵⁹Fe incorporation into r.b.c. Deprivation of isoleucine and S amino acids produced the greatest reduction. During amino acid deficiency there was a retention of ⁵⁹Fe in bone marrow. Accumulation of ⁵⁹Fe in liver was marked during methionine and cystine deficiency.

(French) M.A.Price

5526. CHANGES IN THE FIBROUS COMPONENT OF COLLAGEN AND DEVELOPMENT OF MACROPHAGE GRANULOMA IN RATS FED ON A RESTRICTED OR HYPOPROTEIN DIET. F.Farabolini and G.G.Tedeschi: Quad. Nutr., 1963, 22, 127-134 (1st. Fisiol. Gen. e Clin. Biologica, Univ. Camerino, Italy) After 27

days, the body wt. of rats maintained on a low protein diet, was 78% less than that of control animals fed on an unrestricted semisynthetic diet. Animals kept on a restricted diet (1/3 normal diet) had lost 25% of their initial body wt. after 27 days. However, granulomata had developed in all groups of animals but this was greatest in the hypoproteic group and affected particularly the collagenic fibrous component.

(Italian) G.N.Godson

5527. NITROGEN METABOLISM IN COLD-EXPOSED RATS. J.R.Beatore Canad. J. Biochem., 1963, 41, 1169-1179 (Defense Res. Med. Lab., Box 62, Station K, Toronto, Ontario, Canada) Exposure of c? albino rats to cold (2-3°) for a 7-day period increased amino acid catabolism, and consequently reduced protein synthesis in the period 1-5 days inclusive, despite a marked increase in food intake. Cold exposure was without effect on protein absorption but after 24 hr. in the cold the amount of N appearing in the urine increased from 55% (at 22°) to about 76% of that absorbed. N retention was not affected during the first 24 hr. of cold exposure, but its subsequent reduction appeared to bear a relationship to liver enzyme activity changes, particularly to increased activities of liver transaminases and arginase.

A.M.Gibbins

VITAMINS

5528. DETERMINATION OF VITAMIN A IN WHOLE BLOOD. V.A.Karpacheva: Biokhimiia, 1963, 28, 204-209.

A new method was devised for carotene and vit. A assay in whole blood. Saponification is followed by pptn. of sterols by digitonin at pH 1⁴, ensuring direct spectrophotometry of vit. A and carotene by extraction of these alone. Hb does not interfere with the spectrophotometry.

(Russian) BJ.Cooper

5529. EFFECT OF EXCESS VITAMIN A ON THE OXYGEN CONSUMPTION OF YOUNG FEMALE RATS.

BIOCHEMISTRY

M.M.Sampson, E.Carpenter and R. Wight: J. exp. Zool., 1962, 151, 279-285 (Dept. ZooL, Smith Coll., Northampton, Mass., U.S.A.) Hypervitaminotic-A rats receiving not more than 200 LU./g. body wt. consumed less O₂ than litter mate controls. Rats receiving from 300-525 LU./g. body wt. consumed more O₂ than litter mate controls. The increased O₂ consumption on high vit. A diet supports the histol. evidence of an increase in thyroid activity. R.J.Walker

5530. METABOLIC ACTIVITIES OF VITAMIN A AND RELATED COMPOUNDS IN ANIMALS- I ROLE OF VITAMIN A IN INTESTINAL MUSCULAR CONTRACTION. F.Fujita, Y.Sahashi, T.Suzuki, K.Heno and H.Sone: J. Vitaminol., 1962, 8, 268-274 (Lab. Vet. Physiol., Azabu Vet. Univ., Sagamihara, Fuchinobe, Kanagawa-ken, Japan) Isolated segments of rat small intestine were perfused with Tyrode's soln. and the action of vit. A and related compounds was tested using a kymograph. Free vit. A alcohol and vit. A aldehyde both increased the rate of intestinal movement but the acetate had little effect. Vit. A acid was inhibitory. No activity was observed with β -carotene but vit. A alcohol derived from β -carotene showed activity. It is suggested that free vit. A alcohol may be linked to the intermediate source of H transfer for muscular work in intestinal tissue. E.Parkinson

5531. MODE OF ACTION OF EXCESS VITAMIN A. Vn. CHANGES IN FINE STRUCTURE OF ERYTHROCYTES DURING HAEMOLYSIS BY VITAMIN A. A.M.Glauert, M.R.Daniel, J.A.Lucy and J.T.Dingle: J. cell Biol., 1963, 17, 111-121 (Strangeways Res. Lab., Cambridge, England) Suspensions of rabbit r.b.c. in NaCl were treated with an ethanolic soln. of vit. A and studied by phase control, or fixed in OsO₄ for E.M. study. Within 1 min. the surface of the r.b.c. is greatly increased and large indentations appear from which vacuoles are formed by a micro-pinocytosis like process. Hb is lost through breaks in the cell membrane and cell ghosts are produced containing numerous vacuoles. The effect of vit. A on the lipoprotein membrane is discussed. P-Barrow

5532. INFLUENCE OF VITAMIN A ON VARIOUS ENZYME ACTIVITIES. N.Sozio and A.Patimo: Biochim. appl., 1962, 9, 328-332 (Ist. Patol. Med. e Metodol. Clin., Univ., Bari, Italy) Rabbits were inj. daily with vit. A (100000 I.U.) serum GOT increased 5-fold from the 15-30th days. A lesser increase was observed in serum GPT levels. (Italian) J.C.Crawhall

5533. THIAMINE CONTENT IN AUTOLYSATES OF WINE- AND BEER-SEDIMENT-YEASTS. J.Jakubowska and D.Kusewicz: Acta Microbiol. pol., 1962, 11, 363-372 (Katedra Mikrobiol. Technicznej, Politechnika Szczecinska, Poland) The max. amount of thiamine i.e. 0.68 mg. of dry wt. was reached in the brewery yeast autolysate after 24 hr., whereas in the wine yeast autolysate max. concn. i.e. 0.21 mg./g. of dry wt. was attained after 20 hr. (Polish) M.Korbecki

5534. HYDROLYSIS OF THIAMINE PHOSPHATE ESTERS. F.Riva, D.Giarnieri and L.Hammady: G. Biochim., 1962, 11, 346-351 (Ist. Chim. Biol., Univ., Rome, Italy) Hydrolysis of the phosphate esters of thiamine was studied at varying pH and at temp. of 100°. The triphosphate ester was the most labile especially at low pH values, and the monophosphate was relatively stable. After prolonged incubation and at pH values greater than

9, the thiamine heterocyclic nucleus was broken down. The data is of interest in assessing optimum conditions for extraction of biol. materials for analysis. B.Payne

5535. ACTION OF PHOSPHATE ESTERS OF THIAMINE ON THE α -CARBOXYLASE OF WHEAT GERM. D.Giarnieri and R. Strom: G. Biochim., 1962, 11, 341-345 (Ist. Chim. Biol., Univ., Rome, Italy) Thiamine diphosphate is the coenzyme of purified α -carboxylase obtained from wheat germ. The mono and triphosphate esters of thiamine did not exert any co-enzymic or inhibiting action on α -carboxylase. B.Payne

5536. BIOSYNTHESIS OF THIAMINE. IV. INHIBITION BY VITAMIN B₆ COMPOUNDS. L.M.Lewin and G.M. Brown: Arch. Biochem., 1963, 101, 197-203 (Div. Biochem., Dept. Biol., Massachusetts Inst. Technol., Cambridge, Mass., U.S.A.) A novel method for the synthesis of the mono- and pyrophosphate esters of 2-methyl-4-amino-5-hydroxymethylpyrimidine is described. Inhibn. by BQ compounds due primarily to inhibn. by pyridoxal phosphate of the enzymic reaction in which thiamine monophosphate is formed from the monophosphate ester of 4-methyl-5-(2-hydroxyethyl)thiazole and the pyrophosphate ester of 2-methyl-4-amino-5-hydroxymethylpyrimidine. Kinetic expt. indicated that the inhibn. was a mixture of non-competitive inhibn. and a partially competitive inhibn., the pyridoxal phosphate competing with the pyrophosphate of 2-methyl-4-amino-5-hydroxymethylpyrimidine. B.M. Stevens

5537. POSSIBLE INVOLVEMENT OF AN AMINO DE-CARBOXYLASE IN THE STIMULATION OF THE PERICARDIAL CELLS OF PERIPLANETA. K.G.Davey: J. exp. Biol., 1963, 40, 343-350 (Zool. Lab., Univ., Cambridge, England) Semicarbazide and INH, which are both inhibitors of phosphopyridoxal-dependent systems, inhibit the increase in rate in isolated hearts which is brought about by breis of corpora cardiaca. This inhibn. is partially reversed by phosphopyridoxal. The increase in rate brought about by dopa is mediated by the pericardial cells and inhibited by semicarbazide. The hormone from the corpus cardiacum probably stimulates the pericardial cells to produce an amine from an amino acid by bringing into play the appropriate decarboxylase. A.J.Martin

5538. ISOLATION OF CARBON-14 LABELED PYRIDOX-AMINE FROM CANDIDA UTILIS ATCC 9950. K.D.Lunan and C.A.Wests Arch. Biochem., 1963, 101, 261-268 (Dept. Chem., Univ. California, Los Angeles, Calif., U.S.A.) The entire cellular pyridoxamine content was isolated by ion exchange chromatography. Pyridoxamine was isolated and identified by comparison of chem., physical and biol. prop. with authentic pyridoxamine. Pyridoxamine and pyridoxal were the only substances found in *C. utilis* extracts which promoted growth of a vit. BQ requiring *Streptococcus faecalis* mutant. When *C. utilis* was grown with sucrose as C source in the presence of [3-14C]serine, [1-14C]alanine, [1-14C]acetate or [2-14C]acetate, [14C]pyridoxamine was isolated and recrystallised to const. sp. activity after addition of carrier pyridoxamine. Amounts of 14C incorporated were low. B.M.Stevens

5539. BIOCHEMICAL FUNCTION OF BIOTIN. V. FURTHER STUDIES ON g-METHYLCROTONYL-CoA CARBOXYLASE. R.H.Himes, D.L.Young, E.Ringel-Mann and F.Lynen: Biochem* Z., 1963, 337, 48-61 (Max Planck-Inst. fdr Zellchemie, Mtlnchen,

Germany) 0-Methylcrotonyl-CoA carboxylase was isolated from Achromobacter by repeated pptn. with $(\text{NH}_4)_2\text{SO}_4$ and chromatography on DEAE cellulose. This enzyme showed one boundary in the analytical ultracentrifuge, contained one mol. biotin/184000 g. protein and was inactivated by iodoacetamide, N-ethylmaleimide and p-chloromercuribenzoate. Incubation of the enzyme with ³²ATP, KHCO_3 and MgCl_2 produced a carboxylated enzyme which could be isolated by elution from Sephadex G-50. Transfer of the 'active' CO_2 to P-methylcrotonyl-CoA occurred in the absence of ATP and MgCl_2 . L.Cohn

5540. NIACINOPEN-HYDROLYSING ENZYME IN EXTRACTS FROM RICE SEEDLINGS. H.P.Ghosh, P.K. Sarkar and (the late) B.C.Guha: *Nature*, Lond., 1963, 198, 484-485 (Dept. Appl. Chem., Univ., Calcutta, India) An enzyme in phosphate buffer extracts of rice seedlings, partially purified by pptn. with $(\text{NH}_4)_2\text{SO}_4$ and protamine, catalyses the release of nicotinic acid from niacinogen. The optimum pH was 5.5 and substrate concn. greater than 1M inhibited the enzyme, which was also inhibited by Fe^{2+} and Zn^{2+} , Hg^{2+} and Cu^{2+} ions, p-chloromercuribenzoate, and NaF. It was present in both microsomal and supernatant fractions and caused the synthesis of labelled NAD when incubated with [14C]-nicotinic acid, 5-phosphoryl-ribose-1-pyrophosphate, ATP, Mg, glutamine and glutathione. G.M.Lewis

5541. INFLUENCE OF SOME 4-AMINO ANALOGUES OF TETRAHYDROFOLATE COENZYMES ON PURINE BIOSYNTHESIS. V.Slavíková and K.Slavík: *Biochim. biophys. Acta*, 1963, 71, 604-608 (Inst. Haematol. and Blood Transfusion, Charles Univ., Prague, Czechoslovakia) Aminopterin and other 4-amino folic acid coenzyme analogues did not appreciably inhibit inosinate biosynthesis in pigeon liver. Tetrahydroaminopterin and some of its deriv. substituted for the tetrahydrofolate coenzymes in both transformylation fractions of purine biosynthesis. The deamination of tetrahydroaminopterin and its deriv. to tetrahydrofolate impounds could not be established. B.M. Stevens

5542. CATALYSIS OF THE AUTO-OXIDATION OF 2-MERCAPTOETHANOL AND OTHER THIOLS BY VITAMIN B12 DERIVATIVES: POLAROGRAPHIC AND OTHER INVESTIGATIONS. J.L.Peel: *Biochem. J.*, 1963, 88, 296 (Agric. Res. Council Unit Microbiol., Univ. Sheffield, England) At pH 7, 13 vit. B12 deriv. at concn. of 10 μM or less catalysed the auto-oxidation of 2-mercaptoethanol to the disulphide form, the kinetics of the reaction have been examined with a Polarographic method suitable for following O_2 uptakes of a few min. duration. Catalytic activities of vit. B12 deriv. cover a 12000-fold range from dimethylbenzyl-Udazolylcobamide coenzyme (least active) to Factor B (most active). The reactiori's completely inhibited by ImM-KCN but is unaffected by ImM-EDTA . Catalysis was observed with 7 thiols; dihydro-6-thioctic acid was the most active. Implications and applications of these fractions are discussed.

5543. INFLUENCE OF VITAMIN B12 ON THE CONTENT OF GLYCOGEN IN LIVER AND MUSCLES OF MICE. ty.Krashile 'pozn' Towarzy. Przyjac nauk, Wydz. lek., 1962, 23, 169-199 (II. Klin. Chorób Wewngtrznych, Akad. Med., Poznań, Poland) In mice the s.c. administration of 5 mg vit. B12 twice a week had no effect upon the level and distribution of glycogen in

muscles and liver. Vit. B12 prevented the decrease in glycogen level under anaerobic conditions and after 1 hr. swimming. (Polish) T.Qlebicki

5544. SOME REACTIONS OF VITAMIN B12 COENZYME. A.W.Johnson and N.Shaw: *J. chem. Soc.*, 1962, 4608-4614 (Dept. Chem., Univ., Nottingham, England) Several reactions of the vit. B12 coenzyme were described and interpreted in the light of the structure determined recently by X-ray crystallography. The novel Co-C linkage was easily broken by the action of CN^- , dil. mineral acids or light, and in the latter case it was suggested that a nucleoside free radical was obtained which underwent intramolecular cyclisation. L.G. Gillies

5545. ASCORBIC ACID IN CHLOROPLASTS. B.J.Constable: *Nature*, Lond., 1963, 198, 483-484 (Dunn Nutr. Lab., Univ., Cambridge, England) Chloroplasts were prep. from Iris leaves by differential centrifugation of a homogenate in liquid paraffin. The concn. of ascorbic acid in the chloroplasts was similar to that in the cell sap; it was freely diffusible across the chloroplast membrane when chloroplasts were washed with NaCl. G.M.Lewis

5546. STUDIES IN ASCORBIGEN. I. SURVEY OF OCCURRENCE AND DISTRIBUTION OF ASCORBIGEN IN PLANTS. S.Bose and B.C.Guha: *Ann. Biochem.*, 1963, 23, 149-158 (Dept. Chem., Argonne Nat. Lab., Illinois, U.S.A.) L.Barnes

5547. INCREASE OF ASCORBIC ACID IN CAULIFLOWER DURING BLANCHING. M.C.Malakan: *Nature*, Lond., 1963, 198, 994 (Dept. Appl. Chem., Univ. Coll. Sci. and Technol., Calcutta, India) Blanching cauliflower for 4 min. at 82° with 5 vol. water increased the ascorbic acid content by between 50-60%. G.M.Lewis

5548. REDUCTION OF ADRENOCHROME BY ASCORBIC ACID. G.L.Mattock and R.A.Heacock: *Nature*, Lond., 1963, 198, 993-994 (Psychiatric Res. Unit, Univ. Hosp., Saskatoon, Sask., Canada) The products of reduction of adrenochrome by ascorbic acid were examined by paper chromatography. The unstable 'leuco-adrenochrome' spontaneously dehydrates to form 5,6-dihydroxy-N-methylindole, which reacts slowly with dehydroascorbic acid to form a secondary product as yet unidentified; further unidentified products were formed at neutral and slightly alk. pH. G.M.Lewis

5549. COMPOSITION OF EPIPHYSEAL CARTILAGE. IV. EFFECT OF VITAMIN D₃ ON ENZYMIC ACTIVITIES IN EPIPHYSEAL AND ARTICULAR CARTILAGE OF RACHITIC CHICKS. J.D.Cipera and J.S.Willmen: *Canad. J. Biochem.*, 1963, 41, 1490-1493 (Animal Res. Inst., Res. Branch, Canada Dept. of Agric., Ottawa, Canada) Vit. D₃ was administered in 2 oral doses of 1500 or 2000 I.U. to rachitic chicks, 48 and 24 hr. before the birds were killed at 3 weeks of age. When compared with controls, treated rachitic chicks had increased activities of alk. phosphatase, hexosamine synthetase, and of pyrophosphatase in epiphyseal cartilage, but not in articular cartilage. Phosphorylase and ATPase activities in both types of cartilage appeared to be unaffected by vit. D₃. Vit. D-dosed chicks exhibited lower serum alk. phosphatase activities than controls (28 ± 1.26 and 44.5 ± 3.69 /jmoles Jj-nitrophenol/rnl. serum/hr. incubation, respectively). A.M.Cibbins

BIOCHEMISTRY

5550. TRANSAMINATION IN MUSCULAR DYSTROPHY AND THE EFFECT OF EXOGENOUS GLUTAMATE: A STUDY ON VITAMIN E DEFICIENT RABBITS, AND MICE WITH HEREDITARY DYSTROPHY. R.O.Laferte, H.Rosenkrantz and L.Berlinguet: *Canad. J. Biochem.*, 1963, 41, 1423-1432 (Biochem. Dept., Fac. Med., Laval Univ., Quebec, Canada) The levels of glutamic-oxaloacetic and glutamic-pyruvate transaminases were determined in the tissues from rabbits deficient in vit. E and mice with inherited dystrophy. Important variations between the 2 types of dystrophy, and between the levels of the enzymes in blood and liver of dystrophic rabbits, were noted. Exogenous glutajnic acid was inj. into vit. E deprived rabbits, thus postponing body wt. losses and the onset of the terminal stage of the disease. A discussion is presented of the possible role of glutamic acid in muscular dystrophy of vit. E deprived rabbits.

A.M.Gibbins

5551. METABOLISM OF COENZYME Q IN CHICK EMBRYO. J.Jayaraman and T.Ramasarma: *Biochem. J.*, 1963, 88, 362-368 (Dept. Biochem., Indian Inst. Sci., Bangalore, India) Coenzyme Qio [ubiquinone-50] was isolated in nearly pure form from hen's-egg yolks: the average quantity per yolk was about 0.134 pinole. In the initial stages of development the coenzyme Q content of embryos increased and that of the yolk residue decreased. [¹⁴C]Coenzyme Q, inj. into embryonate eggs, was absorbed by the embryo at the three stages of development tested: 5th, 10th and 15th days. Both in vitro and in vivo [²⁻¹⁴C]mevalonic acid was incorporated into coenzyme Q by embryos at about the 10th day of development, but not at the 5th day. Sterol synthesis by chick embryos was demonstrated as early as the 4th day of development.

5552. SOME ASPECTS OF THE METABOLISM OF COENZYME Q IN THE RAT. J.Jayaraman, V.C.Joshi and T.Ramasarma: *Biochem. J.*, 1963, 88, 369-373 (Dept. Biochem., Indian Inst. Sci., Bangalore, India) Administration of [¹⁴C]coenzyme Qio [ubiquinone-50] by oral or intracardial routes to rats resulted in its exclusive incorporation into liver and spleen. Although the radioactivity decreased rapidly it was not transferred to other tissues even after 48 hr. Most of the radioactivity in the unsaponifiable lipids of liver was in the form of unconverted coenzyme Qio, even after 24 hr. Under these conditions, administered [¹⁴C]coenzyme Qio was not converted into its cyclic isomer, ubichromenol. The coenzyme Q content of rat foetuses increased during development. Blood coenzyme Q is capable of passing through the placenta and being incorporated into the foetuses. Inj. [¹⁴C]coenzyme Qio is rapidly removed from the blood. Dietary coenzyme Q appears to be the source of blood coenzyme Q and therefore assumes an indirect importance in embryonic development. Several rat tissues are capable of synthesising coenzyme Q from [²⁻¹⁴C]mevalonic acid.

5553. COENZYME Q. XXXII. COENZYME Q AND THE MAINTENANCE OF SPERM CELLS IN VITRO.

A.C.Page, jun., M.C.Smith, P.H.Gale, D.Polin and K.Folkers. **XXXK. BIOSYNTHESIS OF COENZYME QIO-** A.F.Wagner, A.Lusi and K.Folkers: *Arch. Biochem.*, 1963, 101, 204-208, 316-318 (Merck Sharp and Dohme Res. Lab. Div., Merck and Co., Inc., Rahway, N.J., U.S.A.) **XXXIL** At least 20% of the cells remained motile for 5-7 days with 1 µg./ml. of coenzyme Q₂, the 6-chromanols of coenzyme Q_j, coenzyme Q₂ of hexahydrocoenzyme Q₄, the 6-chromenols

of the latter 2 or diphenyl-p-phenylenediamine, 10 or 30 µg./ml. of the 6-chromanol of coenzyme Q_i, the 6-chromanol and 6-chromenol of coenzyme Q_{2#} diphenyl-p-phenylenediamine or 'butylated hydroxyanisole*' gave Z3-62fJ_o motility. Similar levels of a-tocopherol, a-tocopherylquinone and 2,3,5-trimethyl-6-phytylbenzoquinone were less effective; vit. K compounds showed sporadic, low activity. With the 6-chromanol of hexahydrocoenzyme Q₄ or a-tocopherol, cells were motile for more than 2 weeks. Water sol. vitamins and related compounds were essentially inactive.

XXXIX. Reaction of ³H and coenzyme Qio by the Wilzbach technique gave a product with over 99% of the ³H in the 6-position. Coenzyme Q_o, fumigatin and 2,3-dihydroxy-5-methyl-1,4-benzohydroquinone were labelled with ³H in the 5-methyl position. None of these products was utilised by *Pseudomonas denitrificans* for coenzyme Q_{1Q} biosynthesis. * B.M.Stevens

HORMONES

5554. MOBILISATION OF FAT BODY GLYCOGEN BY AN EXTRACT OF CORPUS CARDIACUM. W.S.Bowers and S.Friedman: *Nature*, Lond., 1963, 198, 685 (Dept. Entomol., Purdue Univ., West Lafayette, Ind., U.S.A.) Injn. of an extract of the corpus cardiacum of *Blaberus discoidalis* (Serville) into the intact cockroach caused a rise in blood glucose and trehalose and a fall in fat body glycogen. Extracts of the corpus allatum were without effect. Corpus cardiacum extracts exerted a direct effect, being active even when the head was tied off.

G.M.Lewis

5555. EFFECT OF INSULIN ON CARBOHYDRATE METABOLISM OF SMOOTH MUSCLE. L.Lundholm and E.Mohure-Lundholm: *Acta physiol. scand.*, 1963, 57, 130-134 (Pharm. Dept., Univ., Goteborg, Sweden) Insulin stim. the synthesis of glycogen in isolated stomach muscle of rabbits and in bovine mesenteric arteries. There was no effect on the lactic acid production.

H.B.Waynfirth

5556. ACTIVITIES OF GLUCOSE 6-PHOSPHATE DEHYDROGENASE AND OF 6-PHOSPHOGLUCONATE DEHYDROGENASE IN RETINA FROM ALLOXAN-DIABETIC RATS. H.Heath, A.C.Rutter and T.C.Fletcher: *Vision Res.*, 1963, 3, 95-100 (Dept. Chem. Pathol., Univ. Coll. Hosp. Med. Sch., London, England) The method, based on the increase in u.v. absorption at 340 m μ due to the reduction of NADP, enables both estimations to be carried out on the retinae from one rat. No significant change in the activities was found in diabetes. These results are discussed in relation to the previously reported lowered level of NADPH₂ in the retinae from alloxan-diabetic rats. J. Whiting

5557. INFLUENCE OF ENZYMIC ACTIVITIES ON SUBSTRATE OXIDATIONS IN NORMAL AND DIABETIC RAT LIVER AND IN MAMMARY GLAND HOMOGENATE FRACTIONS. K.J.Matthes, S.Abraham and LL.Chaikoff: *Biochim. biophys. Acta*, 1963, 71, 568-577 (Dept. Physiol., Univ. California, Berkeley, Calif., U.S.A.) Decreases in glucose 6-PO₄ [G6P] and gluconic acid 6-phosphate dehydrogenases in diabetic Hver supernatants were not accompanied by a decrease in the G6P oxidation

rate. The inhibitory effect of citrate on the oxidation of G6P and malate in normal and diabetic liver, when the availability of NADP was limited, was principally due to high isocitrate dehydrogenase activity. G6P inhibits of citrate and malate oxidation by lactating gland fractions was similarly mediated. Malic enzyme activity in diabetic liver supernatant was 25% of normal. Weaning decreased G6P oxidising and malic enzyme activities in mammary gland supernatants. Further evidence for conversion of NAD to NADP in liver and lactating gland with ATP is presented.

B.M.Stevens

5558. ACTION OF INSULIN AND OF NADP ON THE IN VIVO METABOLISM OF RAT EPIDIDYMAL ADIPOSE TISSUE. G.Pozza, A.Ghiromi and C.Basilico: G. Biochim., 1962, 11, 326-340 (1st. Clin. Med. Univ., Milan, Italy) Insulin produced an increase in RQ and CO₂ production of rat epididymal adipose tissue incubated in vivo, which may be due to increased activity of hexosemonooiphosphate metabolic pathway. Addition of NADP as stimulant of hexosemonophosphate pathway led to similar increase of RQ but this increase was also observed in absence of glucose provided tissue came from fed rats; when it was obtained from fasted rats, glucose or fructose was required in medium for a similar result.

B.Payne

5559. ISOLATION OF RAT PITUITARY GRANULES AND STUDY OF THEIR BIOCHEMICAL PROPERTIES AND HORMONAL ACTIVITIES. W.C.Hymen and W.H.N.^ap-Shan: J. cell Biol., 1963, 17, 67-86 (Dept. Zool., Univ. Wisconsin, Madison, Wis., U.S.A.) An homogenate of ant. pituitary gland was centrifuged at 275 £ and the supernatant passed through a column of celite no. 545. The granules and microsomes were collected and fractionated by discontinuous density sucrose gradient centrifugation. The acidophilic and basophilic granules were separated as confirmed by electron micrographs and ^bY enzyme, fatty acid and RNA analysis. TSH and Somatotrophin were found in the basophilic granules and growth and lactogenic hormones in the acidophilic. ACTH was localised in the microsomal fraction.

P.Barlow

5560. ADMINISTRATION OF ANTERIOR PITUITARY GROWTH HORMONE TO RATS DURING COLD EXPOSURE. J.R.Beatson: Canad. J. Biochem., 1963, 41, 1449-1453 (Defense Res. Med. Lab., Toronto, Ont., Canada) Male rats were inj. daily with ant. Pituitary [GH] growth hormone (3 mg./100 g. body wt.) and fed ad libitum for 7 days at environmental temp. of 21° and 2-3°. Cold exposure retarded body wt. gain, decreased N retention, and increased the activities of liver arginase, alanine-glutamic transaminase, and phosphate activated glutaminase, none of these effects being stimulated by GH. At 22°, GH decreased the activities of liver arginase, alanine-ptyramic transaminase, and liver glutamic acid dehydrogenase, although cold exposure eliminated the effect on the latter.

A.M.Gibbins

5561. EFFECTS OF GROWTH HORMONE [GH] ON METABOLISM OF N FROM SEVERAL AMINO ACIDS AND AMMONIA. T.G.Vitti and O.H.Gaebelen: Arch. Biochem., 1963, 101, 292-298 (Dept. Biochem., E.B.Ford Inst. for Med. Res., H.Ford Hosp., Detroit, Mich., U.S.A.) GH increased 15N incorporation ^a in i.p. inj. NH₄ citrate into hypophysectomised rat ^b heart, muscle, kidney and spleen. 15N distribution amongst 9 liver protein amino acids indicated that ^cProved NH₃" N utilisation was due to transfer to amino

acids directly involved in urea formation and transamination and increased utilisation of these for protein synthesis. 15N incorporation from i.p. inj^d glycine, L-alanine, L-aspartate and L-glutamate into hypophysectomised rat liver protein was much greater than into muscle protein. GH further increased both. GH increased 15N from all 5 sources appearing in liver or muscle as arginine. Without GH, 15N transfer patterns from alanine and glutamate were similar. Distribution from NH₄ citrate to amino acids other than serine resembled that from glycine.

B,

M.Stevens

5562. IN VIVO STIMULATION BY ACTH OF RAT ADRENALS IN RELATION TO DIETARY FAT.

L.Skovsted, J.P.Funch and H.Dam: J. Endocr., 1963, 26, 457-461 (Danish Fat Res. Inst., Copenhagen, Denmark) Exogenous ACTH did not change the amount or pattern of polyunsat. fatty acids in the adrenals of rats given a fat-free diet, or diets containing hydrogenated or unhydrogenated peanut oil. There was a significant reduction in the corticosterone levels in plasma following ACTH administration in rats fed the fat-free diet.

G.F.Blane

5563. EFFECT OF PIG PITUITARY ACTH FRACTIONS ON DIFFERENT PARAMETERS OF ADRENOCORTICAL ACTIVITY.

E.de Jager, J.D.H.Homan and D.De Wied: Canad. J. Biochem., 1963, 41, 1455-1467 (Res. Lab., Organon Oss, Netherlands)

Purified uhydrolysed ACTH was separated into 5 fractions by chromatography on a column of CM cellulose, using pyridine-acetic acid as buffer. In comparing the extent to which the potencies according to the Sayers adrenal ascorbic acid depletion test corresponded with those obtained from the assay involving plasma corticosterone levels in hypophysectomised rats, a fair agreement was observed for the major fractions, which showed electrophoretic relationship. The minor fractions showed significant differences. These data are discussed together with results of classical assay methods.

A.M.Gibbins

5564. PURIFICATION OF HUMAN TSH.

P.G.Condliffe: Endocrinology, 1963, 72, 893-896 (Nat. Inst. Arthritis and Metabolic Dis., N.L.H., Bethesda, Md., U.S.A.) Steps taken in the purification of human TSH are described. It is concluded that it is more acidic than bovine TSH but has the same mol. wt.

H.C.Jones

5565. MOLE RATIOS OF THE NEUROHYPOPHYSIAL HORMONES IN THE VERTEBRATE NEURAL LOBE.

B.K.Follett: Nature, Lond., 1963, 198, 693-694 (Dept. Pharmacol., Univ., Bristol, England)

In neurohypophysial extracts of all the major classes of vertebrates, the mole ratio of oxytocic to pressor-anti-diuretic principle was estimated and the storage of neural lobe hormone relative to body wt. determined.

G.M.Lewis

5566. STUDIES ON INTRACELLULAR DISTRIBUTION OF VASOPRESSIN.

H.Sachs: J. Neurochem., 1963, 10, 289-297 (Dept. Physiol., Western Reserve Univ. Med. Sch., Cleveland, Ohio, U.S.A.) Homogenates of dog hypothalamo-median eminence [HME] were centrifuged to remove nuclei and cell debris. The 70000 £ pellet from this supernatant contained 40-50% of the vasopressin activity and was rich in neurosecretory particles [NSP]. The NSP fraction from HME contained only 20% of the vasopressin content of neural lobe NSP fraction. Vasopressin in NSP could be cone. 5-fold by centrifugation in a sucrose gradient. Subcellular distribution of protein.

BIOCHEMISTRY

nucleic acid, cytochrome oxidase and (3-glucuronidase were also studied but no correlation could be made with vasopressin distribution. R. Woodman

5567. VASOPRESSIN BIOSYNTHESIS. II. INCORPORATION OF [35S]CYSTEINE INTO VASOPRESSIN AND PROTEIN ASSOCIATED WITH CELL FRACTIONS. H. Sachs: *J. Neurochem.*, 1963, 10, 299-311 (Dept. Physiol., Western Reserve Univ. Med. Sch., Cleveland, Ohio, U.S.A.) After infusing 3 x 10⁹ counts/min. of [35S]cysteine over 3-6 hr. into the 3rd ventricle of dog brain, less than 20 μ g. radioactive vasopressin was isolated from subcellular fractions of the hypothalamus homogenate. Greatest vasopressin incorporation was in the nuclear (600 \pm 15 min.) and crude mitochondrial (10500 \pm 15 min.) fractions. If the latter were treated with deoxycholate most of the radioactivity passed into the supernatant containing membranous structures. Neurosecretory particles showed much lower [35S]incorporation into vasopressin but highest incorporation into other proteins whether [35S]- or [³H]leucine was employed. R. Woodman

5568. UNIVERSALLY APPLICABLE METHOD FOR ASSAYING THYROID FUNCTION IN VERTEBRATES. C.C.Lushbaugh: *Nature*, Lond., 1963, 198, 862-864 (Los Alamos Sci. Lab., Univ. California, Los Alamos, N. Mex., U.S.A.) Binding of 131I by thyroid can be determined by a whole-body assay of radioactivity. The method thus obviates collection of sera and excreta and is independent of body size and shape of localisation of thyroid tissue. J.R.Sargent

5569. DONOR ACTIVITY FOR PEROXIDASE AND EFFECT ON THYROID GLAND OF CERTAIN TYROSINE DERIVATIVES. J.Ljunggren and B.S8rbo: *Acta chem. scand.*, 1963, 17, 563-566 (Biochem. Dept., Nobel Med. Inst., Stockholm, Sweden) Tyrosine and some deriv. were tested as donors for myeloperoxidase by an amperometric technique. Esterification or decarboxylation was found to increase the efficiency of tyrosine in this test but the most potent deriv. were devoid of antithyroid activity in a test *in vivo*. G.F.Blane

5570. RATE OF RETURN OF RADIOIODINE UPTAKE BY NORMAL THYROID AFTER SUPPRESSION BY PHARMACOLOGICAL DOSES OF STABLE IODIDE. A.E.Johnson: *Health Physics*, 1963, 9, 537-538 (M.R.C. Dept. Clin. Res., Univ. Coll. Hosp. Med. Sch., London, England) Thyroid uptake of 132I (50 μ g) was followed by profile counting, and the effect of a large dose (200 mg. I⁻) on uptake was noted. Initial suppression of thyroid uptake occurs after I⁻ treatment, but recovers to 50% of control rate by 3 days, more than 50% by 4 days and returns to normal level at about 8 days. M.S. Lavee rack

5571. PARTIAL INHIBITION OF FIRST PHASES OF BIOGENESIS OF THYROID HORMONES. V. Stole: *Physiol. Bohem.*, 1963, 12, 93-99 (CSAV, Inst. Endocrin., Slovak Acad. Sci., Bratislava, Czechoslovakia) Methylthiouracil (0.775 mg./kg.) given orally to rats decreases the iodination of thyroglobulin in the thyroid to about 50% of normal values. KCNS (10 mg./kg.) releases accumulated I⁻ from the gland. M.S.Laverack

5572. OXIDATION OF 3,5-DIIODOTYROSINE BY PEROXIDASE AND HYDROGEN PEROXIDE. J.Ljunggren: *Acta chem. scand.*, 1963, 17, 567-572 (Biochem. Dept., Nobel Med. Inst., Stockholm, Sweden)

The reaction between 3,5-diiodotyrosine and hydrogen peroxide in the presence of peroxidase resulted in the formation of 4-hydroxy-3,5-diiodophenylpyruvic acid, 4-hydroxy-3,5-diiodobenzaldehyde, and 3,5-diiodo-benzoquinone. G. F. Blane

5573. RECOVERY OF THYROXINE FROM THYROID PROTEIN HYDROLYSED WITH PANCREATIC AND BACTERIAL PROTEASES. W.Tong, E.Raghupathy and I.L.Chaikoff: *Endocrinology*, 1963, 72, 931-935 (Physiol. Dept., California Univ., Berkeley, Calif., U.S.A.) A bacterial protease prep, released iodo-tyrosines and thyroxine from thyroprotein more rapidly than did a pancreatic protease prep. The bacterial protease was also more active in deiodinating thyroxine. H.C.Jones

5574. STEADY STATE OXIDATION OF GLUCOSE IN THE HYPOTHYROID DIABETIC RAT: A ROLE FOR THE ADRENAL CORTEX IN GLUCOSE OXIDATION. D.S.Dow and C.E.Allen: *Canad. J. Biochem.*, 1963, 41, 1293-1305 (Animal Res. Inst., Res. Branch, Canada Dept. Agric. Ottawa, Ont., Canada) Rates of oxidation of [1-14C]- and [6-14C]glucose were measured during the steady state maintained between the sp. activities of blood glucose and expired CO₂ in the hypothyroid diabetic rat following a single i.p. injn. of the sugars. Glucose oxidation by way of glycolysis and the tricarboxylic acid cycle paralleled the decrease in expired CO₂, but that by way of the hexose monophosphate pathway was completely suppressed. This suppression may have been due to the maintenance of NADH₂ as the result of goitrogen inhibn. of steroid catalysed transhydrogenation. Steroid concn. was suggested to be a critical factor in glucose oxidation via the hexose monophosphate pathway. A.M.Gibbins

5575. STORAGE OF TISSUE THIAMINE AND ITS INTESTINAL SYNTHESIS IN HYPO- AND HYPERTHYROID RATS. S.K.Meghal and M.C.Nath: *Ann. Biochem.*, 1963, 23, 169-172 (Dept. Biochem., Nagpur Univ., India) It was shown that, contrary to previous findings faecal thiamine excretion was reduced in hyperthyroid rats irrespective of whether a low thiamine or a thiamine supplemented diet was supplied. L.A.Barnes

5576. DEMONSTRATION OF KININS IN INTESTINAL OBSTRUCTION IN DOGS. W.L.Weipers and J.Sanford: *Nature*, Lond., 1963, 198, 813 (Univ. Vet. Hosp., Bearsden, Glasgow, Scotland) In dogs with isolated intestinal loops, the loop content and i.p. fluid contained a substance causing contraction of guinea-pig ileum; incubation with dog pseudoglobulin released a kinin. G.M.Lewis

5577. EFFECT OF pH AND CHLORIDE IONS ON PLASMA KININASE ACTIVITY. P.N.Aarsen and A.Kemp: *Nature*, Lond., 1963, 198, P87-688 (Dept. Pharmacotherapeutics, Univ., Amsterdam, Netherlands) From expt. on the effect of pH and Cl⁻ on the bradykinin-destroying activity of a guinea-pig serum kininase, it was concluded that estimation of kininase activity should be carried out at pH 8 in the presence of at least 0.02M NaCl. G.M.Lewis

5578. ISOLATION AND ESTIMATION OF ACTIVE POLYPEPTIDE KININS IN BIOLOGICAL FLUIDS AND ANIMAL TISSUES. P.Melchiorrk: *Biochim. appl.*, 1962, 9, 309-322 (1st. Farm., Univ., Roma, Italy) Human blood, urine, cs.f., ascitic and syaovial fluids and various animal tissues were examined for kinin activity. An

i β fraction was obtained by chromatography on 3 Mc cellulose. This was converted to the 131i pipsyl aerw. and separation of kallidin from bradykinin was obtained on a silip gel column. The amino acid composition was obtained by chromatography on Dowex 50.

ccrm (Italian) J.C.Crawhall

*579. INFLUENCE OF NEUROAMINES ON THE OXIDATION OF GLUCOSE BY THE ANTERIOR PITUITARY, n. EFFECT ON NADPH₂ OXIDATION. S.H.Barondes and J.B.Field: Biochim. biophys. Acta, 1963, 73, 324-327 (Clin. Endocrinol. Branch, Nat. Inst. Arthritis and Metabolic Dis., Bethesda, Md., U.S.A.)

NADPH₂ oxidation was stim. An alcohol dehydrogenase Much could react with NADP and which may mediate the effect was demonstrated. B.M.Stevens

5580. RELATION BETWEEN THE OESTROUS CYCLE AND THE BINDING OF CATECHOLAMINES IN THE RAT UTERUS. R.J.Wurtman, E.W.Chu and J.Axelrod: Nature, Lond., 1963, 198, 547-548 (Lab. Clin. Sci., Natl. Inst. of Mental Hlth., Bethesda, Md., U.S.A.)

The capacity of the rat uterus to bind [3H]adrenaline increased continuously as oestrous approached then fell again to a min. at dioestrous. Endogenous adrenaline also showed a max. at oestrous. Binding of 3H-noradrenaline Δ s not concomitantly increased during oestrous.

ceo., G.M.Lewis

*581. DEMETHYLATION OF ADRENALINE TO NOR-ADRENALINE IN THE CAT. W.G.Verly, G.Koch and G.Hunebelle: Arch. int. Physiol., 1962, 70, 624-630 (Inst. L.Fredericq, Univ., Liege, Belgium) [3 - 3 H > Adrenaline (575 μ g) was inj. i.v. during 5 min., via a femoral vein in the cat. Plasma from blood samples collected during the succeeding 5 min. had 13% of their activity in the form of noradrenaline.

(French) M.E.Nutt

&582. REPAIR PROCESSES IN ARTERIAL TISSUE. BIO-CHEMICAL ALTERATIONS IN RABBIT AORTA INDUCED BY NORADRENALINE. L.Lorenzen: Circulat. Res., 1963, 12, 449-454 (Rigshosp., Dept. H., Univ., Copenhagen, Denmark) Male albino rabbits were inj. i.v. with 1-noradrenaline daily for 15 days. The aortic acid mucopolysaccharides were increased in quantity, were qual. altered and were radioactive after Previous injn. of 35 so₄²⁻ into the animal, R.E.Moore

5583. SOME EFFECTS OF 5HT AND RELATED COMPOUNDS ON HUMAN COLLAGEN. T.C.Highton and M.H.Garrett: Lancet, 1963, i, 1234-1236 (Rheumatism Res. Lab., Wellcome Res. Inst., Univ. Otago, Dunedin, New Zealand) The shrinkage temp. of human tendon collagen was estimated after the collagen Δ s been immersed in various compounds. Only 5HT compounds, 5-methoxytryptamine, tryptamine, 5HTP and 5-HIAA affected the shrinkage temp. Histamine, Jtoradrenaline, and other compounds had no effect. 5HT imaleinate in 0-32M concn, reduced the shrinkage temp. Δ s over 30° in some instances. 5HTP and 5-HIAA raised Δ e shrinkage temp. The E.M. appearances of specimens Δ s collagen affected by 5HT show progressive disorganisa-

G.H.Bell

5584. SULPHYDRYL GROUPS AND HISTAMINE RELEASE IN VIVO. W.G.Spector, D.A.Willoughby and J.Frears: Nature, Lond., 1963, 198, 595-596 (Dept. Pathol., St. Bartholomew's Hosp., London, England) When Δ s were inj. with alloxan prior to intra-pleural injn. of Δ fPentine, the increase in vascular permeability in the «eura due to histamine release was blocked. The effect

of alloxan was reversed by administration of cysteinamine. It is concluded that histamine release after injury depends on the integrity of SH groups, perhaps part of an enzyme mol. n-Ethylmaleimide did not block the action of turpentine, nor did cysteine have any protective effect, but these neg. results might be due to failure of penetration.

G.M.Lewis

5585. RELAXING FACTOR IN EXTRACTS OF BLOOD PLATELETS AND ITS FUNCTION IN THE CELLS.

K.Grette: Nature, Lond., 1963, 198, 488-489 (Nat. Inst. of Publ. Hlth., Oslo, Norway) An extract of pig blood platelets incubated with contractile protein from the platelets and ATP caused its complete soln. The reaction was inhibited by Ca²⁺. It is concluded that a relaxing factor is present in platelets similar to that in striated muscle. The mechanism of the 'release reaction' of platelets is discussed in the light of these findings.

G.M.Lewis

5586. ACTIVITY OF 'TOXOHORMONE' IN NORMAL AND PATHOLOGICAL TISSUES. E.Mascitelli-Coriandoli and F.Di Re: Atti. Acad. med. Lombarda,

1962, 17, 272-274 (Lab. Ric. Farmavigor S.p.A., Sesto S.Giovanni, Milan, Italy) 12 hr. after the i.p. injn. of 1 mg. /animal of a material extracted from Walker carcinoma 256 into rats, the plasma Fe content had fallen to 80% of the normal control level. Injn. of a similar extract from normal and pathol. tissues from the rat, and also rat embryos and some protein prep. (ovalbumin, casein) produced a 10-15% decrease in plasma Fe content. (Italian) G.N.Godson

5587. MITOCHONDRIAL LOCALISATION OF THE 'TOXOHORMONE' ACTIVITY. F.Di Re and E.Mascitelli-Coriandoli: Atti. Acad. med. Lombarda, 1962, 17, 275-278 (Lab. Ric. Farmavigor S.p.A., Sesto S.Giovanni, Milan, Italy) The toxohormone

extractable from neoplastic tissue that induces a fall in the plasma Fe content of rats, is mainly localised in the mitochondrial fraction of the tumour homogenate. The active extract from mitochondria had an activity greater than the extract from the total tumour and was followed in order of decreasing activity by extracts from Flexner-Jobling carcinoma, primary hepatoma and Jensen's sarcoma. (Italian) G.N.Godson

5588. EFFECT OF TOXOHORMONE ON THE CYTOCHROME $\frac{1}{2}$ OF VARIOUS RAT TISSUES. F.Di Ri and E.Mascitelli-Coriandoli: Atti. Acad. med. Lombarda, 1962, 17, 453-456 (Lab. Richerche Farmavigor S.p.A., Sesto S.Giovanni, Milan, Italy) Toxohormone, an extract from neoplastic tissue, when inj. i.p. into rats (50 mg./animal), produced a significant decrease in the cytochrome $\frac{1}{2}$ content of the liver and kidney, but not in the heart and skeletal muscles. In hyperthyroid rats, the toxohormone had no effect on the kidney cytochrome $\frac{1}{2}$ level, but did lower the liver cytochrome $\frac{1}{2}$ concn.

(Italian) G.N.Godson

5589. CHANGES IN Δ -30-HYDROXYSTEROID DEHYDROGENASE ACTIVITY IN OVARIES OF MATURING RATS. B.L.Rubin, H.W.Deane, J.A.Hamilton and E.L.Driks: Endocrinology, 1963, 72, 924-930 (Dept. Obstet. and Gynecol., A.Einstein Med. Coll., Yeshiva Univ., Bronx, N.Y., U.S.A.)

A5-3g-Hydroxysteroid dehydrogenase activity in the ovaries of rats was found to be low at the period of initial ovulation and to increase and reach a peak at 9-10 weeks of age. H.C.Jones

BIOCHEMISTRY

**5590. IN VITRO BIOSYNTHESIS OF 18-HYDROXY-
 Fe^{14}C CORTICOSTERONE BY SLICES OF ZONA
GLOMERULOSA OF BEEF ADRENALS AND BY HUMAN
ADRENALS.** T.Sando and A.Lanthier. *Acta endocr.
Kbh.*, 1963, 42, 355-363 (Endocrin. Lab., Med.
Dept., Notre-Dame Hosp., Montreal Univ., Montreal
Canada) The zona glomerulosa of beef and human
adrenals was incubated in a Krebs-Ringer-bicarbonate
medium containing glucose, [4^{14}C]progesterone and
[$4-14\text{C}$]corticosterone as precursors. The identity of the
14c transformation product produced, was investigated
and found to be 18-hydroxycorticosterone. A greater
yield was obtained by beef tissue from corticosterone
than from progesterone. H.B.Waynforth

**5591. INFLUENCE OF ADRENAL STEROIDS ON RADIO-
CALCIUM METABOLISM IN YOUNG BEAGLE DOGS.**
E.J.Collins, A.S.Carpenter and V.F.Baken *Acta
endocr. Kbh.*, 1963, 42, 348-354 (Upjohn Co.,
Kalamazoo, Mich., U.S.A.) Increased elimination
of 47Ca in the faeces and urine of beagle dogs was die
main effect of therapy with several adrenal steroids.
Inhibn. of utilisation of ^{47}Ca was more marked after
treatment with 9a-fluoro, 16a-methylprednisolone than
with 6a-fluoro- t_1 and 6a-methyl-prednisolone.
H.B.Waynforth

**5592. STUDIES ON LYSOSOMES. II. THE EFFECT OF
CORTISONE ON THE RELEASE OF ACID HYDROLASE
FROM A LARGE GRANULE FRACTION OF RABBIR
LIVER INDUCED BY AN EXCESS OF VITAMIN A.**
G.Weissmann and L.Thomas: *J. clin. Invest.*, 1963,
42, 661-670 (Dept. Med., New York Univ. Sch.
Med., New York, U.S.A.) Previous studies have
suggested that vit. A in vivo and in vitro causes release
of acid hydrolases from lysosomes: this work on hyper-
vitaminotic rabbits supports the hypothesis, an excess of
vit. A increasing acid hydrolase activity in both liver
homogenates and cartilage matrix. When, however, the
animals were given cortisone with the vitamin the effect
was diminished, while hydrocortisone added to rabbit
liver homogenates partially antagonised the effect of
excess vit. A administered during life. These findings
agree with the hypothesis that one action of cortisol and
its analogues is the stabilisation of lysosomes against the
effects of excess vit. A. M.J.Bell

**5593. ACTION OF CORTICOSTEROID DERIVATIVES ON
THE ALCOHOL DEHYDROGENASE [ALD] ACTIVITY
OF THE LIVER.** LGy.Fazekas: *Arch. Toxicol.*, 1962,
19, 388-395 (Inst. Med., Univ., Szeged, Hungary)
Administration of cortisone deriv. to rat liver homogenates
had a profound effect on ALD activity. It is suggested
that in humans the adrenal cortex stimulates ALD activity
facilitating the oxidation of alcohol in the liver. Possible
treatment for chronic alcoholism or alcohol poisoning is
discussed. (German) LComish

**5594. COMPARISON OF PROTEIN-BINDING OF CORTISOL
AS MEASURED BY EQUILIBRIUM DIALYSIS AND GEL
FILTRATION.** R.V.Quincey and CH.Grey: *J. Endocr.*,
1963, 26, 509-516 (Dept. Chem. Path., King's Coll
Hosp. Med. Sch., Denmark Hill, London, England)
With undiluted plasma at room temp, the % binding of
cortisol was 97% by equilibrium dialysis and only 60% by
gel filtration. However, the rate of dissociation of the
cortisol-transcortin complex during gel filtration was so
rapid that the 37% difference between the 2 methods
could not be reliably attributed to albumin binding.
G.F.Blane

**5595. INFLUENCE OF CORTISOL ON FOOD INTAKE
AND GLUCOSE METABOLISM IN SHEEP.** J.M.BassetU
J. Endocr., 1963, 26, 539-553 (C.S.I.R.O., Div.
Animal Physiol., I.C.Ross Animal Res. Lab., Prospect,
N.S.W., Australia) Low doses of cortisol (25 mg./
day) stim. the food intake of ewes while doses above
150 mg./day resulted in a decline in food intake. N
excretion was uniformly increased in animals receiving
cortisol while blood glucose levels rose progressively
with increase of cortisol dose level. At the same time
glucose tolerance was progressively impaired. Since there
was no parallelism between increased glucose levels and
the N output it is concluded that increased protein cata-
bolism is not responsible for the rise in plasma glucose
but rather that there is an impairment of glucose utilisa-
tion relative to the blood glucose level. G.F.Blane

**5596. PREPARATION OF [3H]CORTISOL METABOLITES
OF HIGH SPECIFIC ACTIVITY.** D.A.Shaw and R.V.
Quincey: *J. Endocr.*, 1963, 26, 575-576 (Dept.
Chem. Path., King's Coll. Hosp. Med. Sch., Denmark
Hill, London, England) Methods are described for
the prep. of metabolites from [$7-3\text{H}$]cortisol. The com-
pounds prep. chem. include cortisone, tetrahydrocortisone
and tetrahydrocortisol, allotetrahydrocortisol, and a no. of
17-oxosteroids. The labelled 63-hydroxycortisol
metabolite was extracted from the urine of guinea-pigs
following injn. of [3H]cortisol. G.F.Blane

**5597. INFLUENCE OF THYROXINE AND PREDNISOLONE
ON THE OXIDATIVE METABOLISM OF THE MYO-
CARDIUM.** G.Giordano, G.Nigro, LD*Alessandro
and H.Eposito: *Biochim. appl.*, 1963, 10, 18-23
(1st. Patol. Speciale Med. e Metodol. Clin., Univ.,
Napoli, Italy) Rabbits treated with thyroxine
(0*25 mg./kg.) showed a 20% increase of myocardial
cytochrome f on the 4th day, but this fell to a value
below normal on the 8th day. Treatment with prednisolon*
(3 mg./kg.) showed a 50% decrease of myocardial cyto-
chrome f on the 4th and 8th days. A combination of both
these drugs slightly decreased myocardial cytochrome f .
(Italian) J.C.Crawhall

**5598. CoA AND THE BIOSYNTHESIS OF ADRENAL
CORTICOIDS IN RATS WITH HEPATOMAS.**
E.Mascitelli-Coriandoli, F.Di Re and P.Lanzani:
Biochim. appl., 1962, 9, 268-275 (Lab. ricerche
Farmavigor S.p.A., Sesto S.Giovanni, Milan, Italy)
Rats affected by hepatomas induced by 2-acetylaminofluorene
showed hypertrophy of the adrenal glands. These glands
showed a reduced content of CoA and pantothenic
acid and a reduced corticosteroid response to ACTH.
The glands of animals fed additional pantothenic acid did
not show a reduced response to ACTH.
(Italian) J.C.Crawhall

**5599. METABOLISM OF PROGESTERONE IN MAN.
EXTRACTION AND SEPARATION BY COUNTER-
CURRENT DISTRIBUTION OF THE METABOLITES IN
URINE.** R.A.Harkness and K.F other by: *Biochem. J.*,
1963, 88, 308-314 (Postgrad. Med. Sch., Ducane Rd.,
London, England) After i.v. administration of
[$4-14\text{C}$]progesterone to adrenalectomised ovariectomised
women 47-68% of the radioactivity was excreted in die
urine within 4 days and small amounts during the sub-
sequent 7 days. Various methods for extracting the radio-
activity from urine were investigated. Countercurrent
distribution of die urine extracts showed that pregnanediol
and its isomers were the main metabolites. In the freely
extractable and enzyme-hydrolysed- extracts 12-'5% of the
radioactivity was associated with metabolites more polar

BIOCHEMISTRY

than pregnanediol, whereas in the acid-hydrolysed extract 50% of the radioactivity was associated with the more polar compounds.

5600. ENZYMIC SYNTHESIS OF THE SULPHATE ESTERS OF OESTRADIOL-17 β AND DIETHYLSTILBOESTEROL. A.H. Payne and M. Mason. *Biochim. biophys. Acta.* 1963, 71, 1^ ^K f. ^{ext. Biol. Chem., Univ. Mich., U}

Michigan. Ann Arbor, sulphate and oestradiol 3,17 β -sulphate, oestradiol I, monosulphate esters and the diethylstilboestrol were formed by disulphate ester of 3,17 β -sulphate. The esters were separated by paper chromatography with a K pho: te buffer solvent and detected by radioautography w: 35S. B.M. Stevens

5601. REDUCTION IN VITRO OF 16-KETO-[16-14C]-OESTRADIOL-17 β BY MAMMALIAN BLOOD. D.Trachewsky and R.Hobirk. *Biochim. biophys. Acta.* 1963, 71, 748-749 (McGill Univ. Med. Clinic, Montreal Gen. Hosp., Montreal, Canada) Thin layer chromatography showed 2 radioactive products with mobilities corresponding to oestriol and 16-epi-oestriol. When cat blood was used and the former predominated, when rat blood was used, the latter predominated. Prelim. comm. B.M. Stevens

5602. REGULATION OF ADRENAL FUNCTION BY CORTICOCENS AND OTHER HORMONES. K.W.McKenna. *Cancer Res.* 1963, 23, 710-718 (Dept.

Obst and Gynecol., I.H.-Mi¹ ^ ^{rate of} Gainesville. P. ¹ t diolesterol in adrenal corticoid synthesis from pregnenolone primarily by the rate of NADP reduction by glucose 6-PO₄ [G6P] dehydrogenase. Oestrogens and several other hormones competitively inhibited NADP binding to NADP sp. cytoplasmic dehydrogenases. Competitive inhibition by oestrogens of the rate of NADP reduction by G6P dehydrogenase was correlated with the competitive inhibition of the rate of corticoidogenesis. Inhibition was non-competitive with regard to NADP. Oestrogens also non-competitively activate mw AD sp. cytoplasmic lactic dehydrogenase. Km for the activation by oestradiol with excess lactate was 2.7 \times 10⁻⁹M. Inhibition and activation by oestrogens also occurred with ant. pituitary enzymes. B.M. Stevens

5603. DISPOSITION OF INTRA-AMNIOTICALLY ADMINISTERED [6-14C]OESTRIOL AND [6-14C]-OESTRONE SULPHATE BY WOMEN. E.Diczfalusy, K.G.Tillinger, N.Wigquist, M.Levitz, G.P.Condon and J.Daniel. *J. clin. Endocr.* 1963, 23, 503 (Hormone Lab., Dept. Women's Diseases, Karolinska Sjukhuset, Stockholm, Sweden) An average of 6.6% of the radioactivity administered as oestriol appeared in the maternal urine within 72 hr. as compared with 0.6% following injn. of the conjugated oestrone. The foetal tissues contained approx. 10 times more radioactivity when oestriol was administered than when Na oestrone sulphate was given; in both cases the steroids being inj. 50 min. before the surgical interruption of pregnancy. Details are given of the distribution of the hormone in foetal tissues. G.F.Blane

5604. ISOLATION AND IDENTIFICATION OF 3 α ,17 α ,21-TRIHYDROXY-5 α -PREGNAN-20-ONE (ALLO-OXPREGN-5-EN-20-ONE)(17 α ,21-dihydroxy-5 α -pregnolone). J.R.Pasqualini and M.-F.Jayi¹. *Biochem. J.* 1963, 88,

315-318 (Lab. Chim. Biol., Fac M6d., 45, Rue des Saints Peres, Paris, France) 3d, 170L, 21-Trihydroxy-5 α -Pregn-20-one (allo-tetrahydro-compound S) was isolated and identified in human urine after the administration of 33,17 α ,21-trihydroxypregn-5-en-20-one (17 α , 21-dihydroxypregnolone) to a normal subject. Its identification was established on the basis of chromatography in 5 different systems and in 2 systems after acetylation. Its oxidation product was proved to be androsterone before and after acetylation. Of this steroid 60% was found in the least-polar ester sulphate fraction and 40% in the glucuronide fraction.

5605. CONVERSION OF ANDROST-4-EN-3,17-DIONE INTO TESTOLOLACTONE AND OTHER SUBSTANCES BY INCUBATION IN BOVINE BLOOD. H.Levy, T.Saito¹, S.Takeyama and A.P.Merrill. *Biochim. biophys. Acta.* 1963, 71, 749-751 (Univ. Shrewsbury, Mass., U.S.A.) Prelim. for Expt. Biol., Shrewsbury, Mass., U.S.A.) Prelim. comm. B.M. Stevens

POCHOLESTEROL

fi, i S ^ t s ^ (Publ. Meath Res. Inst. City of New York, U.S.A.) 25-50 mg./kg. body wt. of 17 α -methyltestosterone suppressed the formation of bilary stones in rabbits fed 0.5% dihydrocholesterol. It is suggested that this is due to reduced absorption of dihydrocholesterol from the gut. R.Mitchell

5607. INHIBITION OF CALCIPHYLAXIS BY METHYL-TESTOSTERONE. G.Gabbiani. *Sperimentale.* 1962, 112, 457-466 (Ist. di M Chir. Sperimentale, Univ. Montreal, Canada) Daily s.c. administration of methyltestosterone (1 mg./animal) to rats, inhibits the non-sp. calcification of the heart, kidney, aorta, salivary glands, skin and lips, that normally follows dehydro-tachysterol intoxication. The selective calcification due to calciphyaxis is prevented by methyltestosterone. (Italian) G.N.Godson

5608. GAS CHROMATOGRAPHIC ANALYSIS OF 17-HYDROXYCORTICOSTEROIDS BY MEANS OF THEIR BISMETHYLENEDIOXY DERIVATIVES. M.A.Kirschner and H.M.Fales. *Analyt. Chem.*, 1962, 34, 1548-1551 (Dept. Hlth. Ed. and Welfare, N.H., Bethesda, Md., U.S.A.) The bismethylenedioxy deriv. of cortisone conferred stability to the 20,21-side chain and rendered it suitable for gas liquid chromatographic analysis. The deriv. was formed by reaction of the 17-OHCS with formaldehyde in the presence of acid. The specificity of this reaction for the dihydroxyacetone moiety provided a means of selecting cortisone from a complex mixture. Formation of this deriv. and other hydroxylated analogues resulted in a complex, but useful, chromatogram. The method had several advantages over analysis of cortisone by its acetate or pyrolysis product. L.G.Gillies

METABOLIC INHIBITORS AND CARCINOGENS

5609. EFFECTS OF SALICYLATE ON GLUTAMATE DEHYDROGENASE AND GLUTAMATE DECARBOXYLASE.

BIOCHEMISTRY

BJ.Gould, A.K.Huggins and M.J.H.Smith: Biochem. J., 1963, 88, 346-349 (Empire Rheumatism Council Res. Unit, King's College Hoip. Med. Sch., London, England) Salicylate inhib. ox-liver glutamate-dehydrogenase and *E. coli* glutamate-decarboxylase activities in vitro. The mechanism of inhibn. of the glutamate dehydrogenase is reversible but does not involve competition with either glutamate or NAD. Salicylate causes an irreversible inhibn. of the glutamate decarboxylase but this is decreased by preincubation of the enzyme with pyridoxal phosphate. These inhibitory actions of salicylate may contribute to the increased incorporation of ^{14}C from [3- ^{14}C]pyruvate into glutamate that occurs in prep. of isolated rat tissues.

5610. INHIBITION OF BACTERIOCHLOROPHYLL BIO-SYNTHESIS IN RHODOPSEUDOMONAS SPHEROIDES BY 8-HYDROXYQUINOLINE. O.T. G.Jones: Biochem. J., 1963, 88, 335-343 (CS.I.R.O. Div. Plant Industry, Canberra, Australia) When *R. sphaeroides* was grown anaerobically in the light the addition of 8-hydroxyquinoline to the medium decreased the intracellular concn. of bacteriochlorophyll but not that of either the total haem pigments or carotenoids. At the same time a no. of tetrapyrrolic pigments was secreted into the medium. These pigments were purified by chromatography and resembled known p-otochlorophylls and chlorophylls in spectroscopic prop. It is possible that they are intermediates or related to intermediates in bacteriochlorophyll biosynthesis. In addition a Cu phaeophorbide was isolated. Cu^{2+} was essential for 8-hydroxyquinoline to produce this effect.

5611. INHIBITION OF GLUCOSE UPTAKE OF EMBRYONIC CHICK HEARTS BY 2-DEOXY-D-GLUCOSE AND 3-O-METHYLGLUCOSE. R.Litta-Modignani and P.P.Foa: Atti. Acad. med., Lombarda, 1962, 17, 286-289 (Clin. Med. Gen., Univ., Milano, Italy) $4 \times 10^{-6}\text{M}$ 2-deoxy-D⁺lucose [2-DG] inhibits the uptake of glucose ($8-16 \times 10^{-6}\text{M}$) in vitro by hearts of 5-9 day old chick embryos and $2-4 \times 10^{-6}\text{M}$ 3-O-methyl glucose [3-MG] inhibits the glucose uptake of hearts of 9 day old embryos but not 5 day old embryos. Insulin reverses the 3-MG inhibn. but not the 2-DG inhibn. This is compatible with the idea that 2-DG inhibits intracellular phosphorylation of glucose and 3-MG, the glucose transport. (Italian) G.N. Godson

5612. EFFECT OF DISULPHIDE BOND REAGENTS ON CYTOCHROME OXIDASE. S.J.Cooperstein: Biochim. biophys. Acta, 1963, 73, 343-346 (Dept. Anat., Western Reserve Univ., Cleveland, Ohio, U.S.A.) Prelim, comm. B.M.Stevens

5613. INHIBITION OF INORGANIC PHOSPHATE LIBERATION BY] A SODIUM AND POTASSIUM ION STIMULATED [RABBIT BRAIN] ATPase BY OLIGOMYCIN. F.F.J.Basis and H.J.Vreman: Biochim. biophys. Acta, 1963, 73, 346-348 (Johnson Foundn., Univ. of Pennsylvania, Philadelphia, Pa., U.S.A.) Prelim. comm. * B.M.Stevens

5614. INHIBITION OF ALCOHOL DEHYDROGENASE. I. KINETIC STUDIES. L.B.Khouw, T.N.Burbridge and V.C.Sutherland: Biochim. biophys. Acta, 1963, 73, 173-185 (Dept. Pharmacol., Univ. California, San Francisco, Calif., U.S.A.) Chlorpromazine was a potent inhibitor of horse and rabbit liver alcohol dehydrogenases but the yeast enzyme was only slightly inhibited.

Inhibn. was instantaneous, partial and reversible. Neither the SH nor the Zn of the enzyme mol. interacted with chlorpromazine. B.M. Stevens

5615. EFFECT OF SODIUM FLUORIDE ON THE RIBO-FLAVIN PRODUCTION OF EREMOTHECIUM ASHBYI: F.Kaprálek: Biochim. biophys. Acta, 1963, 71, 725-727 (Dept. Microbiol., Charles Univ., Viničná, Prague, Czechoslovakia) Only NaF of the various inhibitors tested, showed different effects on growing cells and on producing mycelium. B.M.Stevens

5616. SEPARATION OF FERTILISATION MEMBRANE [FM] IN URECHIS AND SEA URCHIN EGGS AS PHENOMENON CAUSED BY BREAKAGE OF H BONDS. I. ACTION OF MERCAPTIDE-FORMING, ALKYLATING OXIDISING AND PROTEIN-DENATURING AGENTS. II. ACTION OF CARBOXYLIC ACIDS. S.Isaka and T.Aikawa: Exp. Cell Res., 1963, 30, 139-149, 150-159 (Biol. Inst., Univ., Chiba, Japan) I. Janus

Green dyes were effective in elevating the blisters in the sea urchin eggs without jelly layer. Alkylating, oxidising* mercaptide-forming agents, and protein denaturants were also effective in causing separation of FM in *Urechis* and sea urchin eggs, when properly employed. A possible connection of vitelline and plasma membrane by means of H bonding is proposed.

II. Some aliphatic and aromatic carboxylic acids were investigated for their potency in causing the separation of the FM in sea urchin eggs. The results agreed with the supposition that the acids penetrate the membrane mojt easily in the non-ionised form, but exhibit the membrane elevating potency when ionised and endowed with activity to compete with H bonds between the vitelline and plasm¹ membranes, and that the carboxylate anions should be the site of the activity. K.Jones

5617. INHIBITION ANALYSIS AND INHIBITOR-RESISTANT ENZYMES. J.N.Aronsore: Nature, Lond., 1963, 198, 992-993 (Dept. Chem., Arizona St. Univ., Tempe, Ariz., U.S.A.) A *Bacillus cereus* system is described which is thought to illustrate antihibfl analysis investigation of the enzyme synthesising methionine (probably the final methylation step) with mutant enzymes comprising a resistant homologous series. G.M.Lewis

5618. TOXICITY OF GUANIDINE IN RELATION TO POSSIBLE CHANGES IN CREATININE METABOLISM. G.G.Tedeschi, F.Petrelli and D.Amici: Quad. Nutr., 1963, 22, 135-144 (1st. di Fisiol. Gen. e Chim. Biol. # Univ. di Cameño, Italy) In order to substantiate the hypothesis that toxic guanidines might originate from creatine in the animal body, guanidine, methylguanidine and dimethylguanidine (20 mg./animal) was inj. into rats and rabbits, daily for up to 2 months and the effects on the body wt., histology of the heart, liver, skeletal musd* and kidney, and en the e.c.g. and gestation examined. No pos. effects were observed in any of the measurements* The compound had no general toxic action. (Italian) G.N.GodsoU

5619. HISTOCHEMICAL VARIATION IN SOME DEHYDROGENASE ACTIVITIES OF THE RAT THYROID GLAND AFTER ADMINISTRATION OF THIOCYANATE AND OF METHYL THIOURACIL. F.Melani and P.Gentilini: Sperimentale, 1962, 112, 496-506 (1st. Semeiotica Med., Univ., Firenze, Italy) The activity of succinic- [S], citric- [C], 6-phosphogluconate-[6-PG] and glyceraldehyde-3-phQspheate. [G-3-P] dehydro* genases, of the thyroid gland after rats had been treated

with CNS (20 mg./animal) daily for 20 or 40 days was stim. whereas, the glucose 6-PO₄ dehydrogenase activity remained the same for 20 days and then increased. When the rats were treated with methyl thiouracil (10 mg./animal) daily for 20 and 40 days, all these dehydrogenase enzymes in the thyroid gland were considerably higher in activity than in the CNS-treated animals. It is suggested that the CNS inhibits the uptake of I₂ and reduces % thyronine synthesis, whereas methyl-thiouracil completely blocks the synthesis of thyronine.

(Italian) G. N. Godson

5620. SEARCH FOR BIOTIN ANTAGONISTS AND ISOLATION OF v-BIOTIN. A.B.Ajansen and PJ.Stokes: J. chem. Soc., 1962, 4909-4914 (Res. Lab., J.Wyeth and Brother Ltd., New Lane, Havant, Hants., England) Some N-substituted deriv. of biotin were synthesised in the hope that, because they could not form allophanate ions of the type which are probably essential for normal biochemical function, they might act as antimetabolites. None of the deriv. showed either bactericidal or bacteriostatic activity. A new member of the biotin group, designated v-biotin, was isolated and formulated as N-Phenylbiotin. L.G.Gillies

5S21. METHYLATION OF GUANOSINE AND RELATED COMPOUNDS WITH DIAZOMETHANE. J.A.Haines, C.B.Reese and A.Todd: J. chem. Soc., 1962, 5281-5288 (Uttiv. Chem. Lab., Cambridge, England)

Guanosine, deoxyguanosine and their deriv. were methylated by diazomethane at position 7. The chemistry of 7-methylguanosine was investigated. The decomposition ¹f deriv. of deoxy-7-methylguanosine in aq. soln. proceeded with glycosidic fission at low pH and with cleavage ¹f the imidazole ring at high pH. The relevance of this to mutagenic action was considered. L.G.Gillies

5622. DETERMINATION OF CHOLINESTERASE INHIBITION WITH THE USE OF A CHOLINE-DEPENDENT STRAIN OF NEUROSPORA CRASSA. G.Schatzberg-Porath, J.Zahavy and S.GitteR: Nature, Lond., 1963, 198, 686-687 (Israel Inst. Biol. Res., Ness-Ziona,

Israel) Quant. determination of organophosphorus cholinesterase inhibitors can be made using a cholineless mutant of *N. crassa*. The growth of this organism in a medium containing ACh and cholinesterase is measured in the presence of inhibitor. Application of the method to determination of diisopropyl fluorophosphate is shown. G.M.Lewis

5623. CORRELATION BETWEEN SOME CHEMICAL AND BIOLOGICAL REACTIONS OF ETHYL METHANE-SULPHONATE. E.E.Froese-Gertzen, C.F.Konzak, R.Foster and R.A.Nilan: Nature, Lond., 1963, 198, 447-448 (Dept. Agronomy, Washington State Univ., Pullman, D.C., U.S.A.) The biol. activity of the ¹*utagen ethyl methanesulphonate as measured by its inhibitory effects on the growth of barley seeds, can be correlated with the chemical reactivity of the mutagen as measured by its rate of hydrolysis under various conditions of temp. and pH. It is inferred that biol. effects of ethyl methanesulphonate are closely related to its activity as an alkylating agent. J.R. Sargent

5624. DIETHYL ETHER AND LACTATE DEHYDROGENASE ACTIVITY IN VITRO. N.M.Greene and E.L. Spencer, jun.: Anaesthesiology, 1963, 24, 23-28 (Sect. Anaesthesiol., Yale Univ. Sch. Med., New Haven, Conn., U.S.A.) High concn. of diethyl ether result in an inhibn. of beef heart lactate dehydrogenase as determined by spectrophotometric measurement of the

rate of consumption of NADH₂ in buffered soln. containing only Na pyruvate, lactate dehydrogenase, and NADH₂. While such inhibn. is statistically significant, it is of little or no biochem. significance. A.A.Zimmerman

5625. INTERACTIONS OF ARSENATE WITH PHOSPHATE-TRANSPORTING SYSTEM OF YEAST. A.Rothstein: J. gen. Physiol., 1963, 46, 1075-1085 (Sch. Med. Dent., Univ., Rochester, New York, U.S.A.)

Arsenate competed with phosphate for transport into the yeast cell, their affinity for the transport system being about equal. But in mixtures, the phosphate was taken up about twice as fast as arsenate. Arsenate caused a continuous and irreversible inactivation of the transport system that could be characterised by first order kinetics. This inactivation was slower in the presence of phosphate, and was not the result of an inhibn. of metabolism.

K.Jones

5626. COMPARISON OF SELENITE AND TELLURITE TOXICITY IN E. COLI J.Scala and H.T.Williams: Arch. Biochem., 1963, 101, 319-324 (Dept. Biochem., Cornell Univ., Ithaca, N.Y., U.S.A.) L-, but not D-, methionine enhanced the toxicity of TeO₃²⁻ and SeO₃²⁻ in wild type and the methionine requiring mutant ATCC 9663. Enhancement of TeO₃²⁻ toxicity was produced by S compounds which were complete or partial S sources for *E.coli* and by those that were not metabolised, but all effective compounds contained S as S²⁻. SeO₃²⁻ toxicity was not similarly affected. B.M. Stevens

5627. INTERACTION OF CYCLOCERINE WITH ASPARTATE-GLUTAMATE TRANSAMINASE. M.Ia.Karpeiskii, Iu.N.Breusov, R.M.Khomutov, E.S.Severin and O.L. Polianovskii: Biokhimia, 1963, 28, 345-352.

Cycloserine reacts with the pyridoxylidene form but not at all with the pyridaxamine form of the enzyme. The effects of pH and of time of incubation were also examined. The inhibn. caused by cycloserine develops with time and is irreversible. The product of interaction between cycloserine and aspartate-glutamate transaminase was isolated. (Russian) B.J.Cooper

5628. EFFECT OF SULPHONAMIDES ON FERRICYANIDE REDUCTION BY ILLUMINATED SPINACH CHLOROPLASTS. B.K.Stern: Biochim. biophys. Acta, 1963, 71, 727-729 (Dept. Biochem., Univ. of Chicago, Chicago, Ill., U.S.A.) These sulphonamides which inhibited animal carbonic anhydrase strongly, markedly inhibited the Hill reaction with ferricyanide as electron acceptor. B.M. Stevens

5629. EFFECTS OF ACTINOMYCIN D ON ACETATE STARVED AND LOGARITHMICALLY GROWING EUGLENA GRACILIS. J.J.Blum and D.E.Buetow: Biochim. biophys. Acta, 1963, 68, 625-632 (Gerontol. Branch, Nat. Heart Inst., Bethesda, Md., U.S.A.) On replacement of acetate, starved cells resumed logarithmic growth after a lag in which RNA and protein utilised during starvation were resynthesised. If actinomycin D was added with acetate, growth after the lag was slow, the rate depending on actinomycin D concn. and the time of starvation. During the lag the cells resynthesised a normal amount of protein and almost the normal amount of RNA. After growth resumed, protein, but not RNA, accumulated and DNA was synthesised. Addition of actinomycin D to logarithmically growing cells inhibited rates of growth and RNA synthesis.

B.M.Stevens

5630. RNA SYNTHESIS IN PROTOPLASTS OF E. COLI INHIBITION BY ACTINOMYCIN D. B.Mach and

BIOCHEMISTRY

E.L.Tatum: *Science*, 1963, 139, 1051-1052 (Rockefeller Inst., New York, U.S.A.) Actinomycin D inhibits the DNA-dependent RNA synthesis in protoplasts prep, from *E. coli* K13 by treatment with lysozyme and EDTA; although intact cells are resistant to the drug.

G.M.Lewis

5631. EFFECT OF ISONICOTINIC ACID HYDRAZIDE [INH] AND CYCLOSERINE ON THE GLUTAMIC - OXALOACETIC TRANSAMINASE ACTIVITY OF THE RAT LIVER. M.R.Alioto: *Biochim. appl.*, 1962, 9, 333-343 (Ist. Chim. Biol., Univ., Napoli, Italy)

Inhibitn. of enzyme occurred with much smaller levels of INH and cycloserine than in vitro. 2&Jo inhibn. of activity required 2000 times higher concn. of INH in vitro than in vivo and 68 times higher concn. of cycloserine.

(Italian) J.C.Crawhall

5632. MOLECULAR WEIGHTS OF INTERFERONS FROM DIFFERENT ANIMAL SPECIES. Z.Rotem and P.A. Charlwoob: *Nature*, Lond., 1963, 198, 1066-1038 (Nat. Inst. Med. Res., London, England)

Mol. wt. were determined by density gradient centrifugation in sucrose using radioactive proteins of known mol. wt. as markers. Chick, mouse and monkey interferons have very similar mol. wt. (min. value 13000 - max. value 20000-25000) the sedimentation const. for these interferons being 1.95. J. R. Sargent

5633. PRESENCE IN MAMMALIAN LIVER AND BLOOD OF SUBSTANCES WHICH INHIBIT THE MITOTIC ACTIVITY OF HUMAN CELLS GROWN IN VITRO.

R.Oftebro, P.Laland, J.Dedichen, S.Laland and N.Thorsdal: *Brit. J. Cancer*, 1963, 17, 183-193 (Norsk Hydro's Inst. Cancer Res., Oslo, Norway)

Various fractions were obtained by pptn. from ox blood and ox liver extracts. The effect of these fractions on the mitotic activity in vitro of HeLa cells and Chang-strain liver cells, was determined. Two liver fractions arrested completely mitotic activity in HeLa cells and one was also effective on Chang cells. The fractions were believed to exert their effect on the cell during the interphase period. D.Hamer

5634. ACTION OF ARGINASE AND CATALASE ON GROWTH OF CARCINOMA OF GUERIN. J.Biraben and G.Delmon: *CR* Soc. Biol.*, Paris, 1962, 156, 2011-2013 (Lab. d'Anat. pathol. expt., Fac. M&L,

Bordeaux, France) The albumin/globulin [A/G] ratio of serum was estimated in rats with an implant of carcinoma of Guerin (Ts) after injn. of 1 mg. arginase and 1 mg. catalase per day for 20 days. The serum protein level of normal rats was 6.0 g./100 ml. and the A/G ratio was 1.7. In rats with tumour implants the serum protein level was 7.0 g./100 ml. and the A/G ratio was 1. In rats treated with enzymes the serum protein content decreased to normal and the A/G ratio increased to 1.56. (French) M. A. Price

5635. SOMÉ POTENTIAL AMINO ACID ANTAGONISTS AND RELATED COMPOUNDS. T.A.Connors, A.B.

Mauger, M.A.Peutherer and W.C.J.Ross: *J. chem. Soc.*, 1962, 4601-4607 (Chester Beatty Res. Inst., Fulham Rd, London, England)

In an attempt to produce a tumour inhibitor 2-chloroethionine, glycylethionine, ethionylglycine, glycylethionylglycine and some dipeptides containing the tumour-growth-inhibitor, 1-amino-cyclopentanecarbonyl residue with sarcosine, leucine and tyrosine were prep. Unsuccessful attempts were made to prepare a-fluoroglycine and 3-fluoroaspartic acid. Preliminary tests indicated that S-2-chloroethylhomocysteine caused 40% inhibn. of transplanted Walker rat

carcinoma with one dose i.p. of 25 mg./kg. None of the other compounds had any effect on this tumour.

L.G.Gillies

5636. SELECTIVE INHIBITION OF NUCLEIC ACID

SYNTHESIS IN MYCOBACTERIUM TUBERCULOSIS BY

ISONIAZID. P.R.J.Gangadharam, F.M.Harold and

W.B.Schaefen: *Nature*, Lond., 1963, 198, 712-714

(Dept. Expt. Microbiol. Divn. Res., Natl. Jewish

Hosp., Denver, Colo., U.S.A.) Addition of 1 fig./

ml. isoniazid to growing cultures of the BCG strain of

M. tuberculosis caused a steep reduction in viable count.

Protein synthesis continued for 24 hr. while accumulatio

of RNA and DNA was inhibited. Isoniazid had no effect

on the incorporation of 32p into acid-insol. inorg. poly-

phosphate or incorporation of [¹⁴C]alanine into cell wall

mucopeptide; incorporation of 32p into ethanol-sol.

phospholipid was somewhat affected.

G.M.Lewis

5637. EFFECTS OF THIOACETAMIDE ON INCORPORATION OF [2-14C]OROTIC ACID INTO RNA FRACTIO1

IN LIVER. H.R.Adams and H.Busch: *Cancer Res.*,

1963, 23, 576-582 (Depc. Pharmacol., Baylor Univ.

Coll. Med., Houston, Tex., U.S.A.) 50 mg./kg./

day for 9 days increased the amounts of RNA released by

paeol into the aq. phase [p-RNA] and of RNA remaining

in the phenol [r-RNA] 2-3-fold in rat liver nuclei. In

nucleoli p-RNA was increased 2-fold and r-RNA 3[#]5-fold

Amounts of mitochondrial and microsomal RNA were

correspondingly decreased but the supernatant fraction

p-RNA was increased. Incorporation of [2-14C]orotic

acid into nuclear p-RNA and r-RNA was suppressed. As

measured by sp. activity, labelling of nucleolar p-RNA

was unchanged. Labelling of nucleolar r-RNA was

decreased by 30% at early time points after orotic acid

B.M.Stevens

5638. 5-AZAOROTIC ACID AND RELATED INHIBITOR! OF THE SYNTHESIS DE NOVO OF PYRIMIDINE

NUCLEOTIDES. R.E.Handschumachen: *Cancer Res.*,

1963, 23, 634-639 (Dept. Pharmacol., Yale Univ.

Sch. Med., New Haven, Conn., U.S.A.) 6 x 10⁻⁷N

5-azaorotic acid or 2 x 10⁻⁴M 5-azauracil produced approx. 50% inhibn. of orotic acid metabolism in cell free extracts of mouse liver or L5178Y leukaemia cells. Seven other compounds of the 42 tested also produced at least 50% inhibn. at concn. less than 2 x 10⁻³M. The primary site of action of the 2 symmetrical triazine deri

appeared to be orotidylic acid pyrophosphorylase.

5-Azaorotate was much more effective at inhibiting exogenous orotic acid utilisation by liver slices than by leukaemia cells. 5-Azauracil was nearly inactive in liver slices but effective in leukaemia cells. I.p. injn. of 0.3 pmole 5-azaorotate/g. into mice produced an 80% inhibn. of orotic acid utilisation but did not affect incorporation of uridine into liver.

B.M.Stevens

5639. RESISTANCE TO 6-MERCAPTOPURINE.

H1. DELETION OF A 5'-NUCLEOTIDASE IN A

6-MERCAPTOPURINE-RESISTANT SUBLINE OF THE

EHRLICH ASCITES CARCINOMA. A.R.P.Paterson and

A.Horne Canad. J. Bio. chem., 1963, 41, 1339-1348

(Biochem. Dept., Univ. British Columbia, Vancouver

B.C., Canada) Nuclei prep, from cells of a 6-mercaptopurine-resistant subline of the Ehrlich ascites

carcinoma differed from nuclei isolated from the parent

line of cells in being markedly deficient in 5'-nucleo-

tidase. This deficiency was apparently not related to th<

resistance to 6-mercaptopurine. The nucleotidase activi

ty of Ehrlich cell homogenates was characterised as

being localised primarily in the nuclear fraction, specific for 5'-nucleotides, and inhibited by Zn^{2+}

A.M.Gibbins

5640. SUCCINIC DEHYDROGENASE LEVELS IN LIVERS OF RATS DURING EARLY FEEDING OF 4-DIMETHYLAMINOAZOBENZENE, A REINTERPRETATION OF BIOCHEMICAL DATA. G.kNJones: Brit. J.Cancer, 1963, 17, 153-161 (Roy- Coll. of Surgeons. London. England)

August strain rats on a low protein diet were fed 4-dimethylaminoazobenzene and succinic dehydrogenase activity was subsequently determined on Uver samples by the anaerobic Methylene Blue technique. There was a fall in enzyme activity but this could be accounted for by a change in the proportion of cell types rather than by a biochem. change within the cells themselves.

D.Hamer

5641. UPTAKE OF ARSENIC-74 LABELLED ARSONOAZOPROTEINS IN TISSUES OF TUMOUR BEARING MICE. J.L.Mego and J.D.McQueen: Cancer Res., 1963, 23, 523-530 (Lab. of Radioisotope Res., Div. Neural. Surgery, Baltimore City Hosp., Baltimore, Md., U.S.A.) The uptake of ^{74}As into tumour from i.v. inj. $[^{74}As]arsonoazoalbomin$ approached the uptake from $[^{74}As]arsanilate$ with protein containing 30 moles arsanilate/mole. Clearance of $[^{74}As]arsanilate$ was virtually complete in approx. 24 hr. but 25-50% of the initial concn. remained in tumour for 8 days after $[^{74}As]arsonoazoalbomin$ injn. Large persistent accumulations of $(^{74}As)arsonoazoalbomin$ were found in liver and kidney after injn. of protein with only 1-2 moles arsanilate/mole. Uptake in kidney and rate of disappearance from blood varied directly with the amount of arsanilate bound to protein within the range 2-30 moles/mole protein. Correlation was poor for liver and tumour and neg. for muscle.

B.M.Stevens

5642. CARCINOGENICITY OF 2-NAPHTHYLHYDROXYL AMINE AND 2-NAPHTHYLAMINE. E.Boyland, C.E. Dukes and P.L.Grover: Brit. J. Cancer, 1963, 17, 79-84 (Chester Beatty Res. Inst., London, England) Carcinogenic prop. of 2-naphthylhydroxylamine and 2-naphthylamine were compared by i.p. injn. into groups of albino rats at a dosage of 50 mg./kg. twice weekly, for 3 months. The hydroxylamine deriv. induced tumours in 9/15 rats while the amino produced 2/14. "The results were consistent with the hypothesis that the carcinogenic aromatic amines are active via conversion to hydroxylamines.

D.Hamer

5643. CARCINOGENIC AND GROWTH INHIBITORY ACTIVITY OF LACTONES AND RELATED SUBSTANCES. F.Dickens and H.E.H.Jones: Brit. J. Cancer, 1963, 17, 100-108 (Middlesex Hosp. Med. Sch., London, England) (3-Propiolactone had previously been shown to be carcinogenic in rats. Further tests confirmed that Penicillin G was carcinogenic, so also was pp-dimethyl-tri*-methylene oxide and (+)-parasorbic acid.) D.Hamer

5644. NEW TEST FOR CARCINOGENICITY. IE. NON-CARCINOGENIC AND WEAK CARCINOGENIC HYDROCARBONS. E.Arffmann: Acta Path. microbiol., scand., 1963, 57, 375-394 (Dept. Path. Finsen Inst., Copenhagen, Denmark) Some non-carcinogenic and weak carcinogenic hydrocarbons have been tested on $XO12Q$ Sustatus. Phenanthrene and, with a few exceptions, $^{a}ntRracene$ and triphenylene gave no epithelial response, $^{v}M1_e$ chrysene and beng(a)anthracene induced a pos. re-action, estimated as weak or moderate. Contrary to

reviewed results in mammals reaction to 1,2,4-tri-methylphenanthrene was neg. but pos. to $3',6'$ -dimethyl benz(a)-anthracene. It is preliminarily concluded that the newt test has shown sufficient specificity to be used as a quick-test for carcinogenicity, at least of polycyclic hydrocarbons.

L.Friedmann

5645. EFFECT OF CARCINOGENIC POLYNUCLEAR HYDROCARBONS ON THE METABOLISM OF OESTROGENS. P.H.Jellinck and L.Irwin: Nature, Lond., 1963, 198, 787-788 (Cancer Res. Centre, Univ. of British Columbia, Vancouver, B.C., Canada)

The liver microsomes of rats fed 7,12-dimethylbenz(a)-anthracene or 3-methylcholanthrene had a greatly enhanced ability to convert oestrone a^* oestradiol to unidentified water-sol. products which were biol. inactive*. BenzQ $_Q$ anthracene, dibenzQ $_Q$ anthracene and benzCa $_Q$ pyrene had a similar effect but phenanthrene was inactive. Ethionine inj. 2 hr. before dosing with carcinogen abolished this effect, indicating that enzyme induction may be involved. The significance of these results in relation to effect of hormones on induction of mammary cancer is discussed.

G.M.Lewis

5646. ACETONITRILE AS A CONSTITUENT OF CIGARETTE SMOKE. J.K.Campbell, J.W.Rhoades and A.L.Gross: Nature, Lond., 1963, 198, 991-992 (Dept. Chem., Southwest Res. Inst., San Antonio, Tex., U.S.A.) Using gas chromatography and mass spectrometry, acetonitrile was identified in cigarette smoke at concn. approx. 1 mg./cigarette. None was present in unsmoked tobacco and cigarette papers, showing that it must be a combustion product.

G.M.Lewis

5647. OC-PARTICLE ACTIVITY AND FREE RADICALS FROM TOBACCO. E.Marsden and M.A.Collins: Nature, Lond., 1963, 198, 962-964 (Dominion Physical Lab., Lower Hutt, New Zealand)

Considerations of the levels of a-particle emitters (^{222}Rn , ^{226}Ra , ^{210}Po and ^{210}pb) present in tobacco smoke and leaf suggests that the role of these in carcinogenesis should not be neglected. The variation in stable free radicals in tobacco follows directly the variation in a-emitting activity. A large no. of very unstable free radicals are present in smoke condensates.

J.R.Sargent

5648. FILTRATION OF PHENOLS FROM CIGARETTE SMOKE. D.Hoffmann and E.L.Wynden J. nat. Cancer Inst., 1963, 30, 67-84 (Preventive Med. Div., Sloan-Kettering Inst., New York, U.S.A.) The adsorption capacity of various filter materials for phenols have been tested.

It is possible to reduce the phenol in cigarette smoke up to 90% with selected filter fibres and plasticisers. From a comparative study of the adsorption by various materials, suggestions are made in terms of fibre structure and die use of plasticisers that could lead to further improvement of filters for phenol removal.

J.G.Bennette

CLINICAL BIOCHEMISTRY

5649. CLINICAL APPLICATION OF THE EFFECT OF ACETONE ON SERUM LACTATE DEHYDROGENASE.

A.L.Latner and D.M.Turner: Lancet, 1963, i, 1293-1294 (Dept. Clin. Chem., King's Coll., Newcastle

BIOCHEMISTRY

upon Tyne, England) The lactate dehydrogenase activity remaining after treatment of serum with acetone is an indication of the presence of one of the isoenzymes found in cardiac muscle. This finding has diagnostic significance in relation to myocardial infarction, although pos. results are also obtained in sera from patients with untreated pernicious anaemia and malignant disease.

G.H.Bell

5650. MULTIPLE MYELOMA: IMMUNOCHEMICAL ANALYSIS OF SERUM PROTEINS. G.Pontieri and O.J.Plescia: Sperimentale, 1963, 113, 1-14 (Inst. Microbiol., Rutgers Univ., New Brunswick, N.J., U.S.A.) In multiple myeloma there is a considerable increase in the serum globular protein. This protein was separated into 2 components by zone electrophoresis on cellulose acetate columns and quant., immunochem. analysis by the p-incipitin method and gel diffusion demonstrated the presence of several Ag in these components and also different Ag in the different components. These fractions precipitated about 50% of the total Ab of normal serum fraction. Thus, myeloma proteins are made up of several electrophoretically and antigenically distinct proteins which differ from the normal serum proteins.

(Italian) G.N. Godson

5651. INVESTIGATIONS OF THE INFLUENCE OF SERA FROM PREGNANT WOMEN ON THE GROWTH OF CELL CULTURES IN CONJUNCTION WITH THE OCCURRENCE OF ABNORMAL CTI-LIPOPROTEIN. J.Rejnek, T.Bednářík, E.ReYaoková and A.Doležal: Clin.chim. Acta, 1963, 8, 108-115 (Inst. Haematol. and Blood Transfusion, 2nd. Gynaecol. and Obstet. Clinic, Prague, Czechoslovakia) The influence of sera from different stages of pregnancy on the proliferation of HeLa cells in vitro is reported. The effect was correlated with the occurrence of an abnormal immunoelectrophoretic picture of trilipoprotein. K.Brew

5652. PHYSICAL-CHEMICAL AND IMMUNOLOGICAL STUDIES OF PATHOLOGICAL SERUM MACROGLOBULINS. P.Ratcliff, J.F.Soothill and D.R.Stanworth: Clin. chim. Acta, 1963, 8, 91-108 (Dept. Expt. Pathol., Univ., Birmingham, England) A study is presented of the physico-chem. and quant., gel diffusion precipitin prop. of 14 sera containing pathol. macroglobulins.

K.Brew

5653. DETERMINATION OF TOTAL CHOLESTEROL AND CHOLESTEROL IN a- AND g-LIPOPROTEINS OF SERUM. G.Vanzetti and E.Gatti: Biochim. appl., 1963, 10, 34-50 (Lab. Biochim., Ospedale Maggiore, Milano, Italy) The cholesterol content of human serum in the a- and g-fractions of the lipoproteins was determined by a chem. procedure and by ultracentrifugal analysis which was sensitive to the presence of bilirubin. In a large series of normal patients the total cholesterol was found to be in the range 160-240 mg./100 ml. with lipoprotein cholesterol 45-50 mg./100 ml.

(Italian) J.C.Crawhall

5654. DISTINCTION OF MYELOMA PARAPROTEIN FROM MACROGLOBULINS. M.Mancini, P.Oriente, M.Cuzzupoli and R.Cerqua: Biochim. appl., 1962, 9, 351-382 (1st. Patol. Speciale Med. e Metodol. Clin., Univ., Napoli, Italy) The sera of patients with myeloma and macroglobulinaemia respectively were studied bV starch gel electrophoresis and immunoelectrophoresis. The proteins could be distinguished without the use of ultracentrifugal analysis. The electrophoretic pattern of macroglobulins but not myeloma proteins was

altered by addition of mercaptoethanol to the starch gel. Specific immunophoretic interaction with anti-macroglobulin Ab could be demonstrated.

5656. NEW FLUORIMETRIC TECHNIQUE FOR MEASURING SERUM HIGH- AND LOW-DENSITY LIPOPROTEINS. R.L.Searcy, J.L.Korotzer and L.M. Bergquist: Clin. chim. Acta, 1963, 8, 148-151 (Dept. Pathol., Los Angeles County General Hosp., Los Angeles, Calif., U.S.A.)

K.Brew

5657. PLASMA FREE 5HT. N.Crawford: Clin. chim. Acta, 1963, 8, 39-45 (Dept. Surg., Clin. Res. Dept., Queen Elizabeth Hosp., Birmingham, England) Evidence is presented indicating that normal plasma contains free 5HT. This fraction, unassociated with the platelets was quant. determined in humans using a spectro-photofluorimetric method. A range of values from 0.003 to 0.045 μ g./ml., mean 0.019 pg./ml., was found.

K.Brew

5658. ROUTINE METHOD FOR DETERMINATION^a PHOSPHOGLUCOSE ISOMERASE ACTIVITY IN BODY FLUID. J.E.Horrocks, J.Ward and J.King: J. clin. Path., 1963, 16, 248-251 (N.Lonsdale Hosp., Barrow-in-Furness, Lancs., England) Phosphoglucose isomerase activity was measured in normal serum and c.s.f. by colorimetrically using the determination of fructose by a colour reagent containing resorcinol-thiourea.

J.B.Derbyshire

5659. HISTAMINE IN HUMAN BLOOD [DETERMINED BX SPECTROFLUORIMETRY]. H.Zachariae: Scand. J. clin. Lab. Invest., 1963, 15, 173-178 (Dept. Skin and Venereal Dis. and Clin. Chem., Rigshospitalet, Univ., Copenhagen, Denmark) The method was evaluated using standard soln. of histamine, and the fluorescence intensity found to be proportional to the concn. of histamine within the range studied. In 32 adults the values ranged from 0.04 to 0.14 μ g./ml. of histamine. The recovery of histamine ranged from 86 to 97.5%. The method was considered to offer a simple, sp. time-saving and accurate assay of blood histamine.

E.Parkinson

5660. DISTRIBUTION OF ORAMINO NITROGEN BETWEEN ERYTHROCYTES AND PLASMA IN FOETAL AND MATERNAL BLOOD. K.B.Björnesjö: Scand. J. clin. Lab. Invest., 1963, 15, 198-201 (Dept. Clin. Chem., Central Hosp., Karlstad, Sweden) a-Amino N analyses using the ninhydrin reagent were performed on plasma and r.b.c. from foetal and maternal blood. Corresponding values were obtained from healthy pregnant and non-pregnant. Foetal plasma had a significantly higher level of amino-N than maternal plasma. Maternal r.b.c. showed an increase in amino-N during pregnancy but a decrease in plasma values. The results suggest that

the decrease in plasma amino-N during pregnancy is caused part by active transport of amino acids across the Placenta, and part by a change in the distribution of amino acids between the intracellular and extracellular fluid.

* E.Parkinson

5661. DETERMINATION OF AMMONIUM IN BLOOD AND TISSUE EXTRACTS BY THE PHENOL-HYPO-CHLORITE REACTION. K.Koritzer and S.Voigt: Clin. chim. Acta. 1963, 8, 5-11 (Deut. Akad. der Wissenschaften zu Berlin, Inst. for Komko-Viszeale Pathologic and Therapie, Berlin-Buch, Germany)

The method has the following advantages (1) no complicated apparatus is needed and the method is time saving, (2) microdiffusion is avoided as a source of errors. (3) the method has a greater reliability than those using Nessler's reagent. (German) K.Brew

5662. DETERMINATION OF Ca^{++} IN SERUM. G.A.Lumb: Clin. chim. Acta. 1963, 8, 33-38 (Dept. Med., Royal Infirmary. Manchester. England)

A direct method for measuring Ca^{++} concn. in serum is described which requires half the amount of leramto compared with other methods and is more rapid. The esU's of Ca^{++} - level in normal and pathol. sera are in good agreement with those of another method. Cf. total Ca was independent of total Ca concn. K.Brew

5663. REDUCTION OF METHAEMOGLOBIN IN ERYTHROCYTES OF PATIENTS WITH CONGENITAL MET-HAEMOGLOBINAEMIA. SUBJECTS WITH ERYTHROCYTE GLUCOSE 6-PHOSPHATE DEHYDROGENASE tG 6-PD DEFICIENCY AND NORMAL IND Δ UALS. F.RJaffe: Blood. 1963, 21, 361-372 (Med. Dept. A.Einstein Med. Coll., New York, U.S.A.) Reduction of met-Hb did not occur in the r.b.c. of the patients with methaemoglobinaemia upon incubation with glucose and inosine. The NADH2-utilising diaphorase-like system was normal in G 6-PD-deficient r.b.c. but was deficient in the case of methaemoglobinaemia. The NADPH2 utilising met-Hb reductase system was only abnormal in the G 6-PD deficient r.b.c. Pathways for reduction of met-Hb to Hb are suggested. H.B.Waynforth

5664. CONCENTRATION OF PHOSPHATE ESTERS AND

Patol. Med., Univ.. Milano. Italy) R.b.c. of newborn infants have a lower nicotinic nucleotide and 2,3-diphosphoglyceric acid content than adult r.b.c. The "Jicotinic nucleotide content of the newborn r.b.c. was 42-&7% lower than the adult, the 2,3-diphosphoglyceric acid content was 33% lower and the ATP content 4% higher. (Italian) G.N.Godson

5665. EFFECT OF INCUBATION WITH GLUCOSE OR ADENOSINE ON THE ORGANIC PHOSPHATE ESTER d S K Δ A Δ O N Δ F RED CELLS FROM NEWBORN INFANTS AND ADULT SUBJECTS. F.M.Quarto di Palo and L.Mombelli: Amf. Acad. med. Lombarda. 1962, 17, 398-401 (1st. di patol. medica. Univ.. Milano. Italy) R.b.c. from newborn infants and young children were incubated at 37° for 2 or 6 hr. in an isotonic medium containing 30 /imole/mL of glucose or 30 /imole/ml. of adenosine and the changes in intracellular ATP and 2,3-diphosphoglyceric acid [DPGA] measured. During the incubation in glucose both the ATP and DPGA

content decreased. This decrease was greater in newborn than in adult r.b.c. Adenosine prevented this decrease in adult, but not in newborn r.b.c. (Italian) G.N.Godson

5666. GLYCOLYSIS OF R.B.C FROM NEWBORN INFANTS AND THE DIFFERENCES WITH RESPECT TO ADULT RED CELLS. F.M.Quarto di Palo and H.R.Spinnen

Atti. Acad. med. Lombarda, 1962, 17, 392-394 (1st. Patol. Med., Univ., Milano, Italy) R.b.c. from newborn infants and adults were incubated in an isotonic medium containing 6 jimole/ml. of adenosine or 30 jimole/ml. of glucose at 37° for 2 or 6 hr. and the effect on glycolysis measured. Incubation in glucose induced a greater production of lactic and pyruvic acid than incubation in adenosine, in both types of cells. Adult r.b.c. produced 50% more lactic acid than infant r.b.c., but the infant cells produced 20-100 times more pyruvic acid than the adult r.b.c.

(Italian) G.N.Godson

5667. DIFFERENTIATING BETWEEN VITAMIN B12 DEFICIENT AND FOLIC ACID DEFICIENT MEGALOBLASTIC ANAEMIAS WITH [14C]HISTIDINE.

M.B.Fish, M.Pollycore and T.V.Feichtimer: Blood, 1963, 21, 447-461 (Clin. Lab., San Francisco Gen. Hosp., San Francisco, Calif., U.S.A.) The intermediary metabolism of the Ci pool and histidine in patients with megaloblastic anaemia was studied by measurement of pulmonary excretion of $^{14}\text{CO}_2$ and urinary excretion of ^{14}c after injn. of L-[2-14c]histidine. Simult. measurements of the cumulative 1 hr. pulmonary ^{14}C excretion, and the time of occurrence of max. $^{14}\text{CO}_2$ sp. activity permits rapid differentiation between folic acid and vit. B12 deficient megaloblastic anaemia. Measurement characteristic of the 2 types of deficiencies are given.

H.B.Waynforth"

5668. CHROMATOGRAPHY OF HUMAN Hb. FACTORS INFLUENCING CHROMATOGRAPHY AND DIFFERENTIATION OF SIMILAR Hb. R.T.Jones and W.A. Schroeden J. Chromatography, 1962, 10, 421-431 (Div. Chem. and Chem. Eng., California Inst. Technol., Pasadena, Calif., U.S.A.) A modified procedure for the chromatography of human Hb on Amberlite IRC-50 columns is described. Important factors which influence the separation of these Hb are stressed and a radioactive tracer technique using R^{35} -labelled Hb is presented in which compounds with similar chromatographic prop. may be compared.

P.D.Dawkins

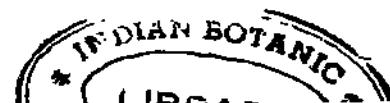

5669. ELECTROPHORESIS OF C.S.F. PROTEINS IN CERTAIN NEUROLOGICAL DISEASES. J.Goa and L.Tveten: Scand. J. clin. Lab. Invest., 1963, 15, 152-158 (Central Lab. Hosp. Norrkoping, Sweden)

Electrophoresis of c.s.f. proteins was carried out after concn. by means of pervaporation or by dialysis against dextran. The 2 techniques gave similar results. Only in a few diseases of the c.n.s. could characteristic changes in the c.s.f. protein pattern be demonstrated. Variation in the yglobulin values were found to give the best information especially in multiple sclerosis and in infectious diseases, within the c.n.s. E.Parkinson

5670. HYDROLYSIS OF CONJUGATED 17-KS.

J.C.De Paoli, E.Nishizama and K.B.Eik-Nes: J. clin. Endocrin., 1963, 23, 81-89 (Dept. Biol. Chem., Univ. Utah Coll. Med., Salt Lake City, Utah, U.S.A.)

Data are presented which indicate that the following hydrolytic procedures are adequate when working with conjugated urinary 17-KS: (a) β -glucuronidase for 17-KS

BIOCHEMISTRY

glucuronosides; (b) ethyl acetate-sulphuric acid solvolysis for 17-KS sulphates; (c) ethyl acetate-perchloric acid solvolysis for 17-KS glucuronosides and sulphates.

G.F.Blane

5671. CONTRIBUTION TO THE STUDY OF PATHOLOGICAL URINARY AMINO ACIDS. M.E.S.A.Relvas: Clin. chim. Acta, 1963, 8, 12-18 (Service de Biochemie, Lab. Natl. de Recherches Veterinaires, Lisbon, Portugal) Urinary elimination of amino acids was studied and the results compared with those from various diseases including leukaemia, diabetes, Hodgkin's, Wilson's and Farconi's diseases. The changed pattern of excretion in some diseases is described.

(French)

K.Brew

5672. URINARY EXCRETION OF ORALLY ADMINISTERED TRITIUM-LABELLED FOLIC ACID AS TEST OF FOLIC ACID ABSORPTION. F.A.Klipstein: Blood, 1963, 21, 626-639 (Med. Dept., Coll. Physn. and Surg., Columbia Univ., Columbia, U.S.A.) Results from the urinary excretion of orally administered [³H]folic acid [3HFA] were compared with those from subjects with folic acid deficiency as detected with a variety of tests available for evaluation of intestinal absorption. The excretion of 3HFA in patients with intestinal malabsorption was about 70% less than in normal subjects. Folic acid deficiency was studied in 12 patients and its incidence shown to be related to the severity of impairment of folic acid absorption.

H.B.Waynfirth

5673. ESTIMATION OF 0-AMINO-ISOBUTYRIC ACID [BAIB] IN HUMAN URINE. D.Bawden: J. clin. Path., 1963, 16, 284-287 (Roy. Marsden Hosp. Path. Dept., London, England) In recovery expt. with a chromatographic method for the estimation of BAIB in human urine, % recovery was 80-100. The mean daily output of BAIB in the urine of 12 normal cT was 86 mg.

J.B.Derbyshire

5674. • NEW COLORIMETRIC METHOD FOR DIAGNOSIS OF PHAEochromocytoma. P.Lanucara, U.Marini and F.F.Gilardi: Atti. Acad. med. Lombarda, 1962, 17, 366-368 (1st. Patol. spec. med., Univ. Milano, Italy) A new colorimetric method for semi-quant. evaluation of urinary 3-methoxy-4-hydroxy mandelic acid (vanillylmandelic acid) [VMA], an important metabolite of adrenaline, was reported. A sample of urine was extracted with ethyl acetate, jj-amino diazoalanine reagent added and the colour measured at 450 and 550 mfi. From the 2 values the amount of VMA was calc. This method is far more rapid than the normal chromatographic technique and is accurate enough for clinical use.

(Italian) G.R. Godson

5675. DETERMINATION BY THIN-LAYER CHROMATOGRAPHY OF URINARY HOMOVANILLIC ACID IN NORMAL AND DISEASE STATES. L.Sankoff and T.L. Sourkes: Canad. J. Biochem., 1963, 41, 1381-1388 (Allan Mem. Inst. Psychiatry, McGill Univ., Montreal, Quebec, Canada) Ethyl acetate extracts of urine were chromatographed on glass plates coated with silica gel, using the org. phase of benzene: acetic acid: H₂O (2:3:1) mixture as solvent. Eluted homovanilllic acid was treated with Folin's phenol reagent and absorbance was measured at 750 m/i. Amounts in normal human urine were found to be 8*23 ± 2*96 mg./24 hr. or 6*42 ± 2*28 mg./g. creatinine. Higher values were obtained in cases of ganglioneuroma and neuroblastoma, in a case of pheochromocytoma, and in one of two cases of Wilson's disease. Values were normal for 3 cases of Huntington's chorea.

A.M.Gibbins

5676. QUANTITATIVE DETERMINATION OF PROTEIN IN URINE. B.Tidstrjftn: Scand. J. din. Lab. Invest., 1963, 15, 167-172 (Protein Lab., Inst. Gen. Pathol., Copenhagen, Denmark) A previously described

micro-method for protein determination was employed on 58 normal subjects to investigate the excretion of protein in urine. The excretion varied slightly from one 24 hr. period to another, but a significantly higher excretion per hr. was found during the day than during the night. Intensive physical exercise caused an appreciable rise in the protein excretion. From these results the upper normal limit of protein excretion was set as 2*5 mg./hr.

E. Parkinson

5677. SERUM CONTENT OF TSH IN HUMAN THYROIDITIS: LOW TSH LEVELS WITH HIGH RADIOIODINE UPTAKE IN MILD AUTOIMMUNE THYROIDITIS. D.J.E1 Kabir, D.Donach and R.Turner-Warwick: J. clin. Endocr., 1963, 23, 510-520 (M.R.C. Neuroendocr., Res. Unit, Dept. Human Anat., Univ., Oxford, England) Serum TSH values were measured

in 24 patients with auto-immune thyroiditis and in 5 other patients with other thyroid disorders by an *in vitro* bio-assay. These data were correlated with histol. examination of biopsies from the glands and other indices of thyroid function. In mild thyroiditis with good colloid stores TSH secretion is partly suppressed by the release of iodinated proteins from injured acini, and the excessive I uptake in some cases of thyroiditis is due either to an intense acinar regeneration or to a metabolic stimulus imparted to the thyroid cells by the inflammatory process itself.

G.F.Blane

5678. EFFECT OF PREDNISOLONE AND TRIIODOTHYRONINE ON THYROID FUNCTION IN HYPERTHYROIDISM. G.Wikholm and J.Einhorn: J. clin. Endocr., 1963, 23, 76-80 (Radiumhemmet, Karolinska Sjukhuset, Stockholm, Sweden) After 7 days of prednisolone treatment there was significant depression of the uptake of radioactive I by the thyroid gland and a fall in serum PBI in hyperthyroid patients. By supplying TSH a thyroid response could still be elicited in die presence of a high level of adrenal steroids. No significant depression of the radio-I uptake or of the level of PBI was observed with the same methods when triiodothyronine was given.

G.F.Blane

5679. ALTERATIONS IN FREE FATTY ACID [FFA] METABOLISM IN ENDOCRINE DISORDERS. I. EFFECT OF THYROID HORMONE. II. SEQUENTIAL STUDIES AND EFFECT OF 2-DEOXY-D-GLUCOSE [2-DG]. W.R.Harla J.Laszlo, M.D.Bogdonoff and E.H.Estes: J. clin. Endocr., 1963, 23, 33-40, 41-49 (Dept. Med., Duke Univ. Med. Sch., Durham, N.C., U.S.A.)

I. The fasting levels of FFA and die response to adrenaline and noradrenaline infusions were studied in euthyroid subjects and in patients with thyroid disorders. In hyperthyroidism there was significant elevation of resting levels of FFA and an enhanced mobilisation of FFA after catecholamine infusion. Although there was wide variation in resting FFA among hypothyroid subjects it appeared that mobilisation after the amine infusions was decreased. It is suggested that the thyroid hormone has an effect on utilisation as well as mobilisation of fatty acids.

II. On the basis of studies using the inhibitor of glucose metabolism 2-DG the thesis is advanced that relative availability of lipid or carbohydrate as energy substrate may be regulated by a balance of cortisone and thyroid hormones.

G.F.Blane

5680. IODINE REPLETION AFTER IODINE DEFICIENCY. R.H.Parker and W.H.Beierwaltes: *J. clin. Endocr.*, 1963, 23, 568-573 (Dept. Int. Med., Univ. Michigan, Ann Arbor, Mich., U.S.A.) 20 subjects from a non-goitrous, euthyroid, I-deficient population were treated with iodized salt. Some of these subjects received a supplement of desiccated thyroid and others KI. Metabolic studies before and after treatment revealed that the rather large difference between PBI and butanol-extract-^{a,b}Ie iodine in the untreated subjects could be attributed to the presence of a non-metabolically active iodoprotein released from the thyroid gland under increased TSH stimn. associated with the I deficient state. G.F.Blane

5681. THYROID FUNCTION IN ENDEMIC GOITRE. I. IMPAIRMENT OF HORMONE SYNTHESIS AND SECRETION IN GOITROUS GLANDS. A.M.Ermans, J.E.Dumont and P/A.Bastenie. II. NON-HORMONAL IODINE ESCAPE FROM GOITROUS GLAND. A.M.Ermans, J.E.Dumont and P.A.Bastenie: *J. clin. Endocr.*, 1963, 23, 539-549, 550-560 (Dept. Radioactive Isotopes, Lab. Exp. Med., Sch. Med., Univ., Brussels, Belgium) I. A detailed study is described of thyroid metabolism in 12 untreated and iodine-treated objects from the Uele in Central Africa. It is concluded that the adaptation mechanism to iodine-deficient conditions is associated with a modification of the normal Pattern of org. iodine metabolism within the gland. II. Radio-iodine studies in 9 goitrous subjects from the Uele area are reported. Since the results were not in keeping with the generally accepted dynamic pattern ^cthesis is put forward that there is, in this group, ^ escape of non-hormonal-I from the goitrous gland. G.F.Blane

5682. THIOCYANATE-LEVEL IN THE SERUM AND THYROID OF COWS FROM AREAS WITH DIFFERENT INTENSITIES OF GOITRE IN HUMAN BEINGS. S.Bobek and A.Pelczarska: *Nature*, Lond., 1963, 198, 1002 (Dept. Animal Physiol, Coll. Agric., Cracow, Poland) In cattle from areas of endemic human goitre, the CNS content of extracts of the thyroid glands was correlated with the incidence of thyroid cysts. It is suggested that CNS- in vegetables have a goitrogenic effect in cattle. G.M.Lewis

5683. LOCALISATION OF IODOAMINO ACIDS ON PLASMA PROTEINS OF SUBJECTS WITH THYROID CANCER. N.Etling: *C.R. Soc Biol.*, Paris, 1963, 157, 100-103 (Group Hospitalier Necker-Enfants Malades, Paris, France) Plasma from normal subjects and those with thyroid cancer was incubated with ^{V*}I thyroxine and 3,5,3-triiodothyronine. 50% of thyroxine was localised on the prealbumin fraction of plasma from normal subjects while 10% was localised on ^{m*}S fraction from cancerous plasma. No radioactivity was associated with the (X2-fraction of S globulin. (French) M.A.Price

5684. OVARIAN DWARFISM WITH PITUITARY TUMOUR. L.W.Kelly: *J. clin. Endocr.*, 1963, 23, 50-53 (Nalle Clinic, Charlotte, N.C., U.S.A.) Enlargement of sella turcica and elevated urinary gonadotrophin secretion were found in a patient with ovarian dwarfism. Gonadotrophin production could be suppressed by exogenous oestrogen. It is suggested that the prolonged ovarian deficiency may have led to the development of a pituitary tumour. G.F. Blane

5685. STEROID HORMONE METABOLITES BEFORE AND AFTER ORCHIDECTOMY FOR PROSTATIC CANCER.

T.F.Gallagher, W.F.Whitmore, B.Zumoffand L.Hellmare *J. clin. Endocr.*, 1963, 23, 523-532 (Sloan-Kettering Inst. Cancer Res., New York, U.S.A.) No correlation could be found between the initial or post-operative levels of androgens or hydrocortisone metabolites in the urine, and the degree of remission of the disease. The changes in adrenal function which did occur appeared to reflect the psychological state of the patients rather than the primary disease. G.F.Blane

5686. PERCHLORIC ACID SOLUBLE BASIC AND ACIDIC PROTEINS OF THE CYTOPLASM: VARIATION IN CANCER. D.Burston, M.P.Tombs, M.E.Apsey and N.F.Maclagan: *Brit. J. Cancer*, 1963, 17, 162-178 (Westminster Med. Sch., London, England) Perchloric acid extracts of various human tissues and tumours were examined by chromatographic and electrophoretic techniques. Particular attention was paid to the ai-globulin and glycoprotein fractions. A component E, was common to all extracts and was similar to serum 3*5 S glycoprotein in composition and immunol. prop. It was considerably elevated in cancer cases. Another component (A) behaved similarly to RNase but had no enzyme activity. The level of this component in liver was depressed in cancer cases. Parallel estimations were also made on Wistar rats. D.Hamer

5687. HISTAMINURIA IN MASTOCYTOSIS. D.J.Demis and J.G.Zimmen *Arch. intern. Med.*, 1963, 111, 309-314 (Dept. Dermatol., W.Reed Army Inst. Res., Washington, D.C., U.S.A.) (X-Methyl-dopa has no effect on histidine decarboxylase, although it inhibits other decarboxylases, and thus has no effect on the urinary excretion of histamine in patients with mastocytosis. E.E.Hobbiger

5688. PERIODIC FEVER ASSOCIATED WITH INCREASED PLASMA UNCONJUGATED AETIOCHOLANOLONE AND GRANULOMATOUS LIVER DISEASE: CASE REPORT AND STUDIES IN AETIOCHOLANOLONE AND CORTISOL CONJUGATION. S.Schenker, H.Wilson and A.Spickard: *J. clin. Endocr.*, 1963, 23, 95-106 (Lab. Clin. Invest., Endocrinol. Branch, N.I.H., Bethesda, Md., U.S.A.) The patient's ability to conjugate and excrete aetiocholanolone, menthol and cortisol were investigated when both asymptomatic and febrile. It was concluded that there was no evidence of an abnormal conjugating mechanism for aetiocholanolone in this patient. G.F.Blane

5689. TESTIS IN MYOTONIC MUSCULAR DYSTROPHY: A CLINICAL AND PATHOLOGIC STUDY WITH COMPARISON WITH KLINEFELTER SYNDROME. W.D.Drucker, W.A.Blanc, L.P.Rowland, M.M.Grumbach and N.P.Christy: *J. clin. Endocr.*, 1963, 23, 59 (Dept. Med., Coll. Physn. and Surgn., Columbia Univ., New York, U.S.A.) A description is given of the clinical picture and the histol. findings in 18 patients with testicular lesions in myotonic dystrophy. The evidence supports the primary nature of the lesion as distinct from any failure of the pituitary stimulus and emphasises the differences between this condition and the seminiferous tubule dysgenesis of Klinefelter's syndrome. Since urinary gonadotrophin levels were generally normal in the presence of degenerating Sertoli cells it is concluded that these, cells do not normally produce a hormone that inhibits pituitary gonadotrophin. G.F.Blane

5690. BIOSYNTHESIS OF DEHYDROISOANDROSTERONE SULPHATE BY HUMAN ADRENOCORTICAL TISSUE.

BIOCHEMISTRY

E.Z. Wallace and S.Lieberman: *J. din. Endocr.*, 1963, 23, 90-94 (Coll. Phys. and Surg., Columbia Univ., New York, U.S.A.) The conversion of [7-3H]dehydroandrosterone to its sulphate ester by homogenates of an adrenocortical carcinoma is described. Details of the methods of analysis and identification of the sulphate product are given.
G.F.Blane

5691. ABSENCE OF ANDROGENS IN HUMAN EJACULATE
J.Raboch, L.Gregorová and K.Kežábek: *J. clin. Endocr.*, 1963, 23, 521-522 (Sexological Inst., Charles Univ., Prague, Czechoslovakia) A chromatographic examination of semen collected from subjects with Sertoli cells only and from normals revealed the absence of testosterone, androsterone, dehydroepiandrosterone, androstenedione, 11β-3-hydroxyaetiocholanolone and 11-ketoaetiocholanolone.
G.F.Blane

5692. SEPARATION OF HUMAN BRAIN GANGLIOSIDES.
S.R.Korey and J.Gonatas: *Life Sci.*, 1963, No. 5, 296-302 (Albert Einstein Coll. Med., New York, U.S.A.) The major spp. of gangliosides were separated by descending thin layer chromatography. The eluted gangliosides included 1 monosialo, 3 disialo and 1 trisialo forms, the gangliosides being distinct from those previously described.
K.Jones

5693. ACID MUCOPOLYSACCHARIDE FROM A SPLEEN OF PRIMARY AMYLOIDOSIS. T.Okuyama and K.Turams: *Clin. chim. Acta*, 1963, 8, 140-142 (Dept. Biochem., Fukushima Med. Coll., Fukushima, Japan).
K.Brew

5(394. PROBLEM OF SPECIFICITY IN SEROLOGICAL DETERMINATION OF HUMAN CHORIONIC GONADOTROPHIN. S.Brody and G.Carlstrom: *Acta endocr. Kbh.*, 1963, 42, 485-497 (Obstet. and Gynaec. Dept., Karolinska sjufchuset, Stockholm, Sweden) Gel diffusion and complement fixation techniques were used to ascertain the heterogeneity of a rabbit antiserum to a purified prep. of chorionic gonadotrophin. The non-sp. Ag and methods to eliminate them were examined.
H.B.Wayforth

5695. ORIGIN OF THE LIPID COMPONENTS OF XANTHOMATA. J.D.Wilson: *Circulat. Res.*, 1963, 13, 472-478 (Dept. Intn. Med., Univ. Texas, Southwestern Med. Sch., Dallas, Tex., U.S.A.) Rabbits were fed 2% fr cholesterol and 1QP/o lard, and finally [4-14C]cholesterol. Most of the cholesterol in xanthomata was derived from the blood stream, but these structures in both rabbits and human patients were able to synthesise phospholipids and fatty acids.
R.E.Moore

5696. CHROMATOGRAPHIC OBSERVATIONS OF HUMAN GASTRIC MUCOPOLYSACCHARIDES. J.Schragec Roy. A.Edward Infirmary, Wigan, England) Gastric mucopolysaccharides were examined by paper chromatography after hydrolysis. Uronic acid did not appear. Glucose, mannose, fucose and galactose were present, fucose and galactose being the predominant sugars in normal secretions. In patients with gastric carcinoma, glucose was greatly increased and galactose decreased.
G.M.Lewis

5697. HISTOCHEMICAL OBSERVATIONS ON LOCALISATION AND ORIGIN OF SPHINGOMYELIN, CEREBROSIDE AND CHOLESTEROL IN NORMAL AND ATHEROSCLEROTIC HUMAN ARTERY. C.W.M.Adams and O.B.Bayliss *J. Path. Bact.*, 1963, 85, 113-119

(Path. Dept., Guy's Hops. Med. Sch., London, England) Methods are described to identify the lipids in aortas and coronary arteries taken at necropsy from subjects aged 2 months to 80 yr*. Sphingomyelin alone is identified in the infant artery. In young adults, cholesterol is often found in intimal macrophages and in the phospholipid pool at the base of atheromatous plaques and in the inner half of media of atherosclerotic vessels*. The phospholipid pool at the base of atheromatous plaque contains mainly sphingomyelin but also cerebroside.
D.MurraJ

5698. EFFECT OF HEAVY CIGARETTE SMOKING ON POST-PRANDIAL TRIGLYCERIDES, FREE FATTY ACYL AND CHOLESTEROL. A.Konttinen and M.Rajasalmi: *Brit. med. J.*, 1963, i, 850-852 (Wihuri Res. Inst., Helsinki, Finland) Post-prandial rise in serum triglycerides after a fat meal was less in 20 young d who were heavy smokers than in a comparable group of 20 non-smokers, probably due to decreased intestinal absorption in smokers. At 6 hr. after the meal triglyceridaemia was similar in the 2 groups. Rise in free fatty acids of plasma was insignificantly greater in smokers than in non-smokers. Serum cholesterol levels were not affected by smoking.
M.E.Nutl

5699. DIET AND PLASMA CHOLESTEROL IN 99 BANK MEN. J.N.Morris, J.W.Marr, J.A.Heady, P.L.Mills and T.R.E.Pilkington: *Brit. med. J.*, 1963, i, 571-576 (MRC Social Med. Res. Unit, London Hospital, London, England) Total fat consumption of 99 British bank men, aged 40-55 yr. was 84-189 g./day, and animal fat 55-173 g./day. Casual plasma cholesterol level was 154-324 mg./100 ml. The distribution of values showed that all had a high fat consumption and a high plasma cholesterol level relative to the 180 mg./100 ml. postulated as the upper level in health. There was little correlation between fat intake and plasma cholesterol level and other causes for the high level must be sought.
M.E.Nutt

5700. STATURE AND NUTRITION IN CYSTINURIA AND HARTNUP DISEASE. J.E.Colliss, A.J.Levi and M.D. Milne: *Brit. med. J.*, 1963, i, 590-592 (Westminster Hosp. Med. Sch., London, England) The mean height of 44 patients with cystinuria was 2*5 cm. less than that for normal subjects, and 5*3 cm. less in 15 with Hartnup disease. This may result from undernutrition in childhood due to loss of essential amino acids in urine and their less efficient absorption from the gut. The relevance of findings to clinical management of die disease is discussed.
M.E.Nutl

5701. CLINICAL TRIAL OF Fe FORTIFIED BREAD. P.C.Elwood: *Brit. med. J.*, 1963, i, 224-227 (Dept. Social and Preventive Med., Queen's Univ., Belfast, N.Ireland) Two groups of 53 and 55 mental hospital patients were given bread made from flour fortified with 60 mg. ferrum redactum/100 g., for 6 months. (Equivalent to approx. 80 mg. Fe per day)* One group was given 50 mg. ascorbic acid twice daily during the last 2 months of the trial. A third group of 5* patients was given 80 mg. Fe daily as ferrous gluconate and a fourth group of 99 had no Fe therapy. Age and H& level of all groups was similar when the trial began*. There was no significant increase in mean Hb of either group given fortified bread, but there was a significant increase in the group given ferrous gluconate. In the group given bread, but no vit. C those having initial Hb < 12*5 g./100 ml. showed a significant increase in Hb level during the trial, but there was a similar incre*st

in comparable patients in the control group. Incomparable patients given ferrous & *cawv^Hbw* increased significantly by 1.60 ± 0.03 g./100 ml. during the 6 months, an increase significantly greater than in all other comparable patients. The value of the present level of Fe fortification of bread in this country u doubtful and additional fortification of no value. M.E.Nutt

5702: SORBITOL DEHYDROGENASE AND HEPATOCELLULAR INJURY: AN EXPERIMENTAL AND CLINICAL STUDY. M.Asada and J-T-GaJTM Gastroenterology, 1963, 44, 578-587 (Dept. Med., Emory Univ. Med. Sch., Atlanta, Ga., U.S.A.)

Studies on liver and serum enzymes such as so/bitol dehydrogenase and glutamic-oxaloacetic "an.aminase" of rats treated with CCl₄ have shown that * < » a * *nes are increased following hepatocellular inj'ry in proportion to the dosage of CO*. Studies on otheen E?? such as ducose 6-bosphatase made inhuman patients 3£ or S u t 'pa&onditions of the ^vershowf that an elevated sorbitol dehydrogenase in PaTM" 1 * "" associated with hepatocellular TM"functions i. many cases. D.N.Wheatley

5703. MUNOELECTROPHORESIS OF PROTEUS OF CORNEAL EPITHELIUM. ^' a " ^ * ^ ; TM , * ^ ; nic. Eyn. FwRes., 1963, 2, 196-202 (Op.ithalmol.CU, uSy^Ghem Belgium) The proteins of die corneal epiSu'm epSted into a greater Jjoffawgn^A by high-tension agar electrophoresis than by paper elec trophoresis. The distribution of the fractions "greatly influenced by the ionic strength of the b << ^ o in : , f great similarity is seen between the paneTM obuined from Paper electrophoresis and from agar electrciphoresii, at relat s confi st 8 different ppt. lines corresponding to different tissue proteins. The fraction present in highest concn. is found in h mals. It appears specificity. that tt has poor stability in soln. and **&*? te* electro I or 3 components which are separated dung slightly. W08. SIGNIFICANCE OF PROTEIN COAT IN HOST-
S P E C S Y OF PLANT VIRUSES. E'Sande; and
G.Schramm: Z. Naturforsch. B, 1963,,18, 198-201
(Max-Planck-Inst. Virusforschung. Tifflungen.

Germany) The infectivity of whole virus and the corresponding free RNA was determined for TMV and turnip yellow mosaic virus. The protein coat of the complete virus enhanced the infectivity of the virus in comparison with the free RNA only in the host to which the virus was adapted. (German) J.C.Crawhall

5707. REACTION DIFFERENCES BETWEEN TOBACCO MOSAIC VIRUS AND ITS FREE RNA WITH NITROUS ACID. H.Schuster and R.C.Wilhelm: Biochim. biophys. Acta, 1963, 68, 554-560 (Max-Planck-Inst. Virusforschung, Ttibingen, Germany) When TMV RNA was treated with HNO₂ at pH 4[#]2 or 5[#]0 adenine, guanine and cytosine reacted with similar velocities. Not all the guanine attacked produced xanthine. When intact TMV was treated with HNO₂, adenine and cytosine were deaminated but guanine was not attacked. B.M.Stevens

5708. MULTIPLICATION AND PROPERTIES OF LACTIC DEHYDROGENASE [LDH] AGENT. A.L.Notkins and S.J.Shochac J. exp. Med., 1963, 117, 735-747 (Microbiol. Lab., Nat. Inst. Dental Res., N.I.H., Bethesda, Md., U.S.A.) Multiplication of LDH agent in mice began within 6 hr. of infection and reached a max. titre in the plasma within 24 hr. The titre decreased over the next 72 hr. but viraemia persisted with high titres for at least 16 months. LDH activity increased in the plasma about 24 hr. after the first sign of increase of LDH agent. The LDH agent is inactivated by ether but not by lyophilisation and freezing and thawing. Centrifugation and filtration studies suggest that the upper size of the agent is about 55 maf. There was little transmission of infection between mice caged together or from mothers to their offspring. H.E.Jones

5709. CYTOPATHOGENIC EFFECTS OF ADENOVIRUS TYPE 5. V. QUANTITATIVE STUDY. Y.Chardonnet, M.Prunieras and R.Sohier Ann. Inst. Pasteur, 1963, 104, 433-449 (Lab. d'Hyg?ene Fac. de Med., Lyon, France) Quant, extraction methods for DNA, RNA and protein from HeLa cells infected with adenovirus type 5 are reported. Significant increases in DNA and protein levels were found 48 hr. after infection. The RNA curve showed a significant peak after 24 hr. (French)

5710. BIOPHYSICAL STUDIES ON NATURE OF SIMIAN PAPOVA VIRUS PARTICLE (VACUOLATING VIRUS SV 40). H.D.Mayor, R.M.Jamison and L.E.Jordan: Virology, 1963, 19, 359-366 (Virol. Dept., Baylor Univ. Med. Coll., Houston, Tex., U.S.A.) The 45 mp diam. virus particle has a buoyant density of 1*30 in CsCl. The complete virion has a mol. wt. of 4*4 x 10⁷, of which &jo is double-stranded DNA. Icpahedral cubic symmetry (5:3:2) is shown and the capsid has 42 protein capsomeres. It is estimated that there are 240 chem. subunits, each with an approx. mol. wt. of 167000. The mature virion is susceptible to photodynamic inactivation with Acridine Orange. J.G.Bennette

5711. VIRUS-INDUCED ACQUISITION OF METABOLIC FUNCTION. VI. DIHYDROFOLATE REDUCTASE, NEW PHAGE-INDUCED ENZYME. C.K.Mathews and S.S. Cohen: J. biol. Chem., 1963, 238, 853-855 (Dept. Biochem., Univ. Pennsylvania Sch. Med., Philadelphia, Pa., U.S.A.) When *E. coli* is infected with T6 phage the dihydrofolate reductase activity is increased to a level approx. 10 times that of thymidylate synthetase. The overall increase in sp. activity of the reductase compared with the level before infection is approx. 20-fold. This

BIOCHEMISTRY

induced enzyme reduces dihydrofolate with NADH₂, an activity that is absent from the uninfected cell.

J.N.Ashley

5712. AUTORADIOGRAPHIC STUDIES OF BEHAVIOUR OF DNA IN HERPES VIRUS INFECTED CELLS. K.Munk and G.Sauen Z. Naturforsch. B, 1963, 18, 210-214 (Inst. Virusforschung, Heidelberg, Germany) Autoradiographs were prep. of HeLa cells infected with herpes simplex virus in which the DNA was labelled with ³H-thymidine. Before infection with virus ³H-thymidine was incorporated only into the peripheral nuclear zone whereas after infection the inner nuclear zone was labelled and the periphery remained clear.

(German) J.C.Crawhall

5713. ATPase ACTIVITY AT SURFACE OF MATURE EXTRACELLULAR HERPES VIRUS. M.A.Epstein and S.J.Holt: Nature, Lond., 1963, 198, 509-510 (Bland-Sutton Inst. Pathol., Middlesex Hosp., London, England) In HeLa cell cultures heavily infected with the HFEM strain of herpes virus, E.M. studies showed that mature virus carries ATPase activity with it when released through the cell membranes which possess this function.

G.M.Lewis

5714. LOCALISATION OF ADENOSINE TRIPHOSPHATASE ACTIVITY IN T2 PHAGE. A.S.Tikhonenko and B.F. Poglazov: Biokhimiia, 1963, 28, 340-344.

A method was devised for separating the T2 phage into various structural elements (head, sheath, tail core), based on successive destruction of phage particles at continuously increasing pH. The highest ATPase activity was found in the tail sheath fraction.

(Russian) B.J.Cooper

5715. DNA METABOLISM IN T5-INFECTED E. COLI BIOCHEMICAL FUNCTION OF PRESUMPTIVE GENETIC FRAGMENT OF PHAGE. Y.T.Lanni and D.J.McCorquodale: Virology, 1963, 19, 72-80 (Microbiol. Dept., Emory Univ., Atlanta, Ga., U.S.A.)

Mechanical shearing (in the Waring blender) of complexes of T5 st and *E. coli* F, after first-step transfer of phage material, interrupts the passage of phage DNA to the host cell and that the transferred fragments control the degradation of host DNA. The results are consistent with the hypothesis that the first-step transfer material is a phage DNA fragment and one of its functions is to induce the degradation of host DNA.

J.G.Bennette

5716. CHARACTERISATION OF POOLS OF PROTEIN IN CELLS OF SHIGELLA FLEXNERI F6S INFECTED WITH PHAGE H-Sh. M.P.Beumer-Jochmans: Nature, Lond., 1963, 198, 506-507 (Inst. Pasteur Brabant, Brussels, Belgium) The effect of infection with H-Sh phage on the DNA and RNA of cells of *S. flexneri* F6S has been followed, by staining with coriphosphine, and the effects of fluorescent anti-bacterial and anti-phage rabbit sera investigated.

G.M.Lewis

5717. PHAGE CONCENTRATION ON ANION EXCHANGE RESIN. I.V.Cherniakhovskaya: Biokhimiia, 1963, 28, 253*257. The chromatographic behaviour of T2 *E. coli* phage on AB-17 anion exchange resin was studied. After dialysis of bacterial phage lysate the resin adsorbed the phage, protein and DNA. Elution with 0.2M NaCl desorbed 93% of the phage with more than 100-fold concn. Appreciable purification of T2 phage was effected by ion-exchange adsorption and differential centrifugation.

(Russian) B.J.Cooper

5718. OXIDATIVE METABOLISM IN RICKETTSIAL-INFECTED MICE. L.P.Zubok: Biokhimiia, 1963, 28, 265-271. Examination of striated muscle homo-

genates obtained from mice infected with rickettsia showed that there was impairment of the oxidation of some intermediate substances in the tricarboxylic acid cycle. (Russian)

B.J.Cooper

5719. HYDRODYNAMIC STUDY OF MOTILITY OF FLAGELLATED BACTERIA. M.E.J.Holwill and R.E. Burge: Arch. Biochem., 1963, 101, 249-260 (M.R.C. Biophys. Res. Unit, King's Coll., London, England) Expressions are derived following Gray and Hancock's method for the velocity of propulsion assuming propulsion by active helical movements of flagella and assuming propulsion by active movements of the body. Energy expenditure necessary to maintain helical displacement waves is compared with energy associated with sinusoidal waves. Size and shape of the bacterial body, the different no. of flagella found and the nature of flagella as shown by E.M. are taken into account. The observed velocities of up to 50 fi/sec. are shown to be possible only if flagella are active motor organs. Most of the flagellar energy is expended in maintaining the helical motion.

B.M.Stevens

5720. ULTRACENTRIFUGAL STUDIES ON EXTRACTS FROM PROLIFERATING YEAST CELLS. S.Chatterjee and N.D.Gupta: Exp. Cell Res., 1963, 30, 224-228 (Biophys. Div., Saha Inst. Nuclear Phys., Calcutta, India) Some ultracentrifugal patterns obtained with the crude extracts of proliferating yeast cells from different phases of the growth cycle are presented.

K.Jones

5721. METABOLISM OF METHYL SUCCINATE IN PSEUDOMONAS FLUORESCENS GROWN ON ITACONATE. H.Katsuki, J.Nagai, A.Wada, LFukuma and S.Tanaka: J. Biochem., Tokyo, 1963, 53, 328-330 (Dept. Chem., Fac. Sci., Kyoto Univ., Kyoto, Japan)* B.M.Stevens

5722. OXIDATION OF SUCCINATE IN BACTERIA.

M.A.Lukoianova, N.S.Gel'man and A.L.Oparin:

Biokhimiia, 1963, 28, 334-339. Succinic oxidase activity in *Micrococcus lysodeikticus* was related to the integrity of the protoplast or the cytoplasmic membrane. This required a definite concn. of phosphate buffer or the addition of Mg²⁺ when the concn. of the buffer was reduced. When these stabilising factors were present, a slight additional secondary protective effect of high polymer DNA in the cell lysate was demonstrated.

(Russian) B.J.Cooper

5723. DIRECT EVIDENCE FOR TRYPTOPHAN ANTHRANILIC ACID CYCLE IN NEUROSPORA. W.H.Matchett and J.A.Demoss: Biochim. biophys. Acta, 1963, 71, 632-642 (Dept. Biol., Univ. California, San Diego, La Jolla, Calif., U.S.A.) Protein tryptophan isolated from wild type and 2 auxotrophs, 1 blocked in the conversion of anthranilic acid to indole glycerol phosphate, after growth with [14C]tryptophan labelled randomly in the benzene ring, had the sainje sp. activity as the tryptophan supplied. With L-[2-¹⁴C]tryptophan, no isotopic diln. was found in the auxotrophi blocjed in the conversion of anthranilic acid to tryptophan but extensive diln. was observed in the other 2 strains. Radioactive anthranilic acid and formylanthranilic acid accumulated in the growth filtrate of the blocked mutant. The sp. radioactivity of these compounds indicated their exclusive derivation from exogenous tryptophan until this was exhausted when the anthranilic acid sp. activity fell abruptly.

B.M.Stevens

5724. METABOLISM OF 6-METHYLAMINOPURINE IN SALMONELLA TYPHIMURIUM. - D.E.Duggan, M.G. Weigert, W.E.Grieb and E.O.Titus: Biochim. biophys-

Acta, 1963, 68, 519-525 (Lab. of Chem. Pharmacol., Nat. Heart Inst., Bethesda, Md., U.S.A.) 6-Methylaminopurine was efficiently utilised by growing cultures of various mutants for polynucleotide purine biosynthesis. In the "purineless" mutant Ade-11 it competed favourably with adenine, guanine and hypoxanthine and in 2 sp. adenine dependent mutants it effected a unique growth increment beyond that attained with adenine. 6-Methylaminopurine is suggested to be converted to a 5'-nucleotide and then demethylaminated to inosinic acid.

B.M.Stevens

5725. STUDIES ON FERROVERDIN. A GREEN IRON-CONTAINING PIGMENT PRODUCED BY STREPTOMYCES WAK. SPECIES. A.Ballio, H.Bertholdt, A.Carilli, E.B.Chain, V.di Vittorio, A.Tonolo and L.Vero-Barcellona: Proc. roy. Soc. B, 1963, 158, 43-70 (Internat'l. Centre for Chem. Microbiol., Istit. Superiore di Sanita, Rome, Italy) The morphological features of an unidentified sp. of *Streptomyces Wak.* are described and optimum culture conditions for pigmentation in shake-flasks and in stirred fermenters determined. Details are given of the methods of production in submerged culture and purification of ferroverdin. The Prep. and identification of reductive and alkali degradation products are reported; on the basis of their structures it is suggested that ferroverdin is the ferrous complex of the n-vinylphenylester of 3-nitroso-4-hydroxybenzoic acid. G.M.Lev

5726. BIOSYNTHESIS OF PORPHYRIN AND BACTERIO-CHLOROPHYLL BY RHODOPSEUDOMONAS SPHEROIDES. IV. S-ADENOSYL^mOOTOT-MAGNESIUM PROTOPORPHYRIN METHYLTRANSFERASE. K.D.Gibson, A.Neuberger and G.H.Tait: Biochem. J., 1963, 88, 325-334 (Dept. Chem. Pathol., St. Mary's Hosp. Med. Sch., London, England)

An enzyme has been detected in chromatophores from *Rhodopseudomonas* which catalyses a reaction between S-adenosylmethionine and Mg protoporphyrin to form a product identified as Mg protoporphyrin monomethyl ester. The enzyme is also present in *R. rubrum*. It is absent from *Rhodopseudomonas* grown under high aeration in the dark. Under these conditions are cololess and do not contain chromatophores. The Mg-protoporphyrin and deuteroporphyrin are substrates for the enzyme. Of the metal ion-protoporphyrin complexes those with Zn and Ca are substrates, but those with Fe²⁺, Mn²⁺ and Mn³⁺ are strong inhibitors of the methylation of Mg protoporphyrin. Methyl groups are not substrates but some of adenosylhomocysteine and 5-adenosylethionine are both competitive inhibitors. The inhib. by the latter explains the observation that in whole organisms ethionine markedly inhibits bacteriochlorophyll synthesis.

5727. BIOSYNTHESIS OF X-S-¹⁴C-GRISEOPHENONE C AND P^d-GRISEOPHENONE B AND A. A.Rhodts, G.A.Somerville and M.P.McGonagle: Biochem. J., 1963, 98, 349-357 (Glaxo Res. Ltd., Sefton Park, Stoke-on-Trent, England) [14C]Griseophenone C and [¹⁴C]griseophenone B added to shake-flask fermentation broths of mutant strains D-3980 and Baiuer-Thom C-M.L3980 were incorporated into griseofulvin, thus confirming that both these benzophenones are intermediates in the biosynthesis of griseofulvin. Similarly, felling of griseophenone A from both P^d-griseophenone C and [36Cl]griseophenone B confirmed the

biochemical sequence previously found: griseophenone C → griseophenone B → griseophenone A. Complete failure to utilise [36Cl]griseophenone A for the biosynthesis of griseofulvin suggested that this benzophenone in the free state may not be an intermediate, although it is closely concerned with griseofulvin biosynthesis. The free-radical mechanism postulated for the final stages of griseofulvin biosynthesis is inadequate: an alternative hypothesis for biosynthesis of (+)-griseofulvin from griseophenone B is suggested. *

5728. FERREDQXIN REQUIREMENT FOR REDUCTION OF HYDROXYLAMINE BY CLOSTRIDIUM PASTEURIANUM. R.C.Valentine, L.E.Mortenson, H.F.Mower, R.L.Jackson and R.S.Wolfe: J. biol. Chem., 1963, 238, PC 856-858 (Dept. of Microbiol., Univ. of Illinois, Urbana, Ill., U.S.A.) The NH₂OH reductase system that converts NH₂OH into NH₃ is separated into two components. One of these is a mixture of enzymes containing hydrogenase and the other is the electron carrier, ferredoxin. Of a no. of electron carriers tested, only photosynthetic nicotinamide nucleotide reductase can replace ferredoxin. Probably this organism contains a sp. ferredoxin-linked NH₂OH reductase. J.N.Ashley

PLANT BIOCHEMISTRY

5729. BISBENZYLtetrahydroisoquinoline alkaloids. IV. MONODEMETHYLATED 1-CURINE. E.Hultin: Acta chem. scand., 1963, 17, 753-758 (Dept. of Pharmacol., Univ. California Med. Center, Los Angeles, Calif., U.S.A.) After treatment with cone. HCl and purification by a Soxhlet extraction with ether the monodemethylated 1-curine could be separated from the basic reaction mixture of curine and its methyl ethers. Only one isomer could be identified.

G.F.Blane

5730. APPARENT CONCENTRATION QUENCHING OF MORPHINE FLUORESCENCE. R.Brandt, M.J.Olsen and N.D.Cheronis: Science, 1963, 139, 1063-1064 (Brooklyn Coll., City Univ. New York, Brooklyn, N.Y., U.S.A.) Fundamental fluorescence equations were examined. Deviations from the theoretical were observed by varying the light path length to determine effects on apparent fluorescence. It was found that the decrease in emission of morphine soln. with the increase in concn. was caused by absorption effects that prevented excitation of the whole system. G.M.Lewis

5731. CONTINUOUS EXTRACTION DURING TREATMENT WITH ULTRASOUND. J.A.Lott and A.E.De Maggio: Science, 1963, 139, 825-826 (Coll. Pharm., Rutgers Univ., Newark, N.J., U.S.A.) An extraction apparatus is described for prep. of alkaloids from solanaceous plants which is more efficient than a Soxhlet extractor; the size of the container is not limited. G.M.Lewis

5732. STRUCTURE OF HUMIC ACID. IV. ELECTRON PARAMAGNETIC RESONANCE STUDIES. G.Tollin, T.Reid and C.Stealink: Biochim. biophys. Acta, 1963, 66, 444-447 (Dept. Chem., Univ. Arizona, Tucson, Ariz., U.S.A.) Evidence for the existence of quinhydrone and quinone moieties, as well as semi-quinone radicals, is presented. B.M.Stevens

BIOCHEMISTRY

5733. ESSENTIAL OIL IN BLACK TEA PRODUCTION AND STORAGE. V.T.Goglia: Biokhimiia, 1963, 28, 308-311. The essential oil content of the tea leaf changed appreciably during various processing stages, increasing during rolling and fermentation, but decreasing during desiccation and storage. The acidic no. of essential oil from tea increased at all stages of processing but remained more or less const, during storage. The ether and saponification no. increased during rolling and fermentation but decreased during storage and desiccation. The change in the total content of carbonyl compounds was similar to that in the ether and saponification no.

(Russian) B.J.Cooper

5734. THEAFLAVIN GALLATE AND THEARUBIGINS OF BLACK TEA. V.Subrahmanyam, D.S.Bhatia, C.P. Natarajan, T.N.Ramakrishnan, S.Ramamani, D.E. Leelavathi, R.Shakuntala and K.K.Gopalan: Indian J. Technol., 1963, 1, 244-246 (Central Food Technol., Mysore, India). I.A.B.S.

5735. DETERMINING THE DEGREE OF POLYMERISATION OF FLAVANS. J.L.Goldstein and T. Swain: Nature, Lond., 1963, 198, 587-588 (Low Temp. Res. Sta., Downing St., Cambridge, England) The Folin-Denis reagent is used to measure total phenolic groups in flavans and the vanillin-sulphuric acid reagent to measure phloroglucinol groups, the ratio between the two is correlated with the degree of polymerisation of the flavans as occurs in ripening fruits. G.M.Lewis

5736. STRUCTURAL AND CHROMATOGRAPHIC CORRELATIONS OF SOME FLAVONOID COMPOUNDS. D.G.Roux: J. Chromatography, 1963, 10, 473-478 (Leather Ind. Res. Inst., Rhodes Univ., Grahamstown, S. Africa) Rf values of 8 flavonoid compounds run in 3 solvent systems for paper chromatography are tabulated. Quinonechloroimides, Ehrlich's reagent and JD-toluenesulphonic acid have been tested for their usefulness as spray reagents. P.D.Dawkins

5737. CHROMATOGRAPHIC SEPARATION AND CHARACTERISATION OF COMPONENT ANTHOCYANINS IN RADISH POOT. ANTHOCYANINS. XXXVm. N.Ishikura and K.Hayashi: Bot. Mag. Tokyo, 1963, 76, 6-13 (Bot. Inst. Fac. Sci., Tokyo Kyoiku Univ., Ohtsuka, Tokyo, Japan) By means of column chromatography and paper electrophoresis, the anthocyanin from red root of radish, Raphanus sativus var. Iwakuni-aka, was separated into 5 components. They were shown to be acylated deriv. of raphanusin (3-di-glucosido-5-monoglucoside of pelargonidin) p-coumaric acid has been detected in raphanusin A, ferulic acid in raphanusin B-1, caffeic acid in raphanusin B-2, p-coumaric and ferulic acids in raphanusin C-1, and p-coumaric, ferulic and caffeic acids in raphanusin C-2. It is suggested that the cinnamic acid residues are linked to some of the sugar hydroxyl groups of raphanusin. N.J.Pinfield

5738. ON THE ANTHOCYANIN CRYSTALS OBTAINED FROM THE BERRIES OF EURYA JAPONICA. A. M.Shibata, N.Takakuwa and N.Ishikura: Bot. Mag. Tokyo, 1962, 75, 413-417 (Lab. of Plant Physiol., Biol. Inst., Foyama Univ., Japan) The anthocyanin component of ripe berries of Eurya japonica was separated into a dehydrated and a trihydrated form. It was identified as chrysanthemin (cyanidin-3-monoglucoside).

N.J.Pinfield

5739. OCCURRENCE OF METHYL A ZOXYMETHANOL IN CYCAS CIRCINALIS L. H-Matsumoto and F.M.Strong;

Arch. Biochem., 1963, 101, 290-310 (Dept. Biochem. Univ. of Wisconsin, Madison, Wis., U.S.A.) Three of the 9 fractions obtained chemically from C. circinalis. nuts were acutely toxic. The water sol. toxic fraction was passed through a C column and eluted material was chromatographed on a cellulose column. A compound occurring pure in 3 of 30 eluate fractions was cryst. and identified as cycasin. Toxicity in 2 of the fractions is suggested to be due to this. The ethyl ether sol. Fraction B produced acute liver damage and death when fed to rats in high doses. Smaller doses for long time periods produced hepatomas. The fraction appeared to contain methylazoxymethanol. Formaldehyde determination by the chromotropic acid method was applicable to rapid cycasin estimation in nuts. B.M.Stevens

5740. DI- AND TETRAHYDROPTERINS IN BLUE GREEN ALGA ANACYSTIS NIDULANS. L.Zieglen: Biochem. Z., 1963, 337, 62-68 (Botanisches Inst., Tech. Hochschule, Darmstadt, Germany) Tetrahydropterin was prep, from a culture of A. nidulans which was frozen in liquid N₂ and then treated with ultrasonic waves. Other pterins could be liberated from freeze dried material by grinding and extracting the debris. Dihydropterin was reduced by dihydrofolic acid reductase from chicken liver in the presence of NADPH₂*

(German) L.Cohn

5741. CHOLINE CONTENT IN SOME SPECIES OF EDIBLE AND NON-EDIBLE MUSHROOMS. Z.Kotomska and H-MJodecki: Roczn. Państ. Zatf. Hig., 1962, 13, 359-364 (Państwowy Zakład Higieny, Warszawa, Poland) Among 16 fungus spp. the highest choline (C) content - about 0*5% of dry wt. was found in Boletus edulis and Lactarius deliciosus. C was determined spectrophotometrically using trie Reinecke salt.

(Polish) T.Qlebicki

5742. LACHRYMATORY FACTOR IN ONION (ALLIUM CEPA) VAPOURS AND ITS PRECURSOR. CG.Spare and A.LVirtanen: Acta chem. scand., 1963, 17, 641-650 (Lab. Foundn. Chem. Res., Biochem. Inst., Helsinki, Finland) The unstable lachrymatory factor precursor was identified as (4)-S-(prop-1-enyl)-L-cysteine sulphoxide which is split in the onion by an enzyme into the lachrymatory factor (propenylsulphenic acid), pyruvic acid and ammonia. G.F.Blane

5743. FUNGUS PIGMENTS. XE TRAMESANGUIN, PIGMENT OF TRAMetes CINNABARINA. J.Gripenberg: Acta chem. scand., 1963, 17, 703-708 (Dept. of Chem., Inst. Technology, Helsingfors, Finland) The isolation of this cryst. pigment is described. It was identified as 2-amino-1-formylphenoxazin-3-one-9-carboxylic acid. The distribution of other fungal pigments is discussed. G.F.Blane

5744. BIOSYNTHESIS OF POLYACETYLENES. V. ROLE OF MALONATE DERIVATIVE AND COMMON ORIGIN OF FATTY ACIDS, POLYACETYLENES AND 'ACETATE DERIVED' PHENOLS. J.D.Bu'Lock and H.M.Smalley: J. chem. Soc., 1962, 4662-4664 (Dept. Chem., Univ., Manchester, England) Radioactivity from diethyl [a-14c]malonate was incorporated sp. into C-1 to C-8 of a C₁₀ polyacetylene and not into the terminal C₂ group. This was analogous to findings with fatty acids and with acetate-derived phenols and a hypothesis linking the three types of biosynthetic product was suggested. L.G. Gillies

5745. ENZYMIC OXIDATION OF WEDELOLACTONE CONTAINED IN ECLIPTA ALBA. S.Shimizu and

S.Hattori: Bot. Mag. Tokyo, 1963, 76, 59-66
 (Central Res. Inst., Japan Monopoly Corp., Yutaka-machi, Shinagawa-ku, Tokyo, Japan) The process of blackening of *E. alba* leaves on heating or injury was shown to be enzymic, the enzyme a polyphenoloxidase which oxidises wedelolactone, a phenolic compound. The enzyme was uncontaminated with ascorbic acid oxidase or peroxidase. The blackening process was retarded by ascorbic acid, but accelerated by the addition of Cu⁺. N.J.Pinfield

5746. REDUCTASES IN REDUCTION OF DISULPHIDE COMPOUNDS IN WHEAT FLOUR. N.I.Proskuriakov and E.S.Zueva: Biokhimiia, 1963, 28, 316-320.
 Two active enzyme systems were found in completely ground wheat grain and in 70% flour: glutathione reductase and protein disulphide reductase, both capable of reducing compounds with disulphide bonds. Cystine reductase was much less active. All the co-factors necessary for the enzymic reduction of S-S bonds, both in sol. low mol. disulphides and in proteins, were found in wheat flour. (Russian) B.J.Cooper

5747. OXALIC ACID METABOLISM IN BEGONIA PLANT. K.Sasaki: Bot. Mag. Tokyō, 1963, 76, 48-58 (Dept. Bot., Fac. Sci., Hokkaido Univ., Sapporo, Japan)
 Oxalic acid oxidase found in various tissues of *B. semperflorens* was associated mostly with the chloroplast fractions. Part of it was extracted with deoxycholate, digitonin or lipase. Oxalic acid was also isolated from these tissues. The partially purified enzyme has an optimum pH of 4.5 and an R.Q. of 2.4 for oxalic acid oxidation. This oxidation was stim. by the addition of Mn²⁺, but strongly inhibited by benzoate, chloropromazine, and nitrate and weakly inhibited by azide. Cyanide had no inhibitory effect. N.J.Pinfield

5748. OXALIC ACID SYNTHESIS IN SHOOTS OF OXALIS PES-CAPRAE: PRECURSORS OF GLYCOLIC ACID AND GLYOXYLIC ACID. A.Millerd, R.K. Morton and J.R.E.Wells: Biochem. J., 1963, 88, 276-281 (Dept. Agric. Chem., Waite Agric. Res. Inst., Univ., Adelaide, South Australia) Studies on oxalic acid synthesis in white shoots of *O. pes-caprae* have been extended by administering [2-14C]glucose, L1-A4C-glycose, [1,5-14C₂]isocitric acid and [-14C]glycolic acid. Identification of compounds that contained 14C activity has shown that both isocitric acid and glycolic acid serve as more efficient precursors of oxalic acid in ¹⁴C than does glucose or ribose. Oxalic acid synthesis in white *Oxalis* shoots appears to be associated with the oxidation of glyoxylic acid which may arise from the oxidation of glycolic acid and from the cleavage of isocitric acid. *

5749. ENZYMIC SYNTHESIS OF OXALIC ACID IN OXALIS PES-CAPRAE. A.Millerd, R.K.Morton and J.R.E.Wells: Biochem. J., 1963, 88, 281-288 (Dept. Agric. Chem., Waite Agric. Res. Inst., Univ., Adelaide, South Australia) The enzymes involved in oxalic acid synthesis have been investigated with cell-free extracts from white shoots of bulbs of *O. pes-caprae*. The production of glyoxylic acid from isocitric acid hydrolysed by isocitrate lyase has been demonstrated, glycolic acid and glyoxylic acid were oxidised by a vinyl-linked oxidase (or oxidases) which differed from a collate oxidase in that both substrates were oxidised at nearly equal rates. The oxidation of glyoxylic acid was not inhibited by oxalic acid. *Oxalis* extracts contained

isocitrate dehydrogenase as well as isocitrate lyase. Glyoxylic acid may be oxidised to oxalic acid, or reduced to glycolic acid by a NADP-linked glyoxylate reductase. The reduction of oxalic acid involving NADPH₂ and CoA has also been demonstrated. *

5750. STUDIES ON WHEAT PLANTS USING CARBON-14 COMPOUNDS. XK. OBSERVATIONS ON METABOLISM OF LYSINE-14C. S.N.Nigam and W.B.McConnell: Canad. J. Biochem., 1963, 41, 1367-1371 (Nat. Res. Council of Canada, Prairie Regional Lab., Saskatoon, Saskatchewan, Canada) When generally labelled [14C]lysine or ct-[6-14C]aminoacidic acid were administered to wheat seedlings 48 and 57%, respectively, of the 14C was recovered in H₂O-SOI materials, with 39 and 11% in the insol. residue. When [WcJ]lysine was administered, lysine, pipecolic acid, and CX-aminoacidic acid had high sp. activities, with glutamic acid and some related substances containing significant 14C. When O-[6-14C]aminoacidic acid was used, lysine and pipecolic acid were weakly labelled, and a-aminoacidic acid had very high sp. activity. Glutamic acid contained appreciable 14C, 63% being in C-5. a-Aminoacidic acid and pipecolic acid are probably on the pathway of lysine metabolism, with acetate a further degradation product. A.M.Gibbins

5751. ISOLATION OF PLANT PROTEINS AND VIRUSES BY PRESSURE-THAWING AND GEL FILTRATION. H.Stegmann and V.Loescheke: Z. Naturforsch. B, 1963, 18, 195-198 (Inst. Biochem., Biol. Bundesanstalt 351 Harm. Menden, Germany) Frozen plant material (-5°) was compressed in a filter press and the extruded sap purified on a Sephadex G25 column, this separated phenols from polyphenoloxidases at temp. below 0° which inhibited denaturation by tanning. This procedure was applied to potato tubers containing potato-S-virus. The Sephadex column was eluted with ammonium acetate buffer (pH 7). Fraction I contained the virus and various enzymes, peroxidase, phenoloxidase, catalase, lactic dehydrogenase and phosphatase. Increasing the buffer concn. liberated various peptides, amino acids and sugars. (German) J.C.Crawhall

5752. KINETIN AS ANTAGONIST OF TOXIC EFFECT OF PSEUDOMONAS TABACI. L.Lovrekovich and G.L. Farkas: Nature, Lond., 1963, 198, 710 (Res. Inst. for Plant Protection, Budapest, Hungary) In leaves of tobacco plants inj. with culture filtrates of *P. tabaci* the sol. protein content decreases, while the amino acid and NH₃ content increases. These effects were counteracted by spraying with 10-5M kinetin. G.M.Lewis

5753. PARTICIPATION OF DEHYDROGENASE IN DEFENCE REACTIONS OF CABBAGE PLANT. T.M.Ivanova and B.A.Rubin: Biokhimiia, 1963, 23, 288-294. The effect of the fungus infection *Botrytis cinerea* on dehydrogenase activity in the cabbage plant varied in different strains of the plant. In the resistant type of plant the infection inhibited the enzymic activity, but the enzyme was activated in the susceptible type of plant. In the resistant type, infection completely inhibited isocitric and succinic dehydrogenases. This effect constituted one of the tissue defence reactions against *B. cinerea*. (Russian) B.J.Cooper

5754. EFFECT OF INHIBITORS ON KINETICS OF IAA OXIDATION. J.A.Sachen Amer. J. Bot., 1963, 50, 116-122 (Dept. Bot., Los Angeles State Coll., Los

BIOCHEMISTRY

Angeles, Calif., U.S.A.) Kinetic studies of the relative effectiveness of some phenolic antioxidants in causing a lag in IAA oxidation, by an enzyme from *Phaseolus vulgaris* pods supported the conclusion that they react with free-radical intermediates within the enzyme-substrate complex, thus greatly inhibited the rate of enzyme turnover. Results of expt. with partially purified enzyme indicate that a form of the enzyme active in the presence of H₂O₂ and IAA is involved in both inactivation of enzyme and the anaerobic destruction of phenolic inhibitors.

T.H.Thomas

5755. EXTRACTION OF REDUCED CYTOCHROME-552 AND -556 FROM EUGLENA GRACILIS (Z). G.Colmano and J.J.Wolken: Nature, Lond., 1963, 198, 783-784 (Biophys. Res. Lab., Eye and Ear Hosp., Pittsburgh, Pa., U.S.A.) Cytochrome-552 and -556 can be extracted from frozen and thawed *E.gracilis* in relatively high concn. by taking advantage of their water solubility and limiting die water phase in extraction so that total concn. of cytochromes remains above 5×10^{-4} M.

G.M.Lewis

5756. LIGHT INDUCED SINGLE ELECTRON TRANSFER REACTIONS BETWEEN CHLOROPHYLL *a* AND QUINONES IN SOLUTION. II. SOME EFFECTS OF NON-QUINOID DONORS AND ACCEPTORS: RIBOFLAVIN, THIOCTIC ACID AND NADH₂. G.Tollin and G. Green: Biochim. biophys. Acta, 1963, 66, 308-318 (Dept. Chem., Univ. Arizona, Tucson, Ariz., U.S.A.)

Reactions were observed in systems with chlorophyll and riboflavin or thioctic acid and in systems with NADH₂, chlorophyll and benzoquinone or riboflavin. Illumination of acidic soln. of chlorophyll and riboflavin produced a semiquinone of riboflavin and, through a side reaction, chlorophyll destruction. In the chlorophyll thioctic acid system, excitation of thioctic acid produced a sp. capable of forming free radicals on interaction with an electronically excited chlorophyll mol. From 2 to 8-fold enhancements in steady state radical concn. were obtained by adding NADH₂ to soln. of chlorophyll and acceptors.

B.M.Stevens

5757. PRIMARY PROCESS OF PHOTOSYNTHESIS: INTERPRETATION OF EMERSON EFFECT AND OF LIGHT INDUCED SPECTRAL CHANGES AT 7000A. G.Tollin: J. thporet. Biol., 1962, 2, 105-116 (Chem. Dept., Arizona Univ., Tucson, Ariz., U.S.A.)

Existing theories of the primary process of photosynthesis are discussed. An extension of the electron transfer theory is presented and a new interpretation of the Emerson effect is given in terms of this extended theory.

J.A.Dawson

5758. SHRINKAGE OF WHOLE CHLOROPLASTS UPON ILLUMINATION. M.Itoh, S.Izawa and K.Shibata: Biochim. biophys. Acta, 1963, 66, 319-327 (Tokugawa Inst. for Biol. Res., Tokyo, Japan) Illumination of a suspension of spinach chloroplasts reduced the vol. at the distribution max. to 51-78% of the vol. before illumination. The vol. change was reversed on return to darkness. Observations on the packed vol. confirmed the shrinkage phenomenon. Light scattering cross-sectional area, however, increased in the light and decreased in the dark. These changes were confirmed by E.M. to be due to changes in the axial ratios of the chloroplasts. Effects of ATP and inhibitors of photophosphorylation and the Hill reaction on the phenomenon are described.

B.M. Stevens

5759. AEROBIC AND ANAEROBIC PHOTOPHOSPHORYLATION [PP] IN SPINACH CHLOROPLAST PREPARATIONS UNDER CONTROLLED LIGHT CONDITIONS. M.Schwartz:

Biochim. biophys- Acta, 1963, 66, 292-307 (Div. Biol., Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) Hie quantum requirements of PP at rate limiting intensities of red light were equal with @-naphthoquinonesulphonic acid, menadione and phenazine methorulphate under aerobic conditions. In an A atm. the quantum requirement increased with all 3, and 0-01N HCN inhibited PP. Aerobic conditions reversed the inhibn. but O₂ uptake and H₂O₂ production occurred. With 3-naphthoquinonesulphon* ic acid or menadione as catalyst, H₂O₂ prodjiced/O₂ con* sumed and ATP produced/O₂ consumed both approached 2. *g*-Phenanthroline and jj-chlorophenylidimethyl urea inhibited PP aerobically and anaerobically, the irihbn. being related to the inhibn. of Hill reaction activity. Only non-cyclic PP is concluded to have been demonstrated in chloroplast prep.

B.M.Stevens

5760. FLUOROMETRIC MEASUREMENT OF PHOTO-REDUCTION OF FLAVIN BY ILLUMINATED CHLOROPLASTS. B.Vennesland, H.-W.Gattung and E.Birkich: Biochim. biophys. Acta, 1963, 66, 285-291 (Max-Planck Inst. Zellphysiol, Berlin-Dahlem, Germany)

The method for measuring reduction and reoxidation of flavins in the presence of suspensions of chloroplasts or grana was based on the fact that oxidised flavins have a strong fluorescence band in the green whereas reduced flavins have no visible fluorescence. The procedure was used to show that illumination of chloroplasts with FMN in A led first to reduction of flavin, and that the reduced flavin was then reoxidised in a dark reaction, which lagged behind the reduction sufficiently to be directly demonstrable.

B.M.Stevens

5761. NITRATE REDUCTION IN LIGHT BY ISOLATED CHLOROPLASTS. F.F.Del Campo, A.Paneque, J.M. Ramirez and M.Losada: Biochim. biophys. Acta, 1963, 66, 450-452 (Sección de Bioquím y Fisiol Cel., Cen. de Invest. Biol., C.S.I.C., Madrid, Spain) NO₃- reduction was demonstrated in a reconstituted chloroplast system in which photoevolutLon of O₂ was suppressed and electrons were supplied by the couple ascorbate-dichlorophenolindophenol instead of water. Prelim, comm.

B.M.Stevens

5762. PHOSPHATASE ACTION ON PHOSPHOGLYCOLIC, 3-PHOSPHOGLYCERIC AND PHOSPHOENOLPYRUVIC ACIDS IN SPINACH CHLOROPLAST FRAGMENTS IN PRESENCE AND ABSENCE OF HIGH CONCENTRATIONS OF METHANOL. J.Ullrich: Biochim. biophys. Acta, 1963, 71, 589-594 (Lawrence Rad. Lab., Univ. of California, Berkeley, Calif., U.S.A.) Sonically broken chloroplasts, both before and after storage in the frozen state, hydrolysed [¹⁴C]phosphoglycolic acid rapidly in aq. soln. at room temp, or in 50% aq. methanol at 0°. C¹⁴CJphosphoglyceric acid, [¹⁴C]phosphoenolpyruvic acid and various sugar phosphates were converted to a no. of compounds usually built up during photosynthesis in aq. soln. at room temp. In ^Q_{Pjo} ipjethanol at 0°, phosphoglyceric and phosphoenolpyruvic acids were very slowly hydrolysed; sugar phosphates were unchanged. None of the compounds were hydrolysed in 80% methanol at 0°.

B.M.Stevens

5763. CHLOROPHYLLASE OF TOBACCO PLANTS. I. PREPARATION AND PROPERTIES OF WATER SOLUBLE ENZYME. S.Shimizu and E.Tamaki: Bot. Mag. TokyOt 1962, 75, 462-467 (Central Res. Inst. of Japan Monopoly Corp., Shinagawa, Tokyo, Japan) Using chloroplasts of *Nicotiana tabacum* var. Bright Yellow, a water sol. prep. of chlorophyllase was obtained. Seasonal changes in enzyme activity and chlorophyll content were

studied. The possible participation of chlorophyllase in biosynthesis of chlorophyll was discussed. N.J.Pinfield

GENERAL BIOCHEMISTRY

5764. SOME POTENTIAL AREAS FOR RESEARCH ON MEANS OF DRASTICALLY INCREASING THE HUMAN LIFE SPAN. L.V.Komarov: *J. theor. Biol.*, 1963, 4, 147-158 (Gerontology Branch, Moscow Soc. Naturalists, U.S.S.R.) Methods by which the life span of

People who have not yet reached old age may be extended are discussed. The principal contention is that the duration of pre-senile life is determined primarily by the level of disparity between the amount of substances coming into certain biosynthetic processes and the material handed on from these processes to subsequent links. Four possible fields of research are suggested.

G.F.Blane

5765. ON BIOCHEMICAL VARIABILITY AND INNOVATION. S.S.Cohen: *Science*, 1963, 139, 1017-1026 (Biochem. Dept., Univ. Pennsylvania Sch. Med.: Philadelphia, Pa., U.S.A.) A lecture. *A. T. C. w. s*

5766. STIMULATION BY MALONATE OR ISOCITRATE OF THE TRANSFER OF HYDROGEN FROM CL-OXOGLUTARATE TO d-OXOGLUTARATE PLUS AMMONIA IN RAT LIVER MITOCHONDRIA. J.M.Tager: *Biochim. biophys. Acta*, 1963, 73, 341-343 (Lab. Physiol. Chem., Univ. Amsterdam, Netherlands) Prelim, comm.

B.M.Stevens

5767. SWELLING PROPERTIES OF MITOCHONDRIAL PREPARATIONS FROM RETINA. D.Y.Wang, T.F. Slater and H.J.A.Dartnall: *Vision Res.*, 1963, 3, 171-181 (M.R.C. Vision Res. Unit, Inst. Ophthalmology, Judd St., London, England) Bovine retinae have been separated into sub-cellular fractions by flotation and differential centrifugation. The methods allow the isolation of distinctive sub-cellular fractions so that a "action rich in mitochondria could be obtained. By Measuring the changes in optical density at 520 m μ of a mitochondrial suspension the osmotic behaviour of the Mitochondria was examined in different concn. of KC1. They were observed to behave as osmometers. In ISO- ftnic media, mitochondria swelled when digitonin (10-4M) or thyroxine (2 x 10⁻⁵M) was added, but Ca²⁺ and HPO₄²⁻ ions, vit. A alcohol and aldehyde, £-chloro-¹⁴C-uribenzzoate and formaldehyde appeared to have little or no activity in this respect. Mitochondrial swelling caused by thyroxine or hypertonicity was reversed by the addition of a mixture of ATP (0.5 mM) Mg²⁺ (2 mM) and Plasma albumin (0.66 mg./ml.). J.Whiting

5768. OXIDATIVE PHOSPHORYLATION OF MITOCHONDRIA FROM TUMOUR AND EMBRYO CELLS. F.Feo, E.Grajeda, L.Galvial and T.Terranova: *Spijennale*, 1962, 112, 439-445 (Ist. PatoL Gen., Univ., Torino, Italy) The rate of oxidative phosphorylation of mitochondria isolated from rat hepatoma ⁵Cl⁴ cells (Yoshida), using succinate and a-keto-gf¹⁴rate as substrates, was not significantly different than that of mitochondria isolated from 10-day old embryo cells. The ATPase activity of mitochondria both sources was negligible under these expt. conditions. (Italian) G.N.Godson

5769. POLAROGRAPHIC STUDY OF MRTOCHONDRIAL SUSPENSIONS. G.D.Christian, E.C.Knoblock and W.C. Purdy: *Biochim. biophys. Acta*, 1963, 66, 415-419 (Div. Biochem., W.Reed Army Inst. Res., Washington, D.C., U.S.A.) Mitochondrial suspensions exhibited a characteristic polarographic wave which was independent of tissue source and found in 2 animal spp. The wave was anodic, irreversible and diffusion controlled. The anodic process resulted in Hg mercaptide formation, the source of mercaptan being SH within the mitochondrial membrane and apparently contained in the protein structure of the mitochondrial membrane. Ageing of the mitochondrial prep. resulted in loss of the early wave and the appearance of a second wave originating from the mitochondrial contents. B.M.Stevens

5770. POLAROGRAPHIC STUDY OF CHROMIUM-INSULIN-MITOCHONDRIAL INTERACTION.

G.D.Christian, E.C.Knoblock, W.C.Purdy and W.Mertz: *Biochim. biophys. Acta*, 1963, 66, 420-423 (Div. Biochem., W.Reed Army Inst. Res., Washington, D.C., U.S.A.) Insulin exhibited a polarographic wave due to reduction of an S-S, probably the intrachain S-S. Cr³⁺ formed complexes with insulin and mitochondria, both complexes involving Cr-S linkages. Insulin reacted with mitochondria through the formation of an SH-S-S linkage. Cr³⁺ enhanced this reaction. B.M.Stevens

5771. CONTRIBUTION OF THE VARIOUS PHOSPHORYLATING STEPS IN THE RESPIRATORY CHAIN TO THE DNP INDUCED ATPase OF RAT LIVER MITOCHONDRIA. H.C.Hemken: *Biochim. biophys. Acta*, 1963, 73, 311-323 (Lab. Physiol. Chem., Univ., Amsterdam, Netherlands) The curve relating ATPase to DNP

concn. at pH 7 showed 2 peaks at approx. 0.1mM and 0.2mM DNP. Low Amytal concn. had more effect on the latter peak whilst low antimycin concn. had more effect on the former. Curves relating DNP induced ATPase to antimycin or Amytal concn. each showed a clearly defined plateau. The effects of the 2 inhibitors were additive; together they produced almost complete inhibn. Without DNP, both induced an ATPase, the activity curves being identical with those where DNP was also present, at concn. of inhibitor at and above that giving max. ATPase without DNP. The DNP induced ATPase at pH 7.0 is suggested to contain 62% of an Amytal sensitive ATPase and 33% of an antimycin sensitive system. B.M.Stevens

5772. INDUCERS OF THE CRABTREE EFFECT AND ITS RELEASE BY UNCOUPLERS AND OTHER AGENTS.

D.Ram, H.S.Kalner and L.Bloch-Frankenthal: *Cancer Res.*, 1963, 23, 600-606 (Dept. Expt. Med. and Cancer Res., Hebrew Univ., Jerusalem, Israel)

Deoxyglucose and glucosamine depressed the oxidative decarboxylation of exogenous pyruvate and lactate by ascites tumour cells while inhibiting their O₂ consumption. DNP, dicoumarol and phenazine methosulphate relieved the inhibn. of endogenous respiration induced by glucose or glucosamine but not by deoxyglucose. Dicoumarol relieved the respiration inhibn. induced by any of the 3 in the presence of pyruvate or lactate and also relieved the depression of the oxidative decarboxylation of these substrates. Dicoumarol and DNP stim. O₂ uptake strongly in the presence of lactate or pyruvate without affecting endogenous respiration. B.M.Stevens

5773. ENERGY PATHWAYS OF HEPATOMAS H-35 AND 7800. A.C.Aisenberg and H.P.Morris: *Cancer Res.*,

BIOCHEMISTRY

1963, 23, 566-568 (J.C.Warren Lab., Huntington Mem. Hosp., Boston, Mass., U.S.A.) Slices showed no aerobic or anaerobic glycolysis, no Crabtree effect and no glycolytically supported protein or DNA synthesis. A brisk response to succinate addition was shown in the respiratory rates of slices of both tumours and of Hepatoma 5123.

B.M.Stevens

5774. ENERGY METABOLISM OF THE LIVER OF MICE AFFECTED BY FRIEND'S LEUKAEMIA. G.Budillon, S.Papa, M.Coltorti and E.Quagliariello. *Biochim. Appl.*, 1962, 9, 383-390 (1st. Chim. Biol. Fisiol. Generale, Univ., Bari, Italy) The O₂ uptake of mouse liver homogenate was reduced in animals suffering from Friend's leukaemia. In particular O₂ uptake using (X-oxoglutarate as substrate was reduced by 30%. No consistent variation in O₂ uptake or P/O ratios was observed in the corresponding liver mitochondria.

(Italian) J.C.Crawhall

5775. ACETOIN AS METABOLITE OF ETHANOL. I-Hassinen: *Acta physiol. scand.*, 1963, 57, 135-143 (Med. Chem. Dept., Univ., Helsinki, Finland) Rabbits receiving disulphiram were given ethanol. Blood acetoin levels were raised by treatment with disulphiram alone. No increase was found after alcohol administration. In liver homogenates acetoin was formed only after giving ethanol and pyruvate. This was inhib. by disulphiram under aerobic conditions only. H.B.Waynfirth

5776. THREE ANTISTAPHYLOCOCCAL FACTORS FROM OX BRAIN. B.Kroenberg, E.S.Cook, C.B.Coutinho and L.G.Nutini: *Nature*, Lond., 1963, 198, 910-911 (Div. Biochem., Inst. Divi Thomae, Cincinnati, Ohio, U.S.A.) When deproteinised ox brain extract is fractionated on a Dowex column, 3 factors are separated which protect mice from lethal infections of a penicillin-resistant strain of *Staphylococcus aureus* when administered prophylactically at 2 mg./day for 5 days prior to infection. G.M.Lewis

5777. EFFECT OF BENZO-5,6-FLAVONE ON PROTEIN-AEMIA IN RAT. G.Zwingelstein, G.Peres and JJouanneteau: *C.R. Soc. Biol.*, Paris, 1962, 156, 2085-2087 (Lab. Physiol. générale, Fac. Sci., Lyon, France) Rats received s.c. injn. of 20 mg. benzo-5,6-flavone/day for 12 days. Electrophoretic separation of serum showed an increase in α-, β- and γglobulins. There was a decrease in serum albumin. These results were like those obtained with cortisone.

(French) M.A.Price

5778. FORMATION OF AN S-GLUCURONIDE FROM TETKAETHYLTHIURAM DISULPHIDE (ANTABUSE) IN MAN. J.Kaslanden *Biochim. biophys. Acta*, 1963, 71, 730-732 (Inst. for Org. Chem. T.N.O., Utrecht, Netherlands). B.M. Stevens

5779. VOLUME FLOW IN A SERIES MEMBRANE SYSTEM. J.T.Ogilvie, J.R.McIntosh and P.F.Curran: *Biochim. biophys. Acta*, 1963, 66, 441-444 (Biophys. Lab., Harvard Med. Sch., Boston, Mass., U.S.A.) B.M. Stevens

5780. INTERACTING SOLUTE FLOWS IN PERMEABILITY STUDIES ON THE SAND DOLLAR EGG. D.B.Ludlum: *Biochim. biophys. Acta*, 1963, 66, 386-396 (Dept. Physiol. and Biophys., New York Univ. Sch. Med., New York, U.S.A.) Equations are derived from the thermodynamics of irreversible processes which show that the flow of any permeable component across a semi-permeable membrane may depend on the simultaneous flows of all other such components through solute-solute inter-

actions. Expt. attempting to demonstrate such effects through their influence on classical swelling curves appeared to be successful. Reflection coeff. determined individually for ethylene glycol, propylene glycol and acetamide are compared with similar data for human r.b.c.

B.M.Stevens

5781. SIGNIFICANCE OF NITROGEN-15 EXCESS IN NITROGENOUS COMPOUNDS OF BIOLOGICAL ORIGIN. O.H.Gaebler, H.C.Choitz, T.G.Vitti and R.Vukmirovich: *Canad. J. Biochem.*, 1963, 41, 1089-1097 (E.B.Ford Inst. Med. Res., H.Ford Hosp., Detroit, Michigan, U.S.A.) Standard deviations of a series of analyses were too small, and values for 15N excess in the same amino acids isolated from different sources were too variable, to support the view that the observed 15N excess in nitrogenous compounds of biological origin was a reproducible error. Differences between amounts of excess 15N of amino acids or amides of animal and plant origin also indicated that the excess 15N had metabolic significance. The smallest 15N excess occurred in amino acids from legume proteins, and 15N concn. was often below normal abundance in synthetic amino acids.

METHODS

5782. CHEMICAL MICRODETERMINATION OF PHENYL- AND TOLYLSULPHONYLUREA DERIVATIVES IN BLOOD. W.Kern: *Analyt. Chem.*, 1963, 35, 50-53 (Dept. Chem. Res., Hoffman-La-Roche, Inc., Nutley, N.J., U.S.A.) A new quant. spectrophotometric micromethod for the determination of phenyl- and tolylsulphonylurea deriv. in blood was described. After selective extraction with org. solvents at pH 5, the compounds were nitrated reduced to aromatic amines, diazotised and coupled with N(1-naphthyl)ethylenediamine to produce azo dyes which were measured spectrophotometrically. L.G. Gillies

5783. POLAROGRAPHIC MEASUREMENT OF OXYGEN TENSION IN MOUSE EHRLICH ASCITES TUMOURS. M.Frimmer and ZJ.Zubrzycki: *Biochim. biophys. Acta*, 1963, 66, 440-441 (Pharmakol. Inst. der Justus Liebig-Univ., Giessen, Germany). (German) B.M.Stevens

5784. DETERMINATION OF TRUE Cl⁻ CONTENT OF BIOLOGICAL FLUIDS AND TISSUES. I. ANALYSIS BY 36d ISOTOPE DILUTION. E.Cotlove: *Analyt. Chem.-Metab.*, Nat. Heart Inst., N.I.H., Bethesda, Md., U.S.A.) An isotope diln. method using 36Cl was described by which the true value of the total Cl⁻ content of a sample of biol. fluid or tissue could be measured for amounts of 150 to 250 pequiv. of Cl⁻. The method involved complete isotopic exchange of stable with added 36Cl⁻ in a soln. formed by hot alk. digestion of the sample and determination of the correct value of the diluted sp. activity in purified soln. obtained by successive stages of alk. dry ashing, oxidation-reduction and distillation. Radioassay was performed by infinite thickness liquid counting and chem. assay was by automatic coulometric amperometric titration with Ag⁺.

L.G.Gulies

5785. DETERMINATION OF TRUE OT CONTENT OF RY BIOLOGICAL FLUIDS AND TISSUES. II ANALYSIS BY SIMPLE, NON-ISOTOPK METHODS. E.Cotjove Analyt. Chem., 1963, 35, 101-105 (Lab., Kidney and End-t-1 ³⁵M ch.. Nat. Heart Inst., N.I.H., Bethesda, MdTSSAO StoJU « Hablend 1115 f. S! for ifae determination of true cl-content were described and compared with an isotopic diln. method. In all cases the final measurement was by an automatic, coulometric-amperometric titration. In analysis of biol. fluids direct diln. and titrauorr were accurate. In analysis of tissue, a soln. ^{10**/1**}TM, ^ could be prep, in 3 ways alk. digestion of wet or dried tissue followed by Zn(OH)2 Pptn. of protein and Pirat e oxidation of SH group* in the supernatant, dU³⁵ TM J extraction of fat-free, dried, P^ veroed tissue. or water extraction. The non-isotopic alk. digestion method was the most consistently accurate and the most wW.... applicable.

5788. APPARATUS FOR STERILISING HEAT-LABILE Med. Sen.. Univ.. Birmingham. England). G A # Lewis

5789. DENSITY GRADIENT FOR ILLATION OF METABOLICALLY ACTIVE THYMUSi NUCLEI. ^D-Fujer and 640. Ten nuclei which approached the metab... se prep. in isotonic sucrose; zonal centrifugation was used for increased resolution. B.M.Stevens

5790. DENSITY-GRADIENT SEPARATION OF ORGANIC AND INORGANIC PARTICLES BY CENTRIFUGATION. W.T.Lammers. Science, 1963, 139, 1298-1299 U.S.A. Particles (Da ed by between in a 2-bromoethanol density gradient. G.M.Lewis

5791. CENTRIFUGAL CHROMATOGRAPHY. V. APPARATUS FOR PREPARATIVE-SCALE PAPER CHROMATOGRAPHY IN CENTRIFUGAL FIELD. M.Pavlceek, J.Rosmus and Z.Deyl: J. Chromatography, 1963, 10, 497-501 (Automation Dept., Tech. Univ. Prague, Czechoslovakia) A simple technique for preparative-scale paper chromatography is described. The time of separation is reduced from 1/3-1/10 of the time required for conventional chromatography. P.D.Dawkins

5792. CHROMATOGRAPHY OF QUATERNARY NITROGEN COMPOUNDS ON BUFFERED CATION-EXCHANGE RESINS. D.D.Christianson, J.S.Wall, J.F.Cavins and R.J.Dimlen. J. Chromatography, 1963, 10, 432-438 (Northern Reg. Res. Labs., Peoria, HI., U.S.A.)

Amberlite IR-120 resin columns were used for the separation of quaternary N compounds and their amine analogues by employing buffers for elution. Substances of biol. interest such as betaine, stachydrine, choline, trigonelline, carnitine, and N-methylnicotinamide have been successfully separated and determined by the u.v. absorption of their periodide deriv.

P.D.Dawkins

5793. MULTIPLE-COLUMN HYDRAULIC METHOD FOR FRACTIONATION OF PARTICLES FOR CHROMATOGRAPHIC COLUMNS. D.R.Whitaker and G.A.Strasdine: Canad. J. Biochem., 1963, 41, 1105-1113 (Div. of Appl. Biol., Nat. Res. Council, Ottawa, Canada)

Liquid at const. temp. was freed of air bubbles and circulated at const. flow rate through a series of vertical columns of progressively increasing diam., a settling bottle, and a filter. The particles to be fractionated (cross-linked dextran, diatomaceous earth, microbead and micropowder ion-exchange resins used here) were either added gradually to the first column by passage of the return flow of liquid through a particle reservoir or were added at the outset to the first column. The flow of liquid distributes the particles between the columns according to particle size and density. A.M.Gibbins

5794. PREPARATIVE SCALE CHROMATOGRAPHY WITH ANALYTICAL COLUMNS. R.P.W.Scott: Nature, Lond., 1963, 198, 782-783 (W.G.Pye and Co., Ltd., Cambridge, England) Large samples may be satisfactorily analysed by gas chromatography if some minutes elapse after placing the charge before elution begins, and if the solute flow rate is adjusted so that thermal changes and column overload effects counteract each other to give a symmetrical peak. G.M.Lewis

5795. PREPARATION OF ECTEOLA-CELLULOSES OF VARIOUS CAPACITIES. H.A.Veder. J. Chromatography, 1963, 10, 507-508 (Biochem. Lab. Pediatric Clinic, Univ., Amsterdam, Netherlands) A modification of the method of Peterson and Sober for the prep. of ECTEOLA-celluloses of various capacities is applied to a prep. for the purification of antihaemophilic factor. P.D.Dawkins

5796. DETECTION OF SULPHUR COMPOUNDS ON PAPER CHROMATOGRAMS. C.de Marco: Nature, Lond., 1963, 198, 683 (Inst. di Chim. Biol., Univ. di Roma, Italy). G.M.Lewis

5797. IDENTIFICATION OF PURINES ON PAPER CHROMATOGRAMS. E.G.CClarke and S.Kalayci: Nature, Lond., 1963, 198, 783 (Dept. PhysioL, Royal Vet. Coll., London, England) Caffeine in 10-20 fig. amounts may be detected on paper chromatograms using a colour reaction with bromine. G.M.Lewis

BIOCHEMISTRY

5798. PAPER CHROMATOGRAPHIC DETERMINATION OF AROMATIC CX-KETO ACIDS. K.H.Nielsen: *J. Chromatography*, 1963, 10, 463-472 (Biochem. Inst., Univ., Arhus, Denmark) A paper chromatographic method for the separation and quant. determination of phenylpyruvic, o-hydroxyphenylpyruvic, p-hydroxyphenylpyruvic and 3-indolylpyruvic acids in aq. soln. or urine as their 3-alkylquinoxalinols by reaction with o-phenylenediamine is described. Oxidation of the aromatic a-keto acids is prevented by NaHS. After separation and elution from the paper, the deriv. are determined by u.v. spectrophotometry. P.D.Dawkins

5799. CHROMATOGRAPHY OF 2,4-DINITROPHENYL-HYDRAZONES ON ACETYLATED PAPER. D.A.Forss and E.H.Ramshaw: *J. Chromatography*, 1963, 10, 268-271 (Div. of Dairy Res. C.S.I.R.O., Melbourne, Australia) Paper chromatography of the 2,4-dinitrophenylhydrazones of various n-alka-2-ones, n-alkanals, n-alk-2-enals and n-alka-2,4-dienals on acetylated paper is described. Good separations have been obtained by overnight equilibration with methanol sat. with heptane followed by development with heptane sat. with methanol. P.D.Dawkins

5800. DETECTION OF COMPOUNDS ON PAPER BY FLUORESCENCE AND PHOSPHORESCENCE AT LIQUID NITROGEN TEMPERATURES. M.P.Gordon and D. South: *J. Chromatography*, 1963, 10, 513-515 (Dept. Biochem., Univ. Washington, Seattle, Washington, U.S.A.) P.D.Dawkins

5801. DETECTION OF SOME AROMATIC ACIDS. D.W.Grant: *J. Chromatography*, 1963, 10, 511-512 (Defence Res. Chem. Lab., Ottawa, Ont., Canada) Paper chromatograms containing aromatic acids were developed, dried and lightly sprayed with 0<3% soln. of H₂O₂. Wet papers were exposed to u.v. light, when after a few minutes blue fluorescent spots became visible. P.D.Dawkins

5802. EVALUATION OF ACID DIAZO DYES BY CHLORIDE DETERMINATION AND PAPER CHROMATOGRAPHY. J.B.Lloyd and F.Beck: *Stain Technol.*, 1963, 38, 165-171 (Dept. Biochem. and Anat., Univ. College, Cardiff, Wales) Since many commercial dye samples vary not only in their dye content but also in the impurities which they contain some method of analysing them is helpful when trying to account for variations in staining prop. The authors suggest a paper chromatography procedure using 80% ethanol and Whatman No. 1 paper for qual. analysis of a no. of diazo dyes; moisture and salt analyses giving some indication of dye quantity. M.J.Bell

5803. METHYL YELLOW AS SPRAY REAGENT IN PAPER CHROMATOGRAPHY OF CHLORINATED HYDROCARBON PESTICIDES. L.F.Krzeminski and W.A.Landmann: *J. Chromatography*, 1963, 10, 515-516 (Amer. Meat Inst. Fndn., Chicago, Ill., U.S.A.) P.D.Dawkins

5804. THIN LAYER CHROMATOGRAPHY OF *cis-trans*-CARBOXYLIC ACID ISOMERS. G.Pastuska and H.J. Petrowitz: *J. Chromatography*, 1963, 10, 517-518 (Bundesanstalt für Materialprüfung, Berlin, Dahlem, Germany) Note. (German) P.D.Dawkins

5805. SIMPLE SATURATION CHAMBER FOR THIN LAYER CHROMATOGRAPHY. B.H.Davies: *J. Chromatography*, 1963, 10, 518-521 (Dept. Agric. Biochem.,

Univ. Coll. Wales, Aberystwyth, Wales) Note. P.D.Dawkins

5806. POLYPHOSPHATE-CELLULOSE, NEW CATION EXCHANGER. PREPARATION AND APPLICATION TO THIN-LAYER CHROMATOGRAPHY. E.Randerath and K.Randerath: *J. Chromatography*, 1963, 10, 509-510 (Inst. fdr Org. Chem., Techn. Hochschule, Darmstadt, Germany) The prep. of cellulose polyphosphate is described. A solvent system for the separation of purine and pyrimidine bases and nucleosides on thin layers of cellulose polyphosphate is given. Compounds were detected by viewing in u.v. light. (German) P.D.Dawkins

5807. GAS CHROMATOGRAPHY OF PYROLYTIC PRODUCTS OF PURINES AND PYRIMIDINES. E.C.Jennings, jun. and K.P.Dimick: *Analyt. Chem.*, 1962, 34, 1543-1547 (Wilkens Instrument and Res. Inc., P.O.Box 313, Walnut Creek, Calif., U.S.A.)

A simplified technique of pyrolysis for the identification of non-volatile materials in fig. quantities by gas chromatography using a H₂ flame ionisation detector. High temp pyrolysis at 1100° to 1200° gave max. yield of pyrolytic products from purines and pyrimidines. Under these conditions various mol. structures showed characteristic thermal fission patterns. The yield of a major pyrolytic product was, in some cases, directly related to the total amount of material subjected to pyrolysis. Slight changes in mol. structure could be detected in the kinds and amounts of the pyrolytic products. L.G.Gillies

5808. GAS CHROMATOGRAPHIC TRAP DESIGNED TO COLLECT COMPOUNDS WHICH TEND TO FORM AEROSOLS. R.K.Stevens and J.D.Mold: *J. Chromatography*, 1963, 10, 398-399 (Res. Dept., Liggett and Myers Tobacco Co., Durham, N.C., U.S.A.) Note. P.D.Dawkins

5809. QUANTITATIVE GAS-LIQUID CHROMATOGRAPHY OF SELECTED BILE ACID ESTERS ON SE-30, QF-1 AND XE-60 SILICONE POLYMERS. A.Kuksis and B.A.Gordon: *Canad. J. Biochem.*, 1963, 41, 1355-1366 (Biochem. Dept., Queen's Univ., Kingston, Ont. Canada) The suitability of the silicone polymers, SE-30, QF-1, and XE-60, for the quant. separation of the common bile acid methyl esters, their acetates, and trifluoroacetates was investigated using narrow bore columns (1/8 in. x 3 ft. or 5 ft., 195-220°, 1-2% w/w stationary phase). Complete and quant. separations were obtained only with trifluoroacetylated bile acid methyl esters on QF-1 columns. Complete separation of acetylated methyl esters was obtained on SE-30 columns, but the area response had to be corrected for quant. determinations. The other columns and deriv. failed to give either complete or quant. separations. A.M.Gibbins

5810. SIMPLE PIPELINE FOR APPLICATIONS OF SAMPLE IN AGAR GEL ELECTROPHORESIS. H.H.Kreutzen Clin. chim. Acta, 1963, 8, 167-168 (Lab. R.K.Ziekef K.Brew verpleging, Hilversum, Netherlaiids).

5811. MICRO STARCH GEL ELECTROPHORESIS. J.H.Daams: *J. Chromatography*, 1963, 10, 450-455 (Section of Exp. Path. and Gerontology, A.Van Leenwe hoekhuis, Netherlands Cancer Inst., Amsterdam, Netherlands) A micromethod for starch gel electro* phoresis on glass cover slips is described. The method has the same resolving power as larger scale apparatus, it is more rapid, taking 15 min. for electrophoresis of serum and requires only 0*2 jil. of serum. P.D.Dawkins

5812. ALTERED PATTERN OF \wedge FUSION IN DOUBLE DIFFUSION SYSTEM. I. BETWEEN TWO SOURCES OF ONE REACTANT. A.Benä & Biochim. biophys. Acta, 1963, 71, 562-567 (Pathophysiolog. Inst. Med. Fac., Univ., Zagreb, Yugoslavia) The diffusion of the reactant may depend on the ratio of concn. gradients of the reactant and dissolved substances in the gel which diffuse against the reactant, hence an increase of this ratio in the area between 2 diffusing sources results in an altered rate of diffusion. Diffusion expt. with and without chem. reaction showed that the mechanism of alteration of the diffusion rate was independent of the $P_{\text{tesene}}^{\circ}$ ent. In the gel. B.M.Stevens

5813. NUCLEAR MAGNETIC RELAXATION OF WATER PROTONS IN AQUEOUS SOLUTIONS OF PARAMAGNETIC MACROMOLECULES. H.Pfeifen Biochim. biophys. Acta, 1963, 66, 434-439 (Physikal. Inst. K.Marx-Univ., Leipzig, Germany) The part of the relaxation rate which was due to paramagnetic particles was proportional to the square of the effective magnetic moment of the particles multiplied by a factor \propto the shortest possible distance [a] between the paramagnetic centre of the particle and the water protons. The effective magnetic moment could often be calc. from the temp. dependent term of the static susceptibility. The function of Ca²⁺ is known only for Paramagnetic particles in S-state with equidistant Zeeman levels. Depending on the electron relaxation time, the diffusioncoefr and the magnetic field a dependence proportional to from I/a to I/a^3 was found for non-polar particles.

(German) B.M. Stevens

5814. EQUIVALENT CIRCUITS AS RELATED TO IONIC SYSTEMS. A.Finkelstein and A.Maura Biochim. J., 1963, 3, 215 (Rockefeller Inst., New York, U.S.A.)

As a direct algebraic consequence of the fundamental flux equations of Nernst and Planck one may construct two types of equivalent circuits for a homogeneous (charged or uncharged) membrane. One, the pure electrical equivalent circuit*, correctly predicts all the electrical p $\frac{d}{d}p$ of the membrane for both steady and transient states. The other, the mixed equivalent circuit*, predicts the steady state I. * characteristics of the membrane and the steady state ionic fluxes. With regard to the portrayal of the physical basis of the properties of atomo $\frac{g}{g}$ ous membrane, * e. mixed equivalent circuit can be misleading, because this same circuit can also be used to depict a mosaic membrane, in which case the circuit gives a pictorialisation of the physical origin of the membrane properties.

5815. ELECTRON SPIN RESONANCE INVESTIGATIONS OF IRRADIATED CARBOHYDRATES J.U.W. Garnett Nature, Chem., Univ. Nev. 8, 985 (Sch. Kensington, Australia). G.M.Lewis

1963, 28, 272-276'. Fractionation of the hyalopksm of hepatic cells from irradiated rabbits, by a modified Cohn V method K. revealed that irradiation caused an increase in the fatty acid content of sediments 1 and 2. Within 2-6 hr. to sediment 2 there was an increase in loosely bound lipids. These changes preceded the appearance of lipaemia. (Russian) B.J.Cooper

5817. LONG-TERM RAT FEEDING STUDIES ON IRRADIATION AND AGE. A.W.Phillips, H.R.Newcomb and D.

Toxicol. appl. Pharm., 1963, 5, 273-297 (Biol. Res. Labs., Dept. Bacteriol., Syracuse Univ., New York, U.S.A.) Chicken stew and raw cabbage, irradiated with γ rays in doses of 5 \times 58 and 0 \times 558 megarad respectively, were added in amounts of 35% each to the diet of postweaning rats. After consuming this diet for 19 days the rats showed decreased levels of alk. phosphatase in both sexes and of monoamine oxidase in ♀; the latter also showed an increase in alanyl- α -aminopeptidase and 2-naphthyl octanoate esterase levels. Sucrase, GOT and GPT were unaffected. Feeding of the same diet to older rats for 104 weeks had no effect on growth rate or reproductive performance and the incidence of pathological lesions. Irradiation of the food with lower doses of γ -rays did not affect the levels of enzyme activity in post-weaning rats. E.E.Hobbiger

5818. ACTION OF V-RAYS ON SODIUM DEOXYRIBONUCLEATE IN SOLUTION. IV. THE MECHANISM OF DENATURATION. P.H.Lloyd and A.R.Peacocke: Proc. roy. Soc. B, 1963, 158, 71-78 (Dept. Biochem., Univ., South Parks Rd., Oxford, England) The extent of denaturation of calf thymus DNA in NaCl soln. is not affected by dose of γ -rays over a 10-fold range if the ratio of dose to DNA concn. is const. The reaction was inhibited by free-radical inhibitors and was more effective if Cl⁻ was replaced by F⁻. The extent of denaturation did not decrease logarithmically with dose, due probably to different stabilities in the linkages between the base pairs of DNA. Denaturation probably occurs through the action of free radicals. G.M.Lewis

5819. SYNTHESIS OF DNA AS FUNCTION OF RADIATION DOSE TO LIVER IN PARTIALLY HEPATECTOMIZED RATS. W.B.Looney, M.L.Pardue and F.W. Banghart: Nature, Lond., 1963, 198, 804-805 (Radiobiol. and Biophys., Lab., Dept. Radiol., Univ. Virginia Sch. Med., Charlottesville, Va., U.S.A.)

DNA synthesis in the liver of partially hepatectomised rats was followed after local irradiation by various doses of X-rays. The dose-response curve resembled that found for DNA synthesis in other systems previously examined. G.M.Lewis

5820. EFFECTS OF ULTRAVIOLET LIGHT ON THYMIDINE DINUCLEOTIDE AND POLYNUCLEOTIDE. R.A.Deering and R.B.Setlow: Biochim. biophys. Acta, 1963, 68, 526-534 (Phys. Dept., New Mexico Highlands Univ., Las Vegas, N.Mex., U.S.A.) Absorbance changes in dithymidylic acid and in polythymidylic acid produced by u.v. irradiation are interpreted in terms of the reversible formation of dimers between adjacent thymine residues. Dimer formation, breakage and steady state fraction were all X dependent. Action spectra for dimer formation were approx. the same as the thymine absorption spectrum. Quantum yields were approx. 0 \times 01 for dithymidylic acid and approx. 0 \times 02 for polythymidylic acid. Action spectra for dimer breakage were the same for both polymers and similar to that for breaking the thymine dimer. The quantum yield was approx. 1. The steady state dimer fraction was approx. 70% for 280 mp and approx. 15% for 240 m(j) irradiation. B.M.Stevens

5821. ULTRAVIOLET INACTIVATION OF DNA PRIMER ACTIVITY. I. EFFECTS OF DIFFERENT WAVELENGTHS AND DOSES. F.J.Bollum and R.B.Setlow: Biochim. biophys. Acta, 1963, 68, 599-607 (Biol. Div., Oak Ridge Nat. Lab., Oak Ridge, Tenn., U.S.A.) U.v. irradiation of native or denatured DNA drastically

BIOPHYSICS

reduced the ability of denatured DNA to act as primer. 280 mJt radiation was more effective than 239 mJi radiation; effects of 280 mJi radiation were partially reversed by 239 mJi radiation. Priming activity was not reduced to 0 but with high adenine-thymine DNA was reduced to approx. 10% of the initial activity. The polymer produced using such irradiated primer had a higher guanine/adenine ratio than normal.

B.M.Stevens

5822. EFFECT OF IONISING RADIATION ON PYRIDINE NUCLEOTIDES OF THYMOCYTES. J.F.Scaife: Canad. J. Biochem., 1963, 41, 1469-1481 (Defense Res. Chem. Lab., Dept. of Nat. Defense, Ottawa, Canada) NAD constituted 95% total oxidised pyridine nucleotides in thymocytes, with very low NADH₂ levels. Following *in vivo* or *in vitro* irradiation with as little as 25 rad, the thymocytes lost NAD, but not RNA, rapidly, with no concomitant rise in NADH₂. NAD loss was principally from the nucleus, and was characterised by an intracellular release of NADase from the mitochondria and nucleus into the cytoplasm. The capacity for thymocytes to synthesise NAD from [7-14C]nicotinamide was reduced. The presence of nicotinamide, but not nicotinic acid, cysteamine, L-cysteine, or promethazine, produced an unphysiol. increase in NAD in whole thymus or thymocytes, but did not prevent development of pyknotic degeneration in irradiated thymocytes. A.M.Gibbins

5823. EFFECT OF X-IRRADIATION ON CHROMIUM-51 CONTENT OF LIVER NUCLEIC ACIDS AND PROTEINS. P.V.Vittorio and E.W.Wight: Canad. J. Biochem., 1963, 41, 1349-1354 (Defense Res. Chem. Lab., Dept. Nat. Defense, Ottawa, Canada) When tracer amounts of Na radiochromate were inj. i.p. into mice, X-irradiation (600 r) produced an increase in the ⁵¹Cr content of the liver. This was accompanied by an increase in ⁵¹C r content of the liver proteins and nucleic acids which was greatest at 16 days, but at 37 days the X-irradiated and non-irradiated values were fairly similar. It was suggested that the ⁵¹Cr content of the liver or liver proteins could be used as an index of repair or recovery following injury by X-irradiation.

A.M.Gibbins

5824. RADIATION-INDUCED GELATION OF DILUTE AQUEOUS PECTIN SOLUTIONS. I.J.Wahba, D.F. Tallman and L.M.Massey, jun.: Science, 1963, 139, 1297-1298 (New York St. Agric. Expt. Sta., Cornell Univ., Ithaca, N.Y., U.S.A.) Gels are produced in pectin soln. by low dose ¹⁴C-irradiation under certain conditions of *pH*, concn., temp., and exposure time in the absence of O₂ and radiation protectants. Free radical intermediates are probably implicated in gel formation. G.M.Lewis

5825. CHANGE IN VISCOSITY OF MEDIUM AFTER IRRADIATION OF BACTERIA WITH U.V. LIGHT. C.N.Murty and A.Guha: Nature, Lond., 1963, 198, 902-903 (Biophysics Lab., Coll. of Med. Sci., Benaras Hindu Univ., Varanasi, India) U.v. irradiation of *E. coli* caused a rise in *r* of the medium, followed by a fall at higher doses. It is suggested that this is due to elution of viscous substances from the cell which are degraded at higher dose rates. G.M.Lewis

5826. LOSS OF SOLUBLE MATERIALS FROM IRRADIATED THYMOCYTES IN VITRO. D.K.Myers, D.E.De Wolfe, K.Araki and W.W.Arkinstalk: Canad. J. Biochem., 1963, 41, 1181-1199 (Biol. Branch, Atomic Energy Canada Ltd., Chalk River, Ont., Canada) Following exposure to X-radiation in doses above 100 r, rat thymo-

cytes incubated in Krebs-Ringer soln. at 37° and pH 7*4 lost acid-sol, ribonucleotide and K into the extracellular fluid, after a lag period of 1 hr. DNA was gradually depolymerised, and deoxycytidylate deaminase became inactivated. Similar losses occurred when the thymus gland was irradiated in the intact animal. A decrease in pH or temp, minimised K loss, which was probably due to a breakdown of intracellular binding structures. The loss of sol. materials appeared to be related to the death of the cells following X-radiation.

• A.M.Gibbins

5827. GLUCURONIDE EXCRETION AND DETOXIFICATION MECHANISM IN WHOLE-BODY IRRADIATED RATS. J.Chiriboga: Nature, Lond., 1963, 198, 803-804 (Agric. Res. Lab., Oak Ridge, Tenn., U.S.A.) Excretion of glucuronides decreased in rats after 1000 r of Co-60 v rays; the sensitivity to intragastrically administered naphthalene was also decreased. Irradiation did not increase the toxicity of chloral hydrate inj. i.p. G.M.Lewis

5828. UNCOUPLING OF OXIDATIVE PHOSPHORYLATION BY IONISING RADIATION. H. THE STABILITY OF MITOCHONDRIAL LIPIDS AND CYTOCHROME $\frac{1}{2}$. J.F.Scaife and B.Hilb: Canad. J. Biochem., 1963, 41, 1223-1233 (Defense Res. Chem. Lab., Dept. Nat. Defense, Ottawa, Canada) Rat or rabbit thymus mitochondria, which contained less than 0*2 pg. cytochrome $\frac{1}{2}$ /mg. protein, showed uncoupling of oxidative phosphorylation following treatment of the animals by 800 rad of ionising radiation 4 hr. prior to sacrifice. Heart Qr liver mitochondria from animals irradiated up to 12 hr. previously showed no uncoupling of oxidative phosphorylation, even though some prep. had reduced cytochrome $\frac{1}{2}$ contents, and irradiation had no apparent effect on endogenous cytochrome c or its binding. It was suggested that the low level of cytochrome c in thymus mitochondria, which contained no lipid uncoupling factor indicated a critical condition at which radiation damage could become manifest. A.M.Gibbins

5829. EFFECT OF IONISING RADIATION ON OXIDATION OF SUCCINATE BY RAT THYMUS MITOCHONDRIA. J.F.Scaife: Canad. J. Biochem., 1963, 41, 1486-1490 (Defense Res. Chem. Lab., Ottawa, Canada)

An examination was made of the succinate-tetrazole reductase activity of thymus from normal and irradiated rats (800 rads 4 hr. earlier). Phenazine methosulphate [PMS] was used to mediate the flow of electrons to 2- β -iodophenyl-3-E"-nitrophenyl-5-phenyl-monotetrazolium chloride hNT₂T. Irradiated prep., from fresh homogenates, exhibited slightly reduced activity in the absent of PMS, but markedly increased activity in its presence*. When the homogenates were centrifuged, a cofactor in the supernatant was required for enzyme activity of the mitochondria. The supernatant was capable of reacting directly with INT, this only occurring in the absence of mitochondria. The homogenate reaction was only slightly inhibited by antimycin A (5% at 2 fig./ml.).

A.M.Gibbins

5830. THYMUS: ITS ROLE IN LYMPHOID RECOVERY AFTER IRRADIATION. R.Auerbach: Science, 1963, 139, 1061 (Dept. Zool., Univ. Wisconsin, Madison, Wis., U.S.A.) In Fi (C3HXAKR) mice irradiated with 900 r X-rays, lymphoid cells of the spleen were # destroyed. Later, recovery was seen in the accumulation of lymphoid cells in spleen lymphoid creptes, except in₅ thymectomised animals. G.M.Lewis

5831. EFFECTS OF LOCAL IRRADIATION (60C0 TELE-THERAFY) ON PERIPHERAL BLOOD AND BONE MARROW. F.A.Goswitz, G.A.Andrews and R.M. Kniseley: Blood, 1963, 21, 605-629 (Oak Ridge Nuclear Studies Inst., Tenn., U.S.A.) ⁶⁰Co tele-therapy caused a reduction in w.b.c. and lymphocytes in peripheral blood. Local irradiation produced a parked hypoplasia in the irradiated sites with a reduction in the no. of megakaryocytes in r.b.c and w.b.c. precursors. After "cancercidar radiotherapy, some capacity of bone marrow to regenerate was retained. Haemosidenn increased in irradiated sites. H.B.Waynforth

5832. SERUM ACTION ON RADIATION RESPONSE IN TISSUE CULTURE. H.M.de Oca, E.J.Schilling, J.C. Bryant, V.J.Evans and W.R.Earle: J. nat. Cancer Inst., 1963, 30, 57-66 (Tissue Culture Sect., Nat. Cancer Inst., Bethesda, Md., U.S.A.) Serum modified the radiation response of NCTC 2071 cells in suspension culture by speeding recovery of the ^{radiated} cells when serum was added either before or immediately after radiations such cells began to recover at 10 days after radiation. Cells irradiated in serum-free medium did not resume growth, or if they did, recovery was delayed to 28 days after irradiation. J.G.Bennette

5833. ACTION OF X-RAYS ON NICTITATING MEMBRANE OF CAT. A.Dresse, M.-h¹T²?/1*³*?/!
Z.M.Bacq: Arch. int. Physiol. 1963, 71, 1-11 (Univ. Liège, Belgium) Brief comm.

(French) M.E.Nutt

5834. RELATION OF DEVELOPMENTAL STATUS OF LIMB FORMATION TO RADIATION SENSITIVITY

Univ. Oklahoma, Norman, Okla., U.S.A) closely graded series of chick embryos in stages 8-35 were X-irradiated with doses selected so that the lethaleffects at different stages were approx. equal. Three types of skeletal anomaly were observed. In limb, which was most marked totally, was * earliest to be induced. This was followed by sp. reduction in the size of individual skeletal components either laterally or at joints. The pattern of radiosensitivity is intimately related to the developmental progression. R.J. Walker

5835. CAN MAMMALIAN EMBRYO BE KILLED BY X-IRRADIATION? R.Rugh and M.Wohlfrohm: J. exp. Zool., 1962, 151, 227-243 (J. exp. Lab. Radiol. Dept., CoU. Phys. and Surg., Columbia Univ., New York, U.S.A.) 181 pregnancies and u. 825 in & £ of CH Lain mice were used to determine the level of X-irradiation necessary to kill 50% of their embryos. Embryos irradiated during the first half of gestation were more sensitive than those in the second half. 80% of embryos were most vulnerable. The periods of radiosensitivity occurred during the early stage and neurogenesis. The epiphysial period of greatest resistance was at implantation. In general the sex ratio was not great, disturbed by X-irradiation. The most consistent and equumult of embryonic or foetal X-irradiation Anting, a reduction in total body size. R.J.Walke

5836. INFLUENCE OF OXYGENATION ON RESTING CELLS ON SURVIVAL AFTER IRADIATION. T.Rudnicki: Pozn. Towarzy. Przyjaci. iur*- Wydz. lek., 1962, 22, 273-

293 (ZaHiad PatoL Ogłoszenia i Dolwiadczalnej, Akad. Med., Poznań, Poland) X-ray irradiation of white rats with a single dose of 430 rads, 2 and 3 days before partial hepatectomy lowered mitotic index and destroyed the chromosomal apparatus of regenerating liver, the effect was more pronounced the shorter the interval between irradiation and increased mitotic activity. Irradiation 45 days before hepatectomy had no effect upon mitosis.

(Polish) T.Qebicki

5837. VARIATION OF RADIATION SENSITIVITY OF PARAMOECIUM AURELIA AS FUNCTION OF TIME OF IRRADIATION IN INTERDIVISION GROWTH CYCLE. J.Calkins: Nature, Lond., 1963, 198, 704 (Dept.

Physics, Univ. Texas, Houston, Tex., U.S.A.) Using cultures of *P. aurelia* in a state of synchronised division, it was shown that sensitivity to X-irradiation varies only very slightly through the interdivision cycle while sensitivity to u.v.-irradiation is greatest shortly after division.

G.M.Lewis

5838. RADIOSENSITIVE STRUCTURE OF T2 BACTERIOPHAGE USING LOW ENERGY ELECTRON BEAMS.

A.Cole and R.Xangle: Biophys. J., 1963, 3, 189

(Dept. Phys., Univ. Texas, Houston, Tex., U.S.A.)

Hydrated T2 bacteriophage were irradiated with 0.75 to 90 kev electron beams. A thin foil isolated the sample chamber from the electron gun source. Survival (plaque formation) was observed. Apparent cross-sections and D37 doses were determined. The max. cross-section of about $5 \times 10^{-13} \text{ cm}^2$ is roughly equal to the cross-sectional area presented by the phage core. As beam energy was increased the average D37 dose first attained a min. value of about 23 kr for 1 kev electrons (which penetrate the relatively inert protein coat) after which the average D37 dose rose with beam energy to a max. value of about 50 kr for fully penetrating beams. These dependencies suggest that the radiosensitive structure exists as a peripheral shell rather than a uniformly sensitive core. A tentative model for the phage structure, based on this and other evidence, is presented. *

5839. COMPARATIVE KILLING EFFICIENCIES FOR DECAYS OF TRITIATED COMPOUNDS INCORPORATED INTO E. COLI. S.Persore: Biophys. J., 1963, 3, 183

(Grad. Sch. Committee Biophys., Pennsylvania State Univ., University Park, Pa., U.S.A.) The killing efficiencies due to the decay of incorporated [3H]thymidine, [3H]uridine, and [3H]histidine in *E. coli*. 15 T-L have been determined, i.e. labelled DNA, RNA and protein. Decays from [3H]thymidine are 2-3 times as effective in producing lethality as those from [3H]uridine and 2-5 times as effective as those from [3H]histidine. It seems that the greater part of damage from [3H]thymidine decays is due to chem. changes associated with nuclear transmutation. *

5840. RADIOPROTECTION BY ACCLIMATISATION TO COLD. R.Ghys: Nature, Lond., 1963, 198, 603 (Lab. Radiobiol., Dept. Biochim., Univ. Laval, Québec, Canada) In rats exposed to ⁶⁰Co-irradiation, the relative biol. effectiveness of chronic doses of 10-12 rad/hr. is about 72% of the efficiency of acute irradiation, all parameters other than dose rate being the same. In the LD₅₀ range the biol. efficiency of chronic irradiation is reduced by 50% in rats acclimatised to cold by exposure to 5° for 1 month; the protective effect lasts about a week. At the LD₅₀ level, the protection coeff. due to cold acclimatisation is reduced to 1/6, but variations for total doses above 1200 rad might be influenced by changes in radiosensitivity during prolonged irradiation.

G.M.Lewis

BIOPHYSICS

5841. EFFECT OF DIETHYLENETRIAMINE-PENTACETIC ACID [DTPA] AND POLYPROPYLENEGLYCOLETHYLENE OXIDE POLYMER ['PLURONICS'] ON EXCRETION OF INHALED $^{239}\text{PuO}_2$ IN DOGS. E.G.Tombropoulos, W.J.Bair and J.F.Park: Nature, Lond., 1963, 198, 703-704 (Biol. Lab., Hanford Lab., Gen. Electric Co., Richland, Washington, U.S.A.) Dogs exposed to aerosols of $^{239}\text{PuO}_2$ were treated subsequently with aerosols of DTPA or 'Pluronics'. The rate of excretion of Pu was somewhat increased, but the distribution in the tissues, other than lymph nodes was scarcely affected.

G.M.Lewis

5842. EFFECT OF AET ON PERIPHERAL BLOOD CELLS OF RABBIT FOLLOWING GAMMA IRRADIATION. N.V.Colclough and CHanna: Arch. int. Pharmacodyn., 1963, 143, 8-16 (Pharmacol. Dept., Med. Coll., Vermont Univ., Burlington, Vt., U.S.A.) S,2-aminoethylisothiouronium bromide hydrobromide [AET] has a well defined ratio-protective effect in small rodents. It did not prolong the survival rate of rabbits exposed to γ -irradiation, but in the haemopoietic system it initiated faster recovery of surviving cells.

T.J.Sullivan

5843. PROTECTIVE EFFECT OF AROMATIC AMINES AGAINST RADIATION DESTRUCTION OF POLYMETHYLMETACRYLATE. Kh.S.Bagdasarian, V.A. Krongauz and N.S.Kardash: Dokl. Akad. Nauk, 1962, 144, 101-104. Spectrophotometry was used in the study of the mechanism by which certain aromatic amines (B-naphthylamine, phenyl-B-naphthylamine, diphenylamine, triphenylamine) have a protective effect against destruction by radiation (60Co yirradiation) of polymethylmethacrylate. Expt. were carried out in a vacuum at room temp, and at the temp, of liquid N₂. Diphenyl-picrylhydrazyl was found to have no such protective effect.

(Russian) BJ.Cooper

5844. PROTECTIVE PROPERTY OF TETRAHYDROXY-QUINONE AGAINST ACTION OF X-RAYS ON YEAST. M.M.Jean-Louis Seris and A.BNB C.R. Acad. Sci., Paris, 1962, 255, 4, 791-793 (Lab. Physiol. vegetale approfondie, Fac. Sci., Toulouse, France) Tetrahydroxyquinone effectively protects yeast cells against the effects of X-rays. The protection is optimal pH between pH 4-6. With concn. higher than 5mM/l. the % of survivors no longer varies with increase in concn. of tetrahydroxyquinone.

(French) J.M.Thomas

5845. REMOVAL OF STRONTIUM-90 FROM MILK. J.Silverman, D.Ghosh and R.L.Belcher: Nature, Lond., 1963, 198, 780 (Dept. Chem. Engineering, Glenn Martin Inst. Technol., Univ. Maryland, Md., U.S.A.) About 90% of Sr in milk is removed by contact with Ca phosphate which is subsequently removed.

G.M.Lewis

5846. RELATIONSHIPS BETWEEN THE DEPOSITION OF STRONTIUM-90 AND CONTAMINATION OF MILK IN THE U.K. E.R.Mercer, J.D.Burton and B.O.Bartlett: Nature, Lond., 1963, 198, 662-665 (A.R.C. Radiobiol. Lab., Letcombe Regis, Wantage, Berks., England) The slow process of plant-base absorption appears to be the major route of contamination of milk with 90sr.

G.M.Lewis

5847. STABILITIES OF SOME ALKALINE EARTH CHELATES OF TETRACYCLINE. D.C.Maxwell, P.J.A. Smith and S.P.Wilford: Nature, Lfcnd., 1963, 198, 577-578 (Chem. Divn., Atomic Weapons Res. Estab., Aldermaston, Berks., England) The acid dissociation const. of tetracycline and the stability const. of its Mg, Ca and Sr chelates were determined potentiometrically. Tetracycline would not appear to be of much value for the removal of radioSr from the skeleton.

G.M.Lewis

5848. STRONTIUM-90 IN HAIR. B.J.Hopkins, L.W. Tuttle, W.J.Pories and W.H. Strain: Science, 1963, 139, 1064-1065 (Sch. Med., Univ., Rochester... New York, U.S.A.) The hair of rats inj. with 90sr contained considerable amounts of this radionuclide when analysed ± 2 months after injn. Rats which had been inj. in utero retained much less Sr, presumably due to loss of hair during growth. Hair analysis may provide a non-destructive method for measuring bone-seeking elements.

G.M.Lewis

5849. CALIBRATION OF CAESIUM-137 CONTENT IN HUMAN BODY. T.A.Iinuma, N.Nohara, T.Nagai and R.Ichikawa: Nature, Lond., 1963, 198, 604-605 (Nat. Inst. Radiol. Sci., Chiba, Japan).

G.M.Lewis

5850. NATURALLY OCCURRING d-EMITTING NUCLIDE IN HUMAN BODY. B.Rajewsky and W.Stahlhofen: Nature, Lond., 1963, 198, 960-962 (M.-Planck-Inst.. Frankfurt am Main, Germany) The levels of 228Th, 226Ra, 210pb and 210Po were determined in human bones. Radiation doses absorbed in bones from 210Po are about 3*1 mrad/yr. and are about 4 times the doses absorbed from 226Ra and its daughter isotopes and from 228Th and its daughter isotopes.

IMMUNITY TO INFECTION

5851. m. PRODUCTION AND PRELIMINARY CHARACTERISATION OF VACCINES FOR THE FIELD TRIAL. M.Kuczajowa and B.-Schiller. Przegl. epidem., 1963, 17, 23-32 (Wydawnictwo Naukowe Szczepionek, Kraków, Poland). J.Korbecki

5852. A QUANTITATIVE METHOD OF PROPERDIN DETERMINATION BY ESTIMATION OF ITS PROTEIN. C.Koziarowski and B.Potnicki: Przegl. epidem., 1962, 16, 461-465 (I Klinika Pediatriczna, Aficid. Med., Wrocław, Poland) The method is based on absorption of properdin on inulin and determination of Protein by the turbidimetric tannin micromethod. (Polish) M.Korbecki

5853. IMMUNISATION OF SCHOOL-AGE CHILDREN AGAINST DIPHTHERIA. A.Gstafazka and T.Olakowski Przegl. Viden., 1962, 16, 43f-442 (Pafistwowy Zakład Hig. Warszawa, Poland) A routine diphtheria-tetanol vaccine absorbed on Al(OH)₃, in spite of & effectiveness caused a high % ^JSS^00:/. The vaccine containing 2Lf of diphtheria toxoid gave a satisfactory response when applied as a repeating dose but was not sufficient as a basic vaccine dose. (Polish) M.Korbecki

5854. MICROMETHOD IN TESTING THE ASCVTITRE. K-W.Jodarczyk: Med. dosw.. Mikrobiol.. 1982, 14. 383-387 (In Klinika Chorob Dziecięcych, Akad. Med. Poznań, Poland). (Polish) H.Osowiecki

5855. SEROLOGICAL REACTIONS IN THE DIAGNOSIS OF RHEUMATIC FEVER IN CHILDREN. I. METHODS OF DETERMINING ANTISTREPTOLYSIN O IN HUMAN BLOOD SERUM. K.Ulewicz: Biul. Inst. Med. morski, 1962, 13, 189-193 (Lab. Sanitarno-Higieniczne Marynarki Wojennej, Gdynia, Poland). ^ j ^ ^ (Polish)

5856. A COMPARATIVE EVALUATION OF THE IMMUNOGENIC POTENCY OF ANTI-HOOPING-COUGH VACCINES IN MAN. II. EPIDEMIOLOGICAL EVALUATION OF PERTUSSIS COMPONENT OF Di Te **. COMBINED VACCINES. A. Adonarfa Przegl. epidem., 1962, 16, 423-430 (Pałtowy Zakład Higieny, Warszawa, Poland) Among children born in 1959-1961 immunised with Di Te Per vaccine 1.3% were affected with whooping-cough in contrast to 6.6% in a control group. The vaccine of Polish origin proved to be more effective than that of Swiss origin. (Polish) M.K.

5857. ANIMAL STUDIES ON ACTIVE ^UNISATION AGAINST TETANUS. L.Korzeni Z. Hyg.-InfektKr., 1962, 149, 1-10 (Behringwerke AG, Marburg a.d. Uhrt Germany) Using guinea-pigs the effectiveness of adsorbed and non-adsorbed tetanus toxoid was studied. Active immunity was dependent on the ^TMTATM*TM^ fte booster dose. (German) A.J.Wansbrough

5858. INCIDENCE OF NATURAL CLOSTRIDIUM WELCHII n-ANTITOXIN IN INDIAN EQUINES ITS RELATIONSHIP TO ANTI-ANTIGENIC STIMULUS. P.S.Basu and R.N.Roy. J. Hyg. Lond., 1963, 61, 213-215 (Bengal Immunity Lab., Calcutta, India) 17 horses and 5 mules had 1 unit or more of natural Circulating C. welchii a-antitoxin, and 5 of them had a ** of 4 uX as determined by the lecithovitellin reaction. 7 of the animals were hyperimmunised with S^welchU d-racins, but the titres produced were not

directly proportional to the natural immunity observed in each of them. J.B.Derbyshire

5859. ANTIBODY RESPONSE TO POLYVALENT INFLUENZA VIRUS VACCINE ADMINISTERED INTRADERMALLY OR SUBCUTANEOUSLY IN AN AGED POPULATION. S.Saslaw, H.N.Carlisle and B.Slutzken Amer. J. med. Sci., 1963, 245, 387-398 (Dept. Med., Ohio State Univ. Coll. Med., Columbus, Ohio, U.S.A.) In aged subjects the Ab response obtained with a polyvalent influenza vaccine was greater after s.c. than after i.d. vacccn. The same titre was obtained regardless of whether a subject has been previously vaccinated. E.E.Hobbiger

5860. DETERMINATION OF TYPE-SPECIFIC ANTIBODIES AGAINST POLIOVIRUS LABELLED WITH PHOSPHORUS-32 BY AN ELUTION TEST. R.Thomssen: Nature, Lond., 1963, 198, 613-614 (Dept. Virol., Inst. Hyg., Univ., Freiberg/Br., Germany) Polio-virus labelled with 32p treated with type sp. Ab was eluted from Al(OH)₃ gel at higher concn. of PO₄ than material incubated with heterologous serum or without antiserum. G.M.Lewis

5861. SAFETY OF IMMUNISATION WITH THE ATTENUATED POLIOVIRUS STRAINS TYPE 1 CHAT AND TYPE 3 W FOX. Przegl., epidem., 1962, 16, 377-388 (Pafistwowy Zakład Higieny, Warszawa, Poland) Immunisation with type 1 Chat was safe whereas occasional polio infections were noted in persons being on contact with those immunised with type 3 W Fox. (Polish) M.Korbecki

5862. DURATION OF HUMORAL IMMUNITY IN POPULATION IMMUNISED AGAINST POLIOMYELITIS. Przegl. epidem., 1962, 16, 405-413 (Pafistwowy Zakład Higieny, Warszawa, Poland) Ab for type 1 were detected in 85-100% and for type 3 in 71-10% of persons immunised against poliovirus. Serol. examination was performed 1-2 months and 1-3 yr. after immunisation. (Polish) M.Korbecki

5863. SEROLOGICAL STUDIES ON ANTIBODY LEVELS IN CHILDREN IMMUNISED AGAINST POLIOMYELITIS IN POZNAN CITY AND PROVINCE. J.Adamski, J.Wiza, B.Mazur Przegl. epidem., 1962, 16, 415-421 (Akad. Med., Poznań, Poland) Serol. examination of 435 children showed that before immunisation 23*4% of them had no Ab against poliovirus whereas 29*8% had Ab against all three types of the virus. After immunisation Ab were not present in 0.7% of children whereas 68*5% showed Ab against all types of the virus. After 2 yr. out of 130 examined children 73*8% showed Ab against all types and 23% against 2 types of the virus. (Polish) M.Korbecki

5864. POLYSACCHARIDE CONTENT OF SCHISTOSOMA SKIN TEST ANTIGENS AND THE REACTIVITY OF OXIDATIVE AND CARBOHYDRATE COMPONENTS. I.G.Kagan and C.G.Goodchild: Amer. J. Trop. Med. Hyg., 1963, 12, 179-183 (U.S. Pub. Health Serv., Atlanta, Ga., U.S.A.) A no. of skin test Ag were analysed for polysaccharide content by the anthrone method and N content by Nessler and micro-Kjeldahl methods. No correlation was observed between N and polysaccharide content of Ag prep, by several methods from cercariae and adults of Schistosoma mansoni. Ag prep, in different laboratories and adjusted to approx. similar N content gave comparable wheal areas when inj. i.d. The polysaccharide content of these Ag varied from 23 to 114 y/znl. It was concluded that polysaccharide

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

content was an unreliable indicator of the in vivo activity of these skin test Ag.

A.A.Zimmerman

5865. GEL DIFFUSION STUDIES WITH TOXOCARA AND ASCARIS EXTRACTS. C.C.Huntley and A.Moreland: Amer. J. Trop. Med. Hyg., 1963, 12, 204-208 (Dept. Pediatrics, Bowman Gray Sch. Med., Winston-Salem, N.C., U.S.A.) Analysis of Toxocara canis and Ascaris lumbricoides extracts was made with a rabbit Toxocara antiserum. At least 9 antigenic components in the Toxocara extract and at least 5 cross-reacting Ag in the Ascaris extract were found. Precipitins to Toxocara extract were found in the sera of two children with visceral larva migrans. One of these two sera also contained precipitins to Ascaris.
A.A.Zimmerman

HYPERSENSITIVITY

5866. V-GLOBULINS AND FRACTIONS I AND m OF PORTER IN PASSIVE ANAPHYLAXIS IN VITRO.

M.Liacopoulos, B.N.Halpern, P.Liacopoulos and M.F. PerramanG C.R. Soc. Biol., Paris, 1963, 157, 76-82 (Inst. Nat. Hyg., H\$P. Broussais, Paris, France)

In the case of direct passive anaphylaxis which comprised previous sensitisation of guinea-pig intestine with Ab, y-globulins and fraction HI produced an anaphylactic response whereas fraction I was inactive. Addition of fraction I desensitised the tissue and made it insensitive to addition of ygtobulins. During previous sensitisation of the tissue with the Ag followed by addition of the sp. Ab, anaphylaxis was observed when the Ag was y-globulin or fraction HI. No reaction occurred with fraction I.
(French) M.A. Price

5867. HYPERSENSITIVITY TO A SYNTHETIC POLYPEPTIDE: INDUCTION OF A DELAYED REACTION.

S.Ben-Efraim, S.Fuchs and M.Sela: Science, 1963, 139, 1222-1223 (Israel Inst. Biol. Res., Nes Ziona, Israel) A multichain copolyptide, p(Tyr, Glu)-pAla-pLys, induced in guinea-pigs a prolonged state of delayed hypersensitivity not associated with detectable circulating Ab. Cross reactions of the delayed type were observed with chem. related polypeptides. G.M.Lewis

5868. PASSIVE TRANSFER OF CONTACT SENSITIVITY BY [3H]THYMIDINE-LABELLED LYMPHOID CELLS.

J.S.Najarian and J.D.Feldman: J. exp. Med., 1963, 117, 775-780 (Surg. Dept., Univ. California Sch. Med., San Francisco, Calif., U.S.A.) Passive transfer of [3H]thymidine labelled lymphoid cells sensitised to dinitrofluorobenzene [DNFB] into homologous guinea-pigs gave pos. skin reactions in the recipients 24 hr. after skin testing with DNFB. Labelled small and large lymphocytes and immature lymphoid cells accumulated at the reaction sites, whereas, labelled non-sensitised lymphoid cells did not appear non-specifically in contact skin reaction sites. These results indicate that contact sensitivity, like tuberculin sensitivity requires the sensitised cell to initiate the skin reaction.
H.E.H.Jones

TISSUE ANTIGENS (EXCLUDING TUMOURS)

5869. THE POSITIVE HAEMAGGLUTINATION-INHIBITION TEST IN HORSE SERA WITH A2 ANTIGEN. S.Woyciechowska and H.Grzelakowa: Med. dośw., Mikrobiol., 1962, 14, 355-364 (Zatfad Wirusologii, Państwowy Zatfad Hig., Warszawa, Poland) Highly pos. results of the haemagglutination-inhibition test were obtained in 35-5% of horse sera with A2 Wiktor 57 Ag and low pos. reactions with A2 Singapo# 57 and A2 Biela 57. 18-8% of horse sera showed a pos. test with A-equine Praha 56 Ag.

5870. A HUMAN 'D-LIKE' ANTIBODY. P.Levine, M.J.Celano, J.Wallace and R.Sangen: Nature, Lond. 1963, 198, 596-597 (Ortho Res. Fndn., Raritan, N.J., U.S.A.) G.M.Lewis

5871. SEROLOGY OF THE CHARACTER D". A.Lauer and H.H.Hoppe: Blut, 1963, 9, 1, 44 (Central Inst. Blood Distrib., Hamburg, Germany) Difficulties in the serol. differentiation of sera containing D and D^u character are described. (German) AJ.Wansbrough

5872. EXPERIMENTAL STUDIES ON PREVENTION OF Rh HAEMOLYTIC DISEASE. C.A.Clarke, W.T.A. Donohoe, R.B.McConnell, J.C.Woodrow, R.Finn, J.R.Krevans, W.Kulke, D.Lehane and B.M.Sheppard: Brit. med. J., 1963, i, 979-984 (Dept. Med., Univ. Liverpool, England) Rh+ blood was inj. into 96 Fb* men. When blood was followed after 1 hr. by 10-20 ml. anti-D sera with a high titre of complete Ab only 50% of inj. cells were cleared within 48 hr. and anti-D product was greater than in controls given blood only. When blood was followed by 35-50 ml. plasma containing incomplete Ab only 3 of 21 men developed anti-D after 3 or 4 stimuli, compared with 11 of 21 controls. Prelin¹, results with anti-D-y-globulin i.m. showed that this was more effective than the most powerful plasma used.

M.E.Nutt

5873. REACTION OF ERYTHROCYTE MUCOPROTEINS WITH ANTI-N PHYTOAGGLUTININS FROM Vicia GRAMINEA SEEDS. E.Lisowska: Nature, Lond., 1963, 198, 865-866 (Dept. Biochem., Ludwik Hirschfeld Inst. Immunol., Wroclaw, Poland) Muco* proteins from human horse and bovine r.b.c. were obtained by extraction of the stroma with hot phenol. Sialic acid was removed by hydrolysis and the serol. activity determined by inhibn. of aggl. of human group N r.b.c. by V. graminea extract. It was concluded that sialic acid & not a component of the r.b.c. receptor substance for the anti-N agglutinin of V. graminea. The activity of N sup' substances against anti-N phytohaemagglutinins of V. flava B was decreased by treatment v* ith trypsin and ficin.
G.M.Lewis

5874. IN VIVO LOCALISATION OF HETEROLOGOUS ANTI-LEUKOCYTE AND ANTI-BONE MARROW ANTIBODIES IN RAT BONE MARROW. T.Kuroyanagi, A.Kurisu and N.Sugiyama: Blood, 1963, 21, 594-604 (Third Dept. Int. Med., Univ. Tokyo, Japan)

131I-labelled heterologous anti-w.b.c. and anti-bone marrow Ab inj. into rats, localised in vivo, in the bone marrow. No localisation occurred in the lungs. The labels, when inj. Lv. disappeared from the plasma and became fixed to peripheral w.b.c. and bone marrow cell⁵ within 1 hr.
H. B. Waynfirth

5875. IMMUNOLOGICAL STUDIES OF SYSTEMIC LUPUS ERYTHEMATOSUS. I. QUANTITATIVE ESTIMATIONS OF NUCLEOPROTEIN-REACTIVE γ -GLOBULIN IN SYSTEMIC L.E. AND OTHER DISEASES. II. VARIATIONS OF NUCLEOPROTEIN-REACTIVE γ GLOBULIN AND HAEMOLYTIC SERUM COMPLEMENT LEVELS WITH DISEASE ACTIVITY. A.S.Townes, C.R.Steward, jun. and A.G.Oslen Bull. Johns Hopkins Hosp., 1963, 112, 183-201, 202-219 (Med. Dept., Johns Hopkins Univ. Med. Sch., Baltimore, Md. U.S.A.) Serum

Y-globulins which reacted with particles of calf thymus nucleoprotein were estimated by CF with a rabbit anti-serum to human γ -globulin. The values obtained were increased in the presence of fresh serum. Ab to DNA contributed only slightly to the reactivity of systemic L.E. sera with this prep. of nucleoprotein. Levels of nucleoprotein-reactive γ -globulin for normal and L.E. Patients and those with rheumatoid arthritis and several other conditions were indicated.

II. A correlation was made between serum levels of nucleoprotein-reactive γ -globulin and haemolytic serum C'. and the course of systemic L.E. High levels of Y-globulin with diminished serum C' activity were seen in patients with renal disease. Some fatalities occurred in these patients. The serol. changes reflected the clinical activity of the disease process. The application of these techniques to clinical evaluation of patients is discussed.* H. B. Waynfirth

5876. ANTIBODIES TO DENATURED DNA IN LUPUS ERYTHEMATOSUS SERUM. V. MECHANISM OF DNA-ANTI-DNA INHIBITION BY CHLOROQUINE.

D.Stollar and L.Levine: Arch. Biochem., 1963, 101, 335-341 (Grad. Dept. Biochem., Brandeis Univ., Waltham, Mass., U.S.A.) Chloroquine inhib. the fraction of denatured DNA with L.E. sera as measured by quant. CF. Chloroquine, unlike nucleotides, inhib. all pNA immune systems to approx. the same extent. Inhibitory effectiveness of chloroquine and several of its analogues was closely correlated with the association const. of the compounds for DNA. Chloroquine also inhib. bacterial transformation by DNA. B.M.Stevens

⁵⁸77. Gm ANTIBODIES IN INFANTS. I.Sander and E.Stichnoth: Blut, 1963, 9, 102-103 (Inst. Legal Med., Sestfal. Wilhelms-Univ., Münster/Westf., Germany) Of 25 infants 2 had anti-Gm serum Ab. The Possibility of the effect of immunisation is discussed. (German) A.J.Wansbrough

^{5g}78. LOCALISATION OF YIA-GLOBULIN (32A" GLOBULIN) IN TISSUE CELLS. A.O.Carbonara, J.A. Rodhain and J.F.Heremans: Nature, Lond., 1963, 198, 999-1000 (Med. Dept. A, Clin. Univ. St. Pierre, Louvain, Belgium) Immunochemical localisation of YIA-globulin in human lymph node cells indicated similar localisation to those of Yss" and YIM-globulins. G.M.Lewis

⁵⁸79. ANTIGENIC SPECIFICITY OF Y2-MYELOMA [MM] GLOBULINS. L.Korngold: J. nat. Cancer Inst., 1963, 30, 553-567 (Wilson Res. Found., Cornell Med. Center, New York, U.S.A.) The antigenic specificity of the MM globulins that were antigenically related to Y2-globulin which is the major component of the normal J-nirnunoglobulin system and is available in large amounts has been re-investigated. Evidence is presented that extensive adsorption of sp. anti-MM globulin sera with formal γ -globulins did not remove Ab against the homologous MM globulin. J.G.Bennette

5880. IMMUNOLOGICAL PROPERTIES OF KALLIKREINS. M.E.Webster, E.W.Emmart, W.A.Turner, H.Moriya and J.V.Pierce: Biochem. Pharmacol., 1963, 12, 511-519 (Nat. Heart Inst., Bethesda, Md., U.S.A.)

Rabbits immunised with crude or partially purified human urinary or pancreatic kallikreins developed Ab which inhib. the vasodilator activity of the kallikreins in dogs. The antigenic heterogeneity of the kallikreins was shown by the presence of multiple precipitin bands in agar gel. The kallikrein-antikallikrein band was tentatively identified with the use of purified kallikreins. Ab to human urinary kallikrein showed cross-reaction both in agar gel and by inhibn. of the vasodilator activity with human pancreatic kallikrein, but not with dog urinary or hog pancreatic kallikrein. L.G.Gillies

5881. DETECTION OF AUTO-IMMUNE ANTIBODY AND TISSUE ANTIGENS BY THE 'MICROSPOT' TECHNIQUE. J.G.Feinberg: J. clin. Path., 1963, 16, 282-284 (Beecham Res. Labs., Brockham Park, Betchworth, Surrey, England) The cellulose acetate membrane 'microspot*' test for pptg. Ab was satisfactory for the detection of Ab to human thyroglobulin in the sera of auto-immune thyroiditis patients. J.B.Derbyshire

5882. DETECTION OF AUTOANTIBODIES TO CYTOPLASMIC AND NUCLEAR ANTIGENS IN FREEZE-DRIED THYROID. R.C.Nairn, T.Ghose, LB.Porteus and J.A.Urquhart: J. clin. Path., 1963, 16, 281-282 (Path. Dept., Univ., Aberdeen, Scotland) Freeze-dried blocks of thyroid could be used for the detection of auto-Ab to cytoplasmic and nuclear Ag, in addition to colloid Ag, by de-waxing the sections with a 3:1 mixture of isopentone and abs. methanol. J.B.Derbyshire

5883. APPEARANCE OF ANTIBODIES TO TROPHOBlast DURING THE POSTPARTUM PERIOD IN NORMAL HUMAN PREGNANCIES. J.F.Hulka, V.Brinton, J.Schaaf and C.Baney: Nature, Lond., 1963, 198, 501-502 (Dept. Obstetrics, Univ. Pittsburgh, Pa., U.S.A.) Ab to placental syncytiotrophoblastic cytoplasm were not detected in pregnant human sera after treatment with fluorescein, but appeared in postpartum sera from about the 4th day. G.M.Lewis

5884. AUTO-IMMUNE PHENOMENA IN PERNICIOUS ANAEMIA [PA]. D.Doniach, LM.Roitt and K.B.Taylor: Brit. med. J., 1963, i, 1374-1379 (Middx. Hosp. Med. Sch., London, England) The incidence of thyroid Ab was higher in PA patients without overt thyroid disease than in normal controls. Microsomal Ab was present in 45% of patients and in 13% of controls. Thyroid function tests in PA patients with high titres revealed sub-clinical thyroiditis. Gastric cytoplasmic Ag were present in 83% of patients with PA in 27% of those with Hashimoto's disease and in 33% with thyrotoxicosis. The incidence of anti-nuclear factor was lower in PA patients than in controls. The incidence of non-organ-sp. CF factor was similar in both PA and control groups.

M.E.Nutt

5885. IMMUNOLOGIC STUDIES ON GONADOTROPHINS. II. BIOLOGICAL ASSESSMENT OF ANTIGENIC NATURE OF FOLLICLE-STIMULATING PRINCIPLE IN HUMAN CHORIONIC GONADOTROPIN PREPARATIONS. C.Isersky, B.Lunenfeld and M.C.Shelesnyak: J. clin. Endocr., 1963, 23, 54 (Biol. Reproduction, Weizmann Inst. Sci., Rehovoth, Israel) Antiserum to human urinary menopausal gonadotrophin [HMG] neutralised FSH activity of both HMG and human chorionic gonadotrophin

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

[HCG] prep, without affecting the HCG activity of the HCG prep. Antiserum to HCG neutralised HCG activity and also that FSH activity which was contained in the HCG prep.

G.F.Blane

5886. SUPPRESSION OF ALLERGIC ENCEPHALOMYELITIS [EAE] IN RATS BY MEANS OF ANTIBRAIN SERUM.

P.Y.Paterson and S.M.Harwin: *J. exp. Med.*, 1963, 117, 755-774 (Med. Dept., New York Univ. Sch.

Med., New York, U.S.A.) Rats inj. with nervous tissue in adjuvant regularly developed signs of EAE within 2 to 3 weeks which generally regressed to give clinically and histol. normal rats by the 6th to 9th week. Serum collected from rats 3 to 6 weeks after sensitisation contained CF antibrain Ab and was able to suppress the development of EAE when given to rats inj. with nervous tissue and adjuvant. Serum pools which did not contain the CF Ab were not able to suppress the disease. Serum containing CF Ab after treatment with 2-mercaptoethanol no longer fixed C* with brain Ag in vitro and no longer suppressed EAE.

H.E.H.Jones

5887. FATE OF TRANSPLANTED BONE. R.Mawdsley and G.A.Harrison: *Nature*, Lond., 1963, 198, 495-496 (Dept. Anat., Univ., Liverpool, Lancs., England)

One whole humerus of a 2 day-old C57 mouse was transplanted s.c. into an adult C57 x R11 hybrid and the other humerus into a C57 adult. After 28 days, both bones were retransplanted into another adult C57, and the transplants examined histol. after another 28 days. In the latter case, the bone was healthy and well vascularised; in the former it was largely avascular and the marrow was necrotic. It was concluded that in isografts, the new bone deposited was of donor origin.

G.M.Lewis

*
5888. MICROSOMAL FRACTIONS AS TRANSPLANTATION ANTIGENS. D.C.Dumonde, S.Al-Askari, H.S. Lawrence and L.Thomas: *Nature*, Lond., 1963, 198, 598 (Dept. Med., New York Univ. Sch. Med., N.Y., U.S.A.)

Suspensions of microsomes from livers and spleens of A/J and C57BL donor mice were capable of sensitising recipient mice to cause accelerated rejection of subsequent skin grafts from the donor strain.

G.M.Lewis

5889. ABSENCE OF SECONDARY DISEASE IN RATS TREATED WITH HOMOLOGOUS BONE MARROW TRANSFUSIONS AFTER ADMINISTRATION OF 'MYLERAN'. A.Dunjic: *Nature*, Lond., 1963, 198, 603-604 (Dept. Radiobiol., Cancer Inst., Univ., Louvain, Belgium)

L-strain rats treated with bone marrow from donors of the same L strain did not present delayed mortality during the 2nd or 3rd month after lethal doses of Myleran or X-irradiation. The delayed mortality with symptomatology of secondary disease occurred in irradiated L strain rats surviving the 1st 30 days, as a result of homologous bone marrow treatment from R strain donors. A higher incidence of delayed mortality was observed among the rats receiving bone marrow treatment within 2 hr. or on die 3rd day following irradiation as compared with the incidence among the rats treated on the 1st day.

G.M.Lewis

5890. SEX-LINKED DRUMSTICK APPENDAGE FREQUENCY AS MARKER FOR BONE MARROW TRANSPLANTATION IN MONKEYS. E.Magliulo, B.G.Crouch and M.J.de Vries: *Blood*, 1963, 21, 620-655 (Med. Biol. Lab., Nat. Defence Res. Org., TNO, Tijswijk, Netherlands) The mean values of drumstick counts in the neutrophil granulocytes in cf and ? of rhesus

monkeys were estimated. The drumstick appendage freq* was not effected by X-irradiation and treatment with autologous bone marrow. The counts were of importance in assessing the 'take*' of a bone marrow graft when ? donors and cf hosts are used.

H.B.Waynfirth

5891. RUNT DISEASE PRODUCED IN THYMECTOMISED F1 HYBRID MICE INJECTED WITH PARENTAL STRAIN LYMPHOID CELLS. C.Martinez, A.P.Dalmasso,

M.Blaese and R.A.Good: *Proc. Soc. exp. Biol.*, N.Y.# 1962, 111, 404-407 (Dept. Physiol., Variety Club Heart Hosp., Minneapolis, Minn., U.S.A.)

Thymectomy performed at birth increased the susceptibility of (AxC3H) F1 recipients to runt disease produced by injn. of A strain parent spleen cells. Operation even at 40 days after birth enhanced disease in (A x C57B1) F1 recipients to A strain cells but not in (A x C3H) F1 recipients to C3H strain cells.

* M.M.Shapland

5892. ROLE OF CHEEK POUCH IN EFFECTING TRANSPLANTATION IMMUNITY IN HAMSTER. D.Shepro, N.Kula and J.A.E.Halkete: *J. exp. Med.*, 1963, 117, 749-754 (Simmons Coll. and Boston Univ. Biol. Sci. Center, Boston, Mass., U.S.A.)

The cheek pouch has no lymphatic supply and large mol. which cannot penetrate the vascular endothelium reach the general circulation by slow diffusion through the cheeji: pouch membrane to lymph vessels of the neck. This 'barrier*' was demonstrated by injn. into the cheek pouch of India ink, 32p (as chromic radiophosphate) and thorotrust.

H.E.H.Jones

5893. ASSAY OF GRAFT-HOST INTERACTIONS ACROSS STRONG AND WEAK HISTOCOMPATIBILITY BARRIERS IN MICE. J.Miller, J.C.Pierce, C.Martinez and R.A. Good: *J. exp. Med.*, 1963, 117, 863-878 (Physiol. Dept., Variety Club Heart Hosp., Minnesota, Minn., U.S.A.)

This new assay of graft-host compatibility consisted of finding cell infiltrates in the livers of mice 1 to 3 days after i.v. injn. of competent lymphoid tissue cells. The infiltrates were of donor origin and could be increased by prior immunisation of donor to the recipient and decreased by prior immunisation of the recipient to the donor. Splenomegaly also occurred in this early perio and was a product of both donor and host-sp. immune reactivity plus a small non-sp. component of host reactivity. Graft-host interactions could be demonstrated in strain combinations isogenic at the H-2 locus without prior immunisation of the donor. Differences in reactivity of reciprocal donor-recipient combinations could be detected in this group as well as in groups differing at the strong H-2 locus.

H.E.H.Jones

5894. CELLULAR INFILTRATION IN HOMOTRANSPLANTED KIDNEYS. W.JdJempster, M.A. Williams, P.Burgess and R. Sparks: *Brit. med. J.*, 1963, i, 18-23

(Postgrad. Med. Sch., London, England) Dog kidney⁵ were transplanted into hosts in which DNA had been labelled by 3H-thymidine. The activity of labelled pyroninophilic cells in subsequent biopsies was 15-58*⁷ that of labelled mononuclear cells in the host blood. Results did not exclude a renal origin for some of the pyroninophilic cells. There was no increase in the no. of labelled cells in transplants to hosts which bore, or had rejected, skin grafts from the kidney donor. The differentiation of infiltrating cells was difficult even by electron microscopy. No labelled cell: were recorded in autotransplanted kidneys.

M.E.Nutt

5895. TIME OF ANTIGEN RELEASE FROM HOMOGRAFTS.

W.J.Dempster, J.S.Calnan and A.E.Kulatilake: Brit. med. J., 1963, i, 23-25 (Postgrad. Med. Sch., London, England) Homografts of skin were made in dogs, rats or mice-and removed just before the expected time of rejection. Second grafts from the same donor, made 10-14 days later, survived as long as the first. Similar results were obtained with kidney homografts in dogs. It is suggested that natural tissue transplantation Ag does not exist, but that die tissue becomes antigenic during disruption and rejection. M.E.Nutt

whether given Lv., i.p. or i.m. with Freund's adjuvant. After this time, titres after Lv. injn. fell; after i.p. injn. they remained steady and after i.m. injn. they continued to rise slowly. In newborn animals inj. i.p. within 18-24 hr. of birth, the Ab gave no pptn. in the Ouchterlony test. G.M.Lewis

5900. 'IMMUNOBLASTS' AND 'IMMUNOCYTES' ATTEMPT AT FUNCTIONAL NOMENCLATURE.

W.Dameshek: Blood, 1963, 21, 243-245 (Med. Dept., Tufts Univ. Med. Sch., Boston, Mass., U.S.A.) 'Immunol. competent cells*' are discussed, and described. H.B.Waynforth

5901. IMMUNOLOGICALLY COMPETENT CELL

(*IMMUNOCYTE^f) SYSTEM. ATTEMPT AT DELINEATION OF CELLULAR RELATIONSHIPS. L.Berman: Blood, 1963, 21, 246-249 (Path. Dept., Wayne State Univ. Med. Coll., Detroit, Mich., U.S.A.) H.B.Waynforth

5902. CEREBRAL CORTEX AND ANTIBODY PRODUCTION. D.F.Pletschy, A.M.Monaenkov and Iu.B.

Ostrovskii: Dokl. Akad. Nauk, 1962, 144, 242-243. Expt. on dogs showed that the intensity of Ab accumulation was related to the strength of various nervous processes in the cerebral cortex. (Russian) B.J.Cooper

5a03. ENHANCEMENT OF ANTIBODY FORMATION BY WHOLE BODY X-RADIATION. F.J.Dixon and P.J. McConahey: J. exp. Med., 1963, 117, 833-848 (Div. Expt. Pathol., Scripps Clinic, La Jolla, Calif., U.S.A.)

Enhancement and acceleration of the Ab response was achieved with large cytotoxic doses of X-radiation given after Ag stimm. The timing of radiation was critical and varied with the physical form of the Ag. It is suggested that radiation depletes the lymphoid tissues of cells and the surviving Ag-stim. cells multiply more rapidly than the non-stim. cells to repopulate the depleted tissues. X-radiation enhancement of Ab formation is produced by different means from those operating in endotoxin and colchicine induced enhancement. H.E.H.Jones

5904. ANTIGENICITY OF POLYPEPTIDES: IMMUNOLOGICAL UNRESPONSIVENESS TO COPOLYMERS OF (X-AMINO ACIDS. P.H.Maurer, R.Lowy and CKierney: Science, 1963, 139, 1061-1062 (Seton Hall Coll. Med., Jersey City, N.J., U.S.A.) Immunol. tolerance toward 3 synthetic random copolymers of the CX-amino acids, glutamic, lysine, alanine and tyrosine, was produced by a single injn. of the polymers into newborn rabbits. The tolerant state could be extended by an additional i.v. injn. of Ag. Repeated injn. of the polymer in adjuvant mixture could "break" die tolerant state. G.M.Lewis

5905. IMMUNOLOGICAL IMPLICATIONS OF ACQUIRED TOLERANCE TO HETEROLOGOUS TUMOURS.

M.R*Anderson and H.N.Green: Nature, Lond., 1963, 198, 861-862 (Dept. Expt. Pathol., Univ., Leeds, Yorks., England) One intrafoetal injn. 2-4 days before birth of a cell suspension of Crocker sarcoma growing in Strong A strain mice produced tolerance to the tumour in Wistar rats. The tumour could then be transplanted by untreated adult rats for 3 generations, presumably due to species-sp. rat protein in the cell surface; at this stage the tumour could not be transplanted back to adult Strong A mice. Strong A mice inoc. s.c. at 1-day old with rat Rd/3 sarcoma supported vigorous growth of this heterologous tumour. G.M.Lewis

ANTIBODY FORMATION

5896. FOETAL RESPONSE TO ANTIGENIC STIMULUS.

H. ANTIBODY PRODUCTION BY FOETAL LAMB. A.M.Silverstein, J.W.Uhr, K.L.Kraner and RJ.Lukes: J. exp. Med., 1963, 117, 799-812 (^nobiol. Branch, Armed Forces Inst. Pathol., Washington, D.C., U.S.A.) The foetal lamb In utero formed Ab in response to Ag stimm. by the 66th to 70th day of the 150 day gestation period. The highest Ab titre was obtained in response to bacteriophage cpX174. Horse ferritin was lightly less effective whereas ovalbumin was only a "weak Ag". *Diphtheria toxin*, *Leishmania tigris* and BCG were unable to stim. Ab production during foetal or early neonatal life. The earliest anti-phage Ab produced by the lamb foetus was a macroglobulin sensitive to the action of 2-mercaptoethanol. Only in older foetuses - with long-lasting stimm. were appreciable amounts of 7S y-globulin Ab formed. H.E.H.Jones

5897. IN-VITRO PRODUCTION OF ANTIBODY LYMPHOCYTES. M.W.Elves, S.Roath, CTaylor and M.C.G. Israels Lancet, 1963, i, 1292-1293 (Clin. Haematol., Dept., Univ., Manchester, England) Lymphocytes from a previously immunised donor transformed and simult. produced Ab in vitro under antigenic stimulus. The small lymphocyte is a potential producer of Ab under appropriate conditions, which shows itself in vivo in the form of the secondary response. G.H.Bell

5898. LOCALISATION OF ANTIBODIES DJJASMA CELLS BY E.M. S.de Petris, G.Karlsbad and B.Perne I. exp. Med., 1963, 117, 849-862 (Sept. Pathol. Lab., Clin. del Laboro'L.Devoto'. Univ. Milan, Italy) Lymph node cells from rabbits hyperimmunized with ferritin were incubated with the Ag. The Ag-Ab RPt-was realised in the cisternae of the endoplasmic reticulum and the perinuclear space of plasma cells. Control animal cells immunised with an unrelated Ag showed no Celling when incubated with ferritin. From direct counts of ferritin in plasma cells a lower limit was determined IS Se w nca Df Ab in the endoplasmic reticulum <12*2 mg./ml. and for the total Ab content of Ae Wasma cell (7*0 x 10*13 g.). H.E.H.Jones

5899. EFFECT OF ROUTE OF ADMINISTRATION OF BOVINE Y-GLOBULIN ON ANTIBODY FORMATION IN THE GUINEA-PIG. T.D.Glover and D.W.Bishop: Nature, Lond., 1963, 198, 901-902 (Dept. Vet. Anat., Univ. Liverpool wtuw-t *-@*- / -~-duction is tested by the PCA procedure, rose sharply for the 1st 10 days after injn. with bovine y-globulin,

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

5906. BREAKDOWN OF POLYVALENT TOLERANCE IN THE CHICKEN BY THYMIC GRAFTS. A.Szenberg and N.L.Warner. *Nature. Lond.*, 1963, 198, 1012-1013 (Hall Inst. Med. Res., Melbourne, Australia) Noii-inbred chickens were rendered tolerant to histocompatibility* Ag by prenatal injn. of embryonic spleen cells so that their circulating w.b.c. were incapable of producing focal lesions on the chorioallantoic membrane. This polyvalent tolerance could be destroyed by grafting 2 lobes of thymus from a 2-month old chicken at 1 week post hatch. G.M.Lewis

5907. EFFECT OF NEONATAL INJECTION OF NORMAL HORSE SERUM ON ELIMINATION OF HORSE ANTI-TOXIN FROM BLOODSTREAM OF ADULT RABBITS. G.Gowland and CL.Oakley. *J. Path. Bact.*, 1963, 85, 221-232 (Nat. Inst. Med. Res., Ridgeway, Mill Hill, London, England) Young rabbits (up to 84 hr. old) given a single s.c. injn. of 400 mg. of normal horse serum proteins were tolerant of horse albumin when challenged at 8-10 months, the tolerance persisting through 2 antigenic challenges and being present at 20 months. Rabbits so treated, when challenged with crude horse *Clostridium welchii* (X-antitoxic serum showed only a transient period of tolerance to antitoxic globulin and decreased tolerance to normal horse globulin. After 2 challenge doses of anti-serum, the rabbits showed no tolerance to antitoxic or normal globulins. D.Murray

5908. IMMUNOLOGICAL TOLERANCE TO LCM VIRUS. E. TREATMENT OF VIRUS CARRIER MICE BY ADOPTIVE IMMUNISATION. M.Volkerc *Acta path. micsobiol. scand.*, 1963, 57, 465-487 (Virus Dept., Statens Seruminst., Copenhagen, Denmark) There was marked decrease of the virus titres in LCM virus carriers following the transplantation of isologous immune lymphoid cells. This effect was first demonstrable 1 or 2 weeks after transplantation, reaching its max. 5 or 6 weeks later but total elimination of the virus has not been observed. Immune lymphoid cells were readily obtained from infected mice. L.Friedmann

5909. EFFECTS OF STEROID SEX HORMONES ON IMMUNOLOGICAL PHENOMENA. A.Kappas, H.E.H. Jones and LM.Roitt: *Nature. Lond.*, 1963, 198, 902 (Courtauld Inst. Biochem., Middlesex Hosp. Med. Sch., London, England) Oestrone given to 7 guinea-pigs and rats inj. with homologous thyroglobulin in Freund's adjuvant reduced the intensity of skin reactions to tuberculin and thyroglobulin, and adjuvant-induced arthritis was suppressed. Oestrone did not affect the rejection of skin homografts or incidence of expt. allergic encephalitis. Auto-allergic thyroiditis in cf was reduced by testosterone. G.M. Lewis

5910. HOMOLOGOUS BONE MARROW TRANSPLANTATION IN DOGS RECEIVING X-RADIATION PLUS URETHANE OR 6-MERCAPTOPURINE. L.J.Cole and E.L.Alpem *Blood*, 1963, 21, 373-385 (U.S. Naval Radiobiol. Defence Lab., San Francisco, Calif., U.S.A.) Mongrel dogs were given homologous bone marrow after prior treatment with 6-mercaptopurine or urethane and with X-irradiation. The mean survival time in these dogs was 23 days as opposed to 10 days for dogs not treated with chemicals. The treated animals showed good recovery of peripheral blood granulocyte count. Secondary disease in these dogs was characterised by anorexia, infection, liver lesions and anaemia. The marrow showed active haematopoiesis in treated animals.

It is concluded that the drugs used are additive to X-irradiation in suppressing the homograft rejection in dogs. H.B.Waynfirth

5911. IMMUNOLOGICAL STUDIES IN BLOOD DISEASES. E.Korinth: *Blut*, 1963, 9, 20-41 (Med. Univ. Clin., Mainz, Germany) A range of patients with various blood diseases including leukaemias, anaemias and RE system conditions were immunised with AB substance, and their iso-agglutinin response compared with that of healthy persons. In proliferate blood disease the degree of competence of response diminished with the degree of malignancy. (German) AJ.Wansbrough

IMMUNOCHEMISTRY

5912. ANTIGENIC DETERMINANTS IN FRAGMENTS OF Y-GLOBULIN FROM RABBIT SERUM. J.W.Goodman: *Science*, 1963, 139, 1292-1293 (Dept. Microbiol., Univ. California Sch. Med., San Francisco, Calif., U.S.A.) When fraction III from papain-digested rabbit serum y-globulin was digested with pepsin, the fragments which were non-dialysable retained (he capacity to ppt. with sp. antiserum. Smaller fragments did not ppt. with Ag but inhib. the pptn. of Ab with fraction III. It is concluded that they carry the antigenic determinants of the y-globulin mol. G.M.Lewis

5913. ANTICOMPLEMENT (ANTI-C^f) ANTI-GLOBULIN REAGENTS. F.Stratton and H.H.Gunsor: *Nature. Lond.*, 1963, 198, 554-556 (Nat. Blood Transf. Serv., Roby St., Manchester, England) Anti-C^f anti-globulin sera were prep. in rabbits by injn. of rabbit r.h.c coated with human Ab and C^f, or human cells sensitised with anti-Lea in the presence of C^f. The antisera were examined by immunoelectrophoresis and contained anti-YI and anti-Y2t 2 anti-pi, anti-3ic and anti-Og Ab. G.M.Lewis

5914. SYNTHESIS OF CHICKEN ANTIBODIES OF HIGH AND LOW MOLECULAR WEIGHT. A.A.Benedict, C.Larson and H. Nik-Khah: *Science*, 1963, 139, 1302-1303 (Dept. Bacteriol., Univ. Kansas, Lawrence, Kans U.S.A.) When primary, secondary and hyperimmune chicken Ab to bovine serum albumin were fractionated by starch-block electrophoresis, 2 major populations of macroglobulin Ab were associated with slow and fast-moving y-globulins. Treatment of these fractions with 2-mercaptoethanol revealed 2 populations of 7S Ab. C.M.Lewis

5915. STRUCTURE OF SPECIFIC ANTIBODY SITE. M.H.Winkler *J. theor. Biol.*, 1963, 4, 237-241 (Protein Fndn., 281 South St., Jamaica Plain, Mass., U.S.A.) Model building expt. are reported which indicate that a small peptide, devoid of fixed three dimensional structure in the absence of the Ag, can distinguish between closely related haptens. It is suggested that Ab specificity may reside in such a peptide. G.F.Blane

5916. PEPTIDE CHAINS OF ANTIBODIES. F.Franek and R.S.Nezlin: *Biokhimia*, 1963, 28, 193-203. A method was devised for destroying the most reactive (interchain) disulphide bonds in the mol. of horse diphtheria and tetanus antitoxins. The S-sulphoantitoxins thus obtained were made to disintegrate into heavier H-chains

and lighter L-chains. The results obtained showed that *e sp. determinant of the antitoxins was most probably contained in the H-chain, but that for the reaction with Ag a complex of H- and L-chains was required.

5923. FAILURE OF INOCULATION WITH POLYOMA VIRUS TO INFLUENCE CHEMICAL CARCINOGENESIS IN MICE. R.A.Malmgren and A.S.Rabson: J. nat. Cancer Inst., 1963, 30, 203-203 (Pathol. Anat. Dept., Nat. Cancer Inst., Bethesda, Md., U.S.A.)

C3H/HeN ? mice, treated with 3-methylcholanthrene by s.c injn. or skin painting, developed the same no. of tumours and at the same rate in polyoma-virus infected and uninfected animals. A/LN <?mice treated with urethane developed the same no. of lung tumours in polyoma-infected and uninfected animals. It is concluded that polyoma virus does not interfere with or protect against chem. carcinogenesis under these conditions.

J. G. Bennette

5924. BLADDER IMPLANTATION IN THE MOUSE AS A MEANS OF DETECTING CARCINOGENIC ACTIVITY: USE OF CRUSHED PARAFFIN WAX OR STEARIC ACID AS VEHICLE. G.M.Bonser, E.Boylard, E.R.Busby, D.B.Clayson, P.L.Grover and J.W.Jull: Brit. J. Cancer, 1963, 17, 127-136 (Med. Sch., Leeds, England)

A range of materials (mostly aromatic hydroxyamines) was tested by surgical implantation into the bladder of albino mice in the form of pellets mixed with paraffin wax or stearic acid. The tests were carried out, in part, to confirm the reliability of such a test for bladder carcinogens. Among compounds found to be active were 2-naphthylhydroxyamine, hi&(2-amino-1-naphthyl) sodium PO4 and 1-phenylazo-2-anthrol. D.Hamer

5925. A SHORT TERM TEST FOR CARCINOGENICITY. P.M.Peacock and E.Dick: Brit. J. Cancer, 1963, 17, 59-61 (Royal BeatsonMem. Hosp., Glasgow, Scotland)

A screening test for carcinogenic activity is described. Embryo skin, lung, stomach and bladder implants from BALB/C strain \$ parents were made into 8-week old mice of same strain. These implants were made into the leg muscle and tests were made by touching grafts against the solid test material before implantation. Mice were killed, examined and grafts sectioned after 16 weeks.

D.Hamer

5926. COMPARISON BETWEEN THE EFFECTS OF THOROTRAST AND A NON-RADIOACTIVE ZIRCONIUM HYDROXIDE SOL IN MICE. J.P.M.Bensted and J.O.CroDkall: Brit. J. Cancer, 1963, 17, 62-69 (Physics Dept., Inst. Cancer Res., London, England)

When tested by i.v. injn. with Schofield strain mice, no difference was observed in the long term effects of thorotrast and *zirconotrust* (zirconium dioxide sol). Only one tumour was observed in each group though the no. of survivors at 17 months was small.

J.G.Bennette

5934. TUMORIGENIC PROPERTIES OF 2-CYANO-4-AMINOSTILBENE IN RATS. W.E.Ribelin, C.B.Shaffer and G.J.Levinskas: *Toxicol. appl. Pharm.*, 1963, 5, 344-349 (Environmental Health Lab., Central Med. Dept., American Cyanamid Co., Princeton, N.J., U.S.A.) Repeated s.c. injn. of 2-cyano-4-aminostilbene produced in rats fibromas at the site of injn., characteristic liver cell changes with occasional hepatoma formation, and an increased incidence of mammary tumours.

E.E.Hobbiger

5935. ROLE OF THE DRAINING LYMPH NODE IN CHEMICAL CARCINOGENESIS. M.R.Andersom *Nature*, Lond., 1963, 198, 599-600 (Inst. Pathol., Sch. Med.. Leeds, Yorks., England) The no. of tumours appearing after s.c. injn. of mice with 20-methylcholanthrene was reduced by prior treatment of the local lymph nodes with thorotrust or X-irradiation. The delay in tumour induction was 6-7 weeks, about the time taken for the lymph nodes to regenerate. It is suggested that chern* carcinogenesis may be mediated by an immune reaction originating in the regional lymph nodes about the area of carcinogen application.

G.M.Lewis

5936. INFLUENCE OF URETHANE ON SUBCUTANEOUS CARCINOGENESIS BY 'TEFLON' IMPLANTS. L.Tomatis and P.Shubik. *Nature*, Lond., 1963, 198, 600-601 (Div. Oncol., Chicago Med. Sch., Chicago, U.S.A.) Urethane given to mice greatly shortened their life span and increased the incidence of tumours induced by implantation of Teflon.

G.M.Lewis

5937. MODIFICATION OF ONCOGENIC EFFECTS OF S-POLYOMA VIRUS BY 'ATTENUATED' M-POLYOMA VIRUS. L.W.Law and A.S.Rabson. *J. nat. Cancer Inst.*, 1963, 30, 635-641 (Biol. Lab., Nat. Cancer Inst., Bethesda, Md., U.S.A.) Attempts are described to use the attenuated M-polyoma variant to prevent induction of tumours in C3H/Bi strain mice also receiving later injn. of the highly oncogenic S variant. Considerable degrees of suppression of S-variant oncogenicity were observed which may have been the resultant of viral Ab produced in response to the M-variant challenge! the possible effects of viral interference, or interferon production.

J. G. Bennette

5938. POLYOMA TUMOUR ANTIGEN IN CELLS TRANSFORMED IN VITRO BY POLYOMA VIRUS. K.Habek *Virology*, 1962, 18, 553-558 (Virus Biol. Lab., N.I.H., Bethesda, Md., U.S.A.) 'Foreign*' cellular Ag previously found in in vivo induced polyoma tumours in hamster or mouse have also been found in in vitro polyoma-transformed cells. The presence of these tumour Ag was determined by showing that polyoma virus' immune animals were resistant to tumour production after challenge with the in vitro transformed cells or with early transplant passage tumours derived from them. Resistance was shown against a challenge with transformed mouse embryo culture cells carrying infectious virus, and against a transplantable tumour derived from them in which no virus could be demonstrated. No resistance was shown in virus-immune mice challenged with a tumour derived from an infected control mouse embryo culture.

J.G.Bennette

5939. TUMOUR FORMATION IN TRANSPLANTED ORGANS OF POLYOMA-INOCULATED HAMSTER. V.Defendi and J.F.Duplanr *Arch. Path.*, Chicago, 1963, 75, 332-336 (Dept. Path., Univ. Pennsylvania! Philadelphia, Pa., U.S.A.) Heart and kidneys from baby hamsters inoc. at birth with polyoma virus were transplanted to the pouch of adult hamsters at various intervals after infection. Sarcomas developed in 9 out of 71 recipients. The latency period, rate of growth and histology were similar to tumours developing in non-transplanted heart and kidney. Polyoma virus localised within organs in 24-48 hr. Growth was not influenced by the age of the host and did not depend upon the production of virus sufficient to induce an Ab response in the host.

R.Mitchell

5940. MALIGNANCY OF POLYOMA VIRUS INFECTION IN MICE IN RELATION TO STRESS. A.F.Rasmussen, W.B.Hildemann and M.Sellers: J. nat. Cancer Inst., 1963, 30, 101-112 (Infect. Dis. Dept., California Univ. Med. Schv, Los Angeles, U.S.A.) Stress by avoidance learning and high freq. sound was applied to weanling Webster-Swiss mice inoc. at birth with polyoma virus by the intracardiac route. The stressing procedure had no significant effect on either overall tumour incidence or survival times.

J.G.Bennette

5941. ROLE OF THYMUS IN POLYOMA VIRUS INFECTION. M.Kodama and G.E.Moore: J. nat. Cancer Inst., 1963, 30, 225-239 (Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.) Virus from a single culture pool was inj. i.v. into AKR and C3H and their F1 WJN* within 24 hr. of birth. Half the mice were thymectomised 2 weeks later. It is concluded from the results that there is a close correlation between the predisposition of AKR mice for leukaemia and their sensitivity to polyoma virus infection, and that the thymus is partly, if not entirely, responsible for the high sensitivity. The incidence of leukaemia was not significantly affected by the presence of polyoma infection:

J.G.Bennette

5942. VARIATION IN ONCIGENICITY OF POLYOMA VIRUS RELATED TO DIFFERENCES IN CELL CULTURE MEDIA. A.S.Rabson and L.L.Law: J. nat. Cancer Inst., 1963, 30, 367-375 (Pathol. Anat. Dept., Nat. Cancer Inst*, Bethesda, Md., U.S.A.) The results of repeated passage of the attenuated M strain of polyoma virus in P388 DL cells grown in 40% human serum medium are described. Under these conditions the weakly oncogenic variant underwent conversion to a highly oncogenic form. The plaque characteristics of the M variant and a highly oncogenic polyoma virus are:

5943. NEOPLASTIC TRANSFORMATION BY POLYOMA VIRUS. M.G.P.Stoken: Brit. med. J., 1968, 1, 1305-1311 (Dept. Virology, Univ., Glasgow, Scotland) A lecture. 52 ref.

5944. LOW MALIGNANCY OF ROUS SARCOMA CELLS AS EVIDENCED BY POOR TRANSPLANT ABILITY IN TURKEYS. V.V.Bergs and V.Groupe: Science, 1963, 139, 922-923 (Inst. Microbiol., Rensselaer Univ., New Brunswick, NJ, U.S.A.) When homologous or isologous transplants of Rous sarcoma cells were made in turkeys, it was found that the main tumor was formed by normal cells by virus wa

hours;

forma-

> of neoplasms. Immunity to the virus may limit growth and systemic dissemination.

C.M.Lewis

5945. A FLOCK OF CHICKENS FREE FROM ANTIBODY TS o? AN mbs % B & s TUMOr'm TKSUE CULTURE. H.Rabin, C.E.A.Hayen, M.Foard and J.B. Pathobiol., Johns Hopkins Univ., Baltim., Md., U.S.A.)

entirely free from Rous Ab was maintained for 2 yr. through 3 generations. Eggs were hatched and chickens reared in isolation. When the Ab-free birds were put in close contact with b. expt induced tumours, a few of them developed. None of the progeny developed a b. w & e p t in Yooms with b. The same proportion of embryos was in the Ab-free flock as in the open flock. Analysis

of the embryo resistance in individuals from Ab-free and open flocks is in agreement with the interpretation that resistance is a single recessive character, and excludes a single dominant but not multifactorial characters.

II. Attempts are described to establish through selection a strain of Rous tumour closer to the natural prototype and to find whether tumours grown in tissue culture under conditions unfavourable to virus production might yield active tumours lacking virus. Serial alternate in vitro and in vivo passages of tumour tissue cultures were grown in media containing Ab, and subsequently maintained at a lower temp, of incubation to decrease virus yield. All cultures produced virus when returned to normal incubation temp.

J.G.Bennette

5946. RESISTANCE OF CHORIOALLANTOIC MEMBRANE [CAM] OF CHICK EMBRYOS TO ROUS SARCOMA VIRUS [RSV] AND MH2 RETICULOENDOTHELIOMA VIRUS. S.S.Dhaliwal: J. nat. Cancer Inst., 1963, 30, 323-336 (Zool. Dept., Malaya Univ., Kuala Lumpur, Malaya) Differences in sensitivity to RSV and MH2 were found in CAM from different chick strains. There was no correlation between the resistance of the CAM and of the adult chick or the embryo proper to RSV. With both viruses at various titres, die *jo* of non-reactors decreased with increase in virus titre, due to the resistant membranes producing a mild reaction when exposed to higher concn. of virus. The effect of CAM resistance to RSV and MH2 is dominant and not sex-linked.

J.G.Bennette

5947. FOCAL CELLULAR ALTERATION IN STABLE AMNION CELLS PRODUCED BY INOCULATION WITH HUMAN LEUKAEMIA BRAIN EXTRACTS. J.A.Whitaker, R. Bo vis, S.L.Andrews and S.E.Sulkin: Cancer Res., 1963, 23, 519-522 (Dept. Pediatrics, Univ. Texas • Southwestern Med. Sch., Dallas, Tex., U.S.A.)

Cell-free brain extracts from leukaemic children were inoc. into cultures of Fernandes, FL and WISH strain amnion cells and Cl'ang liver cells. An alteration in the cells was produced, apparently originating in the nucleus and gradually increasing in size. Affected cells frequently became enlarged and misshapen. The same effects were obtained with serial passages of tissue culture supernatant fluids and with cells frozen and thawed in growth media. Removal of cellular debris by filtration or centrifugation or alterations in cell media did not prevent the effect. Inocn. of extracts from normal human brain did not produce the effect.

5948. MULTIPLICITY OF CELL RESPONSE TO BAI STRAIN A (MYELOBLASTOSIS) AVIAN TUMOUR VIRUS. I. HISTOLOGICAL ALTERATION AND ADENOSINETRIPHOSPHATASE ACTIVITY OF THYMUS OF CHICKENS WITH MYELOBLASTOSIS. L.Arvy, J.R.Sommer, G.de Thé, U.Heine, H.Ishiguro, D.Beard and J.W.Beard. IV. ULTRASTRUCTURAL CHARACTERISTICS OF THYMUS IN MYELOBLASTOSIS AND OF ADENOSINETRIPHOSPHATASE ACTIVITY OF THYMIC CELLS AND ASSOCIATED VIRUS. G.de Thé, U.Heine, J.R.Sommer, L.Arvy, D.Beard and J.W.Beard: J. nat. Cancer Inst., 1963, 30, 401-413, 415-455 (Surg. Dept., Duke Univ. Med. Center, Durham, N.C., U.S.A.)

HI. The normal lymphocytic cells of the thymic cortex were replaced by blast-like elements, originating in small foci and invading the cortex in an orderly manner, with no overall enlargement of the gland and no changes in the medulla. A strong ATPase reaction was seen in the cortex, at the cytoplasmic membranes of the blast-like cells. This histol. picture was not found in

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

any other organ examined, and was not in evidence in the thymus of birds with erythroblastosis.

IV. An E.M. study is presented giving morphol. ultrastructural details of the blast-like cells in the thymus of birds with myeloblastosis. Virus elaboration was shown by the appearance of buds at the cell membrane. Evidence is presented that the source of ATPase associated with virus is also the cell membrane, and that it becomes incorporated in the virus in the process of budding. None of the sp. E.M. changes observed were seen in specimens from birds with erythroblastosis. J.G.Bennette

5949. ORIGIN AND DISTRIBUTION OF VIRUS-LIKE PARTICLES ASSOCIATED WITH MAMMARY TUMOURS IN DBA STRAIN MICE. I. VIRUS-LIKE PARTICLES IN MAMMARY GLAND TISSUE. II. VIRUS-LIKE PARTICLES IN BLOOD AND ORGANS. III. VIRUS-LIKE PARTICLES IN TRANSPLANTED TUMOURS. D.G.Feldman: *J. nat. Cancer Inst.*, 1963, 30, 477-501, 503-515, 517-531 (Rockefeller Inst., New York, U.S.A.)

I. Neither A nor B particles were found in DBA ? virgins up to 6 months of age, but later the mammary glands contained both types of particle. Both types were also found in tissue of pregnant or lactating agent-carrying Rin and (C3H x A)Fi x C3H mice, but no particles were found in mammary tissue of agent-free C57BL and (C3H x A)Fi x C3H. The bearing of the findings on whether the A or B particle is the mammary tumour agent is discussed.

II. Several organs were examined but no A or B particles were found. A single B particle was found in a capillary of a spontaneous tumour and blood of a tumour-bearing mouse contained many B particles. A-type particles were found within the endoplasmic reticulum of the epididymis of both high cancer strain DBA and agent-free C57BL C2.

III. The parent spontaneous tumour contained many A and B particles. Mature B particles were found in transplants up to the 3rd passage only. Occasionally budding and detached B particles without nucleoids were seen in later passages. A particles persisted throughout all the passages examined, up to the 45th. During transplantation, the tumours dedifferentiated from an acinar to a solid alveolar type. J.G.Bennette

5950. ACTION OF CELL-FREE EXTRACTS OF PS TUMOURS ON MICE OF SAME STRAIN. C.Mouriand, J.Mouriand, J.Terrier and B.Martineu *Ann. Inst. Pasteur*, 1963, 104, 460-468 (Inst. Pasteur, Lyon, France) Inj. of cell-free extracts of PS mammary tumours or leukaemias into newborn mice produced the same % of mammary tumours and leukaemias as in controls in ? mice, but there was an increase in the latent period for mammary tumours, and a small decrease in incidence of other malignancies. In c? PS mice there was a larger increase in leukaemias, 4-5% in controls rising to 35% in inj. animals, but they occurred generally later in life in inj. animals. (French) B.Payne

5951. COMPARATIVE VIRULENCE OF MAMMARY TUMOUR AGENT FROM DIFFERENT SOURCES: QUALITATIVE AND QUANTITATIVE DIFFERENCES. K.P.Hummel and CCLittle: *J. nat. Cancer Inst.*, 1963, 30, 593-604 (R.B.Jackson Mem. Lab., Bar Harbor, Maine, U.S.A.) Tumour rates were observed in the offspring of mice inoc. with blood containing mammary tumour agent [MTA] from 4 high-tumour strains. Differences due to quality of MTA were expected to show in the tumour rates of the offspring of inoc. mice,

whereas quant. differences were expected to show only in the inoc. generation. MTA from C3H mice had greater virulence for BALB/c mice than MTA from the other 3 strains: the difference was qual. in character. MTA from ? mice induced more and earlier tumours than that contained in the blood of cf donors: this difference was a quant. one, not reflected in the offspring. J.G.Bennette

5952. MORPHOGENESIS AND GROWTH POTENTIALITY OF MAMMARY GLANDS IN MICE. E. QUANTITATIVE TRANSPLANTATION OF MAMMARY GLANDS OF NORMAL MALE MICE. K.Hoshino: *J. nat. Cancer Inst.*, 1963, 30, 585-591 (Anat. Dept., Yale Univ. Med. Sch., New Haven, Conn., U.S.A.) A new technique for quant. transplantation is described. 15 d* donated mammary glands, transplanted into the fat pads of 11 virgin 9 of die same strain regenerated fully developed glands and lactated. They were indistinguishable from the hosts* intact mammary glands at parturition. J.G.Bennette

5953. PRODUCTION OF TRANSPLANTABLE HEPATOMAS BY INTRASPLENIC IMPLANTATION OF NORMAL LIVER IN MOUSE. E.H.Leduc and J.W.Wilson: *J. nat. Cancer Inst.*, 1963, 30, 85-99 (Biol. Dept., Brown Univ., Providence, R.I., U.S.A.) A pathol. study. J.G.Bennette

5954. MALIGNANT TRANSFORMATION OF M01XSE CONNECTIVE TISSUE GROWN IN DIFFUSION CHAMBERS. E.Shelton, V.J.Evans and G.A.Parker: *J. nat. Cancer Inst.*, 1963, 30, 377-391 (Biochem. Lab., Nat. Cancer Inst., Bethesda, Md., U.S.A.)

After 23 months of continuous cultivation of C3H fibroblasts in diffusion chambers placed by laparotomy into isologous hosts, intraocular or i.m. inoc. resulted in the production of rapidly growing transplantable sarcomas, but after 18 months of cultivation, tumours were not produced. Tissue cultivated in chambers for over a yr. and then grown in vitro produced tumours at the same or earlier times. Tissue that had been maintained in one chamber for periods of 260-378 days gave rise to tumours with the same regularity as tissue that had been repeatedly transplanted into new chambers. Thus fibroblasts cultured in chambers under different physiol. conditions underwent malignant change at the same time. J.G.Bennette

5955. EXPERIMENTAL PRODUCTION OF INTRAMANDIBULAR CARCINOMA IN MICE BY MECHANICAL DAMAGE. C.F.Hollander and T.G.van Rijssel: *J. nat. Cancer Inst.*, 1963, 30, 337-359 (Pathologisch Laboratorium, Leiden, Netherlands) Isologous whisker hair, nylon thread or steel wire when introduced into the alveolar socket produced chronic mechanical injury to the enamel-forming epithelium leading to the development of intramandibular carcinoma, with cyst formation. J. G. Bennette

5956. HEPATOMAS IN RATS FED DIETS CONTAINING PEANUT MEAL AS A MAJOR SOURCE OF PROTEIN. W.D.Salmon and P.M.Newberne: *Cancer Res.*, 1963, 23, 571-575 (Dept. Animal Sci., Agric. Expt. Station, Auburn, Ala., U.S.A.) 64 of 73 Charles River CD rats, fed diets containing 33#3% commercial peanut meal 7-9% dried lean beef or commercial casein and 20% fat, developed hepatomas. 16 rats developed kidney tubule adenomas. When peanut meal was continuously extracted with hot methanol for 72 hr. before use in the diet, only 15 of 88 rats developed hepatomas and none developed kidney adenomas. None of 50 rats receiving a similar

total dietary protein level in the form of dried beef developed hepatomas or kidney adenomas.

B.M.Stevens

5957. INHIBITORY EFFECT OF GUINEA-PIG SERUM ON A NUMBER OF NEW LEUKAEMIAS IN MICE. E.A.Boyse, L.J.Old and E.Stockert: *Nature*, Lond., 1963, 198, 800 (Div. Expt. Chemotherapy, Sloan-Kettering Inst., New York, U.S.A.) Out of 18 new leukaemias of various types arising in inbred colonies of mice, 10 were sensitive to injn. of guinea-pig serum. Suppression of tumour growth occurred under conditions where iso- "nnunity was not a contributory influence. G.M.Lewis

5958. GROWTH INHIBITION OF SARCOMA 180 BY HORMONE ANTISERA AND 5-FLUOROURACIL. L-Anigstein, D.M.Anigstein and E.G.Rennels: *Acta endocr. Kbh.*, 1963, 42, 453-464 (Preventive Med. Dept., Texas Univ. Med. Branch, Galveston, Tex., U.S. A.) Antisera to bovine and human somatotrophic hormone inhib. the growth of sarcoma 180 in young Swiss mice. Antiserum given to mice primed with J²e antiserum in very early life had a greater effect. Combination of antiserum and 5-fluorouracil was more effective than 5-fluorouracil alone which was also inhibitory. H. B. Waynfirth

5959. LEUKAEMIA-INHIBITING PROPERTIES AND L-ASPAPAGINASE ACTIVITY OF SERA FROM CERTAIN SOUTH AMERICAN RODENTS. L.J.Old, E.A.Boyse, H.A.Campbell and G.M.Daria: *Nature*, Lond., 1963, 198, 801 (Div. Expt. Chemotherapy, Sloan-Kettering Inst., New York, U.S.A.) In a study of 7 animals injected to the guinea-pig, only those in the family Cavioidea possessed sera with high levels of L-asparaginase activity and inhibitory activity against mouse leukaemias. G.M.Lewis

5960. SELECTIVE INHIBITION OF RESPIRATION OF PIGMENTED S91 MOUSE MELANOMAS BY PHENYL LACTATE, AND POSSIBLY RELATED EFFECTS ON GROWTH. H.B.Demopoulos and G.Kaley: *J. mit. Cancer Inst.*, 1963, 30, 611-633 (Expt. Pathol. Lab., Nat. Inst. Arthritis, Bethesda, Md., U.S.A.) The Wosinase inhibitor, DL-p-phenyl lactic acid [PLA] increased O₂ consumption in pigmented S91 cells but not melanotic cells from the same tumour. The effect was seen in a tyrosine-free medium was accompanied by a simult. increase in aerobic glycolysis. The time course and kinetic character of this reaction are described, both studies in vitro correlated with the manometric results. PLA also inhib. growth of melanotic S91 tumours ethy transplanted into young DBA/2 mice whereas growth of their somatic tissues was not impaired, but it had no effect on established tumours. J.G.Bennette

5961. EFFECT OF HORMONES ON PODOPHYLLIN-INDUCED VAGINAL ATYPIAS. T.S.Kline: *Arch. fath.*, Chicago, 1963, 75, 343-349 (Dept. Path., Michael Reese Hosp., Chicago, Ill., U.S.A.) Female rats were given daily topical 10% podophyllin for Periods of 1 day to 1 month. Mucosal changes fumbling ^{flaccid} of carcinoma in situ are described, 5^{mg} most severe after 1 or 2 weeks and then gradually finishing. Oestrogens and/or testosterone had no effect on mucosal changes due to podophyllin. R.Mitchell

5962. EFFECT OF OXYGEN TENSION ON SENSITIVITY OF NORMAL AND TUMOUR TISSUES TO ALKYLATING AGENTS. N.Back and J.L.Ambrus: *J. nat. Cancer*

Inst., 1963, 30, 17-29 (Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.) Under conditions of increased O₂ tension at both normal and raised atm. pressures, no increased sensitivity of normal or neoplastic mouse tissues to the biol. effects of nitrogen mustard was demonstrated. Indirect evidence is presented suggesting that the action of alkylating agents is unrelated to free radicals. Thus the similarity of response between ionizing radiation and alkylating agents may be due to attack on the same molecular sites but mediated through unrelated chem. mechanisms. J. G. Bennette

5963. EFFECT OF OLFACTORY LOBECTOMY AND INDUCED PSEUDOPREGNANCY ON THE INCIDENCE OF METHYLCHOLANTHRENE-INDUCED MAMMARY AND OVARIAN TUMOURS IN C3Hb MICE. C.Biancifiori and F.Caschera: *Brit. J. Cancer*, 1963, 17, 116-118 (Univ. of Study, Perugia, Italy)

A comparison was made of the incidence of mammary and ovarian tumours in three groups of methylcholanthrene-treated C3Hb mice: (a) virgin, (b) mice subjected to olfactory lobectomy, (c) pseudopregnant mice. The incidence of mammary tumours in the three groups was 33% 19% and 18% multiple tumours only being observed in the pseudopregnant group. The incidence of ovarian tumours was not significantly different in the 3 groups.

D.Hamer
5964. THE COMPARISON OF INTRAVENOUS AND • INTRA-ARTERIAL NITROGEN MUSTARD AFTER THE ARTERIAL INJECTION OF TUMOUR CELLS.

K.P.Robinson and E.T.Hoppe: *Cancer*. Philad., 1963, 16, 350-354 (Surg. Dept., Univ. Illinois Coll. Med., Chicago, Ill., U.S.A.) Nitrogen mustard was inj. into either the aorta or the peripheral vein of rabbits, following the injn. of tumour cell suspension into the aortic root. Autopsies were made on the twentieth day to count the metastases. Nitrogen mustard reduced the no. of metastases* that resulted from the arterial injn. of tumour cells. The i.v. and intra-arterial routes of injn. were equally effective, but the intra-arterial was the more hazardous. D.L.Connell

5965. INFUSION OF MARROW IN MOUSE AND DOG AFTER THIO-TEPA. H.L.Lochte, jun., S.Kasakura, M.Karetzky, J.W.Ferrebee and E.D.Thomas: *Blood*, 1963, 21, 424-428 (Bassett Hospt., Cooperstown, N.Y., U.S.A.) Infusions of marrow into dogs and mice reduced the toxicity of inj. thio-TEPA only in that range of dose of the drug in which prompt restoration of haematopoiesis was critical to survival.

H.B. Waynfirth

5966. PRELIMINARY EXPERIMENTATION WITH SPECIFIC IMMUNOTHERAPY OF NEOPLASTIC DISEASE IN MAN. I. IMMEDIATE EFFECTS OF HYPERIMMUNE EQUINE Y-GLOBULINS. S.De Carvalho: *Cancer*, Philad., 1963, 16, No. 3, 306-330 (Haematol. Dept., Doctors Hosp., Cleveland, Ohio, U.S.A.)

Hyperimmune ygtobulins, Prep, from the sera of horse and donkey receiving purified Ag from a variety of cancer and leukaemic tissues, were given to leukaemia and cancer patients, some of whom had previously received hormono- and chemotherapy. Of the 15 leukaemia patients 13 had remissions on yglobulin, lasting from 4 weeks to 29 months. Of 16 cancer patients 15 were beneficially affected; this included the partial or complete clearance of objective tumour lesions, lasting from 2 weeks to 11 months. Side effects of this treatment are discussed. D.L.Connell

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

5967. EFFECTS OF SULPHATED DEGRADED LAMINARIN ON EXPERIMENTAL TUMOUR GROWTH. B.Jolles, M. Remington and P. S.Andrews: Brit. J. Cancer, 1963, 17, 109-115 (Radiotherapy Dept., Gen. Hosp., Northampton, England) Male mice of strain TI bearing sarcoma S180 were given injn. of saline soln. of laminarin SO₄ at the site of tumour transplant. Possibly due to interference with stroma, there was an inhibitory effect on tumour growth. D.Hamer

5968. EXPERIMENTAL STUDY OF THE RELATIONSHIP BETWEEN VITAMIN B12 AND TWO ANIMAL TUMOUR SYSTEMS. C.C.Rigby and M.Bodian: Brit. J. Cancer, 1963, 17, 90-99 (Hosp. Sick Children, Gt. Ormond St., London, England) Massive vit. Bi₁₂"dosage was given to August strain rats carrying fibrosarcoma PWAZ and to CAF/JAX mice bearing neuroblastoma C1300. In rats, tumour growth increased by 200% whereas in mice there was a 23% decrease in growth. Concn. of vit. B12 in mouse tumours were 18 times those in rat tumours (estimated by tracers). D.Hamer

5969. SPONTANEOUS REGRESSION OF INDUCED MAMMARY TUMOURS IN RATS. Stretton Young and D.M.Cowan: Brit. J. Cancer, 1963, 17, 85-89 (Imperial Cancer Res. Fnd., London, England)

A study was made of the growth prop. of mammary tumours induced in Sprague-Dawley rats by a single oral dose of 50 mg. of DMBA in oil. The histol. of regressing tumours was very similar to growing tumours and mitoses were common even after pronounced regression. Regressing tumours were not reactivated by injn. of oestradiol, progesterone, growth hormone or cortisone. D.Hamer

5970. HISTOCHEMICAL EVALUATION OF ENZYMIC ACTIVITIES IN HUMAN SQUAMOUS CELL CANCER.

*K.Kawakatsu and M.Mori: Cancer Res., 1963, 23, 539-545 (Dept. Oral Surgery, Osaka Univ. Dental Sch., Osaka, Japan) Alk. phosphatase was confined to stroma. Activity was usually lost in malignant epithelium. Acid phosphatase was localised in neoplastic epithelium. Esterase activity was higher in neoplastic than normal epithelial cells. B-Glucuronidase activities in neoplastic and homologous epithelia were similar. Aminopeptidase activity was generally decreased in tumour parenchyma but was present in basal cell and anaplastic carcinomas and occasionally in stroma. Succinic dehydrogenase was found in peripheral layers of epidermoid cancer and throughout basal cell cancers except in Highly keratinised or necrotic areas. Lactic, malic, glycerophosphate, glucose 6-phosphate and iso-citrate dehydrogenases were localised peripherally to squamous cell cancer subcornified layers. B.M.Stevens

5971. SERUM LACTIC DEHYDROGENASE [LDH] LEVELS IN MICE DURING DEVELOPMENT OF AUTOCHTHONOUS AND CHEMICALLY INDUCED TUMOURS.

C.G.Crispens jun.: J. nat. Cancer Inst., 1963, 30f 361-366 (Anat. Dept., Maryland Univ. Med. Sch., Baltimore, Md., U.S.A.) No correlation was found between tumour size and LDH activity in mice with diem, induced tumours. Both spontaneous and chem. induced tumours reached palpable size before significant increases in LDH levels were recorded. Thereafter, the LDH time curves were similar for both types. The implication of the results in relation to attempts to use LDH assays in the diagnosis of early cancer is discussed. J.G.Bennette

5972. CULTURAL CHARACTERISTICS OF MALIGNANT HISTIOCYTOMAS AND FIBROUS XANTHOMAS.

L.Ozzello, A.P.Stout and Margaret R.Murray: Cancer* Philad., 1963, 16, 331-344 (Div. Surgical Path., Columbia Univ. Coll. Physn. and Surgn., New York, U.S.A.) The cultural behaviour of malignant histiocytomas and fibrous xanthomas was studied in vitro using the Maximow double-coverslip, lying-drop technique. A histiocytic outgrowth was obtained in both groups of tumours, confirming the histiocytic derivation previously suggested by histol. observations. Transformation of neoplastic histiocytes into fibroblasts was followed in vitro. D.L.Connell

5973. INTRANUCLEAR INCLUSIONS IN MULTIPLE MYELOMA AND MACROGLOBULINAEMIA. G.M.Britte Y.Tanaka and G.Brecher: Blood, 1963, 21, 335-351 (Clin. Path. Dept., N.L.H., Bethesda, Md., U.S.A.) Inclusion bodies in the plasma cell nuclei of patients with multiple myeloma and macroglobulinaemia were readily identified in Giemsa stained smears of bone marrow. Their PA-Schiff positivity could be related to the hexose content of the patients' abnormal serum protein. It is suggested that the inclusion bodies represent nuclear elaboration of glycoprotein. H.B.Waynforth

5974. ENDOREDUPLICATION IN ACUTE LEUKAEMIA. C.Bottura and I.Ferrari: Blood, 1963, 21, 207-212 (Clin. Med. Dept., Ribeirao Preto Med. Sch., Ribeirao, São Paulo State, Brazil) Chr. studies in cases of acute myeloblastic leukaemia often showed a normal karyotype before the start of treatment. During treatment with 6-mercaptopurine 44 chr. plus a small fragment were observed. Leukaemic cells also showed repeated endoreduplication. H. Waynforth

5975. CHRONIC GRANULOCYTIC LEUKAEMIA AND PHILADELPHIA CHROMOSOME. P.H.Fitzgerald, A.Adams and F.W.Guna: Blood, 1963, 21, 183-196 (Cytogenet. Unit, Christchurch Hosp., Christchurch, New Zealand) Chronic granulocytic leukaemic patients in relapse showed a high no. of Philadelphia chr. (Phi) pos. mitoses in both blood and marrow whereas those in remission had a much higher no. in the marrow. Demonstration of the Ph¹ by examination of the marrow was of much value in the acute phase of the disease. Therapy depressed the no. of Phi pos. mitoses. H.B.Waynforth

5976. A PATTERN OF CHANGE IN TUMOUR-CELL POPULATIONS IN VIVO. D.C.Roberts: Brit. J. Cancer, 1963, 17, 142-148 (Imperial Cancer Res. Fndn., Mill Hill, London, England) Ascites sublines of epithelioma 255/Bl in C57 mice and Sarcoma BAS/56AA in C3H mice were used and studies of the nuclear characteristics of cell populations were made for 3 weeks after i.p. transplantation. The pattern of change observed with time was repeated in successive transplants but was not cumulative from one transport generation to the next. D.Hamer

5977. E.M. OBSERVATIONS GTI CYTOPLASMIC COMPLEXES OF TRANSPLANTABLE HEPATOMAS IN MICE. N.L.Trotten: J. nat. Cancer Inst., 1963, 30, 113-133 (Anat. Dept., Columbia Univ. Coll. Phys. and Surg., New York, U.S.A.) A descriptive account J.G.Bennette

5978. E.M. OF SCLEROSING ADENOSIS AND INFILTRATING DUCT CARCINOMA OF HUMAN MAMMARY GLAND. S.R.Wellings and P.Roberts: J. nat. Cancer Inst., 1963, 30, 269-287 (Pathol. Dept., Oregon Univ. Med. Sch., Portland, Ore., U.S.A.) A descriptive account. J.G.Bennette

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

579

5979. MERCUROCHROME FLUORESCENCE IN TUMOUR TISSUE. H.Katsuya, T.Kinoshita, Y.Doi, T.Hashizume and H.Motoyama: *Nature, Lond.*, 1963, 198, 497-498 (Dept. Surg., Kumamoto Univ., Kumamoto, Japan) Mercurochrome (Hisodium-2,7-dibromo-4-hydroxy mercurifluorescein) localises in the area of stroma surrounding transplanted mouse Ehrlich ascites tumours and fluoresced *n.u.v. for 15 days. G.M.Lewis

5980. MECHANISMS INVOLVED IN PRODUCTION OF RED FLUORESCENCE OF HUMAN AND EXPERIMENTAL TUMOURS. F.N.Ghadially, W.J.P.Neish and H.C. Dawkins: *J. Path. Bact.*, 1963, 85, 77-92 (Path. Dept., Univ., Sheffield, England) Protoporphyrin yas inj. i.p. or i.v. into mice or rabbits bearing expt. induced or transplanted tumours and non-neoplastic ulcers. Red fluorescence in u.v. light developed in ordinary ulcers as readily as in tumours. The necrotic centres of transplantable tumours of mice and hamsters showed red fluorescence after injn. of certain bacteria isolated from malignant ulcers of rabbit or man. Such organisms produced red fluorescence in infected muscle of mice or rabbits but not of rat, hamster or monkey and also red fluorescent colonies when grown on blood agar containing 5-aminolaevulinic acid. D.Murray

5981. EFFECTS OF EXTRACTS OF PRIMARY AND METASTATIC PANCREATIC ISLET CELL TUMOURS ON GASTRIC SECRETION. G.A.Hallenbeck, C.F.Code and J.C.Kennedy: *Gastroenterology*, 1963, 44, 631-636 (Sect. of Surg. Res., Mayo Clinic, Rochester, Minn., U.S.A.) Some extracts from primary or secondary human islet cell tumours possessed substances >*ich stim. gastric secretion in dogs and also caused kypoglycaemia. The 2 effects are not thought to be Mediated by the same substance, but it seems that the gastric secretion stimulator may be similar to gastrin. D.N.Wheatley

5982. INFLUENCE OF THE HOST AND THE NEOPLASTIC CELL POPULATION ON THE COLLAGEN CONTENT OF A TUMOUR MASS. P.M.Gullino and F.H.Grantham: *Cancer Res.*, 1963, 23, 648-653 (Sect. Tumour-Host Relations, Lab. Biochem., Nat. Cancer Inst., Bethesda, Md., U.S.A.) In Novikoff hepatoma and Hepatomas 129 and 134 collagen of the tumour mass was formed by the host, as shown by separation of epithelial cells from fibroblasts and evaluation of the collagen content of tumours derived from fibroblast-free cells. In Novikoff hepatoma and an osteogenic sarcoma, grown in various hosts, the host was shown to have little influence on the overall collagen content of a tumour. The collagen content of a tumour was changed when a change in the neoplasmic cell population was produced. B.M.Stevens

5983. LEUKAEMIA AND LYMPHOMA IN PATIENTS WITH AGAMMAGLOBULINAEMIA. A.R.Page, A.E. JW and R.A.Good: *Blood*, 1963, 21, 197-206 (Pediatrics Dept., Minnesota Univ., Minneapolis, Minn., U.S.A.) Reports of children with congenital *Sammaglobulinaemia who later developed malignant lymphoma are presented. The occurrence of disease of ** group among patients with this immunological defect 2?Pears to have a significance, reasons for which are cussed. H.B.Waynfirth

5984. IN VIVO PHAGOCYTOSIS. L.J.™! & F. PHAGOCYTOSIS BY INTACT NEOPLASTIC BODY FLUIDS. S.G>Kimball and J.L.Brody: *Blood*, 1963, 21, 462-469 (Med. Dept., V.A. Hasp., Coral Gables, Fla.)

U.S.A.) By means of a skin window technique it was shown that suspensions of Ag, such as rice starch or Candida albicans, made in sera of patients with leukaemic disorders were not phagocytosed normally. The results suggest that certain factors interfere with normal phagocytic activity in the rabbit and perhaps in the human. H. B. Waynfirth

5985. COMPARISON OF OXYGEN TENSIONS IN NORMAL TISSUES AND YOSHIDA SARCOMA OF THE RAT BREATHING AIR OR OXYGEN AT 4 ATMOSPHERES. D.Jamieson and H.A.S.Van den Brenk: *Brit. J. Cancer*, 1963, 17, 70-78 (Cancer Inst. Board, Melbourne, Australia) Male Wistar Hooded and albino rats were used in these tests in conjunction with the Yoshida sarcoma. pO₂ during pressurisation with O₂ was followed in normal tissues and sarcoma tissue. On pressurisation to 4 atm. a 12-fold rise in tumour pO₂ occurred, compared with 15-50 fold increases in normal tissues. A high partial pressure of CO₂ added to the O₂ did not affect the tumour pO₂ level. D.Hamer

5986. GROWTH AND METASTASIS OF TUMOUR IN ORGAN CULTURE. J.Folkman, D.M.Long, jun. and F.F.Becker: *Cancer, Philad.*, 1963, 16, 453-467 (Naval Med. Res. Inst., Bethesda, Md., U.S.A.)

An apparatus was developed to maintain a canine thyroid gland by isolated perfusion with Hb-serum soln. for periods up to 1 week. Mouse melanomas and mast cell tumours implanted in the gland during perfusion grew rapidly, liberated tumour cells into the circulation and, in 1 case, produced metastases. D.I.Connell

5987. VASCULAR MODIFICATIONS IN THE CHEEK POUCH OF GOLDEN HAMSTER DURING DEVELOPMENT OF GRAFTS OF MELANOMA. J.Delarue, J.Mignot and T.Caulet: *C.R. Soc. Biol., Paris*, 1963, 157, 69-71 (Lab. Anat. pathol., Fac. Méd., Paris, France)

A fragment of malignant melanoma was inserted to the cheek pouch of golden hamsters. After 2 days a vascular network appeared around the graft and after 4-8 days the capillary and venous network increased in size with vascularisation of the tumour. Sections of the tumour region showed an inner avascular necrotic zone, an intermediate tumour region with a marked vascular network and an outer zone containing enlarged blood vessels. After 2-4 months metastases appeared in various tissues of the animal. (French) M.A.Price

EXPERIMENTAL PATHOLOGY

5988. HYPOTHERMIA AND INFECTION. H. ENDOGENOUS PERTONIRIS AND BACTERAEMIA IN HYPO-THERMIC MICE. G. Tune vail and T.Lindner,

m. INFLUENCE OF HYPO-THERMIA ON COURSE OF EXPERIMENTAL PNEUMOCOCCAL INFECTION IN MICE. T.Lindner and G.Tuneyall: *Scand. J. clin. Lab. Invest.*, 1963, 15, 115-124, 125-131 (Bact. Central Lab. Stockholm City, Stockholm, Sweden) IL Deep and prolonged hypothermia of mice (22-23° main-tained for more than 40 hr.) resulted in an invasion of bacteria from the intestine into the peritoneal cavity,

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

into the bloodstream or both. No major change of the intestinal flora was effected by the hypothermia. Hypothermia disturbed the elimination of inj. bacteria from the bloodstream. Antibacterial treatment reduced the incidence of peritonitis and bacteraemia, but did not increase the survival time of hypothermic mice.

m. Hypothermia postponed the bacteraemia in mice caused by expt. pneumococcal peritonitis. Once the bacteraemia was established bacterial multiplication was slower in the hypothermic mice than in the normothermic controls. Warming up of the hypothermic mice resulted in a rapidly increasing bacteraemia and death, or in death not preceded by bacteraemia. E. Parkinson

5989. EXPERIMENTAL INTESTINAL STRANGULATION OBSTRUCTION IN GERM FREE RATS. E.Amundsen and B.E.Gustafsson: *J. exp. Med.*, 1963, 117, 823-832 (Germfree Res. Dept., Karolinska Inst., Stockholm, Sweden) The mean survival time of germfree rats with expt. low ileal strangulation obstruction was 240 hr. whereas conventional rats survived for about 44 hr. The strangulation obstruction fluid from the germfree animals was sterile and non-toxic when inj. into mice. The same fluid from conventional animals contained a great no. of micro-organisms and caused death within 24 hr. when inj. i.p. into mice.

H.E.H.Jones

5990. RETROGRADE PROTEUS PYELONEPHRITIS IN RATS. LOCALISATION OF ANTIGEN AND ANTIBODY IN TREATED STERILE PYELONEPHRITIC KIDNEYS. R.S.Cotran: *J. exp. Med.*, 1963, 117, 813-822 (Mallory Inst. Pathol., Boston City Hosp., Boston, Mass., U.S.A.) Rats with retrograde *Proteus* pyelonephritis were treated with antibiotics until their kidneys became sterile. Using fluorescent Ab, sp. *P. mirabilis* Ag was found in some of these kidneys 20 weeks after treatment. Persistent Ag was associated with interstitial chronic inflammation but not with acute inflammation or progressive scarring. Rat yglobulin and *Proteus* Ab were localised in plasma cells of the renal inflammatory infiltrates. It is suggested that persistent Ag in chronic pyelonephritis may lead to the continued local appearance of Ab-producing cells.

H.E.H.Jones

5991. GENERALISED SHWARTZMAN REACTION IN THE PREGNANT GOLDEN HAMSTER. M.Galton: *Science*, 1963, 139, 923-924 (Dept. Pathol., Dartmouth Med. Sch., Hanover, N.H., U.S.A.) A single i.p. injn. of colchicine elicited the generalised Schwartzman phenomenon in the pregnant golden hamster. The condition could not be produced in non-pregnant animals even by bacterial endotoxin in addition to colchicine, such as is effective in rabbits and pregnant rats. It is suggested that colchicine-induced mitotic arrest may damage the intestinal mucosa, permitting endotoxin from the gut flora to enter the body.

G.M.Lewis

5992. ENDOTOXIN TOLERANCE. I. ITS INDUCTION BY EXPERIMENTAL PYELONEPHRITIS. W.R.McCabe: *J. clin. Invest.*, 1963, 42, 610-617 (Dept. Med., Univ. Illinois Coll. Med., Res. and Educ. Hosp., Chicago, Ill., U.S.A.) Using rabbits with induced pyelonephritis tolerance was obtained to the pyrogenic effects of *Salmonella enteritidis* endotoxin over a 4-fold range of dosage: tolerance was reversed by RE blockage with colloidal thorium dioxide or by the eradication of renal infection with antibiotic treatment. The non-endotoxin producing bacteria, *Streptococcus faecalis*, did not produce endotoxin tolerance.

M.J.Bell

5993. ENDOTOXIN HYPERSENSITIVITY AND ITS RELATION TO SHWARTZMAN PHENOMENON.

T.G.Kováts, G.Lázár and P.Végh: *Acta physiol. Acad. Sci. hung.*, 1963, 23, 169-187 (Inst. Pharmacol., Med. Univ., Szeged, Hungary) In guinea-pigs, rabbits and rats there was a natural endotoxin hypersensitivity. The acquisition or inheritance of this could be explained on the basis of ancient symbiosis with endotoxin-producing micro-organisms. The inherited hypersensitivity probably diminished during the first few weeks of life but then const. endotoxin exposure contributed to life-long hypersensitivity (Schwartzman reaction). Defense mechanisms prevented endotoxin from intestinal flora from damaging the organism except when such defense was impaired.

H.G.Bevan

5994. MECHANISM OF ENDOTOXIN INTOXICATION IN RABBITS. T.Fukuda: *Jap. J. Physiol.*, 1963, 13, 155-168 (Dept. Physiol., Chiba Univ. Sch. Med., Chiba, Japan) The depression, dyspnoea (induced by adrenaline discharge) and diarrhoea of endotoxin shod in rabbits were due to central autonomic disturbances and could be sedated by antipyretics. The late stage of intoxication with hepatic glycogen depletion, due to enhanced glycogen utilisation and relative adrenocortical insufficiency, led to hypoglycaemia, hypothermia and arterial hypotension which could not be influenced by antipyretics. A dual mechanism of endotoxin intoxication is postulated: central autonomic disturbances related to the activation of the febrile mechanism and metabolic disturbances leading to carbohydrate depletion.

M.J.Bell

5995. DURATION OF EFFECT OF PVP AND DEXTRAN PREPARATIONS IN HAEMORRHAGIC SHOCK OF CAT. S.Simon and T.Simon: *Acta physiol. Acad. Sci. hung.*, 1963, 23, 189-198 (Pharmacoindustrial Control Lab-i Budapest, Hungary) Cats were bled 25 ml. /kg. or more and PVP or dextran infused in equiv. amounts. The maintenance of blood pressure over 12 hr. was not so good as after reinfusion of blood. Dextran gave a higher survival rate than PVP. High doses of heparin in re-infused blood gave low b.p.

H.G.Bevat

5996. THE ROLE OF COMPLEMENT AND NATURAL ANTIBODIES IN PHAGOCYTOSIS. S.Slopek,

K.Grzybek-Hryncewicz and J.Tfadosz: *Arch. Immunol. Ter. dośw.*, 1962, 10, 559-574 (Inst. Immunol. i Terapii Doświadczalnej, Polska Akad. Nauk, Wrocław Poland) The opsonising prop. of normal guinea-pig serum depended on the presence of natural Ab and C-components C¹, C² and C⁴ were indispensable for opsonisation. Absence of component C³ did not lower this activity.

H.Osowiec-W

5997. INFLUENCE OF THE THYROID ON THE EARLY STAGES OF EXPERIMENTAL INFLAMMATION.

L.Thiebolt, J.Berthelay and S.Blaise: *C.R. Soc. Biol.*, Paris, 1962, 156, 2060-2063 (Ljab. Physiol. Fac Méd., Clermont-Ferrand, France) Injn. of thyroxine to rats or thyroidectomy had inconsistent effects on the oedema produced by implantation of a sponge pellet beneath the skin of the back. Thyroidectomy decreased the no. of w.b.c. migrating to the sponge. 10-100 µg thyroxine/day to rats for 10 days before implantation increased the no. of w.b.c. in die sponge.

M.A.Price

5998. EXPERIMENTAL INVESTIGATION OF THE UPTAKE OF PROTEIN, VIRUSES AND BACTERIA DURING EMBRYOGENESIS OF THE RABBIT. W.Zimmermannfl

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

881

G.H.M.Gottschewski, H.Flamm and C.Kuna Develop. Biol., 1963, 6, 233-249 (Dept. Develop. Physiol., Max-Planck-Inst. animal Breeding, Mariensee/Trenhirst, Germany) Transfer of albumin and Ab from maternal blood into the yolk sac commenced at 1 days 12 hr. post coitum. Viruses given to the mother i.v., or into the uterine lumen entered the yolk sac at 6 days 16 hr. post coitum, as did bacteria introduced into the uterus. It is suggested that discontinuities develop in the non-Cellular mucoprotein coats surrounding the conceptus, and that injurious substances may reach the embryo at the time of implantation. The possibility that early uptake of protein may lead to immunol. tolerance is discussed. (German) J.W.S.Harris

5999. RENAL-CARDIOVASCULAR CHANGES BY SALT-LOADING IN ADRENALECTOMISED RATS.

G.F.Wilgram; S'Young and D.J.Ingle: Arch. Path., Chicago, 1963, 75, 271-275 (Dept. Physiol., Univ. Chicago, Chicago, I.I., U.S.A.) Adrenalectomised-uninephrectomised rats were fed dietary supplements of 4 and 12% salt for 6 months and 4% salt for 1 yr. Hypertension, increased cardiac wt. and lesions of nephrosclerosis in the kidney were found in d¹ rats after 6 months on 12% NaCl diet and in d²rats after 1 yr. on 4% N j g * * ^ R ftct

6000. MORPHOLOGICAL CHANGES IN HYPERCHOLESTEROLEMIC RABBITS GIVEN SATURATED FAT WITHOUT SUPPLEMENTARY CHOLESTEROL.

N.G.Stormby and G.Wigand: J. Atheroscler. Res., 1963, 3, 103-120 (Dept. Path., Univ. Lund, Sweden) The aorta and coronary arteries of rabbits treated with a diet containing either hydrogenated coconut oil or glyceryl trilaurate but no added cholesterol developed atheromatous changes which resembled those seen in rabbits fed cholesterol. G.F.Blane

6001. EFFECT OF ECK FISTULA ON THE DOG LIVER.

S.Castro, F.K.Voutz and A.G.Foraken Arch. Path., Chicago, 1963, 75, 350-359 (Baptist Mem. Hosp., 800 Miami Road, Jacksonville, Fla., U.S.A.) Eck Fistula operations were performed in 6 young adult greyhounds. After 6 weeks, comparison of normal and Post-fistula material showed areas of hepatic: cell degeneration in the latter, with deposition of Fe'. Pigment in Kupffer cells. Amylophosphorylase. *uccuu dehydrogenase and DPN diaphorase showed the same distribution in pre- and post-fistula livers. ^Mitchell

6002. CORN AND COCONUT OIL EFFECTS IN

DIETARY CIRRHOSIS OF RATS. AJ.Patek, N.M.de Fritsch, F.E.Kendall and R.L.Hirsch: Arch. Path., Chicago, 1963, 75, 264-270 (Columbia Univ. Res. Service, Goldwater Mem. Hosp., Welfare Island, N.Y., U.S.A.) Male Sprague-Dawley rats 100-115 gm. wt. were fed low protein, cirrhosis Producing diet for 6 months. One group received 10% corn oil and another 10% coconut oil. Cirrhosis developed in 75% of rats fed corn oil and only 25% of those fed coconut oil. Both groups accumulated liver lipid » J ^ . W. ^ S S ; , - It is suggested that some factor other than lipid accumulation is responsible for the development of expt. dietary cirrhosis. R.Mitchell

6003. SOME LONG-TERM EFFECTS FOLLOWING INFUSION OF INTRAVENOUS FAT EMULSIONS INTO DOGS. S.W.Thompson, II, Q.L.Hartwig, M.Atik, M.A.Fox and t. Cohn, jun.: Toxicol. appl. Pharm., 1963/f. 30B-318TPamöl. Div., U.S. Army Med. Res..

Fitzsimons Gen. Hosp., Denver, Colo., U.S.A.) Dogs infused i.v. with cottonseed oil emulsions over longer periods showed a fall in the Hb concn. during the infusion and a deposition of fat pigment in the liver. The latter gave rise to a foreign body type of host response, with formation of focal intralobular granulomas and interlobular and portal scarring. The infusion had no immediate effect on liver function tests. E.E.Hobbiger

6004. TEMPORARY HEPATIC ISCHAEMIA IN THE

RABBIT. R.Carroll: J. Path. Bact., 1963, 85, 67-75 (Path. Dept., Univ., Liverpool, England) In rabbits anaesthetised with ether, the right ant. and left lobes of liver were rendered ischaemic for periods varying from 5 min. to 3 hr. Following re-establishment of blood flow, the livers were examined at varying intervals. At 3 days, infarcts were found at random throughout the lobes, varying in size according to duration of ischaemia. After 1/2 hr. ischaemia, the earliest evidence of infarction was seen at 6 hr. By 12 hr. a central dead area and polymorph zone had developed and a peripheral dead zone was differentiated from a zone of partial survival by 24 hr. D.Murray

6005. PRODUCTION AND COMPOSITION OF WHITE

BILE IN RAT. M.H.Haber and K.R-Rees: J. Path. Bact., 1962, 85, 127-137 (Dept. Morbid Anat., Univ. Coll. Hosp. Med. Sch., London, England)

The common bile ducts of albino rats anaesthetised with ether were doubly ligated and divided between the ligatures, the animals being killed at intervals of 6 hr.-36 days. The contents of the distended bile duct were collected and analysed chem. After 17-21 days, 'white bile*' was produced. This was a clear, colourless fluid of low sp. gr. In contrast with normal bile, it contained* little or no bilirubin, normal alk. phosphatase, less protein and DNA, normal Na and K but low Ca and no sialic acid. Na31I passed readily from the distended bile duct into the peripheral blood. D.Murray

6006. ALTERATIONS IN FINE STRUCTURE OF HEPATOCYTES PRODUCED BY (3-3-TIENYLALANINE).

Z.Hruban, H. Swift and R.W.Wisslen: J. ultrastructure, Res., 1963, 8, 236-250 (Path. Dept., Chicago Univ., Chicago, I.I., U.S.A.) In the hepatocytes of rats fed on p-3-thienyl-DL-alanine there was an increase of nucleolar size, disorganisation of the endoplasmic reticulum, decrease in glycogen, and alteration of the Golgi and mitochondria apparatus. H.B.Waynfirth

6007. WATER-INDUCED CEREBRAL OVER-HYDRATION

IN THE MATURING RAT BRAIN. M.J.Seller and R.G. Specton: Nature, Lond., 1963, 198, 489-490 (Paediatric Res. Unit, Guy's Hosp. Med. Sch., London, England) Oedema of the forebrain in rats induced by i.v. injn. of water could not be produced in animals less than 11 days old, even when the dose was sufficient to cause pitting oedema, ascites and pleural effusions. It is suggested that this phenomenon may be related to the absence of an effective 'sodium pump' in the brain at this stage. G.M.Lewis

6008. FORMATION AND STRUCTURE OF THE COLLAGEN FIBRIL. R.C.Curran and A.E.Clark: Nature, Lond., 1963, 198, 798-799 (Dept. Pathol., St. Thomas's Hosp. Med. Sch., London, England)

Observations of collagen formation in avascular granulomas produced on the surface of peritoneal implants of egg white and agar showed that the fibrils developed as tubular structures. G.M.Lewis

GENERAL

(INCLUDING STRUCTURE AND VARIATION)

- 6009. INTERPRETATION OF DISTRIBUTIONS OF INDIVIDUAL RESPONSE TIMES IN MICROBIAL INFECTIONS.** G.G.Meynelb Nature, Lond., 1963, 198, 970-973 (Guinness-Lister Res. Unit, Lister Inst. Prev. Med., London, England). G.M.Lewis
- 6010. HIGH RESOLUTION E.M. ON SURFACE STRUCTURE OF *E. COLI*** M.Ogura: J. ultrastructure Res., 1963, 8, 251-263 (Bioquimica Dept., Esuela BioL, Fac. Ciencias, Univ. Central de Venezuela, Caracas, Venezuela) The cell wall of *E. coli* is composed of 2 layers, the outer one of which is denser and contains interwoven filaments. The bacterial capsule also contains these filaments and also materials of a homogeneous nature. The formation of filaments on the surface at cell division occurs later than the formation of the inner dense layer of the cell wall at the new surface. The plasma membrane has a 3 layered structure. H.B. Waynforth
- 6011. CHARACTERISATION OF [^{51}Cr]LABELLED ENDOTOXIN AND ITS IDENTIFICATION IN PLASMA AND URINE AFTER PARENTERAL ADMINISTRATION.** L.Chedid, R.CSkarnes and M. Pa rant: J. exp. Med., 1963, 117, 561-571 (Centre Nat. de la Rech. Sci., Paris, France) Endotoxin was labelled by incubating with $\text{Na}^{51}\text{CrO}_4$. By agar diffusion and autoradiography the ^{51}Cr was attached only to the heavy fractions. These fractions contained more than 99% of the total toxicity of the endotoxin. ^{51}Cr -endotoxin could be found in the plasma taken up to 6 hr. after i.v. injn. of LD₅₀ or sub-lethal doses, and was not totally detoxified as these plasma samples were toxic to adrenalectomised mice. The endotoxin was identified in urine specimens, but it was no longer toxic or radioactive. H.E.H.Jones
- 6012. CHANGES IN SEROLOGICAL REACTIVITY OF ENDOTOXIN INDUCED BY FRACTION IV. (COHN) OF NORMAL HUMAN SERUM.** J.A.Rudbach and A.G. Johnson: Proc. Soc. exp. Biol., N.Y., 1962, 111, 651-655 (Dept. Bact., Univ. Michigan Med. Sch., Ann Arbor, Mich., U.S.A.) A substantial loss in the ability of endotoxin to be ppt. by homologous Ab occurred after incubation with Fraction IV-1 of normal human serum. Immunodiffusion studies revealed that this was associated with dispersion of a major Ag, with formation of a more rapidly migrating component which formed a line of identity with the O-polysaccharide hapten. M.M.Shapland
- 6013. EFFECT OF LARGE DOSES OF BACTERIAL PYROGEN IN THE DOG. II. AN EXPLANATION FOR THE URINE DILUTION.** J.L.Brandt, L.J.Voudoukis and J.Harrop: Canad. J. Biochem., 1963, 41, 1317-1324 (Renal Lab., Dept. Med., Jewish Gen. Hosp., Montreal, Que., Canada) Renal cortical tissue Na concn. was unaffected by endotoxin whereas renal Na concn. of outer and inner medullary portions showed a striking fall. It was postulated that the rise in total renal blood flow, following endotoxin, was mainly medullary and caused a washout of medullary interstitium multiplier deposited Na. The efficiency of the renal countercurrent exchanger was impaired and tubule to interstitium gradient reduced. A.M.Gibbins

- 6014. GROWTH ANOMALY AND LYSIS WITH PRODUCTION OF VIRUS-LIKE PARTICLES IN AN AXENICALU REARED MICROANNELID.** E.C.Dougherty, D.J.Ferral, B.Brody and M.L.Gottbold: Nature, Lond., 1963, 198, 973-975 (Dept. Nutr. Sci., Univ. California, Berkeley Calif., U.S.A.) In axenic cultures of *Enchytraeus*

fragmentosus abnormal outgrowths are induced by a sufficiently large amount of aq. phase in addition to the agar medium, so that a worm becomes trapped therein; this growth anomaly is largely reversible. Cultures of 3 months or more may suddenly lyse releasing virus-like entities somewhat resembling non-inclusion viruses of insects. They are non-infectious. G.M.Lewis

- 6015. EFFECTS OF POSTINCUBATION ON INDUCED MUTATION FREQUENCY. II. THE ROLE OF NUCLEIC ACID AND PROTEIN SYNTHESIS IN SURVIVAL AND MUTATION FREQUENCY.** M.Tabaczynski: Acta micEobiol. pol., 1962, 11, 301-312 (ZaHilad Mikrobiol., Uniwersytet Warszawski, Warszawa, Poland) The mutation freq. of u.v. irradiated double auxotrophic strains of *E. coli* depended upon the degree of protein and nucleic acid synthesis, which were regulated by adding Δ withdrawing adenine or tryptophan. These changes were connected with different survival times of the mutant and parenteral forms on the post-incubation media. M.Korbeck

- 6016. ORIGIN OF BACTERIAL VIRUSES.** Vn: EFFECT OF VARIOUS MUTAGENS (URETHANE, ETHYL URETHANE, HYDROGEN PEROXIDE, DEOXYCHOLATE, MALEIC HYDRAZIDE, BUTADIENE DIOXIDE, TRIETHYLENE MELAMINE, VERSENE AND ACRIFLAVINE) ON PROPORTION OF VIRUS-PRODUCING AND STREPTOMYCIN-RESISTANT CELLS IN CULTURES OF *BACILLUS MEGATERIUM* 20A J.H.Northrop: J. gen. Physiol., 1963, 46, 971-981 (Lab. Rockefeller Inst., Dorner Lab. Biophys. Med. Rhys., Berkeley, Calif., U.S.A.) All the mutagens tested, except acriflavine increased the proportion of virus-producing cells and streptomycin-resistant cells in *B. megaterium* 20A cultur^g to about the same extent. Acriflavine had no effect on the proportion of either type of the cell and triethylene melamine appeared to cause mutations to occur without cell division. K.Jones

- 6017. SIMULTANEOUS ACQUISITION OF OI AND O37 FACTOR BY GROUP G SALMONELLA AS A RESULT OF LYSOGENESIS (ANTIGENIC CONVERSION).** L.Le Min^o, H.W.Ackermann and P.Nicolle: Ann. Inst. Pasteur, 1963, 104, 469-476 (Inst. Pasteur, Paris, France) A phage from *S. poona* which possesses factor O37 was able to induce the appearance of this factor in Salmonella group G which lack it. Factor O37 was apparently always accompanied by OI factor in wild and converted strains. Phage PLT22 capable of inducing OI factor to Salmonella groups A, B and D which lack it has no action on Salmonella OI - belonging to group G. Immuno-fluorescence showed that factor 37 appeared on bacteria 8 to 9 min. after addition of phage to a culture in exponential phase. (French) B. Payne

- 6018. MKED COLONY AUXOTROPHS AND WILD TYPE CELLS FORMED BY THE ACTION OF NITROUS ACID ON *E. COLI*.** F.Kaudewitz and K.Moebus: Z. Naturforsch. B, 1963, 18, 244-253 (Max-Planck-Inst. vergleichende Erbbiol. und Erbpathol., Berlin-Dahleif^r Germany) Cells of *E. coli* incubated with 0[#]2M sodium nitrite gave rise to 3 types of colonies: (a) unchanged wild types, (b) mixed colonies of wild types and

auxotrophic cells, (c) colonies of auxotrophic cells only. The results were correlated with deamination of cytosine and adenine in the genetically determinant DNA chains.

 associated with a rapid infiltration of w.b.c. and macro-
 phages and phagocytosis of staphylococci at sites of
 localisation of bacteria in the skin and kidney. Growth
 of the bacterium was also prevented.

H.B.Waynforth

6024. PATHOGENICITY OF STAPHYLOCOCCI. INTER- ACTION OF ANTI-a-HAEMOLYSIN AND STAPHYLO- COCCUS AUREUS IN MICE. A.M.Fisher and K.Goshi: *Bull. Johns Hopkins Hosp.*, 1963, 112, 143-150 (Med. Dept., Johns Hopkins Univ. Med. Sch., Baltimore, Md., U.S.A.) a-Haemolysin was obtained from

peritoneal exudates of mice after their death produced by i.p. injn. of staphylococci. Large doses of rabbit antisera were given to the mice concurrent with the bacteria and a mild protective effect was observed.

H.B.Waynforth

6025. EFFECT OF CARBOHYDRATES ON PRODUCTION OF STAPHYLOCOCCAL PIGMENT. A.E.Brown and

H.R.Harris: J. clin. Path., 1963, 16, 261-262 (Gen. Hosp. Path. Dept., West Hartlepool, Co. Durham, England)

The fermentation of 5 carbohydrates by 50 strains of *Staphylococcus aureus* was studied. Those strains which ferment eTa carbohydrate showed enhanced pigment production when growing in its presence. For some strains this effect was clearest at low concn. of the carbohydrate.

J.B.Derbyshire

6026. HEMATOLOGICAL CHANGES IN STAPHYLO- COCCAL INFECTIONS IN GUINEA-PIGS.

W.#awkowicz and M.Ochocka: Polski. Arch. Med. Wewn., 1962, 32, 1109-1116 (Inst. Hemat., Warszawa, Poland) I.p. or s.c. injn. of *Staphylococcus aureus* in guinea-pigs produced hypertrophy of lymphatic nodules, extravasation and inflammatory changes in spleen, lymphatic glands, liver, lungs and kidney. The no. of r.b.c. was decreased to 1-2 x 10⁶/mm.3; in a few cases polychromatic and orthochromatic erythroblasts were observed accompanied with a transitory leucocytosis or leucopenia and an increase in the no. of characteristic lymphocytes (lymphoplasmocytes).

6027. MICROBIAL ANTAGONISM BY STAPHYLOCOCCUS AUREUS. G.LBarrow: J. gen. Microbiol., 1963, 31, 471-481 (Public Hlth. Lab., Bradford, England)

Seven strains antagonistic to indicator corynebacteria on solid media were found among 100 *S. aureus* strains of human origin. Sharply defined inhibn. zones were obtained. The inhibitory strains belonged to bacteriophage type 71 and were isolated from superficial infections. The specificity of inhibitory activity against other spp. and strains is described. *S. aureus* strains producing hazy inhibn. zones in the original test "showed similar but less extensive antibacterial activity. Oleic acid prevented inhibn. by both kinds of staphylococci. The prop. of the antagonistic agents are described.

K.Brew

6028. INVESTIGATIONS ON ISOANTAGONISMS

AMONG STAPHYLOCOCCI. E. BACTERIOLOGICAL CHARACTERISTICS OF THE ANTAGONISTIC STRAINS AND THEIR SENSITIVITY TO STAPHYLOCOCCIN A.

T.Lachowicz and T.Romanowski. IE. PROPERTIES AND MECHANISM OF ACTION OF CRUDE PREPARATIONS OF STAPHYLOCOCCIN A. T.Lachowicz.

SENSITIVITY TO STAPHYLOCOCCIN A OF STAPHYLOCOCCI ISOLATED FROM CARRIERS. T.Lachowicz and T.Romanowskfc Med. dośw., Mikrobiol., 1962, 14, 281-287, 290-296, 297-304, 305-309 (Wojskowe Lab. Sanitarno-

Higieniczne, Kraków, Poland) n. 137 strains showed isoantagonistic prop. No correlation was found between

MICROBIOLOGY

their antagonistic and pathogenic prop. 59% of strains were sensitive to 8 antibiotics, 40% were resistant to penicillin and 80% were susceptible to staphylococcin A in concn. of 5-400 U/ml.

m. Staphylococcin A remained fully active for a long time on storage at -20° and for 6 months when kept at +4°. Changes in pH from 1[#]0 to 10, pepsin and trypsin did not affect activity. It was active against Gram-pos. bacteria in concn. of 1-400 U/ml., while Gram-neg. bacteria, *Candida* spp. and BCG were not inhib. in concn. up to 800 U/ml. Studies with the E.M. seem to contradict the bacteriophage nature of staphylococcin A.

IV. 83% of strains isolated from subjects suffering from skin diseases were sensitive to staphylococcin A in concn. of 40 U/ml. while the remaining strains were sensitive to concn. up to 400 U/ml.

V. 89% of 1288 strains isolated from healthy carriers were sensitive to staphylococcin A. The coagulase-pos. strains were inhib. by concn. of 200 U/ml., and coagulase-neg. strains by concn. of 400 U/ml. The most resistant strains were those of phage types 7, 71, 29/71, NT/-, 44A/42B. (Polish) H.Osowiecki

6029. TWO DIPHTHERIA-LIKE STRAINS ISOLATED IN POLAND. A.Kraszewska: Med. dośw. Mikrobiol., 1962, 14, 311-313 (Zatfad Bakteriologii. Państwowy ZaHfed Hig., Warszawa, Poland). (Polish) M.Korbecki

6030. PROPERTIES OF TOXINS OBTAINED FROM DIPHTHERIA-LIKE STRAINS INVESTIGATED IN VITRO AND IN VIVO. A.Kraszewska: Med. dośw., Mikrobiol., 1962, 14, 315-322 (Państwowy Zatfad Higieny, Warszawa, Poland) The diphtheria-like strains produce toxin in vivo and in vitro. This toxin ppt. with diphtheria antitoxin, the process being inhib. by normal horse serum. In addition to changes typical for diphtheria toxin, the toxin produces some necrotic changes of skin, which could not be prevented by the anti-diphtheria serum. (Polish) H.Osowiecki

6031. PROTEIN FRACTIONS OF PURIFIED AND CONCENTRATED DIPHTHERIA TOXOID. J.Iskierko: Med. dośw. Mikrobiol., 1962, 14, 323-329 (Zatfad Chemii Ogólnej. Wydziały Lekarski, Lublin, Poland) Three protein fractions and a glycopeptide fraction were isolated from the purified cone, diphtheria toxoid. Fractions I and II consisted of sp. toxoid protein while bacterial wall and bacterial cell fragments constituted fractions III and IV respectively. (Polish) H.Osowiecki

6032. PHYSICO-CHEMICAL CHANGES OF THE ADSORBENT USED IN DIPHTHERIA TOXOID-VACCINE APPEARING ON PROLONGED STORAGE. W.Wojciak and E.Wolska: Med. dośw. Mikrobiol., 1962, 14, 331-337 (Katedra Chemii Fizycznej Uniwersytetu Adama Mickiewicza, Poznań, Poland) Structural changes due to storage were revealed on roentgenograms of aluminium hydroxide used as an adsorbent for diphtheria toxoid vaccine. (Polish) H.Osowiecki

6033. COAGULATION COMPONENTS IN EXPERIMENTAL AND CLINICAL TUBERCULOSIS. V.V.Chiplunkar and M.Sirs: Indian J. Physiol. Pharmacol., 1963, 7, 44-54 (Pharmacol. Lab., Ind. Inst. ScL. Bangalore, India) Accelerated clotting process with diminished whole blood coagulation and calcium clotting times, a statistically significant increase in the fibrinogen content

and decrease of prothrombin concn. were observed in acute guinea-pig tuberculosis. In ? patients with chronic tuberculosis the biochem. derangement was similar but with the addition of increased whole blood and calcium clotting times. The possibility of using the fibrinogen level of the blood as an index of the extent of the spread of tubercular lesions is discussed.

G.F.Blane

6034. LYtic ACTIVITY ON YEAST CELL WALLS AS A USEFUL CHARACTER FOR THE SEPARATION OF STREPTOMYCES AND NOCARDIA. J.R.Villanueva, S.Gascón and LG.Acha: Nature, Lond., 1963, 198, 911-912 (Inst. 'Jaime Ferran' de MicrobioL, Velazquez 138, Madrid, Spain). G.M.Lewis

6035. 'FLICKERING' IN PROTOPLASTS OF BACILLUS MEGATERIUM. D.M.Millec: Science, 1963, 139, 1060-1061 (Res. Inst., Canada Dept. Agric, London, Ont., Canada). G.M.Lewis

6036. SPORE ANTIGENS OF CLOSTRIDIUM SPOROGEN# C. BIFERMENTANS AND C. SORDELLE. P.D.Walker: J. Path. Bact., 1963, 85, 41-49 (Wellcome Res. Lab., Beckenham, Kent, England) The prep. of spore Ag# of vegetative cell Ag and of corresponding antisera is described. In no case does the spore anti-sera give observable reactions with the vegetative ^H and ^O Ag* Spores of all strains studied of C. sporogenes posses common agglutinogens and precipitinogens. Strains of C. bifermentans and C. sordellii can be differentiated on the basis of spore agglutinogens but not on basis of precipitinogens. No cross reactions occur between spores of strains of C. sporogenes and those of strains of the C. bifermentans-C. sordellii group or with spores of other spp. of the genus Clostridium. D.Murray

6037. HAEMOLYSINS OF E. COLI H.W.Smith: J. Path. Bact., 1963, 85, 197-211 (Animal Health Trust, Stock, Essex, England) Haemolytic E. coli are isolated from faeces of cattle, pigs, sheep and man. Two different haemolysins, a and p are identified. The former is filterable and antigenic. It is best prep. from young cultures from a special alk. broth extract. Neutralising Ab can be induced by i.v. injn. or can be found naturally according to incidence of a-haemolytic JLCOILⁱⁿ faeces. a-Haemolysin is toxic for mice, rabbits and guinea-pigs on i.v. injn., producing intra-vascular haemolysis. g-Haemolysin cannot be obtained cell-free and is not antigenic. D.Murray

6038. COMPARISON OF COLICINE PRODUCTION AND DIFFUSION ON DIFFERENT SOLID MEDIA. J.McGeachie and W.McCormick: J. clin. Path., 1963, 16, 278-280 (Royal Infirmary Bacteriol. Dept.# Glasgow, Scotland) Colicine was extracted by freezing and thawing from various solid media on which E. coli was cultivated for at least 6 hr., and demonstrated on diffusion plates inoc. with Shigella sonnei. Digest nutrient agar gave the highest yield of colicine, the production of which was inhib. by certain peptones. The diffusion of colicine was reduced by incorporation of dextrose in the agar. J.B.Derbyshire

6039. COLICINOGENIC ACTIVITY AND COLICINE SENSITIVITY OF STRAINS OF E. COLI SEROTYPES ISOLATED FROM GASTROENTERITIS AND DIARRHOEA CASES. O.Prakash: Indian J. Microbiol., 1962, 2, 127-134 (Dept. Microbiol., All India Inst. Med. Sci-P New Delhi, India). G.M.Lewis

6040. NEW ANTIGENIC TYPES OF KLEBSIELLA BACILLI. J.Maresz-Babczyszyn: Arch. Immunol. Ter. dosw., 1962, 10, 589-617 (Inst. Immunol. i Terapii doswiadczałnej, Polska Akad. Nauk, Wrocław, Poland) Four new capsular Ag of Klebsiella were isolated and were designated as K:73, K:74, K:75, K:76. A new subgroup of the somatic Ag 0:10 was also separated. H.Osowiecki

6041 AMINO ACID DECARBOXYLASES AND THE INFLUENCE OF POTASSIUM CYANIDE ON THE GROWTH OF KLEBSIELLA BACILLI. LDurlakowa, J.Maresz-Babczyszyn and A.Przondo-Hesek: Arch. Immunol., Ter. dosV, 1962, 10, 619-632 (Inst. Immunol. i Terapii Doswiadczałnej, Polska Akad. Nauk, Wrocław, Poland) Most Klebsiella strains show lysine decarboxylase activity. In addition strains of ?yPe K:73, and K:75 decarboxylate arginine and ornithine. strains that give neg.*capsule swelling reaction with standard anti-K sera show decarboxylase activity only towards lysine or to all 3 amino acids. H.Osowiecki

6042. INFLUENCE OF THE AMOUNT OF LIVE TYPHOID BACILLI ON THE RESULTS OF BACTERIOLOGICAL TESTS. Z.Kurdziel: Med. dosw. Mikrobiol., 1962, 14, 389-395 (Zahfad Mikrobiol., Slgskiej Akad. Med., Zabrze-Rokitnica, Poland). (Polish) M.Korbecki

6043. DISTURBANCES IN ANTIGEN Vi PRODUCTION AS A RESULT OF HP MUTATION IN SALMONELLA TYPHIL. K.Taylor and Z.Buczowskk Biul. Inst. Med. ttorsk., 1962, 13, 223-225 (Inst. Med. Morskiej, Gdańsk, Poland) HP S. typhi mutants resistant to Vi Phage are devoid of Ag Vi, whereas susceptible strains possess this Ag. This indicates that the genetic unit responsible for the disturbance in HP mutants is a gene Wtfch determines synthesis of Vi Ag. (Polish) M.Korbecki

6044. CATALASE AND SALMONELLA TYPHIMURIUM VIRULENCE. U Mayre and W.Zimmerman: Z. Hyg. InfektKr., 1962, 149, 44-56 (Inst. Hyg., Univ. Saarland, Homburg/Saar, Germany) Virulence and catalase activity were low in strains with high respiration efficient, and vice versa. (German) A.J.Wansbrough

6045. BACTERIOLOGICAL AND EPIDEMIOLOGICAL STUDIES IN EXTENSIVE FOOD CONTAMINATION BY SALMONELLA BAREILLY. LNudemusz, P. Krajcsovic and S Szuchovsky: Z. Hyg. InfektKr., 1962, 149, 57-70 (inst. Food Sci., Budapest, Hungary) Symptoms and illness in immediate and latent cases of infection were studied. The outbreak, due to a bakery contamination did not lead to an epidemic, and is discussed in relation to studies on the less virulent Salmonella types. (German) A.J.Wansbrough

6046. MILK-BORNE OUTBREAK OF FOOD POISONING DUE TO SALMONELLA HEIDELBERG. W.A.Knox. T.S.Galbraith, M.J.LewV ^• H J ? !? f i d _ f H ; r M r Johnston: J. Hyg., Lond., 1963, 61, 175-185 (Cent. Public Health Lab., London, England) In a milk-borne outbreak of S. heidelberg infection there were 77 cases of clinical disease and 144 symptomless excretors of E. coli. The source of infection was a cow with a clinical salmonella mastitis, and the origin of the J g f a n was thought to be cat Min ^ ^ ^ tg ^ y

6047. SALMONELLA AND SHIGELLA IN A O O O P OF PERIURBAN SOUTH AFRICAN BANTU SCHOOL CHILDREN. N.J.Richardson and V.Bokkenheuser.

J. Hyg., Lond., 1963, 61, 257-263 (S. African Inst. Med. Res., Johannesburg, S. Africa) Faeces examinations were made on 75 Bantu children on 8 occasions during 1 yr. Salmonella infections occurred in 22 children, and 2 had a Shigella infection. The infections were usually asymptomatic. 18 Salmonella and 2 Shigella serotypes were isolated in the survey. S. typhi, S. paratyphi B and S. paratyphi C were absent. The organisms were highly resistant to penicillin, erythromycin and novobiocin, and some strains were resistant to chloramphenicol and tetracycline. J.B.Derbyshire

6048. VIRULENCE STUDIES OF PASTEURELLA PESTIS ISOLATES FROM THE GREAT SALT LAKE DESERT. B.D.Thorpe, N.J.Marchette and J.B.Bushman: Amer. J. trop. Med. Hyg., 1963, 12, 219-222 (Ecol. and Epizool. Res. Lab., Univ. Utah, Salt Lake City, Utah, U.S.A.) P. pestis has been isolated from 2 Ord Kangaroo rats. Virulence studies on this strain and on another strain isolated from deer mice showed the latter strain to be slightly more virulent. A.A.Zimmerman

6049. CULTURAL CONDITIONS AFFECTING GROWTH OF PASTEURELLA SEPTICA. C.L.Sehgal and R.Mukherjee: Indian J. Microbiol., 1962, 2, 117-120 (Pathol. and Bacteriol. Divn., Indian Vet. Res. Inst., Mukteswar-Kumaun, India). G.M.Lewis

6050. ISOLATION OF PASTEURELLA TULARENSIS ON MEDIA, FROM MATERIALS ORIGINATING FROM PATIENTS AFFECTED WITH TULARAEMIA. E.Skrodzki: Biul. Inst. Med. morsk., 1962, 13, 201-203 (Inst. Med. Morskiej, Gdańsk, Poland) P. tularensis has been isolated from the lymphatic gland of a man affected with tularaemia. The strain was medium virulent and lost its virulence completely on storage in the laboratory. M.Korbecki

6051. TULARAEMIA IN SZCZECIN PROVINCE. FURTHER INVESTIGATIONS. E.Skrodzki, Cz.Dominowska, J.Golba and H.W^uszkiewicz: Biul. Inst. Med. morsk., 1962, 13, 205-218 (Inst. Med. Morskiej, Gdańsk, Poland) 109 cases of tularaemia were recorded during 1952-1960: hares proved to be the main source of infection. 18 strains of Pasteurella tularensis were isolated from hares, Microtus arvalis and ticks. (Polish) M.Korbecki

6052. NASO-PHARYNGEAL CARRIAGE OF HAEMOPHILUS INFLUENZAE TYPE B. D.C.Turk: J. Hyg., Lond., 1963, 61, 247-256 (King's Coll Med. Sch., Newcastle-upon-Tyne, England) The incidence of H. influenzae type B was less than 3% in naso-pharyngeal swabs from white or coloured children in Jamaica. The incidence was much higher in households in which cases of haemophilus meningitis had recently occurred, and also in children in a day nursery and in an orphanage nursery, although no case of meningitis occurred here. J.B.Derbyshire

6053. TAXONOMIC POSITION OF HAEMOPHILUS VAGINALIS*. K.Zinnemann and G.C.Turner: J. Path. Bact., 1963, 85, 213-219 (Bact. Dept., Sch. Med., Leeds, England) Examination of 6 strains of this organism - including the type strain no. 594, shows that on optimum media under reduced O₂ and increased CO₂ tension they grow as Gram-pos. organisms resembling Corynebacteria, differing from those found in man only in being catalase-neg. It is recommended that the organism be named Corynebacterium vaginalis. D.Murray

MICROBIOLOGY

- 6054.** CHOLERAGENIC PROPERTIES OF EL TOR, NON-AGGLUTINABLE AND WATER VIBRIOS CONFIRMED EXPERIMENTALLY. N.K.Dutta, M.V.Panse and H.I. Jhala: Brit. med. J., 1963, i, 1200-1201 (Haffkine Inst., Bombay, India) Rabbits 8-10 days old developed cholera-like symptoms and post-mortem appearance after infection with El Tor and non-agglutinable vibrios isolated from water and serol. distinct from true cholera vibrios of Ogawa, Inaba and Hikojima strains. The disease resembles human cholera and there is a potential danger that these organisms may cause sporadic or endemic cholera in human subjects. M.E.Nutt
- 6055.** CHOLERA VACCINES AND THE EL TOR VIBRIO. E.E.Vella: Brit. med. J., 1963, i, 1203-1207 (Bruce Lab., East Everleigh, nr. Marlborough, Wilts., England) The El Tor vibrio responsible for the 1961 cholera epidemic in Hong Kong was compared with V. cholerae (Inaba strain) by virulence tests in mouse and guinea-pig, active and passive protection tests in mice and agglutinin production in rabbits. The El Tor vibrio is a virulent organism. Active or passive immunisation of mice to V. cholerae gives some protection against El Tor. A trivalent vaccine incorporating Inaba, Ogawa and El Tor strains may be preferable to that in present use, but field trials are necessary to decide this. M.E.Nutt
- 6056.** E.M. OF EXTERNAL AND INTERNAL STRUCTURE OF REITER TREPONEMA. A.Ryter and J.Pillot: Ann. Inst. Pasteur, 1963, 104, 496-501 (Inst. Pasteur, Serv. Photomicrographie, Paris, France) Reiter treponema has been studied by E.M. using ultra thin sections and neg. staining. The helical shape of the cell was found to be due to a bundle of fibrils extending between the 2 extremities. They were to be found between the cell wall and the cytoplasmic membrane. The cell wall was not rigid and did not seem responsible for its cylindrical shape. (French) B.Payne
- 6057.** SURVIVAL OF LEPTOSPIRA CANICOLA IN TICKS, IX ODES RICINUS. Z.Dymowska and S.Szymański: Med., dośw. Mikrobiol., 1962, 14, 379-382 (Zaltfad Parazytoligii Lekarskiej, Pafistwowy ZaHlad Hig., Warszawa, Poland) The survival time of L. canicola in I. ricinus does not exceed 3 days. No evidence was obtained proving that it can be transmitted by ticks. A suspension of ground ticks showed anti L. canicola action. (Polish) HTSowiecki
- 6058.** LEPTOSPIRA CANICOLA INFECTION: REPORT OF 81 CASES AND REVIEW OF THE LITERATURE. A.Pertzelan and W.Pruzanski: Amer. J. trop. Med., Hyg., 1963, 12, 75-81 (Med. B Dept., Assaf Harofe Govt. Hosp., Zerifin, Israel) A review. 52 ref. A.A.Zimmerman
- 6059.** DEVELOPMENTAL EFFECTS OF THE SEX-RATIO AGENT IN EMBRYOS OF DROSOPHILA WILLISTONI. S.J.Counce and D.F.Poulson: J. exp. Zool., 1962, 151, 17-31 (Dept. Biol., Yale Univ., New Haven, Conn., U.S.A.) Developmental disturbances associated with the sex-ratio [SR] condition may occur before zygote formation, during cleavage, during the syncytial blastoderm stage or after cellular differentiation has started in D. willistoni. The chr. seem to be very sensitive to the "effects of the SR agent. Following the first signs of cytol. abnormalities in SR embryos, there is a rapid breakdown of the blastoderm. In such animals there is an effective spread from abnormal to healthy cells and a blackening of the embryos which die after differentiation has begun. The SR agent is a treponema-like

spirochaete. The details of transmission of the SR spirochaete from generation to generation have not yet been determined.

RICKETTSIAE AND VIRUSES

- 6060.** PURIFICATION OF PSITTACOSIS AGENT WITH ANION EXCHANGE CELLULOSE - 'ECTEOLA'. R.Silberman and P.Fisec: Nature, Lond., 1963, 198, 699-700 (Dept. Microbiol., Sch. Med., Univ. Rochester, N.Y., U.S.A.) Purification of strain 6BC psittacosis virus by a procedure involving treatment with ECTEOLA, yielded a product with high infectivity and antigenicity and without anticomplementary activity. G.M.Lewis
- 6061.** SUBCELLULAR CULTIVATION OF VIRUS: GROWTH OF ORNITHOSIS VIRUS IN NON-NUCLEATE CYTOPLASM. T.T.Crocker and J.M.Eastwood: Virology, 1963, 19, 23-31 (Cancer Res. Inst., California Univ. Med. Sch., San Francisco, Calif., U.S.A.) Cytoplasmic fragments from human amnion cells that are motile and undergo pinocytosis, incorporate amino acids but not nucleotide precursors so far tested. The attachment, penetration and initiation of virii growth to the point of moderately advanced maturation of virus inclusions have been studied following infection of cytoplasmic fragments with ornithosis virus. Synthesis of viral DNA was shown by autoradiography. Nuclear participation in the infectious process was not necessary during the events studied, but may be necessary for the renewal of cytoplasmic materials which are equally essential to functional survival of cytoplasm alone. J.G.Bennette
- 6062.** TRACHOMA. H. COMPARISON OF FLUORESCENT ANTIBODY, GIEMSA, AND EGG ISOLATION METHODS FOR DETECTION OF TRACHOMA VIRUS IN HUMAN CONJUNCTIVAL SCRAPINGS. R.L. Nichols, D.E. McComb, N.Haddad and E.S.Murray: Amer. J. trop. Med. Hyg., 1963, 12, 223-229 (Dept. Microbiol., Harvard Sch. Public Health, Boston, Mass., U.S.A.) A controlled study of the 3 methods is presented. The morphology of trachoma inclusions as shown by sp. immunofluorescence is described. Evidence for the superiority of the fluorescent Ab method to Giemsa is discussed. Field and laboratory applications of this method are suggested. A.A.Zimmerman
- 6063.** STRUCTURE OF VACCINIA VIRUS. W.F.Noyes: Virology, 1962, 18, 511-516 (Exp. Pathol. Dept., Sloan Kettering Inst., New York, U.S.A.) A neg. contrast E.M. study is presented. The mature intact particle has a surface covered-Kith 15 m μ projections which are easily denatured to form surface cords. The cords and projections are probably formed from small ring like or tubular subunits covered with an adherent envelope. A double membrane and an internal nucleoid have been visualised. Ultrasonically disrupted particles show internal filaments which may be the DNA macromolecules of the virus. J.G.Bennette
- 6064.** HAEMAGGLUTINATION BY VARIOLA VIRUS. B.R.Murti: Indian J. Microbiol., 1962, 2, 111-116 (Dept. Microbiol., Med. Coll., Guntur, India) Haemaggl. of fowl r.b.c. by strains of vaccinia and

variola viruses was studied. Fowl cells aggl. by vaccinia were not necessarily aggl. by variola. Scar suspensions contained no haemagglutinins. Haemaggln. titres were the same at 22* and 3**. but there was no reaction at 0-4*. G.M.Lewis

6065. SURFACE DIFFERENCES BETWEEN VMONS OF TWO STRAINS OF HERPES SIMPLEX VIRUS.
B.Roizman and P.R.Roane jun.: Virology, 1963, 19, 198-204 (Microbiol. Dept., Johns Hopkins Univ. Med. Sch., Baltimore, Md., U.S.A.) Patterns of elution from calcium phosphate gel differed for 2 variants of herpes simplex virus, which were also shown to be antigenically closely related but not identical. No differences were found in kinetic or multiplicity analyses of inactivation by ether, chloroform or urea. It is concluded that the virions of mP and MP strains of the virus differ in surface structure and composition of the capsid of the envelope. J.G.Bennette

6066. E.M. PARTICLE COUNTS ON HERPES Vm^{TM*} USING PHOSPHOTUNGSTATE NEGATIVE STAINING TECHNIQUE. D.H.Watson, W.C.Russell and P.Wildy: Virology, 1963, 19, 250-260 (Virol. Inst., Glasgow Univ., Scotland) The technique used is described. The particle infectivity ratio was about 10, provided *at the suspensions were not dialysed. Attempts have been made to relate the different morphol. types of Particle with-infectivity. J.G.Bennette

6067. ROLE OF POLYOMA VIRUS AND INTERFERON IN HERPES SIMPLEX VIRUS INFECTION IN VITRO. L.A.Glasgow and K.Habeb: Virology, 1963, 19, 339 (Virus Biol. Lab., N.I.H., Bethesda, Md., U.S.A.) A continuous line of mouse embryo cells persistently infected with polyoma virus was found to be resistant to challenge with herpes simplex virus. The relationship between competing viruses and factors ^P^oTM b¹ c¹ d¹ e¹ f¹ fesistance of the culture and maintenance of the carrier state are defined. J.G.Bennette

6068. ROLE OF SURFACE STATE IN MORPHOGENESIS OF INFLUENZA VIRUS FILAMENTS. H.A.Blough: Virology, 1963, 19, 112-114 (Virus Lab., Pathol. Dept., Cambridge Univ., England) Prelim^comm.

6069. ANTIGENIC STRUCTURE AND BIOLOGICAL PROPERTIES OF SOME INFLUENZA B STRAINS. BO-

j₁f₁S₁t₁S₁; R35ft.ftft^
tag 1940-1959 but no differences could be seen in sensitivity to inhibitors and haemaggln. with r.b.c. of birds and mammals. Has*aggln. of B strain isolated * 1959 showed the highest W₁ lability and the highest destroying act v ty₀ f₁₀₀₀d receptors among auotter Elated B strains. (Polish) H.Osowiecki

6070. LABORATORY INVESTIGATION ON THE INFLUENZA B EPIDEMIC IN WARSAW IN 1962. H.Horbowska and H.Wielopolska: Med. dosw. Mikro-

Epidemiol. Warszawa, Poland) F₁? TM J₁f₁f₁
ns of influenza B virus, 5 were classified as type B, corresponding to Ag structure of B.Johannesb/58 and one J₁ta was 5 U & as type A2, corresponding to We. A₂*Sing a/L/57. (Polish) H.Osowiecki

6071. HAEMAGGLUTINATION INHIBITION: INTERACTION OF INFLUENZA VIRUSES WITH HORSE SERUM INHIBITOR. A.Cohen and F.Biddle: Nature, Lond., 1963, 198, 508-509 (Dept. Bacteriol. Univ. Coll. Hosp. Med. Sch., London, England) An examination

was made of the absorption and effects of horse serum Y-inhibitor on influenza virus strains A/Sing, ASH, PR8, ROB and LEE. Variations in affinity for, and sensitivity to the inhibitor were observed and their significance discussed. G.M.Lewis

6072. EFFECT OF VITAMIN A ALCOHOL ON MORPHOLOGY OF MYXOVIRUSES. I. PRODUCTION AND COMPARISON OF ARTIFICIALLY PRODUCED FILAMENTOUS VIRUS. H.A.Blough: Virology, 1963, 19, 349-358 (Virus Lab., Pathol. Dept., Cambridge Univ., England) Evidence is presented that vit. A, by adsorption to the infected cell surface of the chorioamniotic membrane can produce filamentous virus (influenza PR8 and Newcastle disease virus, Milano strain). Structural differences between the two viruses resulting from this treatment can be used to differentiate them. The mechanism of filament formation is discussed with ref. to E.M. data. J.G.Bennette

6073. CHEMICAL MUTAGENESIS OF NEWCASTLE DISEASE VIRUS. L.Thiry: Virology, 1963, 19, 225-236 (Brabant Pasteur Inst., Brussels, Belgium) Three mutants were produced by HNO₂ treatment of the wild virus, red*-plaque, small plaque and minute plaque. The mutation from white to red was independent of size plaque mutations. Hydroxylamine produced the same 3 mutants, but neither mutagen induced back-mutations towards the wild type. Ethylethane sulphonate and dimethyl sulphate transformed a proportion of red viruses into white-plaque formers, phenotypically similar to the wild type. Mutation from white to red was not seen with these latter agents, which also did not produce plaque-size mutants. J.G.Bennette

6074. PATHOGENESIS OF VIRAL MENINGOENCEPHALITIDES. A.M.Rahman and C.M.Luttrell: Bull. Johns Hopkins Hosp., 1963, 112, 1-14 (Med. Dept., Johns Hopkins Univ. Med. Sch., Baltimore, Md., U.S.A.) Evidence of meningoencephalitis was noted in Swiss mice which were given the Newcastle disease virus after administration of E. coli endotoxin. No effect was observed after giving the virus alone. H.B.Wayforth

6075. VARIANT MEF1 STRAIN OF TYPE 11 POLIOVIRUS READILY GROWN IN CHICKEN EMBRYOS AND RETAINING PATHOGENICITY FOR MONKEY KIDNEY TISSUE CULTURES AND MICE. M.Roca-Garcia: Nature, Lond., 1963, 198, 715-716 (Viral and Rickettsial Res. Sect., Lederle Lab., American Cyanamid Co., Pearl River, N.Y., U.S.A.) G.M.Lewis

6076. PROTECTION AGAINST POLIOVIRUS PARALYSIS BY PRETREATMENT WITH GUANIDINE-DEPENDENT POLIOVIRUS STRAIN. B.Lodd, A.Spanedda, G.Brotzu and W.Ferrari: Life Sci., 1963, No. 5, 331-333 (Dept. Microbiol., Cagliari Med. Sch., Italy) Prelim, note. K.Jones

6077. INTERACTION OF POLIOVIRUS RNA WITH E.COLIRIBOSOMES. J.Warner, M.J.Madden and J.E.Darnell: Virology, 1963, 19, 393-399 (Biol. Dept., Massachusetts Inst. Technol., Cambridge, Mass., U.S.A.) Poliovirus RNA attaches to E. coli

MICROBIOLOGY

ribosomes and stimulates incorporation of amino acids into protein, at least some of which is antigenically related to poliovirus capsid protein. J.G.Bennette

6078. EPIDEMIC SITUATION OF POLIOMYELITIS IN POLAND IN 1961. Przegl. epidem., 1962, 16, 369-375 (Państwowy ZaWad Hig., Warszawa, Poland)

Mass vaccn. in 1959 with the attenuated vaccines (type 1 Chat and type 3 W Fox) resulted in marked changes in epidemiology, aetiology, and clinical symptoms of poliomyelitis in Poland. Since 1960 the no. of poliomyelitis infections in children and the mortality dropped significantly. In 1960 type 3 was the dominating virus. 16% of infections were caused by Coxsackie or ECHO viruses. (Polish) M.Korbecki

6079. ROLE OF NON-POLIO ENTERIC VIRUSES IN CASES REGISTERED AS POLIOMYELITIS. Przegl. epidem., 1962, 16, 389-395 (Państwowy ZaHład Hig., Warszawa, Poland) 15 • 5% of poliomyelitis were caused by Coxsackie and ECHO viruses. Infection with Coxsackie A4 virus occurred most frequently. M.Korbecki

6080. ETIOLOGICAL ROLE OF ENTERIC VIRUSES IN DISEASES OF THE NERVOUS SYSTEM. F.Z.Taytsch: Przegl. epidem., 1962, 16, 397-403 (Państwowy ZaHład Hig., Warszawa, Poland)

Fifty-seven enterovirus strains were isolated from patients with nervous diseases; 40 strains (14 Coxsackie, 14 ECHO and 9 unidentified) were derived from aseptic meningitis. The remaining 17 strains belonged to the Coxsackie (9) and ECHO (3) groups while 5 strains were not identified. The most frequent were A4 and Bi Coxsackie strains and E4 and E9 ECHO strains. (Polish) M.Korbecki

6081. I. PLAQUE ASSAY OF DENGUE AND OTHER GROUP B ARTHROPOD-BORNE VIRUSES UNDER METHYL CELLULOSE OVERLAY MEDIA. II. INHIBITION OF INFECTIOUS AND HAEMAGGLUTINATING PROPERTIES OF TYPE 2 DENGUE VIRUS BY AQUEOUS AGAR EXTRACTS. LT.Schultz and R.W.Schlesinger. Virology, 1963, 19, 40-48, 49-57 (Microbiol. Dept., St. Louis Univ. Med. Sch., Mo., U.S.A.)

L Conditions are defined under which max. cytopathic effects [CPE] of dengue-2 virus are obtainable in KB cell cultures. Agar was found to prevent CPE and demonstrable virus multiplication, and a plaque assay procedure, replacing agar by methyl cellulose in the overlay, has been devised. The general usefulness of this technique for plaque assay of other group B arboviruses is discussed.

n. Aq. agar extract [AE] added to liquid or methyl cellulose overlay medium, inhibits CPE or plaque formation by dengue-2 virus. Intracerebral pathogenicity, plaque formation in KB monolayers, and haemaggl. are all reduced when free virus is mixed with AE. Evidence is presented that the inhib. is due to direct combination of an inhibitory substance with free virus particles. The inhibitor has been partially purified and characterised as a sulphated polysaccharide. J.G.Bennette

6082. IMMUNOLOGICAL STUDIES WITH GROUP B ARTHROPOD-BORNE VIRUSES. IV. PERSISTENCE OF YELLOW FEVER ANTIBODIES FOLLOWING VACCINATION WITH 17D STRAIN YELLOW FEVER VACCINE. E.C.Rosenzweig, R.W.Babione and C.L.Wisseman, jun.: Amer. J. trop. Med. Hyg., 1963, 12, 230-235 (Dept. Microbiol., Univ. Maryland Sch. Med., Baltimore, Md., U.S.A.) Neutralising and haemagglut-inhibiting Ab have been found to persist 16 to 19 yr. following a

single dose of 17D strain yellow fever vaccine in retiring Navy and Marine personnel who gave no evidence of other group B arthropod-borne virus exposure.

A.A.Zimmerman

6083. NON-INFECTIOUS HAEMAGGLOTTININ AND COMPLEMENT-FIXING ANTIGEN OF JAPANESE B ENCEPHALITIS. M.Kitoaka and CNishimura: Virology, 1963, 19, 238-239 (Virol. Dept., N.I.H., Tokyo, Japan) Prelim, comm. J.G.Bennette

6084. KINETICS OF NEUTRALISATION REACTION BETWEEN JAPANESE ENCEPHALITIS VIRUS AND ANTI-SERUM. N.Hashimoto and A.M.Prince: Virology* 1963, 19, 261-272 (Virus Dept., U.S.Army Med. Command Japan, APO343, San Francisco, Calif., U.S.A.) Kinetic antiserum neutralisation curves with the virus were characterised by exponential inactivation phases of short duration, sometimes followed by recovery phases in which surviving virus increased progressively in the neutralisation mixture. An investigation of this phenomenon has led to the hypothesis of a combined action of dissociation of virus: neutralising Ab complexes, and replacement with either blocking Ab or Ab with ability to alter the critical site or sites on the virus surface such as to prevent further combination with neutralising Ab. J.G.Bennette

6085. IMPROVED CONDITIONS FOR PRODUCTION OF ARTHROPOD-BORNE VIRAL HAEMAGGLUTINS IN INFECTED HeLa CELL CULTURES. M.Likar, S.M. Buckley and D.H.Clarke: Virology, 1962, 18, 647-649 (Virus Lab., Rockefeller Found., New York, U.S.A.) Prelim, comm. J.G.Bennette

6086. CYTOPATHOGENIC EFFECT ON THE TISSUE LINE GIRARDI AFTER INFECTION WITH TICK-BORNE ENCEPHALITIS VIRUS. Z.Kawecki: BiuL Inst. Med. morsk., 1962, 13, 219-222 (Inst. Med. Morskiej, Gdańsk, Poland) The tissue line Girardi adapted to human serum (in contrast to that adapted to horse serum) did not show cytopathogenic effect after infection with the virus. An Ag was obtained from the vims grown on Girardi tissue which gave pos. reaction in CF-tests with serum of guinea-pigs hyperimmunised with K5 strain and with sera of persons recovered from tick-borne encephalitis. M.Korbecki

6087. EXPERIMENTAL OSTEITIS PROVOKED BY A VIRUS. J.Markowa: Pozn. Towarzy. Przyjac. nauk. Wydz. lek., 1962, 23, 255-285 (II Klin. Chirurg., Akad. Med., Kraków, Poland) Mice with expt. osteitis induced by the tick-borne encephalitis virus S47 survived 8-10 days, depending upon the no. of passages of the virus. Radiol. and histol. examination revealed inflammatory changes, necrosis associated with swelling* proliferation of marrow tissue, extravasation followed by proliferation of connective tissue. Viruses introduced into the marrow were still alive after 10 days. (Polish) T.qtfbicki

6088. E.M. DEMONSTRATION OF PURIFIED VENEZUELAN EQUINE ENCEPHALITIS VIRUS. M.Mussgay and J.Weibel: Virology, 1963, 19, 109-112 (Virol. Dept-i I.V.L.C, Apartado 1827, Caracas, Venezuela) Prelim, comm. J.G.Bennette

6089. HAEMAGGLUTINATION WITH REOVIRUSES. A.M.Lerner, J.D.Cherry and M.FInland: Virology» 1963, 19, 58-65 (Med. Dept., Harvard Med. Sch.,

MICROBIOLOGY

589

Boston, Mass., U.S.A.) The effects of various receptor reactive substances on the haemaggl. prop. of reoviruses on human R.b.c. are described. Conditions for adsorption and elution of the viruses to R.b.c. have been studied. It is concluded that reovirus-R.b.c. union involves mucoproteins on the surface of both reactants. Those on the virus surface contain SH groups, but those of the R.b.c. do not, so that the essential bond between them may not be of SH character. J.G.Bennette

**6090. PICORNAVIRUS GROUP. INTERNATIONAL
ENTEROVIRUS STUDY GROUP.** Virology, 1963, 19,

6° 91. HAEMAGGLUTINATION BY MEASLES VIRUS.
III. IDENTIFICATION OF TWO DIFFERENT HAEM-AGGLUTININS. f.Norrby: Virology, 1963, 19, 147-157 (Virus Res. dept., Karolinska Inst., Stockholm, Sweden) Two fractions with haemagglutinating [HA] activity were separated by sucrose density gradient centrifugation. The 'large' HA component that sedimented more rapidly is responsible for almost all the infectivity and haemolysing activity, although it constitutes only a small part of the total HA material present in unseparated retract. The conversion of large into small, slowly sedimenting HA material without infectivity or haemolysing activity, can be effected by treatment with heat, ether or Tween 80, and particularly by a combination of the last two." The 2 fractions are immunologically identical, as shown by cross adsorption tests, but the large HA material seemed to adsorb 3 times more Ab per particle than the small. J.G.Bennette

⁶° 92. DIARRHOEA OF TRAVELLERS. IV. VIRAL STUDIES OF VISITING STUDENTS IN MEXICO WITH FURTHER BACTERIOLOGICAL AND PARASITOLOGICAL OBSERVATIONS. M.A.Rosenbluth, W.Schaffner and B.H. Kean: Amer. J. trop. Med. Hyg., 1963, 12, 239-245 (Dept. Public Health and Prev. Med., New York Hosp.-
T Cornell Univ. Med. Center, New York, U.S.A.)
Investigations of 195 college students arriving in Mexico City as tourists showed that about one third became ill. Viruses were isolated from 2 stool specimens from sick objects but appear to play only a minor role in the aetiology of tourists' diarrhoea. A.A.Zimmerman

⁶ 93. I. OPTIMUM TEMPERATURE FOR GROWTH AND
SENSITIVITY TO INTERFERON AMONG DIFFERENT
VIRUSES. E. INTERFERON PRODUCTION BY DIFFER-
ENT VIRUSES. J. Ruiz-Gomez and A. Isaacs: Virology,
1963, 19, 1-7, 8-12 (Nat. Inst. Med. Res., Mill Hill,
London, England) I. The optimal temp, for plaques
Production by 11 viruses in chick embryo fibroblast cul-
tu*es varied between 32T and 42f Good correspondence
w*s found between the optimal temp, for growth and the
sensitivity of these viruses*t6 interferon in the same type
of Plaque assay. A relationship was found between these
Prop, and the virulence of these viruses for the chick
embryo, but 2 exceptions were noted. - * << .
H. Viruses with an optimal temp, of growth of 35" in
*ick embryo fibroblasts generally gave good yields of
^terferon in these cells. Viruses with higher optimal
temp, gave much lower yields. When production of
^terferon was measured at different temp, in a single
cVcl_e of virus growth, the highest yields of interferon
wer'e found at temp, above the optimal temp, for virus
growth. Newcastle disease virus showed contrasting
behaviour in primary cultures of chick and human cells.

The results favour the suggestion that poor production of interferon may be one factor in virus virulence.

J.G.Bennette

6094. VIRAL INTERFERENCE IN TWO LINES OF HeLa CELLS. K.Cantell and K.Paucken Virology, 1963, 19, 81-87 (Virus Lab., Philadelphia Children's Hosp., Pa., U.S.A.) The S3 and F lines of HeLa cells were compared for interferon production and behaviour in interference assays. Protection against vesicular stomatitis virus was established in both lines by u.v. -irradiated Newcastle disease virus [NDV_{Uv}] hut in neither by influenza virus [PR8uv3-]. On exposure to NDV_{WT} however, the S3 line yielded 10-50 times less interferon than either F or primary human amnion cells. The age of the culture had a pronounced effect on the sensitivity of S3 cells to NDV_{Uv}^{anc*}^{tu} interferon, whereas the behaviour of F cells was not age dependent. The implications of the results on the cancerous origin of the HeLa lines and their sensitivity to interferon are discussed. J.G.Bennette

6095. BIOLOGICAL STUDIES OF INTERFERON. II. TEMPORAL RELATIONSHIPS OF VIRUS AND INTERFERON PRODUCTION BY CELLS INFECTED WITH EASTERN EQUINE ENCEPHALOMYELITIS [EEE] AND INFLUENZA VIRUSES. R.R.Wagnen *Virology*, 1963, 19, 215-224
(Microbiol. Dept., Johns Hopkins Univ. Med. Sch., Baltimore, Md., U.S.A.) Under all the conditions studied, interferon was detected only after virus multiplication had reached a peak. EEE virus could induce interferon production in L cells in the absence of demonstrable cytopathology, but interferon yields were greater in L and chick embryo cell cultures undergoing rapid cell destruction after infection at high multiplicity. In chorioallantoic membrane the onset of interferon production coincided with the disappearance of influenza . haemagglutinin from the cells. Cellular levels of influenza S Ag were not significantly affected by endogenous interferons. The physical and biol. prop. of S Ag and interferon served to differentiate these 2 products of influenza-infected cells. J.G.Bennette

6096. VACCINIA VIRUS PLAQUE FORMATION AND INHIBITION BY INTERFERON. L DYNAMICS OF PLAQUE FORMATION. J.Lindenmann and G.E.Gifford. **H. DYNAMICS OF PLAQUE FORMATION IN PRESENCE OF INTERFERON.** G.E.Gifford, S.T.Toy and J.Lindenmann. **IE. SIMPLIFIED PLAQUE INHIBITION ASSAY OF INTERFERON.** J.Lindenmann and G.E.Gifford: *Virology*, 1963, 19, 283-293, 294-301, 302-309 (*Microbiol. Dept., Florida Univ. Med. Coll., Gainesville, Fla., U.S. A.*) I. Plaques of vaccinia virus in chick embryo monolayers without agar emerged into visibility according to a normal sigmoid curve. The distribution of plaque diam. could be approximated by a normal Gaussian curve with a variable proportion of plaques hidden below the threshold of visibility. The time course of plaque induction and of diam. increase is described. Strains of vaccinia virus differ in the rate of appearance of primary and secondary plaques.

IL Pre-incubation with interferon only slightly reduced plaque formation as compared to simult. addition of interferon with the infecting virus. Plaque counts, diam. and the log of total plaque area were linearly inhib. by interferon, and the lesions emerged more slowly into visibility. The growth rate of treated plaques was reduced but remained independent of plaque size or time. Some of the infected cells seemed to be permanently prevented from forming plaques.

EH. Interferon and virus are added simult. to chick

MICROBIOLOGY

- embryo monolayers without agar, and plaque counts made after staining with crystal violet 44-48 hr. after incubation started. The dose-response curve and other characteristics of the assay are described. J.G.Bennette
- 6097. STRUCTURE OF CAPSID OF GAL VIRUS.** D.H.Watson, I.A.Macpherson and M.CDavies: Virology, 1963, 19, 418-419 (Virol. Inst., Glasgow Univ., Scotland) Prelim, comm. J.G.Bennette
- 6098. TWO ATTENUATED STRAINS OF MTCOMA VIRUS ISOLATED IN GREAT BRITAIN.** P.J.Chapple and E.T.W.Bowen: J. Hyg., Lond., 1963, 61, 161-168 (M.A.F.F. Infestation Control Lab., Worplesdon, Surrey, England) Two field strains of myxoma virus isolated in Great Britain were tested for virulence in rabbits by i.d. inocn. Both strains were relatively attenuated, and one resembled the KM13 strain. The characteristics of the strains suggested that the evolution of myxoma virus in Great Britain was similar to its evolution in Australia. J.B.Derbyshire
- 6099. ANTIGENIC DIFFERENCES BETWEEN STRAINS OF FOOT-AND-MOUTH DISEASE [FMD] VIRUS OF TYPE SAT 1.** N.StG.HysloR J.Davie and S.P.Carten J. Hyg., Lond., 1963, 61, 217-230 (Res. Inst., Pirbright, Surrey, England) Cross-protection tests in cattle with formalised vaccines showed that 2 strains of FMD virus (type SAT 1 - RV11 and SA 13/61) were antigenically different. CF and neutralisation tests in tissue cultures confirmed this observation. J.B.Derbyshire
- 6100. HEAT-LABILE COMPLEMENT-FIXING ANTIGENS IN THE GROWTH-CYCLE OF FOOT-AND-MOUTH DISEASE VIRUS.** D.N.Planterose, B.Cartwright and F.Brown: Nature, Lond., 1963, 198, 864-865 (Res. Inst. (Animal Virus Diseases), Pirbright, Surrey, England) Heat-labile (at 56° C)-fixing activity has been observed in all cultures of foot-and-mouth disease virus studied. Attempts to separate a heat-labile component from the 25 mfi and small components of the virus by sucrose density gradient centrifugation failed. Observation of the formation of the heat-labile material in pig kidney tissue cultures indicated that it is present at some stage of the virus growth cycle. G.M.Lewis
- 6101. CHEMICAL AND MORPHOLOGICAL CHANGES OF FELINE KIDNEY CELLS INFECTED BY A CYTOPATHOGENIC AGENT OF THE CAT (VPG = PERUGIA CAT VIRUS).** V.Torlone and F.Titoli: Sperimentale, 1963, 113, 42-53 (1st. Zool. Profilattico Sperimentale Umbria e delle Mache, Perugia, Italy) When feline kidney cell monolayers were infected with the cytopathogenic agent isolated from cats with rhinitis and conjunctivitis (previously reported), a paranuclear mass containing RNA appeared, which resembled the paranuclear mass appearing after enterovirus or poliovirus infection. There was an increase in total RNA and a decrease in total DNA in the infected cells; the protein content remained unchanged. Viral Ag was demonstrated by fluorescent Ab techniques in the cytoplasm and cytoplasmic lesions. (Italian) G. N. Godson
- 6102. EQUINE HERPES VIRUSES.** G.Plummer and A. P. Waterson: Virology, 1963, 19, 412-416 (Wellcome Res. Lab., Beckenham, Kent, England) Prelim. comm. J.G.Bennette
- 6103. PATTERN OF VIRAL AND CELLULAR DNA SYNTHESIS IN PSEUDORABIES VIRUS-INFECTED CELLS IN**

LOGARITHMIC PHASE OF GROWTH. A.C.Kaplan and T.Ben-Porat: Virology, 1963, 19, 205-214 (Microbiol. Dept., Albert Einstein Med. Center, Philadelphia Pa., U.S.A.) The biphasic character of the kinetics of thymidine incorporation into the DNA of logarithmically growing rabbit kidney cells is the resultant of 2 con* current processes: progressive inhibn. of the rate of synthesis of cellular DNA and gradual increase in the rate of synthesis of viral DNA. Expt. on the mechanisms of inhibn. of cellular DNA synthesis in infected cells are described. This inhibn. is not due to the failure of the infected cells to enter into the DNA-synthesising period of their growth cycle, nor is it the result of the degradation of cellular DNA in these cells. In infected cells there is a shift of the cellular DNA towards the periphery of the nucleus which may be responsible for the inhibn. o» cellular DNA synthesis. J.G.Bennette

6104. ADAPTATION OF HORSE SICKNESS VIRUS TO TISSUE CULTURE. H.Mirchamsy and H.Taslimi: Nature, Lond., 1963, 198, 704-706 (Razi Serum and Vaccine Inst., Karadj, Iran) Details are given of the interaction between horse sickness virus and hamster kidney cells and of the development of infectivity during a single growth cycle of the virus. G.M.Lewis

6105. CANINE DISTEMPER VIRUS IN CHICK EMBRYO CELL CULTURE: PLAQUE ASSAY, GROWTH AND STABILITY. R.H.Bussell and D.T.Karzon: Virology* 1962, 18, 589-600 (Bacteriol. Dept., Buffalo Univ. Med. Sch., N.Y., U.S.A.) Cytopathic effects were studied in chick embryo cultures infected with 3 strains of the virus. One of these, an egg-adapted strain, show# reduced cytopathogenicity for the chorioallantoic membrane after culture in chick embryo cell cultures. Virus attachment was slow, was followed by an eclipse period of 8-10 hr., after which there was an increase in cell associated virus. 2-4 hr. after this, virus appeared in the fluid phase, but always in smaller amounts than that recoverable from the cells. In the plaque assay, a linear relationship was found between virus concn. and plaque no. Hie virus is relatively thermolabile. J.G.Bennette

6106. TRANSFORMATION IN HAMSTER KIDNEY MONOLAYERS BY VACUOLATING VIRUS, SV-40. P.H.Blad and W.P.Rowe: Virology, 1963, 19, 107-109 (Infect. Dis. Lab. N.I.H., Bethesda, Md., U.S.A.) Prelim. comm. j. G. Bennetts

6107. SIMIAN-VIRUS-40-INDUCED EPENDYMOSES IN NEWBORN HAMSTERS. I. VIRUS-TUMOUR RELATIONSHIPS. P.Gerber and R.L.Kirschstein: Virology, 1962, 18, 582-588 (Viral Immunol. Lab., N.I.H., Bethesda, Md., U.S.A.) Intra-cerebral inocn. of newborn hamsters with SV40 produced ependymomas with a latency a* freq. depending on the concn. of virus used. No evidence of virus multiplication was fourfd in brain, tumour or oth* tissue extracts, but trace amounts of virus were detected when intact tumour cells were seeded* on monkey kidney monolayers. Only a small proportion of the tumour cells contained infectivity. No free virus was obtained from cultured ependymoma cells. Other simian viruses were tested for ependymoma production and none was found active. J.G.Bennette

6108. GROWTH CYCLE OF VISNA VIRUS IN MONOLAYER CULTURES OF SHEEP CELLS. H.Thorman: Virology, 1963, 19, 273-278 (Enterovirus Dept., State Serum Inst., Copenhagen, Denmark)

The kinetics of visna virus growth and its cytopathogenicity are described. Increase in free virus almost coincided with increase of cell-associated virus, and more virus was found in the fluid phase than in the cell-associated form throughout the growth period, indicating rapid release of newly formed virus, most of which was found on the external surface of the cells. This agrees with the E.M. evidence for visna virus formation by budding in the cell membrane.

J.G.Bennette

6109. ADVERSE REACTIONS IN CATTLE FOR VACCINATION WITH LAPINISED RINDERPEST VIRUS. G.R.Scott

J. Hyg., Lond., 1963, 61, 193-203 (Vet. Res. Lab., Kabete, Kenya) 310971 cattle in Kenya, vaccinated with lapinised rinderpest virus, were observed for adverse reactions, the overall incidence of which was 0·0%. However, as the true population at risk embraced only rinderpest-susceptible cattle, the real incidence of adverse reactions was almost 0·W%. These ^" " . ^ t -n t e aggravation of latent protozoal infections, " " " " " " " " reactions, and transient spermatolysis in bulls. Anaphylaxis was rarely recorded. Four strains of virus isolated from reacting cattle had the characteristics of rinderpest virus.

J.B.Derbyshire

6110. STUDIES IN TISSUE CULTURE ON THE PH-STABILITY OF RINDERPEST VIRUS. B.Liess and

W.Plowright: J. Hyg., Lond., 1963, 61, 205-211 (E.A.V.R.O., Muguga, P.O.Box 322, K.C. ^ ^ S. Iya) The stability of rinderpest virus in veronal-acetate buffer of pH 3-0-10 at 4° was measured by infectivity titrations in bovine kidney tissue cultures. An attenuated strain was relatively stable from pH 4-10-2, with a half-life of 2 hr. at the extremes of this range. Max. stability was in the range pH 7·2-8·0. Two virulent strains showed a marked stability at high pH, but were much less stable at low pH.

J.B.Derbyshire

6111. E.M. OF RINDERPEST VIRUS IN BOVINE MOLTNEY

Animal Dis. Lab. Isla N. Dept. Alf kidney cells infected at htfli n S S w & with *e virus were *in-sectioned and WrtnedS, E.K. Tie effects of Infection were visible \ll 3 hr. but development of inclusion* was slower. Virus developed within or in contact with TM; " ? ^ S 11 \ll smic sac. of vims are described. Karaqf small Oracles and inclusion aggregates are 1^{MF}. J.Bennette

6112. RABBIT POX: EXPERIMENTAL STUDY OF PATHWAYS

M.J.Duckworth: J. Path. Bact., 1963, 87, 101-110 (Bact. Dept., Univ. Liverpool, England) Infection is induced by intranasal, i.d. and conjunctival inoc. of Utrecht and of Rockefeller Inst. strains of virus into rabbits and also by contact with previously infected animals. The latter produces primary sites of infection in upper and lower respiratory tracts, rarely in conjunctiva. Invasion involves successively primary site, regional lymph nodes, circulating w.b.c., spleen and other remote tissues. Widespread dissemination of virus precedes other signs gene Rabb tract are not infective until second day of illn s. pite high initial litres of virus. D.Murray

6113. MOUSE SALIVARY DISEASE

L RNA, DNA AND PASCHIFF REACTIONS IN SGV-

INFECTED LIVER. N.G.Grand and E.R.Grandel.

n. SULPHYDRYL AND DISULPHIDE REACTION IN SGV-INFECTED LIVER. N.G.Grand, E.R.Grandel and LLyon: Arch. oral Biol., 1963, 8, 265-270, 271-274 (Dept. Oral Pathology, Coll. Dent., Univ. Illinois, Chicago, Ill., U.S.A.)

I. SGV intranuclear inclusions contained RNA and increased amount of glycoproteins. Glycogen and glycoproteins in the cytoplasm of inclusion-bearing cells may be sources of substances essential for the formation of viral nucleic acid glycoprotein complexes. The halo encircling the inclusion body is probably an artefact of aggregation or dehydration.

II. SGV infected mouse liver showed increases in sulphhydryl and disulphide protein groups especially in SGV-induced inclusion bodies. The increase was disproportionately greater for disulphide than for sulphhydryl groups suggesting changes in the aggregation or hydration states of inclusion body proteins.

6114. ISOLATION OF A MURINE LEUKAEMOGENIC

VIRUS P-LLV. A.Precerutti and L.W.Law: Nature, Lond., 1963, 198, 801-803 (Nat. Cancer Inst., Bethesda, Md., U.S.A.)

G.M.Lewis

6115. E.M. AND BIOASSAY STUDIES ON MURINE

LEUKAEMIA VIRUS (RAUSCHER). R.F.Ziegel and F.J.Rauschen: J. nat. Cancer Inst., 1963, 30, 207-219 (Viral Oncol. Lab., Nat. Cancer Inst., Bethesda, Md., U.S.A.) Prelim, descriptive account.

J.G.Bennette

6116. RAPID INTRACEREBRAL PASSAGE AND RECOVERY OF MOLONEY LEUKAEMIA VIRUS FROM MOUSE BRAIN TISSUE. H.J.Spencen: J. nat. Cancer Inst., 1963, 30, 313-321 (Med. Res. Lab., M.L.Bassett Hosp., Cooperstown, N.Y., U.S.A.)

The virus was recoverable in large quantities from brain harvested 7 days after intracerebral inoc. of newborn BALB/c mice. Serial brain passage resulted in enhancement when harvested at 7 day intervals, but not at 3 day intervals, when leukaeomogenic activity of brain extracts declined rapidly. There was no evidence of neurotropic adaptation. Virus persisted in brain at high titres until advanced stages of the disease. It was also recovered from brain following i.p. infection.

J.G.Bennette

6117. STRUCTURE OF GROSS LEUKAEMIA VIRUS.

D.F.Parsons: J. nat. Cancer Inst., 1963, 30, 569-583 (Ontario Cancer Inst., Toronto, Canada) A descriptive E.M. study.

J.G.Bennette

6118. ASSAY AND MULTIPLICATION OF AVIAN

MYELOBLASTOSIS VIRUS [AMV]. P.K.Vogt and H.Rubin: Virology, 1963, 19, 92-104 (Virus Lab., California Univ., Berkeley, Calif., U.S.A.) A simple quant. assay for AMV depending on interference between AMV and Rous sarcoma virus is described. This has been applied to the study of AMV growth in vitro and in vivo. It was also found that AMV can be assayed directly using the fluorescent Ab stain to identify foci of cells producing viral Ag.

J.G.Bennette

6119. FACTORS INFLUENCING DETERMINATION OF CELLULAR MORPHOLOGY IN CELLS INFECTED WITH ROUS SARCOMA VIRUS [RSV]. A.M.Prince: Virology, 1962, 18, 524-534 (Pathol. Dept., Yale Univ. Med.

Sch., New Haven, Conn., U.S.A.) The composition of the medium favouring morphol. alteration of turkey fibroblasts by RSV in vitro is described. Tumours induced in vivo by single virus particles varied widely in

MICROBIOLOGY

morphology, showing spindle-cell, round-cell, giant-cell and fusiform-cell types. Possible correlations between in vitro and in vivo morphol. changes are discussed, and in vitro morphol. conversion is related to neoplastic potential.

J.G.Bennette

6120. SENSITIVITY OF ROUS SARCOMA VIRUS [RSV] ASSAYS. R.M.Dougherty and P.J.Simons: *Virology*, 1962, 18, 559-566 (Exp. Biol. and Virol. Div., Imp. Cancer Res. Fund, Mill Hill, London, England)

Statistical analysis of RSV assays on Brown Leghorn embryo chorioallantoic membrane gave results similar to those from White Leghorn embryos in some respects, but comparative assays of standard frozen stocks of RSV showed that the Brown Leghorns were 10-50 times more sensitive than White Leghorns on the chorioallantoic membrane and about 10 times more sensitive by the focus method in tissue culture. In contrast to other reports, the incidence of non-reactors to RSV on the chorioallantoic membrane was very low (2 out of 800 embryos). A modification of the technique for counting RSV foci in tissue culture is described.

J.G.Bennette

6121. GROWTH OF NORMAL AND ROUS SARCOMA VIRUS INFECTED CHICK EMBRYO CELLS IN RAT BRAINS. T.M.Scotti, M.Dorsey jun., S.S.Lefkowitz, A.Duwelius and M.M.Sigel: *Cancer Res.*, 1963, 23, 531-534 (Variety Children's Res. Foundn., Miami, Fla., U.S.A.) Infected cells grew more efficiently and developed into typical Rous sarcomas even when cells had been in contact with virus for only 15-90 min. More abundant growths were often obtained when cells had been exposed to virus for 2 days. Infected cells showed no morphol. evidence of transformation by virus at die time of implantation. Haemorrhage was noted in many of the Rous tumours.

B.M.Stevens

6122. ABSENCE OF INFECTIOUS ROUS VIRUS IN RAT TUMOUR XC, WHOSE STRUCTURALLY INTACT CELLS PRODUCE ROUS SARCOMA WHEN TRANSFERRED TO CHICKS. J.Svoboda, P.Chfle, D.Simkovis and L.Hilgerc *Folia biol.*, Praha, 1963, 9, 77-81 (Inst. Expt. Biol., Czech. Acad. Sci., Prague, Czechoslovakia) Intact cells of tumour XC from rats induced tumours in chicks, but cell-free prep. (filtrates, cone, microsomes and main cell fractions) were not effective in causing tumours. Virus was not found in sediments from centrifuged culture fluid. Anti-sera from chicks, capable of neutralising Rous virus in tissue culture did not affect the ability to produce Rous sarcoma in chicks. No haemagglg. agent of polyoma virus type was obtained from Rous sarcoma, Rous virus or culture fluids from tumour XC and Rous sarcoma cell cultures.

M.S.Laverack

6123. CHARACTERISTICS OF NORMAL AND TRANSFORMED CLONES ARISING FROM BHK21 CELLS EXPOSED TO POLYOMA VIRUS. M.Stoker: *Virology*, 1962, 18, 649-651 (Virol. Inst., Glasgow Univ., Scotland) Prelim, comm.

6124. POLYOMA VIRUS VARIANT WITH NEW ANTIGENIC DETERMINANTS. J.D.Hare and H.R.Morgan: *Virology*, 1963, 19, 105-107 (Microbiol. Dept., Rochester Univ. Med. Sch., N.Y., U.S.A.) Prelim. comm.

J.G.Bennette

6125. LYtic INTERACTION AND CELL TRANSFORMATION WITH LARGE- AND SMALL-PLAQUE MUTANT OF POLYOMA VIRUS. D.Medina and L.Sachs:

Virology, 1963, 19, 127-139 (Virol. Lab., Weizmanf Inst., Rehovoth, Israel) Evidence is presented that the small-plaque polyoma mutant SP2 has a higher efficiency both for the lytic interaction and for cell transformation than the large-plaque virus BP5. The results also indicate some conditions that can change the rate of cell transformation.

J.G.Bennette

6126. PURIFICATION OF POLYOMA VIRUS. E.WinocoU* *Virology*, 1963, 19, 158-168 (California Inst. Technol., Pasadena, U.S.A.) Homogeneous purified prep. of the virus were obtained by equilibrium density gradient centrifugation in CsCl. Homogeneity was shown by ultracentrifugal analysis, E.M. observations and u.v. absorption spectrum. Two bands were formed in the density gradient, one which contained complete virus particles showing infectivity comparable to haemagglg* power, and the other containing empty particles in which haemagglg. was not accompanied by corresponding in* fectivity. From the difference in buoyant densities between the 2 types of particles, the amount of DNA in the full particles was estimated as 13*4%.

J.G.Bennette

6127. PHYSICAL CHARACTERISTICS OF POLYOMA VIRUS. II. NUCLEIC ACID. L.V.Cra*ford: *Virology* 1963, 19, 279-282 (Virol. Dept., Glasgow Univ., Scotland) DNA extracted from polyoma virus is double stranded and has a base composition of 48% guanine plus cytosine. Problems of mol. size determination are discussed.

J.G.Bennette

6128. INHIBITORS OF POLYOMA VIRUS HAEMAGGLUTINATION IN NORMAL MOUSE SERA AND ORGANS. P.Baldazzi and S.Salmon: *Sperimentale*, 1962, 112# 446-456 (1st. Microbiol., Univ. Firenze, Italy) Extracts (0-05M phosphate pH 7*2, 15 min, 40°) from salivary and thymus glands, liver, lungs, kidney, brain and brain fat tissue of normal mice and mice immunised against polyoma virus, contained a polyoma-virus haemagglg. inhibitor. Sera from normal mice also con⁰tained this inhibitor. The activity was thermolabile. Organ extract inhibitors bound the virus at 4°, and 37° whereas normal serum inhibitors bound the virus only at 4°. There were no differences between the vims binding ability of organ extracts from normal and immune mice* (Italian) G.N.Godson

6129. POLYOMA VIRUS AND L CELL RELATIONSHIP. I. SOME CHARACTERISTICS OF CELL LINE PERSISTENTLY INFECTED WITH POLYOMA VIRUS. J.D.Hare, P.Baldazzi and H.R.Morgan: *J. nat. Cancer Inst.*, 1963, 30, 45-56 (Microbiol. Dept., Rochester Univ.# N. Y., U.S.A.) An L cell clone has supported active proliferation of polyoma virus without cytopathic effect for 2 yr., without increase in neoplastic capacity, as indicated by failure to produce tumours in C3H mice or in cheek pouches of cortisonised hamsters. Some conditions for the maintenance of the earlier state are described. Evidence is present that persistent infection is the usual relationship between polyoma virus and the strain L cell* (Italian) J.G.Bennette

6130. MOLECULAR STRUCTURE OF SOME INSECT VB^W INCLUSION BODIES. G.H.Bergold: *J. ultrastructure Res.*, 1963, 8, 360-378 (Virologia Dept., I.V.L.C., Apartado 1827, Caracas, Venezuela) E.M. studies have shown the presence of dot and line patterns in poly* hedra and capsule insect virus inclusion bodies. The inclusion body protein mol. were spheres arranged in a face-centered cubic system. This ?rrange*ment indicated that there were 6 selective points of special attraction on

*e surface of each mol which led to die cubic system.
Virus particles in the inclusion bodies did not run a ito
cryst. lattice. H.B.waymionn

6137. EFFECT OF U.V. LIGHT ON TOBACCO MOSAIC VIRUS CONTAINING 5-FLUOROURACIL. A.Becarevifi, B.Djordjević and D.Sutić. *Nature. Lond.*, 1963, 198, 612-613 (Inst. Appl. Nuclear Sci. Agric., Zemun, Belgrade, Yugoslavia) Tobacco leaves infected with TMV were incubated with 5-fluorouracil; this treatment rendered the virus particles significantly more susceptible to inactivation by u.v. light. G.M.Lewis

6138. DENSITY HETEROGENEITY ZN PURIFIED PREPARATIONS OF BROAD BEAN MOSAIC VIRUS.

A.Laronson and J.B.Bancroft: Virology, 1962, 18,
570-575 (Plant Pathol. Dept., Purdue Univ.,
Lafayette, Ind., U.S.A.) An apparently homogeneous
purified prep. of the virus separated into 2 closely placed
bands on density gradient CsCl centrifugation. Only the
bottom band yielded infective virus or RNA. Small
differences in the amount of RNA between the 2 com-
ponents could account for the density difference.
Evidence from sedimentation studies suggested that die
missing nucleotides did not result in extensive frag-
mentation of the RNA. J.G.Bennette

6139. KINETICS OF LABELLING OF TURNIP YELLOW MOSAIC VIRUS WITH PHOSPHORUS-32 AND SULPHUR-35. R*E.F.Matthews, E.T.Bolton and H.R. Thompson: *Virology*, 1963, 19, 179-189 (*Microbiol.*)

Dept., Auckland Univ., New Zealand) The time course of labelling has been followed using ^{35}S to label protein and ^{32}P to label RNA. A theoretical treatment for the relation between virus protein and nucleoprotein is presented. The simplest model is one in which the protein is formed reversibly and the nucleoprotein irreversibly from the same pool of precursor protein sub-units. The minor nucleoprotein components cannot be stages in the assembly between the empty protein shell and complete virus. J.G.Bennette

**6140. EVIDENCE OF RELATIONSHIP BETWEEN TURNIP
YELLOW MOSAIC VIRUS AND WILD CUCUMBER
MOSAIC VIRUS. R.Macleod and R.Markham:**

Virology, 1963, 19, 190-197 (A.R.C. Virus Res. Unit, Huntingdon Rd., Cambridge, England) A serological relationship has been found between the 2 viruses which are not known to have any common host plant. Similarities in physicochem. prop. and morphology are noted and considered as a possible basis for grouping plant viruses. J.G.Bennette

b141. MECHANICAL TRANSMISSION OF WHEAT

1963, 19, 88-91 (Plant Res. Inst., Canada Agric.
Dept., Ottawa, Canada) The virus was transmitted
mechanically to virus-free leafhopper by injn. of clar-
ified extracts of viruliferous leafhoppers. Having become
infective the leafhoppers transmitted the virus until they
died. J.G. Repette

6142. ISOLATION FROM WHEY OF INHIBITORS OF THE BARLEY STRIPE MOSAIC VIRUS [BSMV]. W.A.F.Magborg, N.M.Chopra and W.S.Chełack: *Canad. J. Bot.*, 1963, 41, 1-12 (Canada Dept. Agric. Res. Sta., Winnipeg, Manitoba, Canada) Fractions isolated from whey were bioassayed to determine their potency as inhibitors of BSMV. Potent proteinaceous substances were obtained by dialysis, denaturation with ethyl alcohol and fractional pptn. with $(NH_4SO_4^*$). Increase in potency was associated with an increase in die proportion

MICROBIOLOGY

of material that moved towards the cathode in electrophoresis at pH 8[#]6. Elutions from the electrophoretic bands gave evidence of high potency in the 2 substances that moved towards the cathode but there was also evidence of degradation during elution. Solway purple had no effect on the inhibitory material but ninhydrin destroyed all its activity.

A.Meany

6143. STABILISATION OF BROME MOSAIC VIRUS BY MAGNESIUM AND CALCIUM. M.K.Brakke: *Virology*, 1963, 19, 367-374 (Plant Pathol. Dept., Nebraska Univ., Lincoln, Neb., U.S.A.) A descriptive account of stabilisation at various pH produced in purified virus prep, by Mg and Ca ions. J. G.Ben net te

6144. OLPIDIUM AS VECTOR OF TOBACCO NECROSIS VIRUS. D.S.Teakle and A.H.Gold: *Virology*, 1963, 19, 310-315 (Plant Pathol. Dept., California Univ., Berkeley, Calif., U.S.A.) Evidence is presented establishing that tobacco necrosis virus and the Olpidium zoospore form a sp. and intimate relationship which leads to transmission of infection. The fungus appears to be able to carry the virus both when swimming in suspension and when the zoospore protoplast penetrates the root.

J.G.Bennette

6145. CHROMATOGRAPHIC STUDIES ON PLANT VIRUSES. I. ISOLATION OF POTATO VIRUS X BY VARIOUS SYSTEMS OF ADSORPTION CHROMATOGRAPHY. J.H.Venekamp and W.H.M.Mosch: *Virology*, 1963, 19, 316-321 (Phytopathol. Res. Inst., Wageningen, Netherlands) A new chromatographic method is described that uses cellulose and various mixtures of polyethylene glycol in NaCl soln. Chromatography using calcium phosphate and DEAE-cellulose did not yield pure vias, as judged by the absence of nucleoprotein.

J.G.Bennette

6146. USE OF PROTEIN IN EXTRACTION OF COCOA SWOLLEN-SHOOT VIRUS FROM COCOA LEAVES. A.A.Brunt and R.H.Kenten: *Virology*, 1963, 19, 388-392 (West African Cocoa Res. Inst., Tafo, Ghana)

Macerating cocoa leaves infected with the virus in a medium containing phosphate, thioglycolate, diethylidithiocarbamate, and protein released virus that could be pelleted. Little or no virus separated in the absence of protein. Various proteins were tested. It was found that the amount of protein relative to the wt. of leaf material being extracted was more important than the concn. of protein in the medium. It is suggested that protein combines with leaf tannins diminishing the formation of non-infective virus-tannin complexes.

J.G.Bennette

6147. COMMENT ON 'APHID VECTOR AFFECTED BY ELECTROSTATICS'. R.Markham: *Virology*, 1962, 18, 647 (A.R.C. Virus Res. Unit, Huntingdon Rd., Cambridge, England) Prelim, comm.

J.G.Bennette

YEASTS AND FUNGI

6148. INFLUENCE OF NICOTINIC ACID ON THE GROWTH-STIMULATING EFFECT OF INOSITOL ON SACCHAROMYCES CARLSBERGENSIS. O.F.Braekkan and G.Boge: *Nature*, Lond., 1963, 198, 585-586 (Government Vitamin Lab., Norwegian Fisheries Res. Inst., Bergen, Norway) A marked depression of the

growth-stimulating effect of inositol on S. carlsbergensis was produced by addition of nicotinic acid. For reliable results in the assay of inositol, nicotinic acid must be added to this system.

G.M.Lewis

6149. E.M. OF MITOCHONDRIAL CHANGES IN SACCHAROMYCES. T.Hirano and C.C.Lindegreri: *J. ultrastructure Res.*, 1963, 8, 322-326 (Biol. Res. Lab., Southern Illinois Univ., Carbondale, Ill., U.S.A.) New lamellated mitochondria were observed in old cultures of yeasts under partial anaerobic conditions. They appeared to result from changes in the inner membrane of other mitochondria.

H.B.Waynfirth

6150. TOXIC METABOLITES OF ASPERGILLUS FLAVUS. R.D.Hartley, B.F.Nesbitt and J.O'Kelly: *Nature*, Lond., 1963, 198, 1056-1058 (Trop. Prod. Inst., London, England) Four unidentified toxic components have been purified from a crude toxin prep, of A. flavus. U.v., i.r. and nuclear magnetic resonance spectra of the 4 compounds are presented and discussed. Elementary analysis are also presented. The results indicate close similarities between the 4 components.

J.R.Sargent

6151. RAMULOSIN FERMENTATION. C.W.Hesseltine, C.R.Benjamin, B.Bradle and W.F.Hendershot: *Amer. J. Bot.*, 1963, 50, 209-210 (N.Region Res. Lab., Peoria, Ill., U.S.A.) A non-sporulating strain of Pestalotia ramulosa v Beyma NRRL 2826 produced large amounts of ramulosin but 2 other sporulating strains of this sp. did not. All 3 strains have similar C and N utilisation patterns. On optimal media 58% of the total dry wt. of culture consisted of ramulosin. It is not produced until after most of the mycelium is formed. A sporulating form that fails to produce ramulosin has been found in fermentations carried out at elevated temp.

T.H.Thomas

6152. MODIFIED CELLULOSIC MEDIUM FOR THE ISOLATION OF CELLULOLYTIC FUNGI FROM INFECTED MATERIALS AND SOILS. R.G.Bose: *Nature*, Lond., 1963, 198, 505-506 (Microbiol. Sect., Indian Jute Mills Assocn. Res. Inst., Calcutta, India) A cellulose medium prep, from filter paper treated with HCl is very suitable for isolation of cellulolytic fungi.

G.M.Lewis

6153. FINE STRUCTURE OF MYCOTA. K. FUNGAL MITOCHONDRIA. R.T.Moore and J.H.McAlear: *J. ultrastructure Res.*, 1963, 8, 144-153 (E.M. Lab., California Univ., Berkeley, Calif., U.S.A.) A survey of the micro-morphology of over 50 genera of Eumycota shows a variability of mitochondrial structure similar to that of algae and higher plants. There appear to be no main characteristics of fungal mitochondria.

H.B.Waynfirth

OTHER MICRO-ORGANISMS

(Some abstracts on Protoza, Diatoms etc. may be found in the Experimental Zoology and Botany Sections)

6154. MALARIA IN CHIMPANZEES. X. PRESUMED SECOND GENERATION OF THE TISSUE PHASE OF PLASMODIUM OVALE. R.S.Bray, R.W. Burgess and J.R.Baker: *XL EARLY FORMS OF THE PRE-ERYTHROCYTIC PHASE OF LAVERANIA FALCIPARA*. R.S.Bray

and A.E.G)nders Amer. J. trop. Med. Hyg., 1963, 12, 1-12. 13-18 (Liberian fast. Amer. Fndn. Trop.MW, Harbel, Liberia) X. 8 and 9 day old pre-erythrocytic schizonts of *P. ovale* and the exo-erythrocytic schizonts found in liver biopsies taken from chimpanzees 16 to 19 days after inoc. with sporozoites of *P. falciparum*. Evidence is presented to support the hypothesis of successive growing exo-erythrocytic generations of *P. ovale*.

X? ^ e2..2-5, 3, 3-5, and 4-day-old P"£<**>f_{rf} cytic forms of *L. falciparum* are described from the liver of a chimpanzee. These ranged with age from 4 to 24 fm. w diam. and from 2 to 250 in no. of nuclei. AU laying Parenchyma cells of the liver. A.A.Zimmerman

6155. LEISHMANIASIS IN THE SUDAN REP^{LIC.}

K. ECOLOGICAL RELATIONSHIPS OF SANDFLY SPECIES AND LEISHMANIA INFECTION. H.Hoogstraal and D.R.Dietlein. X. NATURAL INFECTIONS IN RODENTS. H.Hoogstraal. P.F.D.van Peenen, T.P.Reid and D.R.Dietlein: Amer. J. ^ . ^ i ! ^ 1963, 12, 165-174. 175-178 (Bureau Med. and Surg., Navy Dept., Washington, D.C.) Dan. no Leishmania

SSS^MSiBrWftfESgS
Jan in this Province. *P. orientalis* showed a high infection rate. *i*Sectrons identical with *L.donovani* on the basis of appearance in culture and pathogenesis in hamsters were recovered from 2 rodents, WZ^tf^{gg}Eg. PP.. trapped in Malakal town. Upper Nile province. It appears that a rodent-sandfly-rodent cycle of leishmaniasis occurs in this town, but that in the absence of man-biting sandflies, humans do not become infected in this urban centre. A.A.Zimmerman

6156. EPIDEMIOLOGY AND CONTROL OF H ^ A N TRYPARASOMIASIS IN GLOSSINA MORSITANS FLY BELTS. L.van den Berghe and F-L-Lambrechts Amer. J. trop. Med. Hyg., 1963, 12, 129-164 (Dept. Trop. Med. and Public Health, Tulane Univ, New CMjg ^ La., U.S.A.) *Trypanosoma pambiensis* is transmissible by flies of the *G. palpalis* group from inai to tsetse fly. This, together with fly control, is discussed fully. A.A.Zimmerman

6157. BOVINE TRYPARASOMIASIS ^ NIGERIA.

U. INCIDENCE AMONG SOME MIGRATING CATTLE WITH OBSERVATIONS ON KAMDJATK) N O P W r BLOOD PREPARATIONS AS METHOD OF SURVEY.

Sectn.

W. African Examination o brought for trypanosomiasis treatment during an annual migration through Zaria Pt ed significantly more *Trypanosoma congolense* than examination of corresponding wet prep. *T. vivax* was found in 23.3% of the infected animals, *T. congoense* in 76.7% and *X. brucei* in 4.7%. *T. uniforme* was not found. A. Meany

6158. CDLTWATIDNOFTOTOBJA ^ CONDII IN VITRO IN CONDITIONS IN WHICH TISSUES ARE

CULTIVATED. G.Jan: Wiad. parazyt., 1962, 8, 307-313 (Wojewódzki Zakład Hig. Weterynaryjnej, Katowice, Poland) Survey of literature. (Polish) M.Korbecki

6159. GROWTH REQUIREMENTS OF ENTAMOEBA HISTOLYTICA. VIE. THERMOLABILITY OF THE GROWTH-PROMOTING PROPERTIES OF THE CLG AND SHAFFER-FRYE MEDIA. J.G.Shaffer and V.Iralu: Amer. J. trop. Med., Hyg., 1963, 12, 19-21 (Lutheran Gen. Hosp., 1775 Dempster St., Park Ridge, IL, U.S.A.) The heat lability of the growth promoting ability of the CLG and Shaffer-Frye media for propagation of *E. histolytica* has been studied. The initial temp, for 15 min. heating is 55° and 53° respectively, but differences in pH, the presence of agar or loss of volatile gaseous elements may also play a role in determining heat lability. A.A.Zimmerman

6160. PASSAGE OF BACTERIOLOGICALLY STERILE ENTAMOEBA HISTOLYTICA IN HAMSTER LIVERS.

H.L.Wiles, S.E.Maddison, S.J.Powell and R.Elsdon-Dew: Ann. trop. Med. Parasitol., 1963, 57, 71-74 (Amoebiasis Res. Unit, Univ. Natal, Durban, S.Africa) Direct inoc. of pus from human cases of amoebic liver abscess and inoc. of *E. histolytica* from cultures (where it was associated with *Clostridium welchii*) produced bacteriologically sterile lesions in the liver of hamsters. P.J. Baron

6161. ALGAE: NITROGEN FIXATION BY ANTARCTIC SPECIES. O.Holm-Hansen: Science, 1963, 139, 1059-1060 (Dept. Bot., Univ. Wisconsin, Madison, Wis., U.S.A.) *Nostoc commune* was the only sp. of alga from terrestrial and freshwater habitats in Antarctica capable of growing in N-free medium. Assimilation of 15N was confirmed. G.M.Lewis

6162. EFFECTS OF TRIS (HYDROXYMETHYL) AMINO METHANE ON THE GROWTH OF HAEMATOCOCCUS PLUVIALIS FLOTOW: J.McLachlan: Canad. J. Bot., 1963, 41, 35-40 (Atlantic Regional Lab., Nat. Res. Council of Canada, Halifax, N.S., Canada) Tris inhibits growth of *Haematococcus* in ASM medium, a modified ASM medium. Inhibn. is reduced by increasing the Ca concn. of the medium; pH has no effect on Tris tolerance unless the level of Ca is increased and then an increase in pH reduces Tris toxicity. The results with *Haematococcus* are compared with results of a previous study on *Microcystis aeruginosa*. A.Meany

6163. EPIDEMIOLOGY OF ECHINOCOCCOSIS IN THE MIDDLE EAST. H. INCIDENCE OF HYDATID INFECTON IN SWINE IN LEBANON AND ITS SIGNIFICANCE. G.W.Luttermoser and M.Koussa: Amer. J. trop. Med., Hyg., 1963, 12, 22-25 (Dept. Trop. Health, Sch. Public Health and Med., American Univ. Beirut, Lebanon) One third of 300 mature swine examined were infected with hydatid cysts. The condition of the cysts indicates that swine are not important hosts of this infection in the Lebanon. A.A.Zimmerman

6164. HUMAN INFECTION WITH GONGYLONEMA IN GEORGIA. J.CDismuke, jun. and C.F.Routh: Amer. J. trop. Med. Hyg., 1963, 12, 73-74 (Georgia Dept. Publ. Hlth., Div. Lab., Atlanta, Ga., U.S.A.) This report describes the extraction of a single *Gongylonema* from the lower lip of a man in Georgia and suggests the source was shallow wells or the ingestion of cockroaches. A.A.Zimmerman

MICROBIOLOGY

AGENTS ACTING AGAINST MICRO-ORGANISMS

(See also Pharmacology)

ANTIBIOTICS AND CHEMOTHERAPY

6165. MODIFIED SUBSTRATE SPECIFICITY OF CELL-BOUND PENICILLINASE. E.Ron-Zenizer and N.Citri: Nature, Lond., 1963, 198, 887-888 (Dept. Bacteriol., Hebrew Univ., Hadassah Med. Sch., Jerusalem, Israel) The membrane-bound Y'Penicillinase of Bacillus cereus 569/H has a different and broader range of specificity than the extracellular penicillinase. Its activity against methicillin is 10 times greater than that of a-penicillinase. It is suggested that the location of an enzyme with respect to a cell structure may determine the range of its activity. G.M.Lewis

6166. TECHNIQUES FOR RAPID AND SENSITIVE DETECTION OF PENICILLINASE. R.J.Holt and G.T. Stewart: J. clin. Path., 1963, 16, 263-267 (Queen Mary's Hosp., Carshalton, Surrey, England) Penicillinase production was detected by spot inocn. of the test organism onto membrane filters placed on the surface of nutrient agar containing 2jjg./ml. penicillin G and seeded with the Oxford staphylococcus. For the newer penicillins a two-stage technique was employed. For quant. estimations, antibiotic gradient plates were used. The method was suitable for staphylococci, coliforms and Proteus, and for lysates, filtrates and dialysates. J.B.Derbyshire

6167. INFECTIONS DUE TO METHICILLIN-RESISTANT STRAINS OF STAPHYLOCOCCUS PYOGENES. J.W.Harding: J. clin. Path., 1963, 16, 268-270 (Central Middlesex Hosp. Path. Dept., London, England) Methicillin- resistant strains of S. pyogenes were isolated from 2 human infections. Both strains were of the same phage type, but the infections differed markedly in severity. J.B.Derbyshire

6168. ANTIBACTERIAL ACTIVITY OF DEMETHYL-CHLOROTETRACYCLINE COMPARED WITH OTHER TETRACYCLINES. S.Gay and L.Grassi: Biochim. appl., 1962, 9, 303-308 (Lab. ricerche Gibipharma S.p.A., Milano, Italy) Demethylchlortetracycline was shown to be superior in vitro to chlortetracycline against Bacillus cereus, Salmonella typhi, Staphylococcus pyogenes and Corynebacterium diphtheriae. (Italian) J.C.Crawhall

6169. LIPOLYTIC ACTIVITY OF STAPHYLOCOCCI V. EFFECT OF CHLORAMPHENICOL. VI. EFFECT OF PENICILLIN. N.Macri: Biochim. appl., 1962, 9, 349-354, 355-360 (1st. Microbiol., Fac. Di Scienze, Univ. Messina, Italy) V. The hydrolytic cleavage by staphylococci of Tweens 20, 40, 60 and 80 was studied in the presence of chloramphenicol (10-80 (zg./ml.) at increasing diln. of inoculum. Inhibn. of hydrolysis of Tween 80 occurred most readily, followed by Tween 20. Tween 40 and 60 were about equiv. in this assay.

VI. Penicillin at levels of 5000-100000 U/ml. was not as effective as chloramphenicol in inhibiting the hydrolysis of any Tween, though hydrolysis of Tween 80 was the most readily affected. (Italian) J.C.Crawhall

6170. EFFECT OF 5-IODO-2'-DEOXYURIDINE ON VACCINIA VIRUS IN VITRO. B.Loddo, S.Muntoni and W.Ferrari: Nature, Lond., 1963, 198, 510

(Dept. Pharmacol., Univ. Cagliari, Italy) 3[#]3 |ig⁷ ml. 5-iodo-2'-deoxyuridine inhibits the cytopathogenic effect of vaccinia virus (a DNA virus) but is without effect even at 100 times this concn. on the RNA viruses polio 1 and Coxsackie B3. G.M.Lewis

6171. CURE OF VACCINIA INFECTION BY 5-IODO-2'-DEOXYURIDINE [IDU]. H.E.Kaufman, A.B.Nesburn and E.D.Malone: Virology, 1962, 18, 567-569 (Ophthalmol Div., Florida Univ., Gainesville, Fla. U.S.A.) IDU is known to cure or greatly improve severe corneal herpes simplex infection. IDU also cures advanced corneal vaccinal keratitis in rabbits. In about half the treated eyes, no virus could be detected after treatment, whereas virus was present in all the untreated eyes. J.G.Bennette

OTHER AGENTS

6172. EFFICIENCY OF ANTISEPTICS WHEN ACTING ON DRIED ORGANISMS. R.Hare, E.Raik and S.Gash: Brit. med. J., 1963, i, 496-500 (St. Thomas's Hosp. London, England) Ability of antiseptics to kill several spp. of organisms in dried broth films on glass surfaces was investigated. 1% sol. of cresol, phenolic coal-tar distillate, chloroxylenol and of Na hypochlorite and 70-90% ethyl alcohol killed all spp. tested in < 5 min Longer periods were required with 0.5% and 0.02% chlorhexidine, 0.5% and 1% phenol, 1.4% formaldehyde and 0.5% phenol + 1% formaldehyde (liquor formaldehydi chirurgicalis). Spores of Bacillus subtilis were unaffected by all except Na hypochlorite and formaldehyde. Tests with 6 more strains of Staphylococcus aureus showed that 0.5% chlorhexidine took 20-30 min. to kill all the organisms compared with < 5 min. for 1% chloroxylenol and 1% lysol. Similar tests with 14 more strains of Pseudomonas pyovanea showed that 1% chloroxylenol and 0.5% chlorhexidine were as effective against this organism as 1% lysol. M.E.Nutt

6173. DISINFECTION OF HANDS; REMOVAL OF RESIDENT BACTERIA. E.J.L.Lowbury, H.A.Lilly and J.P.Bulb: Brit. med. J., 1963, i, 1251-1256 (Accident Hosp., Birmingham, England) Various soap and detergent prep, containing hexachlorophane or polyvidone iodine were more effective than ordinary bar soap in removal and suppression of resident bacteria of the hands. A single application of hexachlorophane prep, had little disinfecting action, but reduction in flora was apparent 1 hr. after the first application and was progressively greater after 1-2 days repeated use. Polyvidone iodine had a larger initial effect and also some cumulative action after repeated use. M.E.Nutt

6174. EFFECT OF SOME ANTISEPTIC REAGENTS ON THE BACTERIAL FLORA OF SMALLPOX LYMPH. E.Cardone: J. Hyg., Lond., 1963, 61, 187-192 (New York City Health Dept., E. 16th St., New York, U.S.A.) Smallpox calf pulp derived from animals whose skin was treated with Roccal (alkyl dimethylbenzy¹ ammonium chloride) showed a more rapid diminution in bacterial flora in the presence of 0.5% phenol and 0.8% ether than prep, from calves which were not skin-treated. Vaccine lymph containing 0.2% Roccal caused no untoward reactions in rabbits or humans, and the viral potency of the vaccines was not affected." J.B.Derbyshire

MICROBIOLOGY

6175. CASE OF VACCINIA NECROSUM (OR PROGRESSIVE VACCINIA), WITH SEVERE HYPOGAMMAGLOBULINAEMIA, TREATED WITH n-METHYL ISATIN B-THIOSEMICARBAZONE (33T57). T.H.Flewett and F.L.Ken J. cUn-Path., 1963, 16, 271-277 (Little Bromwich Gen. Hosp., Birmingham, England) In a total case of vaccinia necrosom with hypogammaglobulinemia in a baby, treated with γ -globulin and 33T57, intranuclear as well as cytoplasmic inclusion bodies were found in the skin epithelial cells. Vaccinia virus was isolated from the skin lesion, local lymph node, brain and kidney. • J.B. Derbyshire

6176. HEAT INACTIVATION OF INFECTIOUS RNA OF POLIO AND TOBACCO MOSAIC VIRUSES. M.P.Gordon, J.W.Huff and I.J.Holland: Virology, 1963, 19, 416-418 (Biochem. Dept., Washington Univ., Seattle, W\$h., U.S.A.) Prelim. comm. J.G.Bennette

6177. STERILISATION OF AIR FILTERS FOR HIGH PRE-VACUUM AUTOCLAVES. R.J.Fallon: J. clin. Path., 1963, 16, 259-260 (Ruchill Hosp., Glasgow, Scotland) Two spp. of bacteria failed to grow. * rough a glass fibre filter when placed on the outside of the filter, or through the glass fibre filter paper, but a fungus did penetrate through squares of glass fibre paper. Glass fibre filter retained its efficiency. In a steriliser which was used for 96 sterilisation cycles during 1 yr. J.B.Derbyshire

SOIL MICROBIOLOGY

§178. DEVELOPMENT CYCLE OF RHIZOBIUM LUPINI IN ROOT NODULES. J.Gqlfbowska and U.Stypniewska:

Acta microbiol. poi., 1962, 11, 313-318 (ZaHlad Roflin Pastewnych, Poznañ, Poland) Six stages have been distinguished using a differential staining technique. M.Korbecki

6179. EFFECT OF THE PLANT AND OF ECOLOGICAL CONDITIONS ON DEVELOPMENT OF SYMBIOSIS BETWEEN LUPINE AND RHIZOBIUM LUPINI. J.Gqlebiov/ska and U.Stypniewska: Acta microbiol., pol., 1962, 11, 319-328 (ZaHlad Roflin Pastewnych, Poznañ, Poland) Symbiosis with R. lupini was not observed in lupine plants grown in alk. media, N-deficient media and under conditions of light deficiency; red-light was indispensable for development of R. lupini. M.Korbecki

6180. PHOSPHATASE ACTIVITY OF RHIZOZIUM. L.Zelazna: Acta microbiol. pol., 1962, 11, 329-334 (Uniw. Marii Curie-Styfodowskiej, Lublin, Poland) Rhizobium strains (52/60) showed alk. phosphatase and 41 strains acid phosphatase: the activity of the former enzyme being distinctly higher. The activity of alk. phosphatase was higher in the strains showing higher growth rate. M.Korbecki

6181. DEHYDROGENASES OF RHIZOBIUM. AN 'EFFECTIVE' AND 'NON-EFFECTIVE' STRAIN OF RHIZOBIUM TRIFOLII. J.De Ley and P.Manik Ann. Inst. Pasteur, 1963, 104, 524-528 (Lab. Microbiol., Fac. Sci., Ghent, Belgium) 'Effective*' and 'non-effective*' bacterial prep. from R. trifolii have been studied with regard to their dehydrogenase activity. Dehydrogenases for D-galactose, D-xylose, L-arabinose, lactose, maltose, Na D-gluconate, Na lactobionate, Na D, L-lactate, mannitol, sorbitol, Na D,L-malonate, Na fumarate, Na succinate, Na L-mandelate were demonstrated. The activities were variable, but no significant differences between 'effective*' and "non-effective*" strains were noted. (French) B.Payne

PHARMACOLOGY

ANTIBIOTICS AND CHEMOTHERAPY

6182. A GLUCURONIDE METABOLITE OF SULPHAMETHOMIDINE IN HUMAN URINE. F.J.DiCarlo, S.G.Malamant and G.E. Phillips: *Toxicol. appl. Pharm.*, 1963, 5, 392-400 (Biochem. Dept., Warner-Lambert Res. Inst., Morris Plains, NJ., U.S.A.) Sulphamethomidine is excreted in human urine partly as an N⁴-acetyl conjugate and partly as an ether glucuronide in which the glucuronic acid moiety is linked to the pyrimidine nucleus. E.E.Hobbiger

6183. LABORATORY STUDIES ON OXACILLIN. J.O.Klein, L.D.Sabath and M.Finland: *Amer. J. med. Sci.*, 1963, 245, 399-412 (Dept. Med., Harvard Med. Sch., Boston, Mass., U.S.A.) Oxacillin (5-methyl-3-phenyl-4-isoxazolyl penicillin) is orally effective and acts on penicillinase-producing staphylococci and those that do not produce penicillinase. It is more active than methicillin against the former but less active than penicillin G against the latter. The new penicillin has an affinity for plasma proteins and data on its absorption, after oral and i.m. administration, and urinary excretion are presented. E.E.Hobbiger

6184*. COMPARATIVE LABORATORY AND CLINICAL OBSERVATIONS ON TWO NEW ORAL PENICILLINS, QXACILLIN AND ANCILLIN. H.Abu-Nassar, T.W. Williams, jun. and E.M.Yow: *Amer. J. med. Sci.*, 1963, 245, 459-466 (Dept. Med., Baylor Univ. Coll. Med., Houston, Tex., U.S.A.) A therapeutic and laboratory investigation of 2 new partially-synthetic penicillins which are penicillinase-resistant and stable in acid. The results indicate that the new penicillins are approx. equiactive in vitro and in vivo and are devoid of serious toxicity. E.E.Hobbiger

6185. INTERFERENCE OF PYRIDOXINE METABOLISM BY PENICILLIN. V.Perotti: *Atti. Acad. med. Lombarda*, 1962, 17, 466-468 (Lab. di Biochim. Ospedale Maggiore Milano, Italy) Male rats maintained on a vitamin controlled diet were given 50000 I.U. of penicillin G i.m. daily for 30 or 75 days and then oxalic or xanthemic acid was administered and the amount of these compounds excreted in the urine measured after 24 hr. In animals on a complete diet, the addition of penicillin to the diet caused no changes in the amount of oxalic and xanthemic acid excreted in the urine compared with the non-penicillin treated animals. In animals maintained on a pyridoxine-deficient diet, penicillin caused a significant increase in urinary oxalic acid excreted after oxalic acid dosing as compared with the non-penicillin treated controls, but had no effect on the xanthemic acid excretion. (Italian) G.N.Godson

6186. PENICILLIN IN GERM-FREE GUINEA-PIGS. S.B.Formal, G.D.Abrams, H.Schneider and R-Laundy: *Nature, Lond.*, 1963, 198, 712 (W.Reed Army Inst. Res., Washington, D.C., U.S.A.) Normal guinea-pigs inj. with a single dose of penicillin died within 7 days from enterocolitis, the bowels containing large no. of Gram-neg. organisms. Guinea-pigs reared in a germ-free environment did not succumb to penicillin, nor to infection with *E. coli* isolated from a moribund penicillin-treated animal. G.M.Lewis

6187. SALIVARY EXCRETION AND INACTIVATION OF SOME PENICILLINS. CADLER-HRADECKY and

B.Kelentey: *Nature, Lond.*, 1963, 198, 792-793 (Dept. Stomatol., Dept. Pharmacol., Univ. Med. Sch. Debrecen, Hungary) After administration i.m., I.v. or per os of procaine-penicillin, methoxy-phenyl penicillin, ethoxyphenyl-penicillin, penicillin G potassium, dibenzylethylenediaminedi-penicillin or dimethoxyphenylpenicillin to rabbits previously inj. with pilocarpine, blood and saliva levels of the penicillins were measured for 24 hr. G.M.Lewis

6188. PENICILLAMINE AND VITAMIN B₆ INTER-RELATIONSHIPS IN THE RAT. J.G.Heddle, E.W.McHenry and G.H.Beaton: *Canad. J. Biochem.*, 1963, 4: 1215-1222 (Dept. Nutr., Sch. Hyg., Univ., Toronto, Ont., Canada) Changes in blood transaminase activities after 13 days of treatment were used to illustrate a definite antagonism of vit. B₆ to DL-penicillamine (0-25% level of diet) in rats of either sex. The effects of the drug on food intake, body wt., and transaminase activity were not completely prevented by even 2000 fig vit. B₆/10 g. diet. 50 mg. pyridoxine HCl was suggested as giving near-max. protection against possible vit. B₆ antagonistic effects of 1[#]5 g. DL-penicillamine. These studies may have significance in the treatment of Wilson's disease by penicillamine. A.M. Gibbins

6189. THE FUNGISTATIC ACTION OF SOME CHEMIC COMPOUNDS ON CANDIDA ALBICANS. J.Alkiewicz E.Janiak and S.Kucharski: *Arch. Immunol. Ter. dosw* 1962, 10, 633-638 (Szkola Med., Poznań, Poland) The fungistatic action of some chemical compounds on *C. albicans* was defined in fungistatic units. The strong fungistatic action was shown by merthiolate, quinosol ar Gentian Violet. H.Osowiecki

6190. ACTION OF ANTIFUNGAL ANTIBIOTIC, NYSTATIN ON THE PROTOZOA LEISHMANIA DONOVANI. IE. STUDIES ON THE LYSIS OF CELLS OF L. DONOVANI B.K.Ghosh and A.N.Chatterjee: *Ann. Biochem.*, 1963, 23, 173-186 (Indian Inst. for Biochem. and Expt. Med., Calcutta, India) Lysis of the cells by nystatin was studied under different conditions and results compared with lysis of the cells by other surface-active compounds. In the presence of nystatin the cells were lysed to the same extent as by osmotic shock. The lysis was very sensitive to pH change. L.Barne

6191. EFFECT OF DITHIAZANINE, GIVEN AT VARIOUS INTERVALS AFTER INFECTION ON TRICHINELLA SPIRALIS IN MICE. M.ftlvey and T.CDefeo: *Amer. J. trop. Med. Hyg.*, 1963, 12, 62-64 (Dept. Microbiol., Univ. of Missouri, Mo., U.S.A.) Dithiazanil iodide, given orally to mice infected with *T. spiralis*, proved effective at 2 and 4 mg. levels Ag- body wt. only if given soon after infection. The same concn. of drug given on the 7th, 14th or 21st day after infection for 3 days did not cause a reduction in the no. of larvae recovered. Dithiazanine at 1 mg./kg. body wt. caused 1 reduction in larvae regardless of the time interval between infection and administration. A.A.Zimmerman

6192. EFFECT OF COMBINING STREPTOMYCIN WITH NITROFURAZONE ON THE DEVELOPMENT OF RESISTANCE OF STAPHYLOCOCCUS AUREUS IN VITRO. J.Bielawski: *Arch. Immunol. Ter. dosw.*, 1962, 10t 639-644 (Akad. Med., Wrocław, Poland) It was found that the combined treatment of *S.aureus* with streptomycin and nitrofurazone slowed the development of resistance to both these antibacterial drugs. H.Osowiecki

6193. TUBERCULOSTATIC EFFECT OF NITROFURANE DERIVATIVES. S.A.Oiler, K-K.Medne, K.K.Venter, S.K.Germane and A.Ia.Zile: Dokl. Akad. Nauk., 1962, 144, 108-111. A study was made of the tuberculostatic effect of a-, β -unsat. and polyene aldehydes and ketones of the 5-nitrofuran series. Their effect was compared with that of streptomycin and isoniazid. Some of the deriv. were found to be effective for resistant strains. (Russian) B.J.cooper

6194. DIRECT PROPORTIONALITY OF EXCRETION RATE AND SERUM LEVEL OF TETRACYCLINE IN HUMAN SUBJECTS. T.Chulski, R.H.Johnson, C.A. Schlagel and J.C.Wagner: Nature, Lond., 1963, 200, 450-453 (Upjohn Co., Kalamazoo, Mich., U.S.A.). Urinary excretion rate of unchanged orally administered tetracycline is directly proportional to the serum level of tetracycline in man. The apparent vol. of distribution of tetracycline was determined to be about 100% of the body wt. J.R.Sargent

6195. TURBIDIMETRIC ASSAY OF CHLORAMPHENICOL. R.B.Mukherjee, J.K.Chatterjee, B.K.Bose and B.N. Dutta: Indian J. Microbiol., 1962, 2, 101-11 (es. and Develop. Lab., Dey's Med. Stores (Mfg) Pvt. Ltd., Calcutta, India). Turbidimetric methods are described for the assay of chloramphenicol employing different test organisms e.g. Micrococcus PVOgenes var. 4ureus, E. coll, iridescens, pyymomaes, Salmonella, tifiosa, S. paratyphirosa B and S. Typhimurium. The dose ^ 3 S curve is linear up to at least 25 μ g/mL. G.M.Lewis

6196. PYRVINIUM PAMOATE IN THE TREATMENT OF STRONGYLOIDIASIS. E.D.Wagne: Amer. J. trop. Med. Hyg., 1963, 12, 60-61 (Dept. Microbiol., Sch. Med., Univ., Loma Linda, Calif., U.S.A.) Use of pyrvinium pamoate on 34 Ethiopians suggests that this drug may have a curative effect in infections or Strongyloides stercoralis. A.A.Zimmerman

6197. CLINICAL TRIALS WITH THIABENDAZOLE [MK-360] AGAINST HUMAN STRONGYLOIDIASIS. K.H.Franz: Amer. J. trop. Med. Hyg., 1963, 14, 211-214 (Firestone Plantations Co., Harbe, uoenaj MK-360 has proved to be effective in the treatment of Strongyloidiasis. Side effects can be repressed by the use of small-particle formulations. A.A.Zimmerman

6198. STUDIES ON CHEMOPROPHYLAXIS OF LOASIS. n. OBSERVATIONS ON D^THY^RBAMA Zme CITRATE (BANOCIDE) AS PROPHYLACTIC IN MAR. B.O.Duke: Ann. trop. Med. Parasitol., 1963, 57, 82-96 (Helminth. Res. Unit W.African Coanc. Med. Res., Kumba, W. Cameroon) Expt. carried out on 4 volunteers indicate that 5jrg./kg. Banocide taken daily for 3 consecutive days once a month should give complete prophylaxis against Loa loa. r.j.uaron

6199. HOOKWORM PROBLEM IN THE GREATER BUENOS AIRES AREA WITH PARTICULAR REFERENCE TO CHLOROPHENOL THERAPEUTIC EFFICACY OF TR. Med. Hyg., PIPERAZINE. J.Waks: Amer. J. trop. Rawson Hosp., 1963, 12, 56-59 (Dept. Parasitology, ts in 30 patients Buenos Aires, Argentina) Trial of chlorophenol suggest that single dose treatment with PiPerazine can be used for mass *era Py A #A zimmerman

6200. SUPPRESSIVE ACTIVITY OF SODIUM ANTIMONY DIMERCAPTOsuccinate [TWSB] IN EXPERIMENTAL INFECTIONS WITH SCHISTOSOMA MANSONI. J.I.Bruce and E.H.Sadun: Amer. J. trop. Med. Hyg., 1963, 12, 184-187 (Dept. Med. Zool., W.Reed Army Med. Center, Washington, D.C., U.S.A.) Lm. injn. of TWSB into Macaca mulatta monkeys, expt. infected with S. mansoni, resulted in suppressing the passage of eggs in their faeces. Drug toxicity was not observed.

A. A. Zimmerman

6201. SYNTHESIS AND BIOLOGICAL PROPERTIES OF 1-(4-METHYLELENOBIPHENYL-4')-2-DICHLORO-ACETYLAMINOPROPANDIOL-1,3[MS]. J.Supniewski, F.Rogoz and J.Krupifiska: Dissert. Pharm., 1962, 14, 21-27 (Zalfad Farmakol., Polska Akad. Nauk. Krakow, Poland) MS has been synthesised from 2-methylselenobiphenyl. It is highly toxic for white mice; it inhibits Gram-pos., Gram-neg. and the acid fast bacilli but does not affect pathogenic fungi. (Polish) W.Chmurzyfiska

6202. SYNTHESIS AND BIOLOGICAL PROPERTIES OF 1-(4-METHYLTHIOBIPHENYL-4')-2-DICHLORO-ACETYLAMINOPROPANDIOL-1,3) [MTP]. J.Supniewski, F.Rogoz and J.Krupifiska: Dissert. Pharm., 1962, 14, 13-20 (Zalfad Farmakol., Polska Akad. Nauk. Krakow, Poland) MTP was synthesised and the corresponding biphenyl analogue of chloromycetin obtained after Bambas were proved more toxic than chloromycetin itself. Both deriv. inhibited Gram-pos. bacteria and acid fast bacilli and to a lesser extent Gram-neg. bacteria. No action was observed on pathogenic fungi. (Polish) W.Chmurzyfiska

6203. DEHYDROXYLATION OF CAFFEIC ACID BY RAT AND RABBIT CAECAL CONTENTS AND SHEEP RUMEN LIQUOR. A.N.Booth and R.T.Williams: Nature, Lond., 1963, 198, 684-685 (Dept. Biochem., St. Mary's Hosp. Med. Sch., London, England) Inhibn. of intestinal micro-organisms by neomycin or "Dimol" prevented the dehydroxylation of caffeic acid administered orally to rats. Incubation of caffeic acid with caecal contents led to the appearance of 3,4-dihydroxyphenylpropionic acid, ja-hydrazycyphenylpropionic acid and ni-hydroxycinnamic acid. Similar dehydroxylation was produced by caecal contents from the rabbit and by sheep rumen micro-organisms. G.M.Lewis

CENTRAL NERVOUS SYSTEM

6204. STUDIES OF RESPIRATORY GAS FLOWS. A COMPARISON USING DIFFERENT ANAESTHETIC AGENTS. E.S.Munson, M.Farnham and W.K.Hamilton: Anesthesiology, 1963, 24, 61-67 (Div. Anaesthesiol., State Univ., Iowa City, Iowa, U.S.A.) An analysis is given of 72 pneumotachogram tracings on patients anaesthetised with different anaesthetics.

A.A.Zimmerman

6205. ANESTHETIC MANAGEMENT DURING OPEN INTRACARDIAC SURGERY. R-A.Theyre, E.A.Moffitt and J.W.Kirklin: Anesthesiology, 1962, 23, 823-827 (Sect. Anesthesiol., Mayo Clinic, Rochester, Minn., U.S.A.) An account is given of current anaesthetic practice at the Mayo Clinic during all phases of open intracardiac surgery. Pre-operative medication, induction

PHARMACOLOGY

and maintenance of anaesthesia and management during perfusion are discussed.
A.A.Zimmerman

6206. CLINICAL AND BIOCHEMICAL STUDIES OF CYCLOPROPANE ANALGESIA IN OBSTETRICS. S.M.Snidler, F.Moya, V.Thorndike, A.Bossers, H.Morishima and L.S.James: *Anesthesiology*, 1963, 24, 11-17 (Dept. Anaesthesiol., Columbia Univ., New York, U.S.A.) Cyclopropane analgesia is claimed to be a safe, simple and effective means of inducing maternal pain relief with no apparent depression of the infant. 26 ref. A.A.Zimmerman

6207. HAEMODYNAMIC AND CENTRAL NERVOUS ACTIONS OF CYCLOPROPANE IN THE DOG. H.L.Price, W.A.Cook, jun., S.Deutsch, H.W.Linde, R.D.Mishalove and H.T.Morse: *Anesthesiology*, 1963, 24, 1-10 (Dept. AnesthesioL, Univ. Pennsylvania Sch. Med., Philadelphia, Pa., U.S.A.)

A report is given of studies on the autonomic and circulatory actions of cyclopropane in dogs. Perfusion of the head alone with blood containing cyclopropane increased the systemic arterial mean and pulse pressures and catecholamine concn., but exposure of the body alone gave diametrically opposed results. The effect of depressing 'depressor' neurones in the medulla oblongata is discussed. A.A.Zimmerman

6208. ESTIMATION OF HALOTHANE TENSIONS IN BLOOD BY GAS CHROMATOGRAPHY. I.F.H.Purchase: *Nature*, Lond., 1963, 198, 895-896 (Dept. Vet. Clin. Studies, Sch. Vet. Med., Cambridge, England) A method is described for the rapid and accurate estimation of halothane in blood by determination of its concn. in a gas phase in equilibrium with blood. G.M.Lewis

6209. PERFORMANCE OF DIGITALISED HEART DURING HALOTHANE ANAESTHESIA. S.Shimosato and B.Etsten: *Anesthesiology*, 1963, 24, 41-50 (Dept. Anaesthesia, Tufts Univ. Sch. Med., Boston, Mass., U.S.A.) Determinations of left and right ventricular function curves, tension time index and left ventricular stroke power were made in non-medicated and non-operated dogs prior to and after digitalisation, and during halothane anaesthesia. Ventricular function curves were drawn and discussed. 47 ref. A.A.Zimmerman

6210. INCIDENCE OF CATECHOLAMINE-INDUCED ARHYTHMIAS DURING HALOTHANE ANAESTHESIA. N.Andersen and S.H.Johansen: *Anesthesiology*, 1963, 24, 51-56 (Dept. Anesthesia, County Hosp. Copenhagen, Gentofte, Hellerup, Denmark)

Increased myocardial excitability occurs as readily with infusion of adrenaline as with noradrenaline during halothane anaesthesia. The risk of evoking ventricular arrhythmias is increased with infusion rates of >10 fig./min. and in the presence of arteriosclerotic cardiac disease. A.A.Zimmerman

6211. TRYPTAMINE RECEPTORS IN THE C.N.S.: EFFECTS OF ANAESTHETICS. E.Marley and J.R.Vane: *Nature*, Lond., 1963, 198, 441-444 (Inst. Psychiatry, Maudsley Hosp., London, England) Small doses of pentobarbitone depressed spinal reflexes in cats and their response to tryptamine mainly through an action on the reticular formation, whereas anaesthetic doses also depressed spinal reflexes directly. The effects of anaesthetic doses of chloralose, hydroxydione and halothane on spinal reflexes and the action of tryptamine and its analogues is also reported. G.M.Lewis

6212. EFFECT OF METHOTRIMEPRAZINE ON RESPIRATION. J.W.Pearson and T.J.DeKornfeld: *Anesthesiology*, 1963, 24, 38-40 (Dept. Anaesthesiol., Baltimore City Hosp., Baltimore, Md., U.S.A.)

A study was made of respiratory depression produced by 3 new phenothiazine analgesic, methotriimeprazine. 15 mg. produced no significant respiratory depression.

A. A. Zimmerman

6213. ANTAGONISM BETWEEN NALORPHINE AND CHLORPROMAZINE. E.Frommel, LV-LeSebur and M.Beguin: *Arch. int. Pharmacodyn.*, 1963, 143, 52-77 (Inst. Therapeutics, Fac. Med., Geneva, Switzerland) Nalorphine antagonised and prevented the hypothermic and sedative actions of chlorpromazine in various animals, but had no effect on the respiratory depressant action of chlorpromazine. The hypothesis of competitive antagonism between alkaloids is discussed and questioned. (French) T.J.Sullivan

6214. ELECTRICAL ANAESTHESIA. A.van Poznak: *Anesthesiology*, 1963, 24, 101-108 (Cornell Univ. Med. Coll., New York, U.S.A.) A review. 41 ref. A.A.Zimmerman

6215. ACTIVE STRUCTURE OF LOCAL ANAESTHETICS. EFFECTS ON ELECTRICAL AND CHOLINESTERASE ACTIVITY. P.Rosenberg, H.B.Higman and E.Bartels: *Biochim. biophys. Acta*, 1963, 66, 406-414 (Dept. Neurol., Coll. Phys. and Surg., Columbia Univ., New York, U.S.A.) The inhibn. of AChase purified from electric tissue by procaine, dibucaine and tetracaine and the quaternary analogue of tetracaine decreased as the pH increased from 6 to 9. As the pH was raised from 7.5 to 9 the inhibiting effects of procaine and tetracaine decreased more than that of the quaternary tetracaine. Carbamylcholine and quaternary tetracaine blocked the electrical activity of the isolated single electroplax about equally well at pH 6 and pH 9. Tetracaine was more potent at pH 6 than at pH 9. B.M.Stevens

6216. MEMBRANE POTENTIALS IN ISOLATED AND ELECTRICALLY STIMULATED MAMMALIAN CEREBRAL CORTEX. EFFECTS OF CHLORPROMAZINE [CPM], COCAINE [CC], PHENOBARBITONE [PB] AND PROTAMINE [PTM] ON TISSUES' ELECTRICAL AND CHEMICAL RESPONSE TO STIMULATION.

H.H.Hillman, W.J.Campbell and H.McD.Lwain:

J. *Nearochem.*, 1963, 10, 325-339. Using glass capillary microelectrodes a mean value of -38 mV for resting membrane potential [RMP] was found in guinea-pig brain slices. 1 min. after cessation of 1 min. stimn. RMP fell to 0 to 20 mV. Recovery to prestimn. levels took approx. 3 min. RMP were diminished by 50 pM CPM and increased by 0-3 mg./ml. PTM. The fall in RMP after stimn. was diminished or recovery accelerated by 50 μ M CPM, 300 μ M PB or 20 fM CC. CPM inhibited Na and K fluxes during stimn. Spike discharges with after potentials were frequently observed when the micro-electrodes pierced the tissue. These discharges were unaffected by any of the drugs studied. R. Woodman

6217. INFLUENCE OF NEOCORTICAL AND HIPPOCAMPAL SPREADING DEPRESSION ON THETA RHYTHM* ELICITED BY PHYSOSTIGMINE.

Z.Bohdanecky, T.Weiss and E.Fifkova: *Arch. int. Pharmacodyn.*, 1963, 143, 23-33 (Res. Inst. Pharmacy and Biochem., Prague, Czechoslovakia) High voltage, 4-7 c/s, e.e.g. waves are recorded from the hippocampus and the tegmental reticular formation in rats. The waves are elicited by physostigmine 1 nig./kg.

i.p. and are hot influenced by spreading depression in *e neocortex or in the contralateral hippocampal and reticular areas.
S.E. Smith

6218. PHARMACODYNAMICAL EFFECTS OF A VOLATILE FRACTION ISOLATED FROM SESELI SIBIRICUM (BENITH). K.S.Jamwal, O.P.Sethi and L.C.Chopra: Arch. int. Pharmacodyn., 1963, 143, 41-51 (Dept. Pharmacol., Res. Lab. Jammu and Kashmir, Jammu Tawi, India) Pharmacol. effects of a suspension of *S. sibiricum* oil in 10% aq. gum acacia are studied using intact rats and dogs and isolated organ Prep. The oil induces sedation and slight analgesia and Potentiates the action of pentobarbitone. It causes hypotension and respiratory stimn. in morphine-phenobarbitone-anaesthetised dogs, vasoconstriction in the isolated hind-Umb and a spasmolytic action in uterine and intestinal Prep.
S.E. Smith

6219. SOME CENTRAL NERVOUS SYSTEM DEPRESSANT PROPERTIES OF 2-METHYL-3- α -TOLYL-4(3H)-QUINAZOLINONE (TR-495). L.C.Weaver, W.R.Jones and T.L.Kerley: Arch. int. Pharmacodyn., 1963, 143, 119-126 (Biomed. Res. Dept., Pitman-Moore Co., Indianapolis, Ind., U.S.A.) In mice and rats TR-495 50-400 mg./kg. orally or i.p. produces central depressant effects: enhancement of hexobarbitone hypnosis, hypnosis, hypothermia, antagonism to pentylenetetrazole seizures and tremorine tremors.
S.E. Smith

6220. PROCAINE ESTERASE ACTIVITY IN HUMAN BRAIN. R.Guiffre, G.Moricca, R.Cavaliere and A.Masla: Clin. chim. Acta, 1963, 8, 54-57 (Inst. Biol. Chem., Univ., Rome, Italy) Human brain substance homogenates were shown to catalyse the hydrolysis of procaine to ϵ -aminobenzoic acid and diethyl-aminoethanol. The effects of pH and substrate concn. on the initial velocity of hydrolysis were studied. K.Brew

6221. PHARMACOLOGICAL PROPERTIES OF SOME OXAZOLINE DERIVATIVES. J.Krupińska and R.Rembiesa: Dissert. Pharm., 1962, 14, 131-142 (ZaHiad Farmakol., Akad. Med., Kraków, Poland) 2-(1-naphthylamine)- and more so 2-(4-merhoxy-1- α -phthylamine)-deriv. of oxazoline show tranquillising Prop. in contrast to 2-phenylamine- and 2-(1-biphenyl-amine)deriv. The effects of both naphthylamine deriv. were tested with regard to the level of b.p., the rate of Aspiration and function of nictitating membrane in cat, the movements of isolated intestine and body hyper-tension in rabbits, the menstrual cycle in mice, diuresis in rats, and sugar, lactic acid, pyruvic acid and cholesterol level in blood of rabbits. Some observations were also made during evipan anaesthesia, cardiazol and strychnine convulsions¹ (Polish) J.Barafiska

6222. CENTRAL NEUROUS EFFECT OF ANTIDIABETIC SULPHONYLUREA COMPOUNDS. K.Lehotzky, LMészáros and L.Tardos: Acta physiol. Acad. Sci. hung.* 1963, 23, 219-223 (Pharmacol. Lab., Chinoiin Pharmaceut. Works, Budapest, Hungary) Lv. tolbutamide causes strychnine-like convulsions; e.g. show these to involve the entire cortex. H.G.Bevan

6223. VARIATIONS IN PLASMA POTASSIUM LEVELS OF MOTHER AND FOETI OF RATS ACCORDING TO THE NATURE OF THE ANAESTHETIC ADMINISTERED TO

GESTATING FEMALES. J.Manley: C.R. Soc. Biol., Paris, 1963, 157, 82-84 (Lab. Physiol. comparSe, Fac. Sci., Paris, France) 40 rats in the 21st day of gestation were anaesthetised by diethyl ether or s.c. injn. of 5 mg./100 g. Nembutal. The plasma K level of rats receiving ether was 4¹03 mequiv./l. while that of rats receiving Nembutal was 4¹9 mequiv./l. In the case of the foeti the level of those from Nembutal anaesthetised rats was 4²25 mequiv./l* and from ether anaesthetised rats 5¹ mequiv./l. (French) M.A.Price

6224. SUICIDE WITH TOFRANIL, A PSYCHO-PHARMACEUTIC. J.L.Obersteig and J.B.Sumlen: Arch. Toxicol., 1962, 19 (6), 339-344 (Med. Inst. Univ. Basel, Switzerland) A new method of estimation of tofranil is described. Use is made of thin layer chromatography and u.v. spectroscopy. The drug is very easily oxidised and undergoes rapid metabolic changes. Special colour tests are given for the identification of these metabolites. (German) LCornish

6225. ON THE DETECTION OF REVONAL [BARBITURATE FREE NARCOTIC] POISONING. M.G.Mallinckrodt and L.Lautenbach: Arch. Toxicol., 1963, 20, 31-37 (Inst. Med. Univ., 853 Erlangen-Nürnberg, Germany) The widespread use of Revonal coupled with some fatal suicide attempts has led to a novel method of detection. Use is made of u.v. spectroscopy and various chromato-graphic techniques allied with sp. spot tests. It is claimed that Revonal can be extracted from human organs 9 months after death. (German) LCornish

6226. THE DETECTION OF CONTERGAN AND DORIDEN [GLUTARIC ACID DERIVATIVES] ESPECIALLY IN CADAVEROUS MATERIAL. W.Paulus and R.Keymer: Arch. Toxicol., 1963, 20(1), 38-43 (Inst. Med. Univ., 53 Bonn, Germany) A method is described for the simult. detection of these 2 drugs. The tests are: resorcinol melt, treatment with hydroxylamine, cobalt acetate and metal complex formation, chromatographic techniques etc. Details for the extraction from human organs are also given. (German) LCornish

6227. ELIMINATION OF INTERFERENCE DUE TO UREA IN THE DETERMINATION OF MEPROBAMATE WITH ρ -DIMETHYLAMINOBENZALDEHYDE. S.L. Kanten: Clin. chim. Acta, 1963, 8, 2-4 (V.A. Hosp., Palo Alto, Calif., U.S.A.) Incubation of 1¹0 ml. of serum at 50' for 15 min. with one drop of urease prior to extraction eliminates the interference of urea with the colorimetric determination of serum meprobamate with ρ -dimethylaminobenzaldehyde. Urease does not affect the drug, as it is being extracted from either water or serum. K.Brew

6228. INTERFERENCE PATTERNS IN TWITCH POTENTIATION OF THE RAT PHRENIC NERVE-DIAPHRAGM BY ARYL ESTERS OF TROPINE AND β -TROPINE. IV. S.L.Friess and R.C.Durant: Toxicol. appl. Pharm., 1963, 5, 358-370 (Div. Physical Biochem., Naval Med. Res. Inst., Nat. Naval Med. Center, Bethesda, Md., U.S.A.) The enhancement of the twitch response of the isolated phrenic nerve diaphragm, stim. directly or indirectly, by mixtures of ϵ -tolylacetate esters of tropine and β -tropine and of α -chlorophenylacetates was investigated. The results, which give information on the extent to which the effects of the drugs are additive, are discussed in terms of Waser's pore model of the post-synaptic membrane. E.E.Hobbiger

PHARMACOLOGY

6229. EFFECT OF ALKALOSIS ON THE ACTION OF THE NEUROMUSCULAR BLOCKING AGENTS. R.L.Katz, S.H.Ngai and E.M.Pappen: *Anesthesiology*, 1963, 24, 18-22 (Dept. Anaesthesiol., Coll. Phys. and Surg., Columbia Univ., New York, U.S.A.) The effect of Na₂CO₃-induced alkalosis on the action of the neuromuscular blocking agents was studied in the cat sciatic nerve-tibialis muscle prep. Alkalosis antagonised the action of (+)-tubocurarine and decamethonium but potentiated the action of gallamine, dimethyl tubocurarine, and succinylcholine. A.A.Zimmerman

6230. DECURARISING ACTION OF COFFEE ON STRIATED MUSCLE OF MAMMALS. J.Delga and P.Foulhoux: *CR. Soc. Biol.*, Paris, 1963, 157, 54-58 (Centre d'Etudes du Bouchet, Vert-le Petit, S.-et-O., France) I.v. injn. of 50 mg./kg. caffeine to chloralose anaesthetised mice after curarisation with 1 mg./kg. (+)-tubocurarine resulted in reappearance of contractions of the right abdominal muscles. Caffeine reversed the effects of 0.1 mg./kg. (+)-tubocurarine on the sciatic-gastrocnemius prep. of the chloralose anaesthetised rat. (French) M. A. Price

6231. ACTIONS OF METHAMINODIAZEPoxide ON CARDIAC, SMOOTH AND SKELETAL MUSCLES. B.R.Madan, J.D.Sharma and D.S.Vyas: *Arch. int. Riarmacodyn.*, 1963, 143, 127-137 (Pharmacol. Dept., Med. Coll., Bikaner, India) Methaminodiazepoxide had weak anti-ACh activity on isolated smooth and skeletal muscles. It did not antagonise the inhibitory action of ACh on the atria nor benefit auricular arrhythmias. However, it suppressed ectopic ventricular tachycardia after ligation of the coronary arteries in dogs. T.J.Sullivan

6232. ACTION OF SUCCINYL CHOLINE ON MUSCLE FIBRE CONTRACTION: POSSIBLE THERAPEUTIC USES. G.Francesco and G.Rossi: *Atti. Acad. med. Lombarda*, 1962, 17, 447-449 (Clin. Ostet. and Ginecologia, Univ. Milano, Italy) Review. 24 ref. (Italian) G.N. Godson

6233. EFFECT OF SUCCINYL CHOLINE ON THE MUSCULAR SPASMS OF THE UTERUS (TOCOGRAPHIC EXPERIMENTS). G.Francesco, A.Ferrero and G.Rossi: *Atti. Acad. med. Lombarda*, 1962, 17, 450-452 (Clinica Ostet. e Ginecologia, Univ. Milano, Italy) Tocographic tracings taken before and after the i.v. administration of succinylcholine to patients undergoing caesarian section, showed that the drug depressed the uterine contractions. (Italian) G.N.Godson

6235. EFFECT OF ACh ON ISOLATED HEART FROM THIAMINE DEFICIENT RATS. B.Bhagat: *Arch. int. Pharmacodyn.*, 1963, 143, 17-22 (Dept. Physiol. and Pharmacol., Chelsea Coll. Sci. and Technol., London England) Thiamine deficiency or slight excess did not affect die amplitude or rate of the isolated rat heart, nor the response to ACh. T.J.Sullivan

6236. CONDUCTION BLOCK PRODUCED BY ACETYLCHOLINE IN CETYLTRIMETHYLMONIUM-TREATED FROG NERVES. R.R.Walsh and G.D.Webb: *Biochem. Pharmacol.*, 1963, 12, 451-456 (Dept. Physiol., Univ. Colorado Med. Sch., Denver, Colo., U.S.A.) After pretreatment with the synthetic cationic surfactant, cetyltrimethylammonium bromide, frog sciatic nerves were found to be very susceptible to axonal conduction block by externally applied ACh, as shown by depression of the amplitude of the A-potential. The block was completely reversible at 0.02M, and largely but not completely reversible at 0.1M. The response was not due to deficiency of Na in the medium* The effect appeared to be non-sp. but the surfactant pre-treatment might have modified the physico-chem. prop* of the axonal membranes and thus any previously existing specificity. L.G. Gillies

6237. INFLUENCE OF ATROPINE ON ENZYME PRODUCTION IN PANCREAS. K.Heinkel and H.Rubin: *Z. Ges. exp. Med.*, 1963, 136, 571-581 (Med. Clin. and Polyclinic, Univ. Erlangen-NHrnberg, Erlangen, Germany) In rats, amylase and lipase activity were reduced in the serum and increased in xht pancreas after atropine(0.005-1.0 mg. i.p.). (German) P.F.Meyer

6238. BIOSYNTHESIS OF NORADRENALINE IN ISOLATE! CANINE HEART. C.A.Chidsey, G.A.Kaiser and E.Braunwald: *Science*, 1963, 139, 828-829 (Cardiology Branch, Nat. Heart Inst., Bethesda, Md., U.S.A.) When radioactive dopamine was inj. into the blood perfusing an isolated dog heart, noradrenaline obtained from the heart 1 hr. later contained between 1-10% of the radioactivity. The turnover of noradrenaline was higher in the ventricles than in the atria. G.M.Lewis

6239. NORADRENALINE SYNTHESIS FROM TYROSINE-14C IN ISOLATED PERFUSED GUINEA-PIG HEART. S.Spector, A.Sjoerdsema, P.Z.Nirenberg, M.Levitt and S.Udenfriend: *Science*, 1963, 139, 1299-1301 (Nat. Heart Inst., N.I.H., Bethesda, Md., U.S.A.) The isolated, perfused guinea-pig heart synthesised nor-adrenaline from [14c]tyrosine at rates comparable to those reported for the intact animal. G.M.Lewis

6240. DIFFERENCES IN D- AND L-NORADRENALINE-3H. J.J.Kopin and W.Bridgers: *Life Sci.*, 1963, No. 5, 356-362 (Barnes Hosp., St. Louis, Mo., U.S.A.) 1 hr. after the administration of the labelled catecnolamines, the 3H/14C ratios of noradrenaline [NA] in the heart and spleen were similar in rats receiving the mix*. tures containing L- or D,L-NA-1⁴C. The 3H/14C ratio in the tissue NA of animals receiving D, L-NA-1⁴C with D, L-NA-3H was the same at 1 and 24 hr. K.Jones

6241. RELEASE OF NORADRENALINE FROM SYMPATHETIC POST GANGLION FIBRE. J.H.Burn: *Bull. Johns Hopk. Hosp.*, 1963, 112, 167-182 (Pharmacol. Dept., Oxford Univ., Oxford, England) Review. 48 ref. H.B.Wayforth

AUTONOMIC NERVOUS SYSTEM

6234. FURTHER STUDIES ON THE CONFORMATION OF ACh. J.H.Feliman and T.S.Fujita: *Biochim. biophys. Acta*, 1963, 71, 701-705 (Div. Neurol., Univ. Oregon Med. Sch., Portland, Ore., U.S.A.) I.r. absorption spectra and acylation rates of a no. of ACh analogues were examined. Results indicated that the shift toward the higher energy of the i.r. absorption of the ACh carbonyl peak and its higher rate of acylation argued against a cyclic conformation and for an inductive influence of the quaternary N. B.M.Stevens

^{6242.} METABOLISM OF [14C]NORADRENALINE BY CAT BRAIN IN VIVO. E.Mannarino, N.Kirshner and B.S. Nashold: J. Neurochem., 1963, 10, 373-379 (Duke Univ. Med. Center, Durham, N.C. U.S.A.) After injn. of 35 µg. [14C]noradrenaline (2 pc) into the lat. ventricle of cat brain under amytal anaesthesia, chief metabolites found in brain tissue were normetadrenaline (NMA) and 3-methoxy-4-hydroxyphenyl glycol (MPG). TMA and MPG conjugate appeared in the urine. Ipronilazid (i.p. injn. 24, 15 and 3 hr. before adrenaline, injn.) did not affect brain catabolites apart from slightly accelerating their formation but inhibited their subsequent oxidation as judged by a higher proportion of urinary NMA. Evidence for catechol-O-methyl transferase as the main system in brain for adrenaline inactivation is discussed. R. Woodman

^{6243.} MODE OF ACTION OF γ -AMINOBUTYRIC ACID ON THE CARDIOVASCULAR SYSTEM. H.C.Stanton: Arch. int. Pharmacodyn., 1963, 143, 195-204 (Pharmacol. Dept., Colorado Univ. Med. Center, Denver, Colo., U.S.A.) Lv. administered GABA caused hypotension in dogs, rabbits, guinea-pigs and cats. Results suggested that this effect was due to a transient block of peripheral autonomic ganglia.

T.J.Sullivan

^{6244.} POTENTIATION OF THE PRESSOR ACTIVITY OF L-NORADRENALINE BY GUANETHIDINE. L.Cavalca, U.Marini and C.Novi: Atti. Acad. med. Lombarda, 1962, 17, 378-384 (1st. patologia spec. med., Univ., Milano, Italy) In dogs, normal and deprived of their Mnal medulla from C1-L2 and infused with (-)-noradrenaline, treatment with guanethidine (5 mg./kg. body w/f) Produced protracted strengthening of the pressor effects of the noradrenaline infusion. A second and third Buanethidine administration did not produce this potentiation but gave a hypotensive effect.

(Italian) G.N.Godson

^{6245.} INHIBITION BY SPARTEINE AND POSTHYPOPHYSEAL EXTRACTS OF THE INVERSION OF ADRENALINE DURING URETHANE ANAESTHESU. A.Baisset, P.Montastruc and G.Puig; C.R. Soc. Biol., Paris, 1962, 156, 2127-2130 (Lab. de Physiol., Fac. de M6d., Toulouse, France) 25 mg. /kg. asparteine pltfiae inhibited the inversion of the effect of 2 mg./⁸. adrenaline on b.p. of dogs anaesthetised with 1 g. Jtrethane/kg. A similar inliibn. was obtained with totuitary extracts containing 6 I.U. vasopressm to 10 I.U. ^o*ytocin. Oxytocin did not inhibit the inversion of the adrenaline effect. Sparteine sulphate lowered the pH of *e blood. (French) M.A.Price

^{6246.} A VASOPRESSOR RESPONSE TO ISOPRSNALINE IN THE CAT. K.R.Butterworth: Nature, Lond., 1963, 198, 897-898 (Dept. Pharmacol., St. Mary's Hosp. Med. Sch., London, England) Large doses of iso-fenallnc given i.v. to cats have 2 effects on the vascular system:- (i) a 0-adrenergic blocking action which prevents the falls in b.p. normally produced by small doses, w/tfe not antagonising the depressor effect of other substances such as ACh and histamine; it converts the [^]pressor effect of ethyl noradrenaline to a pressor one and prevents the fall in b.p. from small doses of ^{ad*}enaline, (ii) an excitatory effect on a-adrenergic receptors which causes a rise of b.p. G.M.Lewis

^{6247.} LATENT VASOPRESSOR EFFECT OF 5HT TO THE CHICKEN R.D.Bunag and E.J.Walaszek: Arch. int. S. T. S. S. 1963, 1443, 10881118 (Dept. Pharmacol., ffil^SSi Mod. Centr. Kansas City, Kansas, U.S.A.) Vascular effects of 5HT are studied in phenobarbitone-

anaesthetised White Leghorn hens. The initial depression response is blocked by atropine, compound 48/80 or para-bromdylamine. The latent pressor effect is diminished by BAS-phenol and UML-491 but unaffected by reserpine, cocaine, or phenoxy-benzamine. 5HT is shown to have a vasoconstriction action on the isolated wing. The action is thought to be due to a direct effect on smooth muscle.

S.E.Smith

^{6248.} DEMETHYLATION OF METANEPHRINE-7-H IN VIVO. A.F.de Schaepdryver, Z.M.Bacq, W.de Potter, J.Rensonand G.Crieb Arch. int. Pharmacodyn., 1963, 143, 285-286 (Heymans Inst. Pharmacol., Ghent Univ., Belgium) Following the administration of 25-75 [ic [7-3H]metanephrine to rabbits, [3H]adrenaline, noradrenaline and 3,4-dihydroxymandelic acid are isolated from urine and liver, demonstrating that both O and N-demethylation of metanephrine occur.

S.E.Smith

^{6249.} NEUROMUSCULAR EFFECT OF 5HT. M.M.Gromakovskia: Dokl. Akad. Nauk, 1962, 144, 236-241. Expt. on frog muscle prep, showed that the increased work capacity in skeletal muscles produced by anticholinesterase substances is effected by the participation of 5HT. (Russian) BJ.Cooper

^{6250.} HYPERTENSIVE ACTION OF SODIUM GLUTAMATE. P.Bouvet, T.Gayet-Hallion and N.Dorme: C.R. Soc. Biol., Paris, 1962, 156, 2001-2005.

I.v. injn. of 20-60 mg. Na glutamate/kg. to rabbit resulted in a moderate hypertensive response which was abolished by mecamylamine and attenuated by phenolamine. Adrenalectomy decreased the effect of Na glutamate. /fid*! • (French) M.A.Price

^{6251.} BLOOD PRESSURE EFFECTS OF GUANETHIDINE AND TYRAMINE IN DOG. JJ.Reuse and F.Bergmanre C.R. Soc. Biol., Paris, 1962, 156, 2146-2149 (Lab. Pharmacodynamie, Univ. libre de Bruxelles, Belgium)

The threshold dose for an increase in b.p. of pentobarbital anaesthetised dogs by guanethidine was 0*5 mg./kg. Max. response was obtained with a dose of 4-5 mg. Aft-Pretreatment with 1 mg. guanethidineAg- increased the hypertensive effects of 0*8 fig. adrenaline/kg, and 50 jig. tyramine/kg. inj. 20-40 min. later. (French) M.A.Price

^{6252.} EFFECTS OF RESERPINE, GUANETHIDINE AND a-METHYL-dopa ON RESISTANCE TO COLD. M.Pouliot and J.Leblanc: Arch. int. Physiol., 1963, 71, 73-82 (Dept. Physiol., Laval Univ., Quebec, Canada) Rats were adapted to cold by exposure to 5° for 1 month. Injn. of reserpine, 1 mg./kg. i.m., 2 hr. before exposure to -20° accelerated fall in body temp, and decreased survival time. A similar dose given 48 hr. before exposure had no effect. Injn. of 15 mg./kg. guanethidine i.p. 24 hr. before exposure to -20° had no effect, but when this was given (10 mg./kg. i.p.) every 3 days during cold adaptation resistance to cold increased. Administration of a-methyl-dopa, 300 mg./kg. i.p., twice daily during acclimatisation had the opposite effect. Administration of similar doses of a-methyl-dopa to non-acclimatised rats for 3 days before exposure to -20° also decreased their survival time compared with that of controls. Results confirm the importance of catecholamines in resistance and adaptation to cold. The increase in thermogenic activity of noradrenaline injn. during chronic exposure to cold may be due to a relative deficiency of the amine which increased the sensitivity of the animals to its metabolic effects.

PHARMACOLOGY

6253. DOPAMINE: ITS OCCURRENCE IN MOLLUSCAN GANGLIA. D.Sweeney: *Science*, 1963, 139, 1051 (Biol. Lab., Harvard Univ., Cambridge, Mass., U.S.A.) Fluorometric and paper chromatographic evidence indicates that dopamine is the only catecholamine present in the ganglia of 3 gastropods and 7 pelecypods examined. G.M.Lewis

6254. DL-DIHYDROXYPHENYLALANINE AND ELEMENTARY EMOTIONAL BEHAVIOUR. B.N.Halpern, C.Drudi-Baracco and D.Bessirard: *C.R. Soc. Biol.*, Paris, 1963, 157, 85-90. In mice, administration of DL-dopa induced a modification of emotional behaviour which appeared as a group toxicity. Pretreatment with MAO inhibitors reduced the dose of dopa which induced group toxicity. The group toxicity of dopa was influenced by the ambient temp. Chlorpromazine and reserpine attenuated the group toxicity provoked by dopa but at higher doses than those necessary to abolish the group toxicity of amphetamine. (French) M.A.Price

6255. 3,4-DIHYDROXYPHENYLACETIC ACID [DOPAC] IN RABBIT CORPUS STRIATUM NORMALLY AND AFTER RESERPINE TREATMENT. Nils-Erik Anden, Björn-Erik Roos and B.Werdin: *Life Sci.*, 1963, No. 5, 319-325 (Dept. Pharmacol., Univ. of Göteborg, Sweden) 2 hr. after the administration of reserpine the DOPAC value in the corpus striatum increased about 3 times. The rise of the DOPAC concn. corresponded to about 60% of the released dopamine and returned to normal after 12 hr. The effect of reserpine on the 5HIAA level in the brain stem was also studied, and the results are discussed. K.Jones

6256. AMPHETAMINE AND AMMONSHORN-SCLEROSIS. T.McLardy. *Nature*, Lond., 1963, 198, 900 (St. Andrew's Hosp., Northampton, Northants., England) A neurohistol. survey has been made of 11 guinea-pigs in which 10 mg. amphetamine was inj. i.m. before exposure to carbon monoxide hypo-oxia. Five animals showed full seizures and 2 of these had ischaemia in CA2 cells, and 6 animals had no seizure and no ischaemia. In 11 controls not premedicated with amphetamine, there was ischaemia and seizures in all the animals. This expr. evidence may point to a reason for the development of ammonshorn-sclerosis in young epileptics receiving a daily small dose of amphetamine. G.M.Lewis

6257. EFFECTS OF DIPHTHERITIC TOXAEMIA ON BLOOD VESSELS. S.N.Arsecularatne: *J. Path. Bact.*, 1963, 85, 21-33 (Bact. Dept., Univ. of Ceylon) The vascular response to i.v. injn. of (-)-noradrenaline is examined in the rabbit sedated with i.m. Na pentobarbitone by direct observation of mesenteric vessels of an exteriorised loop of upper ileum and of scrotal vessels. Constrictor response is assayed by % reduction of vessel diam. 30 hr. after i.m. injn. of *Corynebacterium diphtheriae* gravis, the response to this drug is reduced: injn.-to-response times before and after infection are equal. Lesions are found at this time in the adrenal glands of infected animals. D.Murray

ENDOCRINES

6258. INFLUENCE OF ANABOLIC STEROIDS VERSUS EFFECT OF GLUCOSE ON MUSCULAR DEGENERATION

IN PIGS. P.C.Hart, D.Kroeske, W.Sybesma and H.E.v.d.Veen: *Nature*, Lond., 1963, 198, 716 (Res. Inst. for Animal Husbandry, 'Schoonoord', Driebergenweg, 10 D, Zeist, Netherlands) When examining the degree of muscle degeneration in pigs, the transmission value method provides a sharper distinction than visual examination. Treatment of pigs with anabolic steroids ('Durabolin') favourably affects muscle degeneration, while the abnormality is promoted by administration of glucose in the feed. - G.M.Lewis

6259. EFFECT OF CERTAIN CYTOSTATIC AND FUNGISTATIC STEROIDS ON ACTIVITY OF THE RETICULO-ENDOTHELIAL SYSTEM. T.Nicol and D.L.J.Bilbey. *Nature*, Lond., 1963, 198, 492 (Dept. Anat., King's Coll., Strand, London, England) Six synthetic steroids inj. s.c. into mice were tested for their effect on the phagocytic activity of the RE system after injn. of carbon. Two main inhibitors of phagocytosis were androst-5-ene-30,16g-diol and 3|3-methoxyandrost-5-en-16g-o_l. G.M.Lewis

6260. REVIEW OF WORK WITH LCI. 33828. A NON-STEROIDAL PITUITARY INHIBITOR. A.S.Parkes: *J. Reprod. Fertil.*, 1963, 5, 460-461 (Physiol. Lab., Univ. Cambridge, Cambridge, England). Abstract. H.E.H.Jones

6261. THYROID FUNCTION DURING TREATMENT WITH ERGOT DERIVATIVE LYSERGIC ACID BUT^aNOLAMIDE [MLAB]. L.Szánó, A.L.Reviczky and T.Grynaeus: *Acta med. Acad. Sci., hung.*, 1963, 19, 169-183 (2nd Dept. Med., State Inst. Rheumatol., Budapest, Hungary) MLAB a known 5HT antagonist, was found to increase thyroid activity of rats in every parameter studied. There was evidence of increased secretion of TSH and it is suggested that MLAB may increase peripheral deiodination, stimulate thyroid function directly, and stimulate thyroid function indirectly via the hypothalamic-pituitary system. G.F.Blane

6262. ANTI-FERTILITY EFFECTS WITH SOME RETROSTEROIDS [17a- ALLYL-90-10a-ANDROST-4-EN-17-OL-3-ONE, 3,17-DIACETOXY-9B-100C-ANDROSTA 3,5-DIENE, 17a -(2^f-METHALLYL)-9|3,10a-ANDROST 4-EN-17-OL-3-ONE] IN ANIMAL EXPERIMENTS. H.F.L.SchWen J. *Reprod. Fertil.*, 1963, 5, 457 (N.V. Philips-Duphar, Weesp, Netherlands). Abstract. H.E.H.Jones

6263. CONTRACEPTIVE EFFECT OF ORAL PROGESTINS: PROPERTIES OF COMPOUND SC-11800, A NEW ORAL INHIBITOR. V.A.Drill: *J. Reprod. Fertil.*, 1963, 5, 464 (Div. Biol. Res., G.D.Searle and Co., Chicago, Ill., U.S.A.) Abstract. H.E.H.Jones

6264. EFFECTS OF LONG-TERM USE OF OVULATION INHIBITORS ON EXCRETION OF OVARIAN STEROIDS. R.P.Shearman: *J. Reprod. Fertil.*, 1963, 5, 459 (Obstet. Dept., Univ. Sydney, Sydney, N.S.W., Australia). Abstract. " H.E.H.Jones

6265. ANTIOVULATORY AND OTHER BIOLOGICAL PROPERTIES OF MEGESTROL ACETATE, 17a-ACETOXY-6 METHYL PREGNA 4:6-DIENE-3:20-DIONE (B.D.H. 1298). A.David, K.Edwards, K.P.Fellowes and J.M.Plummen J. *Reprod. Fertil.*, 1963, 5, 333-348 (Biol. Dept., British Drug Houses Ltd., Godalming, Surrey, England) B.D.H. 1298 appears to be the most potent anti-ovulatory compound so far reported. It is also a highly active oral progestational substance, being

more active in the Clauberg assay than medroxy progesterone acetate, norethynodrel and dimethisterone given orally, and progesterone s.c. It is non-toxic in mice and rats except at high doses in rats where some adrenal atrophy was observed. It has no anabolic, androgenic or oestrogenic prop, and no virilising effect on the developing foetus,

H.E.H.Jones

6266. ABSENCE OF ANTI-PROGESTATIONAL EFFECTS OF JTI-XYLOHYDROQUINONE IN WOMEN. P.K.Malkan and S.Suijan: J. Reprod. Fertil., 1963, 5, 458 (All India Inst. Med. Sci., New Delhi, India). Abstract. H.E.H.Jones

6267. ORAL CONTRACEPTION AND BLOOD COAGULABILITY. O.Egeberg and P.A.Owren: Brit. med. J., 1963, i, 220-221 (Univ. Hosp. Rikshospitalet, Oslo, Norway) In 5 healthy women contraceptive therapy with Enovid was followed by shortened plasma cephalin time, marked increase in factor VIII activity and slight increase in factor VII activity. No significant changes were observed in blood samples collected at intervals during 1 menstrual cycle in 5 healthy non-treated women. M.E.Nutt

6268. ORAL AND RECTAL THYMOLYTIC ACTIVITIES OF SOME ANTI-INFLAMMATORY STEROIDS IN WEANLING RATS. M.A.Pratt, R.M. Atkinson, E.A. Woollett and E.G.Tomich: J. Endocrin., 1963, 26, 451-455 (Glaxo Res. Ltd., Greenford, Middx., England)

Anti-inflammatory steroids, including cortisone, prednisolone, becamethasone and dexamethasone, and some of their phosphates, acetates and hemisuccinates were compared for thymolytic activity in rats by oral and rectal routes. A comparison is made between the information obtained on rectal absorption and published information on rectal absorption in man. It appeared that the degree of rectal absorption, both in man and weanling rat, depends on the chem. nature of the steroid and the form in which it is presented.

G.F.Biane

6269. TISSUE PREDNISOLONE DISAPPEARANCE. V.Kemeny and P. Vecsei: Acta physiol. Acad. Sci. hung., 1963, 23, 137-142 (Res. Dept., State Inst. Rheumatol., Budapest, Hungary) Rats weighing 150-200 g. were given 12·5 mg. of prednisolone i.v. and killed at 5-60 min. Blood disappearance rates for Prednisolone corresponded to $\frac{1}{2}$ -life values from the literature. Liver homogenates contained amounts increasing with time after dose. The kidney contained both prednisolone and prednisone, the rate of conversion to Prednisone increasing for 30 min. and thereafter decreasing. H.G.Bevan

6270. RESPONSE OF SUBMANDIBULAR GLAND OF CASTRATED MOUSE TO LOCAL AND SYSTEMIC and I.

Dept., Univ., Birmingham, England) The atrophic submandibular glands of the castrated mouse are restored in wt. by both systemic and local administration of testosterone and 17 α -ethyl-19-nor-testosterone. From a concomitant study of levator ani muscles and seminal vesicles it is concluded that the effect on the submandibular glands presents an anabolic rather than androgenic activity and the utilisation of this response in an assay procedure is discussed.

G.F.Biane

6271. PRESENCE OF A POSSIBLE CAFFEINE-STEROID COMPLEX IN HUMAN URINE. EXMihlawa and K.B.Eik-Nesr: J. Chromatography, 1963, 10, 493-496

(Dept. Biol. Chem., Univ. Utah, Coll. Med., Salt Lake City, Utah, U.S.A.) A caffeine-cortisone complex has been isolated and characterised from human urine. This complexing phenomenon was found only in about 36% of normal individuals. Acid hydrolysis yielded cortisone and caffeine. After infusion of 14-14C]cortisol, [14C]cortisone bound to caffeine was isolated from the urine. No complex was detected from individuals maintained on a caffeine-free diet. P.D.Dawkins

GENERAL PHARMACOLOGY

6272. CUMULATIVE DOSE-RESPONSE CURVES.

J.M.Van Rossum and F.G.Van Den Brink: Arch. Int. Pharmacodyn., 1963, 143, 240-246 (Pharmacol. Dept., R.C. Univ. Med. Sch., Nijmegen, Netherlands) Cumulative dose-response curves for stimulant drugs on isolated intestine can be made by increasing the drug concn. in the organ bath step by step without washing out after each single dose. The time for making a complete curve is about 2 min. Histaminic and muscarinic drugs were used as stimulants.

T.J.Sullivan

6273. METHOHEXITAL AND ITS EFFECT ON LIVER FUNCTION TESTS. N.M.Bitrich, A.V'R.Kane and R.E.Moshen: Anesthesiology, 1963, 24, 81-90 (Dept. Anaesthesiol., Providence Hosp., Detroit, Mich., U.S.A.) Methohexitol produces more depression of liver function than thiopental or thiamyal, but produces less depression on the basis of equal anaesthesia.

A.A.Zimmentfan

6274. EFFECT OF HISTAMINE ON ARTERIAL BLOOD AMMONIA IN MAN. M.D.Turner and O.A.Arpaek: Nature, Lond., 1963, 198, 590-591 (Dept. Med., Royal Free Hosp., London, England) In human subjects with liver disease treated with promethazine i.m., histamine caused a rise in blood ammonia levels within 0·5-1 hr.; this was presumably related to gastric secretion.

G.M. Lewis

6275. HISTAMINE ACTION OF THE LATEX OF CALOTROPIS GIGANTEA AIT. J.C.Saha and S.Kasinathan: Arch. int. Pharmacodyn., 1963, 143, 78-89 (Biol. Dept. Med. Coll., Pondicherry, India) C. gigantea

latex was found to possess all the pharmacol. prop. of histamine, and results of paper chromatography and electrophoresis indicated the presence of histamine in the latex in large quantity.

T.J.Sullivan

6276. INHIBITION BY ANTIHISTAMINES OF THE CYTOTOXIC ACTION OF HISTAMINE IN CLONE CULTURED CELLS. LFand: Arch. int. Pharmacodyn., 1933, 143, 1-7 (Cytopsiol. Lab., Creedmoor Inst. Psychobiol. Studies, Queens Village, New York, U.S.A.) In the quant. clonal tissue culture bioassay, homogeneous populations of a stable cell-culture strain, D-98 (normal adult bone marrow) were used. Chlorglycine and diphenhydramine protected a significant proportion of the cell population from lethal concn. of histamine, and were not themselves cytotoxic. No histamine release from these cells by 48/80 was detected.

T.J.Sullivan

6277. ANTIHISTAMINE DRUGS ON RAT PREGNANCY: EFFECTS OF PYRILAMINE AND MECLOZINE.

PHARMACOLOGY

F.Bovet-Nitti, G.Bignami and D.Bovec Life Sci., 1963, No. 5, 303-310 (Dept. Therap. Chem., Inst. Super, di Sanita, Roma, Italy) Pyrilamine [mepyramine] administration in the early stages of pregnancy in rats caused an increase in the freq. of implantation anomalies and several toxic effects appearing in the last stages of pregnancy. Meclozine had no effects.

K.Jones

6278. ANTIHISTAMINE AND ANTIBRADYKININ EFFECTS OF NORMAL URINE EXTRACTS. B.A.Kovacs and K.I.Melville: Nature, Lond., 1963, 198, 1060-1061 (Dept. Pharm., McGill Univ., Montreal, Canada) Extracts of mammalian urine contain a substance (or substances) which antagonises both in vitro and in vivo the effects of histamine and bradykinin and in vitro antagonises the anaphylactic response.

J.R.Sargent

6279. MECHANISM OF DECIDUALISATION. H. HISTAMINE-RELEASING ACTION OF PYRATHIAZINE. G.J.Marcus, P.F.Kraicer and M.CShelesnyak. **HI. DECIDUALISATION IN HISTAMINE-DEPLETED RAT.** P.F.Kraicer, G.J.Marcus and M.CShelesnyak: J. Reprod. Fertil., 1963, 5, 411-418, 419-423 (Biol. Reprod. (Biodynamics), Weizmann Inst. Sci., Rehovoth, Israel) n. Injn. of the antihistamine pyrathiazine in rats induced extensive decidualisation of the uterus, produced a characteristic histamine-release syndrome, and increased the urinary excretion of histamine two-fold. Pretreatment with pyrathiazine protected rats from the lethal effects of histamine-liberator compound 48/80, but not of histamine. Pyrathiazine was therefore shown to release histamine in the rat, and its effectiveness as a decidual inducer is consistent with the postulated role of histamine in decidual induction.

In pregnant and pseudopregnant rats depleted of histamine by treatment with compound 48/80 or pyrathiazine the decidual reaction in response to endometrial trauma was markedly reduced, while systemic induction with pyrathiazine was prevented completely. These observations support the hypothesis that decidualisation by systemic pyrathiazine is mediated by histamine released systemically, whereas induction by local stimuli is mediated by histamine released in the uterus only.

H.E.H.Jones

6280. ATTEMPTED DECIDUALISATION IN HAMSTER AND RAT WITH PYRATHIAZINE. M.W.Orsini: J. Reprod. Fertil., 1963, 5, 325-332 (Anat. Dept., Wisconsin Univ., Madison, Wis., U.S.A.) Limited decidioma formation was seen in hamsters inj. i.p. with 10 or 15 mg. pyrathiazine on the 4th day of pseudopregnancy. Trauma of the uterus on the 4th day of pseudopregnancy induced decidioma in a much larger % of the treated hamsters. Only 1/19 rats inj. i.p. with 20 mg. or more of pyrathiazine on the 4th day of pseudopregnancy showed decidualisation. These results suggest that i.p. pyrathiazine is not an effective means of producing Hp.cidioma of the hamster and rat.

H.E.H.Jones

6281. PHARMACOLOGICAL PROPERTIES OF PENTAERYTHRITE DERIVATIVES. HI. PENTAERYTHRITE DIBENZOATE. J.Maj: Dissert. Pharm., 1963, 15, 1-15 (Zaklad Farmakodynamiki A.M. w Krakowie Kierownik, Podchorazych 1, Poland) Pentaerythrone dibenzoate was found to prolong amycal anaesthesia, diminish mobility of mice stim. with ritalin, caffeine, cocaine and morphine, inhibit the reaction to mescaline, and enhance the analgesic action of morphine. The hypotensive activity of this compound in rabbits was attributed to diminished force of cardiac contraction; the sympathetic nervous system was not involved.

G.F.Blane

6282. MECHANISM OF TYRAMINE STIMULATION OF ISOLATED HEARTS. P.Fresia, A.Mortari and G.Siolk Atti. Acad. med. Lombarda, 1962, 17, 502-503 (1st. Farmacol. Univ. Milano, Italy) Rats were depleted of catecholamine by treatment with reserpine or tyramine or both together and the effect of tyramine on the isolated perfused heart studied. The inotropic and tachyphylactic effects of tyramine were no different from those on normal hearts. Tyramine effects in vitro, therefore are independent of the heart catecholamine content and act directly. (Italian) G.N. Godson

6283. ACTION OF DIGITOXIN ON MOVEMENT OF 42K IN ISOLATED GUINEA-PIG ILEUM. T.Godfraind and A.Godfraind-De Becker: Arch. int. Physiol., 1962, 70, 738-741 (Univ. of Lovanium, Leopoldville, Congo) Brief commn. (French) M.E.Nutt

6284. STUDIES ON THE APPEARANCE AND TERMINATION OF ACONITINE-INDUCED ATRIAL FIBRILLATION WITH MICROELECTRODES. M.Goto, T.Tamai and T.Yanaga: Jap. J. Physiol., 1963, 13, 196-207 (Dept. Physiol., Kyushu Univ., Fukuoka, Japan)

Using the isolated right atrium from a young rabbit the authors have examined the effect of aconitine-induced fibrillation, the electrical activity from two fibres being traced simult. in order to clarify die mechanism. Aconitine-induced atrial fibrillation has been found to be preceded or attended by acceleration and fluttering of atrial activity followed by the formation of local blocks and disturbances of the spread of sinus rhythm; a formation of one or more ectopic pace-makers; an irregular interaction of activity among the adjacent fibres. The formation of local blocks and the formation of ectopic pace-makers are believed of prime importance for the generation of the atrial fibrillation.

M.J.Bell

6285. EFFECT OF ANTIMONY DIMERCAPTOSUCCINATE ON THE ELECTROCARDIOGRAM IN PATIENTS TREATED FOR SCHISTOSOMIASIS. A.Abdalla and A.Badran: Amer. J. trop. Med. Hyg., 1963, 12, 188-192 (Res. Inst. Trop. Med., Cairo, Egypt) The effect of antimony dimercaptosuccinate [Astiban] on the e.c.g. has been studied. T wave charges occurred slightly more frequently with this drug than with tartar emetic, and the intensity of these charges was greater.

A.A.Zimmerman

6286. COMPARISON OF THE ACTIVITIES OF ASPARTATES AND NICOTINIC ESTERS OF DIETHYLAMINOETHANOL ON CARDIAC CHANGES DURING ACUTE HYPO-OXIA. M.Lamarche, R.Royer and M.Bas: C.R. Soc. Biol., Paris, 1962, 156, 2099-2101 (Lab. Pharmacol., Fac. M&d., Nancy, France) A mixture of K and Mg aspartates had a pos. inotropic action on the isolated heart of guinea-pig. A similar effect was obtained with nicotine esters of diethylaminoethanol. Injn. of aspartates protected the animal against the changes in cardiac function during acute hypo-oxia. The nicotine ester of diethylaminoethanol was without effect. (French) M.A.Price

6287. DIURETICS. G.M.Wilson: Brit. med. J., 1963, i, 285-292 (Dept. Pharmacol., Univ., Sheffield, England) A lecture, 149 ref. M.E.Nutt

6288. THE INFLUENCE OF TBr AND CHLORAZANIL ON DIURESIS, EXCRETION OF ELECTROLYTES AND ON THE ANTIDIURETIC ACTION OF HYPOPHYSIN AND NICOTINE. M.Chrusciel: Dissert. pharm., 1962, 14, 143-157 (Zahlad Farmakol., Sljska Akad. Med.,

PHARMACOLOGY

6291. COMPARATIVE STUDIES ON MERCURATED 1,6,8-TRIAZABICYCLO (4.3.0) NONANE-7,9-DIONES AND CHLORMERODRIN. W.B.McKeon jun.: Arch. int. Pharmacodyn., 1963, 143, 181-194 (Sterling-Winthrop Rentschler, New York, U.S.A.) Oral tov*-ac- chloruretic and emetic actions in dogs and 7 T^{1/2} in mice of 1,6,8-triazabicyclo (4.3.0) nonane- Atrendi ?nes are compared with those of chlormerodrin. are q. Ul, incurcial doses *e diuretic and chloruretic actions an- Jlar. Most of the new diones- are less emetic and are less toxic than chlormerodrin. S.E. Smith

6292. OBSERVATIONS ON THE EFFECT OF SPIRONO-J-ACTONE IN OEDEMA ASSOCIATED WITH RENAL DISEASE. LLipman and F.del Greco: Amer. J. med. sci., 1963, 245, 413-420 (Dept. Med., Passavant Mem. Hosp. and Northwestern Univ. Med. Sch., Chicago, m., U.S.A.) The natriuretic and diuretic activity of spironolactone is inversely related to the degree of renal impairment? E.E.Hobbiger

6293. CHLOROTHIAZIDE-INDUCED GOUT AND DIABETES. R.H.Schwab, J.K.Perloff and R.L.Porus: Archi-Jintern. Med., 1963, 111, 465-470 (Dept. Med., Div. Cardiology, Georgetown Univ. Med. Center, 3800 Reservoir Rd., N.W., Washington, D.C., U.S.A.) Chlorothiazide treatment can produce hyperuricaemia and hyperglycaemia. The mechanisms involve

E.E.Hobbiger

6294. SEARCH FOR POTENT HYPOGLYCAEMIC AGENTS. JV. EFFECT OF BIGUANTOES AND mSULW ON GLUCOSE UPTAKE AND GLTCOGEN CONTENT OF

ISOLATED RAT DIAPHRAGM. S.P.Paul and A.N.Bose: Indian J. Physiol. Pharmacol., 1963, 7, 55-58

(Bengal Immunity Res. Inst., Calcutta, India) The results of expt. with 4 biguanides on glucose uptake by isolated diaphragm studies suggested that this type of substance may act by increasing the dissimilation or oxidation of glucose in the tissues. This would contrast with the action of insulin which is held to help the assimilation of glucose in the form of glycogen.

G.F.Blane

6295. DIABETOGENIC ACTION OF SODIUM SELENITE. G.Danon, G.Paulet and M.Cormier: C.R. Soc. Biol., Paris, 1963, 157, 51-54. Fourteen rabbits received i.v. injn. of 0*5 mg. Na selenite/kg. Six animals showed changes in glucose metabolism characteristic of permanent diabetes (10-60 days) while 4 animals showed temporary diabetes (5-10 days).

(French) M. A. Price

6296. THE INFLUENCE OF SODIUM SALICYLATE AND ORINASE [TOLBUTAMIDE] ON BLOOD SUGAR LEVELS IN RATS. R.Gryglewski: Dissert, pharm., 1962, 14, 123-130 (ZaHiad Farmakologii, Polska Akad. Nauk, Krakow, Poland) I.p. administration of aq. soln. of Na-salicylate had no effect upon blood sugar level in healthy rats or those with alloxan diabetes. Injn. of Na salicylate with tolbutamide caused more pronounced hypoglycaemia than tolbutamide only. S.c. injn. of Na salicylate suspension in oil decreased blood sugar level by about 35%.

6297. EFFECT OF TOLBUTAMIDE ON BLOOD FLOW AND METABOLISM OF LIVER IN HEALTHY DOGS. A.KBnig and W.Rautenberg: Z. Ges. exp. Med., 1963, 136,

563-570 (Physiol. Inst., Univ., Greifswald, Germany) In anaesthetised dogs, blood flow in the hepatic veins measured directly was reduced during and for approx. 2 hr. after an i.v. tolbutamide infusion (80 mg./kg. over 2 hr.). During the infusion, O₂ consumption was reduced and arterial glucose concen. fell. Glucose release from the liver was increased as shown by the difference in glucose concn. between hepatic vein and femoral artery. The plasma K-level tended to rise during and after the infusion, with a late rise in K release from the liver.

(German) P.F.Meyer

6298. AZEPINAMIDE THERAPY IN DIABETES. F.C.Wood, jun., W.H.Stimson and R.H.Williams: Acta endocr. Khb., 1963, 42, 432-436 (Med. Dept., Washington Univ. Med. Sch., Seattle, Wash., U.S.A.) Azepinamide, a new sulphonylurea had ability to control blood glucose similar to that of tolbutamide and chlorpropamide. There was no toxicity. Its only advantage over these other drugs was its low plasma half-life of 14 hr.

H.B.Waynfirth

6299. THE USE OF AZEPINAMIDE IN THE MANAGEMENT OF DIABETES MELLITUS, WITH A REPORT OF JAUNDICE AS A COMPLICATION, AND COMMENTS RELATIVE TO THE USE OF ORAL HYPOGLYCAEMIC AGENTS. A.Weinstein, R.Massie and A.B.Scoville: Amer. J. med. Sci., 1963, 245, 432-439 (Diabetic Clinic, Vanderbilt Univ. Sch. Med., Nashville, Tenn., U.S.A.) Azepinamide, a sulphonylurea deriv., is more effective than tolbutamide as an hypoglycaemic agent, but appears to be less safe than the latter as shown by the incidence of jaundice.

E.E.Hobbiger

6300. EFFECT OF GLUCOSE PERFUSIONS ON THE INSULIN ACTIVITY OF SERUM AND ON GLUCOSE ASSIMILATION IN THE NORMAL DOG. R.Bellens, W.Malaisse, V.Conard and J.R.M.Franckson: Arch. int.

PHARMACOLOGY

Pharmacodyn. 1963, 143, 277-284 (Expt. Med. Lab., Free Univ. Brussels, Belgium) Insulin secretion in response to one glucose perfusion in dogs did not affect the pancreatic response to a subsequent perfusion. Thus, after a second perfusion, serum insulin activity increased as much as after the first. These two successive insulin secretions caused increases in the coefficient of insulin assimilation. These effects of hyperglycaemia are compared with the response to sulphonamide hypoglycaemic drugs. (French) T.J.Sullivan

6301. ANTAGONISM BETWEEN Na SALICYLATE AND BRADYKININ IN THE RAT. J.Lecomte and J.Troquec Arch. int. Physiol., 1962, 70, 735-737 (Inst. L. Fredericq, Univ. Liège, Belgium) Brief comm. (French) M.E.Nutt

6302. SALICYLATE LEVELS OF RAT ORGANS AFTER PARENTERAL ADMINISTRATION OF RADIOACTIVE SODIUM SALICYLATE. H.Ebergardt: Arch. int. Pharmacodyn., 1963, 143, 205-218 (Univ. Orthopaedic Clinic, Homburg, Saar, Germany) The distribution of carboxy-¹⁴C-Na salicylate is studied in 4 rats. All tissues contain much lower levels than serum because of intense binding by serum albumen. The highest levels are found in liver, kidney, adrenals, heart, lungs and spleen, moderate levels in the adenohypophysis and the lowest in variable areas of the brain. (German) S.E. Smith

6303. THE EFFECT OF SALICYLATE ON PLASMA NON-ESTERIFIED FATTY ACIDS. S.G.Gilgore, W.L. Drew and J.J.Rupp? Amer. J. med. Sci., 1963, 245, 456-458 (Dept. Med., Div. Endocrinol., Jefferson Med. Coll., Philadelphia, Pa., U.S.A.) Results obtained with an i.v. infusion of Na salicylate indicate that the drug has an insulin-like action on carbohydrate metabolism, but unlike insulin raises the plasma level of non-esterified fatty acids. E.E.Hobbiger

6304. ASPIRIN AND GASTROINTESTINAL BLOOD LOSS. J.R.Leonards: Gastroenterology, 1963, 44, 617-619 (Dept. Biochem., Med. Sch., Western Reserve Univ., Cleveland, Ohio, U.S.A.) ⁵⁹Fe and ⁵¹Cr labelled erythrocytes were used to study gastrointestinal bleeding into the gut of human subjects. It was found that aspirin (Bayer) administered at a dosage of 2*56 g./day caused haemorrhage in the gut but that no haemorrhage occurred when sol. aspirin (Alka-Seltzer in citrate buffer) was administered at the same dosage level. D.N.Wheatley

6305. METHOD FOR DETERMINATION OF MICRO-QUANTITIES OF IPRONIAZID AND OTHER NI-ALKYL-N₂-ACYL-HYDRAZINES IN BODY FLUIDS AND TISSUES. J.Reider and M.Roth: Biochem. Pharmacol., 1963, 12, 445-450 (Dept. Expt. Med., F.Hoffman-La Roche and Co. Ltd., Basle, Switzerland) A method for the determination quant. of iproniazid, isocarboxazid and pivaloyl-benzylhydrazine and other similar compounds in all kinds of biol. material was described. It was based on the extraction of the compounds into a butyl acetate-butanol mixture or, for urine only, chlorform and subsequent formation of a coloured formazan by reaction with a tetrazolium salt-reagent. The procedure is relatively simple, reproducible and sufficiently sp. for pharmacokinetic studies of these drugs. L.G.Gillies

6306. DRUG-SPECIFIC LEUCO-AGGLUTININ IN FATAL CASE OF AGRANULOCYTOSIS DUE TO CHLORPROMAZINE. G.C.Hoffman, J.S.Hewlett and F.L.Garzon: J. din. Path., 1963, 16, 232-234 (Cleveland Clinic

Fndn. Clin. Path. Dept., Cleveland, Ohio, U.S.A.) Serum from a case of fatal agranulocytosis due to chlorpromazine caused aggl. of normal human w.b.c. in the presence of chlorpromazine. It was suggested that an immunol. mechanism might be involve[^] in the pathogenesis of chlopromazine-induced agranulocytosis.

J.B.Derbyshire

6307. PHARMACOLOGICAL STUDY OF TRIHYDROXY 2,4,6-PROPIOPHENONE. R.Cahen and A.Boucherle: CR. Soc. Biol., Paris, 1963, 157, 112-116 (Fac. Med. et de Pharm., Grenoble, France) Trihydroxy 2,4,6-propiophenone showed a depressive action on the smooth muscle of certain organs of guinea-pig, rat and mice as shown by *in vivo* and *in vitro* studies. This effect was greater than that of trihydroxy 1,3,5-benzene. The most characteristic action of trihydroxy 2,4,6-propiophenone was an increase in the bile output of dogs. (French)

M.A.Price

6308. ACCUMULATION OF DRUG ANIONS IN GASTRIC MUCOSAL CELLS. B.K.Martin: Nature, Lond., 1963, 198, 896-897 (Nicholas Res. Inst. Ltd., Slough, Bucks-England) It is suggested that during absorption of acidic drugs from the stomach across the pH gradient between the mucosal cell and gastric lumen, damage to the mucosal cells may result from accumulation of the anion. G.M.Lewis

6309. APPLICABILITY OF FERGUSON'S PRINCIPLE AND THE 'SIEVE THEORY' TO NEGATIVE INOTROPISM. L.Molinengo: Arch. int. Pharmacodyn., 1&2, 143, 90-107 (Inst. Pharmacol. and expt. Theraj., Univ. Turin, Italy) Neg. inotropic effects of urethane, benzyl alcohol, benzamide, acetanilide, atropine, quinidine and other drugs are studied using isolated rat ventricular strips. The EDSQ varies within the solubility of the compounds (Ferguson's principle) and the rate of onset of effect with the molecular vol. (Sieve theory). An exception is procainamide, its rate of onset of effect being faster than predicted. (Italian) S.E. Smith

6310. EFFECT OF METHOTREXATE [MTX] AND 'MELPHALAN' [MP] ON THE SURVIVAL OF TUMOUR AND SKIN HOMOGRAFTS. J.P.Glynn, A.R.Bianco and A.Goldin: Nature, Lond., 1963, 198, 1003-1004 (Lab. Chem. Pharmacol., Nat. Cancer Inst., N.I.H., Bethesda, Md., U.S.A.) The fates of DBA/2 leukæmia and skin homografts were compared in BALB/c mice treated with MTX and MP. The results indicated that, even in a system involving minor histocompatibility differences, pretreatment with MTX does not alter homograft immunity. The homograft response to the leukæmia was abrogated by a dose of MTX which prolonged the survival of skin homografts by only 2 days, indicating that a system involving the immune response to a tumour homograft could be a sensitive indicator for detection of weak immune suppression. G.M.Lewis

6311. PROLONGATION OF HOMOGRAFT SURVIVAL IN GUINEA-PIGS TREATED WITH AMETHOPTERIN. M.C.Berenbaum: Nature, Lond., 1963, 198, 606-607 (Surg. Unit, St. Mary's Hosp. Med. Sch., London, England) Survival time of skin homografts in the guinea-pig may be doubled or trebled by i.p. administration of amethopterin at 9 to 12 mg./kg. Doses of 15 mg./kg. were prohibitively toxic. G.M.Lewis

6312. EFFECT OF 3'-AMINO-3'-DEOXYADENOSINE [ADA] AGAINST ASCITIC TUMOURS OF MICE. L.H.Pugh and N.N.Gerben: Cancer Res., 1963, 23,

PHARMACOLOGY

609

640-647 4Inst. Microbiol., Rutgers, New Brunswick, N.J., U.S.A.) I.p. injn. of ADA isolated from *Helminthosporium* sp. no. 215, 24 hr. after S3A ascitic adenocarcinoma implantation, produced significant tumour inhibn. In a group receiving 72 fig./mouse the first death occurred after 2^{1/2} months whereas the median survival time for saline treated control mice was 1 month and all were dead after 34 days. Survival time was also increased in mice bearing Ehrlich ascites tumours. Inhibitory activity was minimal against ascitic Gardner lymphosarcoma and Sarcoma 180. At non-toxic dosages, the compound exhibited more antitumour activity than Puromycin aminonucleoside. ^{B.M.} Stevens

6313. CLINICAL AND PHARMACOLOGICAL STUDIES WITH 5-IODO-2'-DEOXYCYTIDINE [ICDR].

P.Calabresi, W.A.Creasey, W.H.Prusoff and A.D. Welch: Cancer Rp., 1963, 23, 583-592 (Dept. Med., Yale Univ. Sch. Med., New Haven, Conn., U.S.A.) ICDR was administered to 12 patients with advanced neoplastic diseases. 85-98% of the pZapBCDR administered to 4 patients was deaminated. The 5-iodo-2'-deoxyuridine [IUDR] formed was cleaved to 5-iodouracil which was deiodinated yielding I'. ICDR produced stomatitis, hair loss, nail changes and haematopoietic depression in a similar manner to IUDR. One of the 4 Patients receiving [125I]ICDR, in whom sustained blood levels of [125I]IUDR resulted, showed marked regression of a carcinoma of the vulva on 4 occasions. Antineoplastic effects and manifestations of toxicity were comparable to those after [125I]IUDR therapy. Patients in whom [125I]ICDR did not produce adequate blood levels of [125I]IUDR showed neither signs of toxicity nor significant antineoplastic effects. ^{B.M.} Stevens

6314. EFFECTIVENESS OF 2-CHLORO-4^f-4^{'''}-DI-2'-IMIDAZOLIN-2-YL TEREPHTHALANILIDE[piHYDRO-CHLORIDE [NSC-38280]] AND METHOTREXATE [MTX], IN COMBINATION, AGAINST ADVANCED LEUKAEMIA L1210. J-M.Venditti, A.Goldin and L.Kline: Cancer Res., 1963, 23, 593-599 (Lab. Chem. Pharmacol., Nat. Cancer Inst., Bethesda, Md., U.S.A.) At optimum doses, daily treatment with the 2 drugs in combination was approx. 100% more effective than either drug alone in increasing the median w_{TM}^{TM}/TM ?* *ice. Low, relatively ineffective levels of NSC-38280 combined with highly effective levels of MTX gave max. Effectiveness. With this dosage ratio, combination treatment increased the range of doses swing a high degree of therapeutic effectiveness. A marked degree of additivity of antitumour activity with min. additive toxicity towards the host was indicated. ^{B.M.} Stevens

6315. CLINICAL STUDIES WITH VINCERISTINE.

P.P.Carbone, V.Bono, E.Freim and C.O.Brindley: Blood, 1963, 21, 640-647 (Med. Branch Nat. Can. Inst., Bethesda, Md., U.S.A.) Patients with malignant neoplastic diseases, especially lymphoma were given SS_C & tae^e nnftDe its toxicity. Ac^e tolerated *^e and the amf-tumour prop. The tolerated dose was ~0.05 mg./kg. on most patients. Toxic symptoms were >inflined to the neuromuscular system and gastrointestinal tract. Thrombocytosis sometimes occurred. Tumour ^{na} th

6316. VINCERISTINE [VCR] IN THE TREATMENT OF LYMPHOMAS AND LEUKAEMIAS. D.G.Miller and H.D.Diamond: Cancer Res., 1963, 23,

613-621 (Lymphoma Service, Dept. Med., Mem. Hosp., New York, U.S.A.) VCR, an analogue of Vinblastine, isolated from *Vinca rosea* Linn., was given to 35 patients with Hodgkin's disease and other lymphomas and leukaemias. Only patients with Hodgkin's disease showed significant response, 9 of the 23 having temporary remissions lasting at least 1 month. Toxicity, principally neuromuscular, was frequently encountered and was severe enough to require discontinuation of therapy in 50% of patients adequately treated.

B.M. Stevens

6317. ACTION OF 6-MERCAPTOPURINE ON PORPHYRINOGENESIS IN WHITE RAT. A.Gajdos and M.Gajdos-Torok: C.R. Soc. Biol., Paris, 1962, 157, 42-46 (Clin. Med. THotel-Dieu, Paris, France)

Administration of 5-10 mg. 6-mercaptopurine/day to white rats resulted in an increase in porphyrin synthesis. There was an increase in urinary level of 6-amino-laevulinic acid and coproporphyrin and an increase in the liver content of porphobilinogen and 6-aminolaevulinic acid. The purine nucleotide content of r.b.c. decreased with inhibn. of phosphorylation of AMP. (French)

M.A.Price

6318. ANTIMITOTIC CHEMOTHERAPY IN MALIGNANT TUMOUR THERAPY: DIFFERENT ROUTES OF DRUG ADMINISTRATION. M.Sforza, A.Scarduelli and A.Parmegiani: Atti. Acad. med. Lombarda, 1962, 17, 496-501 (Clin. Chirurg., Univ., Milano, Italy)

Dogs with a gastroduodenal resection (Reichel-Polya's method) were given antimitotic agents by intraportal and general routes and also by local application and the effects compared. 20 mg. of triethylene thiophosphoramidate and 7^{1/2} mg. of methyl-bis-(3-chlorethyl)chloride were used. These drugs when administered by the intraportal and general routes caused considerable damage to the bone marrow tissue and frequently induced death. Local application did not have these effects.

(Italian) G.N. Godson

6319. EFFECTS OF PRETREATMENT WITH CARCINOSTATIC AGENTS ON TUMOUR GROWTH AND WHITE BLOOD CELLS. F.A.Schmid, M.M.Schmid and K.Sugiura: Cancer Res., 1963, 23, 607-612 (Div. Expt. Chemotherapy, Sloan-Kettering Inst. Cancer Res., New York, U.S.A.) Good correlation was observed between the degree of lymphopenia caused by 24 hr. pretreatment with cyclophosphamide (cytoxan), triethylene melamine [TEM], N mustard, hydrocortisone acetate, total body X-radiation, X-radiation of chest and hind legs, 6-mercaptopurine, amethopterin, mitomycin C or actinomycin D and the enhancement of growth of i.v. inj. Ehrlich ascites cells. Effects on neutrophils were not correlated with tumour growth. Cyclophosphamide, TEM, X-radiation and hydrocortisone acetate had the greatest effect on lymphocytes and tumour growth. Pretreatment with cyclophosphamide did not enhance pulmonary tumour formation in C3H mice receiving i.v. injn. of isologous tumour cells from spontaneous mammary adenocarcinomas. ^{B.M.} Stevens

6320. CHEMOTHERAPY STUDIES OF MAMMARY TUMOURS OF C3H MICE. G.A.LePage and N.Howard: Cancer Res., 1963, 23, 622-627 (Life Sci. Res., Stanford Res. Inst., Menlo Park, Calif., U.S.A.) Increasing the total no. of thioguanine doses produced toxicity, as measured by body wt. loss and mortality, at a lower total dose. Toxicity was much greater when thioguanine was given every 12 hr. instead of every 24 hr. Responses of spontaneous tumours in ? and early transplant generations of such tumours with an average intermitotic

PHARMACOLOGY

time of 5 days, to thioguanine every 24 hr. were greater than those to equiv. doses every 12 hr. Response was correlated with incorporation of [14C]thioguanine into nucleic acids. Spontaneous tumours and transplant generations appeared equally responsive to thioguanine, some spontaneous tumours regressing completely. Responses to azaserine were also examined. B.M.Stevens

6321. INHIBITORY ACTION OF FLAVONOIDS ON MAMMARY CARCINOGENESIS IN MICE. G.Rudali and L.Juliarcfc C.R. Soc. Biol., Paris, 1963, 157, 72-74 (Inst. du Radium, Fondation Curie, Paris, France) 85-90% of ? of strain RIII maintained under continuous reproduction exhibited mammary tumours from the age of 5 months. Administration per os of 1*2 mg. of flavonoid complex inhibited the appearance of secondary tumours. A similar inhibn. was obtained by injn. of lyophilised antihyaluronidase serum.

(French) M. A. Price

6322. POTENTIAL BRONCHODILATORS IN FLAVONOID SERIES. D.Kidd: J. chem. Soc., 1962, 5121-5125 (Edinburgh Pharmaceut. Indust. Ltd., Res. Dept., Edinburgh, Scotland) 3-Amino-4',7-dimethoxyflavanone and -flavone were synthesised. Many variations in the positions of substituents known to give enhanced bronchodilator activity to the flavone molecule were introduced. 7-Amino-4'-methoxyflavone and two new phenolic chloroflavones were prep. Some isoflavone deriv. were also studied. The bronchodilator activities found were higher than that of apigenin and lower than that of khellin. L.G.Gillies

6323. EFFECTS OF NITROGEN MUSTARDS ON INCORPORATION OF AMINO ACIDS INTO PROTEINS OF TUMOURS AND OTHER TISSUES. MUSTARD DERIVATIVE OF SERINE. W.L.Nyhan and E.L.Hoehn-Saric: Biochem. Pharmacol., 1963, 457-465 (Dept. Paediatrics, Johns Hopkins Univ. Sch. Med., Baltimore, Md., U.S.A.) The effects of O-[N-di-(2-chloroethyl)carbamoyl]-DL-serine, a nitrogen-mustard deriv. of serine, on the incorporation of amino acids into proteins were studied in rats bearing the Walker 256 carcinosarcoma. The i.p. injn. of 1500 mg./kg. regularly induced carcinostasis and occasionally produced complete regression of the tumour while producing minimal systemic toxicity. These effects were accompanied by an inhibn. of the incorporation of amino acids into the protein of the tumour. This was greater in the nuclear than in the cytoplasmic proteins suggesting a predominantly antinuclear action. The inhibn. was observed only in the tumour. The results suggested that the compound was acting not as an analogue inhibitor but as an alkylating agent. L. G. Gillies

6324. METABOLISM OF 35s-(1,2-DICHLOROVINYL)-L-CYSTEINE IN RAT. R.F.Derr and M.O.Schultze: Biochem. Pharmacol., 1963, 12, 465-474 (Dept. Agric. Biochem., Univ. Minnesota, Inst. Agric, St. Paul, Minn., U.S.A.) After administration of this compound by stomach tube and by i.p. injn. the major radioactive components in the urine were inorg. SO₄²⁻, an unidentified component, S-(dichlorovinyl)-L-cysteine and its N-acetyl deriv., the last 2 predominating soon after administration and the inorg. SO₄²⁻ being later the only detectable metabolite. The highest concn. of radioactivity was found in the kidney. Heart and liver contained about 25% as much and other organs 10%. The major portion of the radioactivity was associated with the protein fraction of kidney, liver and heart. In blood plasma 80% was bound in non-dialysable form. L.G.Gillies

6325. METABOLISM OF 35s-(1,2-DICHLOROVINYL)-L-CYSTEINE IN CALF. R.F.Derr, M.O.Schultze, N.S. Mizuno, D.D.Joel and J.H.Sautter: Biochem. Pharmacol., 1963, 12, 475-488 (Dept. Agric. Biochem., Coll. Vet. Med., Univ. Minnesota, St. Paul, Minn., U.S.A.) The drug was inj. i.v. into calves to study its metabolism and the possible preferential accumulation of the tracer in haematopoietic tissues. The molecule was attacked rapidly as shown by the fact that, although it disappeared from blood plasma in less than 80 min*, none was found in the urine. There was a high concn. of 35s in the urine, in 9 compounds of which only inorg. SO₄²⁻ was identified. The highest concn. of 35s associated with protein and lipid fractions in urine was found after 40 min. Bile, 20 to 40 min. after injn. of the drug, contained extremely high levels of radioactivity in the form of inorg. SO₄²⁻ and 3 unidentified compounds but not the drug itself. The metabolism of this drug in the calf was different from that in the rat, in keeping with the different biol. response to the drug. L.G.Gillies

6326. MEGLABLASTOSIS PRODUCED BY A CYTOSINE ANTAGONIST. 1-p-D-ARABINOFURANOSYLCYTOSIDE R.W.Talley and V.K.Vaitkericius: Blood, 1963, 21, 352-362 (Oncol. Div., Ford Hosp., Detroit, Mich., U.S.A.) Temporary regression of tumour masses in some patients with lymphosarcoma was produced with cytosine arabinoside. This substance also induced megaloblastic changes in the marrow, with mktotic abnormalities and decreases in the Hb, w.b.c. and platelets in the peripheral blood. H.B.Waynforth

6327. ACTION OF TRYPSIN INHIBITORS ON THE DEVELOPMENT OF LESIONS OF THE OESOPHAGUS, INDUCED IN RAT BY REFLUX. R-Lambert: C.R. Soc Bipl., Paris, 1962, 156, 2076-2079 (Clin. mèd., Hopital Ed.Herriot, Lyon, France) A termino-lateral oesophageal-duodenal anastomosis in rats induced lesions of the oesophagus by reflux of alk. pancreatic secretions. Administration of 1000 U per day Zymofren Specia or 6000 U per day Iniprol Choay, both polypeptidase inhibitors, protected the animal from oesophageal lesions. (French) M.A.Price

6328. INHIBITION OF SYNTHESIS OF RNA IN E. COLI BY THE NARCOTIC DRUG LAEVORPHANOL. E.J.Simon: Nature, Lond., 1963, 198, 794-795 (Dept. Med., New York Univ. Sch. Med., New York, U.S.A.) The morphine analogue laevoiphanol completely inhibits growth of *E.coli* at concn. 10-3M due to inhibn. of RNA synthesis as indicated by die reduction in incorporation of 32p into the acid-insol. fraction. Uptake of thymidine into DNA and leucine into proteins was not affected. G.M.Lewis

6329. STUDIES OF COMPOUNDS WITH ANTICOAGULANT ACTIVITY FROM THE GROUP OF 4-HYDROXYCOUMARIN DERIVATIVES. IV. CONDENSATION PRODUCTS OF 4-HYDROXYCOUMARIN WITH HALOGEN DERIVATIVES OR AROMATIC ALDEHYDES. M.Ecksetin and J.Cwynan Dissert. pharm., 1962, 14, 29-39 (Pracownia Technol. Chem. Srodkow Lecznicyzych, Akad. Med., Krakow, Poland) 4-Hydroxycoumarin deriv.: 3,3-(α -ui- or β -chlorobenzylideno)-bis-4-hydroxycoumarin and 3,3'-(5 β -chloro-5' β -iodofurfurylideno-2 β)>bis-4-hydroxycoumarin showed the anticoagulant prop. Condensation reaction of 4-hydroxycoumarin with some deriv. of aromatic aldehydes was investigated. W.Chmurzyiska

6330. EXPERIMENTAL ANIMAL STUDIES OF SOME COBALT COMPOUNDS AFTER INTRAVENOUS INJECTION. G.Tauberger and O.R.Kummen. Arch. int. Pharmacodyn.. 1963. 143. 219-239 (Pharmacol. Inst., Bonn Univ., Germany) Pharmacological actions of Co dihistidine, C02-EATA and C0Cl₂ are studied in rats and cats, in chloralose-urethane anaesthetised cats. The Co compounds have partly stimulant and partly inhibitory actions in the circulation, heart, and respiration. (German) S.E.Smith
- ⁶³³¹ DISCUSSION OF INTRAVENOUSLY ADMINISTERED CHLORINE (CARRIER FREE) IN THE RHESUS MONKEY. E.A.Daigneau U: Toxicol. appl. Pharm., 1963. 5. 331-343 (Dept. Pharmacol., Univ. Tennessee Med. Unit, Memphis, Tenn., U.S.A.) Y is mainly deposited in bone and organs with phagocytotic activity, and pretreatment of monkeys with zymosan, i.v...has no effect on its blood clearance, distribution and excretion. The distribution of Y « the same in monkeys, rats, dogs and rabbits. E.E.Hobbiger

6332. MECHANISM OF PIPERAZINE-EMESIS IN DOGS. M.T.Peng: Arch. int. Pharmacodyn.. 1963. 143. 173-180 (pept. Physiol. Coll. Med., Nat. Taiwan Univ., Taipei, Taiwan) Administration of piperazine 60-200 mg./kg. i.v. to dogs causes vomiting and diarrhoea. The vomiting is prevented by prior surgical ablation of the trigger-zone or denervation of the gut. S.E.Smith

6333. NEONATAL TETANUS AND PULMONARY COMPLIANCE OF TOTALLY RELAXED INFANT. P.M.Smythe Brit. med. J.. 1963. ^6^571 Child Health. Univ. Capetown. S. Afr. with neonatal tetanus were treated with recants and intermittent pos. artificial respiration (IPPR) with precautions to keep the airway clear. Mortality was reduced from 93ft to 20ft when adequate ventilation was ensured by measuring alveolar pCO₂ by a ^reading method, suggesting that death had been primarily due to respiratory insufficiency. Mean static $c_{\text{TM}}^{\text{TM}}$ infants weighing > 3 kg. was 2.5 ml./cm.²H₂O " « . tracheal p.f compared with a mean of 5 ml/cm. H₂O in spontaneously breathing infants. Compliance varied directly with inspiratory p.. thus < *% minTM" of effective inspiratory pp is important. « In e J^15 J^ compliance fell after prolonged IPPR. it was ^ affected ^ changes in ventilation rate or posture. Use of IPPR in other types of respiratory distress is discussed. M.E.Nutt

TOXICOLOGY

6334. ATROPHY OF RAT TESTIS AS INDEX OF CHEMICAL TOXICITY. W.E.Ribelin Arch. Path., Chicago, 1963, ^75, 229-235 (Environ. Lab., Amer. Cyanamid Agric. Res. Center, N.J., U.S.A.) - S M S S Was - reviewed a fact of drug Testicular atrophy might be used as an index of drug toxicity. R.Mitchell
6335. APPLICATION OF PAPER CHROMATOGRAPHY TO THE TOXICOLOGICAL STUDY OF DRUGS. III. PAPERCHROMATOGRAPHIC BEHAVIOUR OF A FEW BASIC-DRUG'S IN RELATION TO THEIR STRUC-

TURE. J.Ve&erková, J.Solc and K.KScl: J. Chromatography, 1963, 10, 479-492 (Lab. Jun. Tonic and Gerichtliche Chem. Der. Karls-Univ., Prague, Czechoslovakia) Thirty drugs have been studied with regard to their relationships between structure and behaviour to the reverse phase systems petroleum/ethanol-water-ammonia. Rf values are tabulated for 7 such systems containing varying proportions of ethanol to the mobile phases. In general, Rf values increased with increasing ethanol content for tertiary bases but decreased for quaternary bases. Influence of temp. on Rf value was also investigated. (German) P.D.Dawkins

6336. RELATIONS BETWEEN STRUCTURE, METABOLISM AND TOXICITY OF THE 'CYCLODIENE' INSECTICIDES. G.T.Brooks and A.Harrison: Nature, Lond., 1963, 198, 1169-1171 (Biochem. Dept., A.R.C.-Pest Infestation Lab., Slough, Bucks., England) Comparative studies of insecticides suggests that the different toxicities to the housefly of several closely related substances possessing the hexachlorobicycloheptane nucleus in common is due at least in part to the presence of detoxification processes. J. R. Sargent

6337. APPLICATION OF PAPER CHROMATOGRAPHY AND SPECTROPHOTOMETRY FOR DETECTION OF COMPONENTS OF 'AMIDOCIN' IN BIOLOGICAL MATERIAL. F.Borkowski and A.Dluznewska: Dissert. Pharm., 1963, 15, 95-100 (Inst. Eksperyty Sadowych w Krakowie, Krakow, Westerplatte, Poland) Details are given of a method for the determination of the 3 components of 'Amidochin'-pyramidon, quinine and caffeine in biol. material. The isolated drugs were separated by paper chromatography and estimated spectrophotometrically. G.F.Blane

6338. FATAL SUICIDAL POISONING WITH CHLOROQUINE [RESOCHIN, NIVAQINE B]. J.B3umler and M.L.Odin: Arch. Toxicol., 1963, 20, 96-101 (Med. Inst. Univ., Basel, Switzerland) This anti-malarial drug when taken in large doses can lead to death. A method is described for its identification in human organs. Use is made of spectroscopy (u.v. and i.r.) and chromatography (paper and thin layer). (German) I.Cornish

6339. ACUTE POTASSIUM OXALATE POISONING. W.Neugebauen Arch. Toxicol., 1962, 19, 275-277 (Münster i. Westf., Engelstr. 23, Germany) Due to the rarity of attempted suicides with K oxalate, the case of a 63 yr. old patient was thoroughly investigated. He suffered from acute depression and had attempted suicide once before. On swallowing K oxalate (20 g.) he complained of pains in the abdomen, sweated profusely, vomited and lost the use of his limbs. He died in the ambulance approx. 75 min. after taking the poison. A brief discussion on oxalate poisoning is given. (German) I.Cornish

6340. SODIUM CHLORIDE POISONING DUE TO EXCESSIVE INTRAVENOUS ADMINISTRATION. H.G.Cze: A:ch. Toxicol., 1962, 19, 284-292 (Med. Univ., Hamburg-Eppendorf, Germany) For possible therapeutic reasons 80 g. of NaCl in aq. soln. was inj. into a patient. Loss of consciousness resulted, and full facilities were recovered only after 8 days. After 1 yr. the patient still showed signs of the poisoning. (German) I.Cornish

6341. A SUICIDE ATTEMPT WITH VALAMIN [1-ETHYL-NYL CYCLOHEXYL-CARBAMATE] WITH A CONTRIBUTION FOR ITS ELIMINATION AND TREATMENT.

PHARMACOLOGY

H.Langecker, G.Neuhaus, K.Ibe and M.Kessel: Arch. Toxicol., 1962, 19, 293-301 (Schering AG, W. Berlin, Germany) A 21 yr. old patient swallowed 40 g. of Valamin and was brought to hospital 14 hr. later. Haemodialysis and standard treatment for barbiturate poisoning led to recovery. A careful chromatographic investigation of body fluids revealed the presence of some unchanged valamin and hydroxylated metabolites. (German) LCornish

6342. SLOW CHRONIC MERCURY POISONING IN DENTAL PRACTICE. S.Preussner, H.-P.Klücking and G.Bast: Arch. Toxicol., 1963, 20, 12-20 (Med. Clinic Univ. Rostock, East Germany) Clinical symptoms of a dentist and his assistant are described. The usual signs of Hg poisoning were missing, but on investigating the surgery, the attn. was found to be contaminated with Hg vapour. This was due to small Hg pools under the floor boards and the prep. of Cu amalgam at elevated temp. Details are also given for the quant. determination of Hg in the urine, and therapeutical treatment for the patients. (German) LCornish

6343. FATAL CYANIDE POISONING OF A CHILD. A.Fiori and M.Marigoc: Arch. Toxicol., 1963, 20, 21-27 (Inst. Med. Legale Univ., Padova, Italy) Cyanide poisoning in children is rare. The post-mortem examination of a 4 yr.-old child is described, death was due to cyanide poisoning ascertained from the presence in the stomach of less than 100 µg.¹⁰ cyanide. The literature is also reviewed; 48 ref. (German) LCornish

6344. THALIDOMIDE: EFFECT UPON PREGNANCY IN THE RHESUS MONKEY. J.F.Lucey and E.Behrman: Science, 1963, 139, 1295-1296 (Dept. Paediatrics, Univ. Vermont Coll. Med., Burlington, Vt., U.S.A.) 50 or 200 mg. thalidomide daily were administered to ♀ rhesus monkeys after mating. There were no signs of pregnancy and it was concluded that thalidomide killed the embryo prior to implantation. G.M.Lewis

6345. INFLUENCE OF INCREASING DOSES OF GLUTETHIMIDE (DORIDEN) ON GESTATION AND FOETAL DEVELOPMENT OF RABBIT. H.Tuchmann-Duplessis and L.Mercier-Parot: CR. Soc. Biol., Paris, 1963, 157, 5-8 (Lab. d'Embryol., Paris, France) In rabbit, a sp. which is particularly sensitive to the teratogenic action of thalidomide, Doriden interrupted gestation but did not induce foetal malformations. 100-400 mg. Doriden/day resulted in 15-30% foetal resorption. With higher doses, 80% resorption occurred but the remaining foeti were normal. (French) M. A. Price

6346. OXYGEN CONSUMPTION OF THE HEART OF THE GUINEA-PIG WITH ACUTE CARBON MONOXIDE INTOXICATION. R.Mole and M.Ferrari: Biochim. appl., 1963, 10, 51-57 (1st. Med. del Lavoro, Univ. Napoli, Italy) The O₂ consumption of the various chambers of the heart of the guinea-pig was measured. These values were reduced by 30% of the normal if the animal was exposed to CO but not if it was exposed to pure N₂. (Italian) J.C.Crawhall

6347. CARBON MONOXIDE CONTENT OF THE BLOOD AND A CLINICAL PICTURE OF INDUSTRIAL CARBON MONOXIDE POISONING. H.Rossmann: Arch. Toxicol., 1962, 19, 345-354 (Badischen Anilin-Soda AG, 67 Ludwigshafen a Rh., Germany) The case histories of 225 patients suffering from occupational CO poisoning are described. Individual patients show varying

degrees of tolerance, depending on age and physical condition. A large no. of objective and subjective tests for ascertaining the poisoning are described and the author is in disagreement with published work on the effect of CO poisoning on blood pressure. (German)

LCornish

6348. HALOTHANE HEPATITIS. W.J.Heidenberg, LToria and J.Cebula: Lancet, 1963, i, 1185-1186 (V.A. Hosp., Bronx, New York, U.S.A.) In a case of hepatitis after halothane anaesthesia delayed symptoms were noted, and the presenting signs were those of pyrexia of unknown origin. All documented cases of this complication, except one from Paris, have been reported from the United States. Although the agent was manufactured solely in Great Britain until approx. 6 months ago and the bulk of clinical trials were performed there, no cases have so far been reported from that country. G.H.Bell

6349. A CASE OF FATAL ORAL CARBON TETRA-CHLORIDE POISONING. LDvořák: Arch. Toxicol., 1963, 20, 72-78 (Path. Anatom. Ustav, Kunz Fac., Hradec Králové, Czechoslovakia) Carbon tetrachloride poisoning usually occurs via inhalation; a case is described when death was due to an oral intake of 10 ml. Besides serious liver damage, other organs also appear to have been affected. The possible role of alcohol, as accelerating death, is discussed. (German)

-LCornish

6350. CARBON TETRACHLORIDE POISONING IN LIVER OF NEWBORN RAT. M.J.R.Dawkins: J. Path. Bact., 1963, 85, 189-196 (Nuffield Inst. for Med. Res., Univ., Oxford, England) S.c. injn. of CCI₄ into newborn Sprague-Dawley albino rats produces no histol. evidence of necrosis, no accumulation of fat and an insignificant rise in serum isocitric dehydrogenase. Max. levels of CCI₄ in liver are similar in newborn and in adult but max. concn. occurs much earlier and falls more rapidly in former. CCI₄ does not modify the post-natal fall in liver glycogen nor the large rise in glucose-6-phosphatase activity. D.Murray

6351. EFFECT OF TREATMENT ON EXPERIMENTAL LIVER CIRRHOSIS IN RATS. IV. EFFECT ON CCI₄-INDUCED CIRRHOSIS OF LIVER EXTRACTS, LIPOCAIC SULPHONAMIDE DERIVATIVES AND CYSTEINE-CONTAINING PREPARATIONS. W.D.Krey, L.Hesse, M.Wirtz, W.Creutzfeld and H.A.Kfhl: Z. Ges. exp. Med., 1963, 136, 535-542 (Med. Univ. Clinic, Freiburg i. Br., Germany) Hepatocellular damage induced in rats by 0.75 ml. CCL⁴/kg. given twice weekly for 12-14 weeks was not prevented by any of the test substances, but the degree of damage appeared to be less in rats treated during the period of CCI₄ intoxication with daily injn. of liver extract or liver hydrolysates. (German)

P.F.Meyer

6352. EFFECT OF ADMINISTRATION OF GLUCURONIC ACID IN RATS TREATED WITH CARBON TETRA-CHLORIDE. V.P.Valame, R.G.Chitre and U.K.Sheth: Arch. int. Pharmacodyn., 1963, 143, 165-172 (Pharmacol. Dept., Seth G.S.Med. Coll., Bombay, India) Acute and chronic liver injury was produced in rats by parenteral administration of carbon tetrachloride. The extent of the injury was estimated by liver function tests and histol. studies. Glucuronic acid, administered prophylactically and during carbon tetrachloride treatment failed to protect the liver. T.J.Sullivan

6353. STIMULATORY EFFECTS OF CHLORDANE ON HEPATIC MICROSOMAL DRUG METABOLISM IN THE

RAT. L.O.Hart, R.W.Shultice and J.R.Fouts *Toxicol. appl. Pharm.*, 1963, 5, 371-386 (Dept. Pharmacol., Coll. Med., State Univ. Iowa, Iowa City, U.S.A.) The halogenated hydrocarbon insecticide chlordane, Biven i.v. to rats, increases the activity of liver microsomes, as assessed by the rates of oxidation of hexobarbitone, N-dealkylation of aminopyrine and oxidation of the ring sulphur of chlorpromazine. The increase can be prevented by concurrent administration of DL-ethionine and is not observed when chlordane is added to microsomes in vitro. E.E.Hobbiger

6354. THE RELATIONSHIP BETWEEN LIVER NECROSIS AND PENTOBARBITAL SLEEPING TIME IN RATS. T.Balazs and H.C.Gricc *Toxicol. appl. PhfTM*, 1963, 5, 387-391 (Food and Drug Labs., Dept. Nat. Health and Welfare, Ottawa, Ont., Canada) Jaundice, as assessed by serum glutamic pyruvic transaminase level and icterus index, and pentobarbitone sleeping are not causally related. The latter is, therefore, unreliable for assessing liver injury in " " ^ ^ g j j j k l r

6355. RADIOMIMETIC AGENTS AND X-RAYS* IN MICE AND AET PROTECTIVENESS. M. Asano, T.T.QdeU, T.P.McDonald and A.C.Upton: A ^ - f * * - f] ^ * ? , 1963, 75, 250-263 (Biol. Div. Oak Ridge Nat. Lab., Oak Ridge, Tenn., U.S.A.) ^ t ^ f f i t ^ effects-of X-Rays, mechlorethamine hydrochloride (HN₂HC1), triethylenemelamine (T.E.M.), busulfan (myleran) and 4M20 (4-p-dimethylamino styrlyl quinohne) * are studied in young adult mice RF/UP and (101 x C3H) FI/Cum. LD₅₀ at 30 days is given for these w o n ; and * e main sites of action given. The effects; o f . * < « J » - Projective agent. 5-(2-amino-ethyl) isothiouronium-Br-HBr[AET] was found to vary when given before drug or X-ray challenge and to potentiate the effect ^ g j ^

6356. NEUROPATHY FOLLOWING EXPOSURE TO ADIMETHYLAMINE SALT OF(2,4-DICHLOROPHOXY)-ACETIC ACID. M.C.Berkley and K.R.Magee: Arch. intern. Med., 1963, 111, 351-352 (Univ. Michigan Med. Center. Univ. Hosp., Dept. Neurol., Ann Arbor, Mich.) t to be attri- D dimethyl- E.E.Hobbiger

amine, is described.

6357. TCOCICRETmOPATHYFOLLOW^G PROLONGED TREATMENT WITH d1-CB-TR ^ ^ METHYL-PHENYL ISOPROPYLAMINE HTOKKHWRJDE (P-1727) IN EXPERIMENTAL ANIMALS. C i ^ r ? a h " £ \ * \ A * j O'Connor, R.A.Yearly and T.Kuwabara: *Toxicol. appl. Pharm.*, 1963, 5, 298-305 (Dept. Pharmacol., Med. Res. Labs Chas Pfizer and Co. Inc., Groton, Conn.) amphetamine and a degeneration of

visual receptors and a pigmentary proliferation in the posterior compartment of the dog's eye on prolonged oral treatment. It is thought that these changes are the consequence of vasoconstriction in retinal and choroidal blood vessels. E.E.Hobbiger

6358. ALTERED FUNCTION IN A10MAL.SINHAL.mG CONJUGATED NIT! Ulrich and J.K.Leng 5. 319 Poli J.S.Dept. Health, O Toluene Animals exposed to concn. of nitro-olefin ^ chlomow & required to produce deaf or gross symptoms of disease show an increase of total

pulmonary flow resistance, which is reversed by atropine, and tidal volumes, and a decrease of respiratory rate and voluntary activity. The data give information on the structure-activity relationship amongst nitro-olefins.

E.E.Hobbiger

6359. CHLORINATED INSECTICIDE CONTENT OF HUMAN FAT IN SOUTHERN ENGLAND. CG.Hunter, J.Robinson and A.Richardson: *Brit. med. J.*, 1963, i, 221*224 (Shell Res. Ltd., Tunstall Lab., Sittingbourne, Kent, England) Analysis of body fat obtained from 131 consecutive necropsies in S. England showed the presence of DDT deriv. equiv. to 2 • 21 p.p.m. of DDT and of HEOD (1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a, 5,6,7,8,8a-octahydro-exo-1, 4-endo-5,8-dimethanophthalene) equiv. to 0*21 p.p.m. Amount of insecticidal material present compares favourably with that found in W.Germany and more than favourably with that in U.S.A. There are indications that equilibrium levels have been reached, reflecting current exposures.

M.E.Nutt

6360. CORRELATION BETWEEN LIPID CONTENT AND PERCENT MORTALITY OF ALFALFA WEEVIL TO HEPTACHLOR AND MALATHION. S.E.Bennett and C.A.Thomas jun.: *J. econ. Entomol.*, 1963, 56, 239-240 (Dept. Entom., Agric. Exp. Stn., Univ. Tennessee, Tenn., U.S.A.) From 1-7 days old mortality was fairly const, with slight fat increase. Heptachlor and malathion caused less mortality as fat increased from, 10-35 days. The greatest change occurred from 7-14 days:- 9*4-31*4% fat (dry wt.) and 95-30% mortality with heptachlor and 95-75% with malathion, % moisture also decreased. H. W. Spencer

6361. ABSORPTION IN THE LUNG OF DIELDRIN IN THE PRESENCE OF STEAM AND AIR. K.J.Freundt and M.Kiese: *Arch. Toxicol.*, 1962, 19, 313-320 (Pharm. Inst. Univ., Munich, Germany) Rats were made to inhale moist air containing 300, 150 and 75 µg. of dieldrin/1. At least 50% of animals died after 12, 20 and 40 hr. treatment respectively. Their behaviour before death was similar to that shown by rats inj. with a soln. of dieldrin. Precautions are necessary for humans working in a moist atm. containing dieldrin.

(German) LCornish

6362. FATAL ACUTE DIELDRIN POISONING. O.Pribilla: *Arch. Toxicol.*, 1963, 20, 61-71 (Inst. Med. Univ., 23 Kiel, Germany) These are extremely rare. Two cases were thoroughly investigated. After description of the medical symptoms, a new method is outlined for the extraction of dieldrin from human organs. The possible mode of action of the poison on the liver is discussed.

(German) LCornish

6363. COMBINED USE OF RODENTICIDAL DUST AND POISON SOLUTION AGAINST HOUSE-MICE (MUS MUSCULUS L.) INFESTING A FOOD STORE. F.P.Rowe and A.H.J.Chudley: *J. Hyg. Lond.*, 1963, 61, 169-174 (M.A.F.F. Infestation Control Lab., Tolworth, Surrey, England) Boxes containing 1% warfarin dust surrounding a soln. of 0*005% warfarin with 5% sugar were placed in a mouse-infested food store. The mouse population, as determined by test-bating, was reduced by 95% after 5 weeks, and by almost 100% after 20 weeks.

J.B.Derbyshire

6364. TOXICOLOGY OF TOLUENE DHSOCYANATE. D.Henschler, W.Assmann and K.O.Meyer: *Arch. Toxicol.*, 1962, 19, 364-387 (Insi. Pharm. Toxicol., Univ., 87 WUrzburg, Germany) The effect of 2,4- and 2,6-toluene diisocyanate [important industrial chemicals] on rats and guinea-pigs was investigated.

PHARMACOLOGY

The mortality rate caused by damage to the respiratory track and lungs is described in detail. Tests were also carried out on human volunteers and the visible signs of poisoning are given. It is concluded that the max. per*missible concn. in an enclosed space is 0*02 p.p.m.

(German) I.Cornish

6365. PERMANENT INJURY AFTER TRI- α -CRESOLPHOSPHATE [TOCP] POISONING. W.Neugebauen: Arch. Toxicol., 1962, 19, 278-283 (Münster i. Westf., Engelstr. 23, Germany) The shortage of edible vegetable oils during the war led to widespread usage of mineral oils containing TOCP. Two cases have been investigated for a period of 15 yr. First symptoms appeared within a week (pain in the abdomen) followed by apparent recovery but nervous disorders and crippling of the limbs finally led to complete incapacitation. No cure is mentioned.

(German) I.Cornish

6366. TOXICITY OF SOME n-ALKYL BROMIDES TO LARVAE OF THE CITRUS NEMATODE. W.Moje: Nature, Lond., 1963, 198, 608-609 (Dept. Plant Pathol., Univ. California, Riverside, Calif., U.S.A.) The toxicity of a series of n-alkyl bromides from n-butyl to n-undecyl was tested against larvae of the citrus nematode. The nematocidal activity was related not only to their bimolecular nucleophilic substitution reactivity, ease of hydrolysis and toxicity of the resulting alcohols, but also to their lipid solubility. G.M.Lewis

6367. PRELIMINARY STUDIES ON THE USE OF SORPATIVE DUSTS FOR THE CONTROL OF THE HUMAN LICE, PHTHIRUS PUBIS (L) AND PREDICULUS HUMANUS CAFITIS DE GEER. LB.Tarshis and R.Blinstrup: Amer. J. trop. Med. Hyg., 1963, 12, 91-95 (Dept. Entomol., Univ. California, Los Angeles, Calif., U.S.A.) An account is given of the use of Dri-Die 67, 2% Dibrom-Dri-Die 67 and 0*05% Pyrethrum-Dri-Die 67 for the control of pubic and head lice. 27 ref. A.A.Zimmerman

6368. PRELIMINARY LABORATORY AND FIELD STUDIES ON THE UTILISATION OF DRI-DIE 67 AND TWO PERCENT DIBROM-DRI-DIE 67 FOR THE CONTROL OF THE WESTERN CONE-NOSED BUG, TRIATOMA PROTRACTA (UHLER). LB.Tarshis: Amer. J. trop. Med. Hyg., 1963, 12, 96-102 (Dept. Entomol., Univ. California, Los Angeles, Calif., U.S.A.) Expt. show that unfed and engorged triatomids are knocked down faster in 2% Dibrom-Dri-Die 67 than in the Dri-Die 67. A combination of both can control infestation and in no way affect humans. A.A.Zimmerman

6369. METHODS OF ALTERING NITROGEN MUSTARD TOXICITY IN DOG. I. SPLEEN AND MESENTERIC ARTERY EXCLUSION. N.Lempert, R.P.Leather and W.B.Scharfman: Blood, 1963, 21, 213-220 (Surg.

Dept., Albany Med. Coll., Albany, N.Y.y U.S.A.) Cross-damping of the splenic vessels prior to injn. of nitrogen mustard into dogs did not improve the mortality rate of these animals. However exclusion of the spleen and small intestine was found to be practical in protecting these organs from the effect of the drug.

H.B.Waynfirth

6370. ACUTE INTRAVENOUS AND INTRAPERITONEAL TOXICITY STUDIES ON SODIUM PENTABORATE DECAHYDRATE AND SODIUM TETRABORATE DECAHYDRATE. O.D.Easterday and H.Hamel: Arch. int. Pharmacodyn., 1963, 143, 144-164 (Med. Res. Center, Brookhaven Nat. Lab., Upton, Long Island, N.Y., U.S.A.) The toxic actions of Na pentaborate (and tetraborate) decahydrate are studied in mice. Simult* administration of D-glucose reduces the lethal effects to both components. Detailed borate/glucose ratios, LD50 and relative potencies are given. S.E. Smith

6371. VOMITING, HYPOTHERMIA, AND RESPIRATORY PARALYSIS DUE TO TETRODOTOXIN (PUFFER FISH POISON) IN THE CAT. H.L.Borison, L.E.McCarthy, W.G.Clark and N.Radhakrishnan: Toxicol. appl. Pharm., 1963, 5, 350-357 (Dept. Pharmacol., Univ. Utah Coll. Med., Salt Lake City, Utah, U.S.A.) Tetrodotoxin, i.v., produces in cats a vomiting response which is abolished by ablation of the medullary emetic chemo-receptor trigger zone. Intraventricular injn. of doses much smaller than those required by the i.v. route followed by volitional paralysis, hypothermia and respiratory failure, while reflexes are unaffected. These effects are attributed to an action on paraventricular structures in the brain stem. E.E.Hobbiger

6372. BOTULINUS TOXIN: EFFECT ON THE C.N.S. OF MAN. H.R.Tylen: Science, 1963, 139, 847-848 (P.B.Brigham Hosp., Boston, Mass., U.S.A.)

Electrical stimm. of multiple peripheral nerves elicited H reflexes in a 61 yr. old patient with botulism. Such reflexes were suggestive of some central release or failure of inhibitory control of a monosynaptic or polysynaptic spinal reflex arc. Botulinus toxin may resemble toxin in inhibiting interneurons at the spinal level. G.M.Lewis

6373. ON VENOM OF LESSER WEEVERFISH, TRACHINUS VIPERA. D.B.Carlisle: J. mar. biol. Ass. U.K., 1962, 42, 155-162 (Anti-locust Res. Cent., 1 Princes Gate, London, England) The weever probably injects 0*5-0*2 mg. dry wt. of venom when it stings. 60% of the venom dry wt. consists of toxic muco-substances (two albumins and an amino-polysaccharide), having a neuro-toxic effect. 1-20 pg./mg. dry wt. of the venom consists of SHT which probably causes the pain of the weever sting. P. J. Baron

GENERAL AND METHODS

6374. THEORETICAL CRITERIA FOR USE OF RELATIVE ORGAN WEIGHTS AND SIMILAR RATIOS IN BIOLOGY.

L.Angervall and E.Carlström: *J. theor. Bid.*, 1963, 4, 254-259 (Dept. Pathol., Univ., Gothenburg, Sweden)

Prerequisites for the legitimate use of the organ wt./body wt. type of ratio in the analysis of biological data are outlined. The errors which may occur through the indiscriminate use of these ratios are discussed and Principles stated for the analysis of differences between organ wt. dependent on body wt.

G.F.Biane

6375. NEW AUTOMATIC DISPOSABLE SYSTEM FOR BLOOD COUNTS AND HAEMOGLOBIN.

M.H.Freundlich and H.W.Gerarde: *Blood*, 1963, 21, 241-242 (Bureau Biol. Res., Rutgers, State Univ., New Brunswick, N.J., U.S.A.)

which uses a self-contained and a pre-filled disposable plastic diln. container. W.b.c., r.b.c., hb and platelet counts can be done on 0.013 ml. blood sample. Correlation with standard techniques was good except for 1

6376. TECRQUE FOR SAMPLING BONE MARROW FROM LIVING MOUSE.

H.I.Pilgurte: *Blood*, 1963, 21, 241-242 (Anat-Dept., Buffalo "iv. Med. Sch., Buffalo, N.Y., U.S.A.)

BODY TEMPERATURE

6383. CALORIGENIC RESPONSE OF COLD-ADAPTED RABBITS TO ADRENALINE AND TO NORADRENALINE.

W.H.Cottle: *Canad. J. Biochem.*, 1963, 41, 1334-1337 (Physiol. Dept., Univ. Alberta, Edmonton, Alta., Canada)

Cold adapted rabbits (-15° to -37°) were compared with control animals (29°-30°) in their reactions to adrenaline and noradrenaline bitartrate soln., made up in 5% glucose, delivered at 5 µg. base/kg, /min. over periods of 5 hr. Cold adapted animals had a higher metabolic rate over the initial hr., a greater response to adrenaline ($P < 0.01$) and noradrenaline infusion ($P = 0.05$) than did control animals, response of the latter to noradrenaline being doubtful. The rectal temp. of all groups rose slightly during tests, and infusion of 5% glucose had no effect in any group.

A.M.Gibbins

6384. THERMOGENIC EFFECTS OF NORADRENALINE IN NEW-BORN AND INFANT KITTENS AND OTHER SMALL MAMMALS. A POSSIBLE HORMONAL MECHANISM IN THE CONTROL OF HEAT PRODUCTION.

R.E.Moore and M.C.Underwood: *J. Physiol.*, Lond., 1963, 168, 290-317 (Dept. Physiol., Royal Free Hosp. Sch. Med., London, England)

O_2 consumption, deep and surface body temp., were measured in kittens. Noradrenaline, but not adrenaline (400 µg./kg. s.c.) was a powerful thermogenic stimulant at 35° environmental temp., but the effect declined with age to zero at 512 g. (or 32 days) by regression calcn., and to approx. equality between the two catecholamines at 26 days of age. The thermogenic response was suppressed progressively by hypo-oxia, the threshold being about 110 mm. Hg pO₂ inspired air, and the suppression being near complete at about 70 mm. Hg pO₂. Noradrenaline, but not adrenaline, was able to reverse metabolic suppression by hexamethonium at 30° environmental temp. Supporting observations on young rabbits and rats are given, and a theory of neonatal control of heat production is postulated.

PHYSIOLOGY

SKIN AND BONE

6385. SKIN-SH LEVELS OF MICE. J.A.DiPaolo: Nature, Lond., 1963, 198, 1007-1008 (Roswell Park Mem. Inst., New York Dept. Hlth., Buffalo, N.Y., U.S.A.) Variations in skin sol. -SH levels were observed between different strains of mice, different age groups and at different stages of hair growth. Females showed a higher mean -SH content than males. G.M.Lewis

6386. QUANTITATIVE AND QUALITATIVE CHANGES IN HUMAN EPITHELIUM DURING SENESCENCE. I. NIPPLE EPIDERMIS. A.Meriggi and T.Zavarella: Atti. Acad. Med. Lombarda, 1962, 17, 469-475 (Div. Anat.-Patol., 1st. Nazionale dei Tumori, Milan, Italy) The nipple epidermis was studied in 80 women aged 24-40 yr. and in 80 women aged 65-82 yr. old. With increased age, senility caused a significant reduction in epidermal thickness and in the no. of cell layers. (Italian) G.N.Godson

6387. EFFECT OF Ca AND ANTIDIURETIC HORMONE ON Na TRANSPORT ACROSS FROG SKIN. I. EXAMINATION OF INTERRELATIONSHIPS BETWEEN Ca AND HORMONE. II. SITES AND MECHANISMS OF ACTION. P.F.Curran, F.C. Herrera and W.J.Flanigan: J. gen. Physiol., 1963, 46, 999-1010, 1011-1027 (Inst. Venezolano de Invest. Cient., Caracas, Venezuela) I. Ca added to the soln. bathing the outside of isolated skin reduced net Na transport across the skin while ADH caused an increase. Ck and ADH did not compete but acted independently at 2 different sites located on the same barrier to Na movement in the skin. Ca also reduced Cl⁻ influx across the short-circuited skin while ADH had no effect on Cl^{*} movement.

n. The primary effect of both agents was on the Na permeability of the outward facing membrane of the frog skin cells, as shown by the determination of unidirectional Na fluxes across die 2 faces of the transporting cells. Neither agent appeared to have a direct effect on the active transport system itself. Na permeability of the outer membrane played an important role in controlling the rate of net active Na transport across the skin. K.Jones

6388. EFFECTS OF TEMPERATURE AND METABOLIC INHIBITORS ON THE ACTIVE Na TRANSPORT IN FROG SKIN. T.Takenaka: Jap. J. Physiol., 1963, 13, 208-218 (Dept. Physiol., Tokyo Med. and Dental Univ., Yushima, Bunkyo-ku, Tokyo, Japan) Na transport in frog skin through the low temp. region by measuring the short-circuit current has been studied. Using the double Na labelling method and metabolic inhibitors it is found that between 6° and 20° the short-circuit current is almost equal to the net Na transport at each temp. The temp. coeff. of the short-circuit current changes at approx. 14°. At least 2 mechanisms are concerned with the Na-active transport in frog skin. M.J.Bell

6389. NAIL-GROWTH. W.B.Bean: Arch. intern. Med., 1963, 111, 476-482 (Dept. Med., Coll. Med., State Univ. Iowa, Iowa City, U.S.A.) Measurements of nail growth in a human subject were carried out over a 10 yr. period, covering the ages of 32 to 42.

E.E.Hobbiger

MUSCLE

6390. BIREFRINGENCE OF ISOLATED MUSCLE FIBRES IN TWITCH AND TETANUS. A.Eb^rstein and A.Rosen-falk: Acta physiol. scand., 1963, '57, 144-166 (Neurophysiol. Inst., Univ., Copenhagen, Denmark) During a twitch in single frog muscle fibres birefringence decreased before tension was developed and reached a min. before tension reached a max. Doublerpeak changes in phase difference were not normally observed. The decrease in birefringence was the same in twitch and tetanus. Reasons for this decrease are suggested.

H.B.Waynforth

6391. TOTAL ENERGY PRODUCTION AND PHOSPHOCREATINE HYDROLYSIS IN ISOTONIC TWITCH. F.D.Carlson, DJ.Hardy and D.R.Wilkie: J. gen. Physiol., 1963, 46, 851-882 (Dept. Biophys*, Johns Hopkins Univ., Baltimore, Md., U.S.A.) Studies on the frog's sartorius muscles showed that shortening heat came from some other chem. reaction than phosphocreatine (PC) hydrolysis, or else Hill's equation ($E = A + W + ax$) failed to describe correctly the energy output in a complete cycle of contraction and relaxation. To decide between these possibilities direct measurements of heat and work during a complete cycle were made, and PC breakdown was measured on the same muscles. PC hydrolysis and its associated buffer reactions can account for the total energy output of isometric and isotonic twitches. K.Jones

6392. NATURE OF MUSCLE-RELAXING FACTOR.

I. IMPROVED ASSAY SYSTEM. F.N.Briggs and F.Fucfon. SOME PHYSICOCHEMICAL PROPERTIES.

F.Fuchs and F.N.Briggs: J. gen. Physiol., 1963, 46, 883-891, 893-904 (Dept. Physiol., Univ. Sch. Med., Pittsburgh! Pa., U.S.A.) I. It was possible to inactivate intrinsic granule relaxing factor, as shown by the analysis of die effects of deoxycholate [CD] and benzalkonium chloride [B-Cl] on granule relaxing activity, myofibril and glycerinated fibre responses to ATP, and the sensitivity of these actomyosin-containing systems to relaxing factors. The intrinsic relaxing factor was destroyed by treating actomyosin with 1mM DC or 0.005% B-Cl for 5 min. at room temp.

II. A sol. muscle-relaxing factor [MRF] was found in the homogenates of rabbit skeletal muscle. The relaxing activity was not due to the presence of contaminants, and could be removed or destroyed by charcoal, dialysis, prolonged heating and treatment with the chelating resin, chelex-100. MRF appeared to be similar or the same as die factor formed by the incubation of muscle granule fractions and ATP. The mol. wt. of the active agent was < 4000, as studied by gel filtration. K.Jones

6393. SPECTROPHOTOMETRIC STUDIES ON INTACT MUSCLE. I. COMPONENTS OF RESPIRATORY CHAIN. H. RECOVERY FROM CONTRACTILE ACTIVITY.

F.FJBbsis: J. gen. Physiol., 1963, 46, 905-928, 929-969 (E.R.Johnson Found. Med. Phys., Univ. Pennsylvania Sch. Med., Philadelphia, Pa., U.S.A.)

I. The relative concn. of the respiratory components in various intact skeletal muscles were in agreement with those of mitochondrial prep. of mammalian tissues and of the ones from toad skeletal muscle. The cytochrome b and pyridine nucleotide levels were rather low in the ~ anoxic minus oxygenated difference spectra, their low levels being caused to a certain degree by a partial reduction during the resting steady state.

PHYSIOLOGY

617

H. The effects of various factors on the levels of NAD, cytochrome b, cytochrome f and flavoprotein in intact muscles were studied. Although even limited activity (< 5 twitches) initiated glycolysis as shown by the intracellular pH, the primary control of respiration resided in the ADP concn. rather than in the levels of substrate or inorg. PO₄. ATP appears to be the primary energy donor for muscular contraction.

K.Jones

6394. GLUTAMATE-INDUCED DEPOLARISATION IN CRUSTACEAN MUSCLE. A.Takeuchi and N.Takemoto: Nature, Lond., 1963, 198, 490-491 (Dept. Physiol. Sch. Med., Juntendo Univ., Hongo, Tokyo, Japan) Depolarisation of the membrane of the abductor muscle of the dactyl in the 1st walking leg of the crayfish (*Cerberus*) was produced by electrophoretic application of glutamate to the neuromuscular junction, the glutamate-sensitivite is placed on the outer surface of the membrane.

G.M.Lewis

6395. INFLUENCE OF CALCIUM IONS ON POTASSIUM CONTRACTURE IN AN INSECT LEG MUSCLE. D.J.Aidley: Nature, Lond., 1963, 198, 591-592 (Dept. Zool., Univ., Cambridge, England) Expt. on the mesothoracic extensor tibiae muscle of *Schistocerca gregaria*, showed that the contracture produced by K did not occur in the absence of Ca, Mg, Ba and Mn⁺ - could not substitute for Ca. while Sr, Co and Ni produced small contractures.

C.M.Lewis

6396. CHANGES IN IONIC COMPOSITION AND RESTING AND ACTION POTENTIALS IN FROG SARTORIUS MUSCLE FIBRES MAINTAINED IN VITRO. M.H.Draper, H.Friebel and K.Karzel: J. Physiol., Lond., 1963, 168, 1-21 (Dept. Physiol., Univ., Edinburgh, Scotland) The mean resting potential (RP) of sartorius muscle fibres maintained in frequent intervals was consistently 92 mV at 16°C. L.J.E.M. of less than 0.5 mV. No significant fall in mean RP was observed during periods of up to 8 hr. If careful attention was paid to technique. During tow

the mean membrane potential and water and the mean size of the excitatory junctional potentials of up to 80% and (V) a marked decrease in the effect of applied current indicating increase in membrane conductance.

G.M.Lewis

6398. DISSOCIATION OF CONTRACTION AND STIMULATION OF LACTIC ACID ON SMOOTH MUSCLE UNDER ANAEROBIC CONDITIONS. L.Lundholm and E.Mohme: Lundholm: Acta physiol. scand., 1963, 57, 125-129 (Pharmacol. Dept., Univ., Goteborg, Sweden) In the presence of glucose, the contractile effect of lactic acid production. K stim. the contractile process while it decreased the lactic acid production. K+ had a

more pronounced effect on substrate-depleted arterial muscle than did adrenaline, histamine or Ba.

H.B.Waynfirth

6399. CONTRACTION AND GLYCOGENOLYSIS OF SMOOTH MUSCLE. L.Lundholm and E.Mohme: Lundholm: Acta physiol. scand., 1963, 57, 125-129 (Pharmacol. Dept., Univ., Goteborg, Sweden)

Glycogenolysis in bovine tracheal muscle and mesenteric artery and in rabbit gut was augmented under aerobic conditions of electrical stimm. Carbacholine enhanced glycogen breakdown in tracheal muscle. In anaerobic conditions glycogenolysis did not follow contraction which illustrates a difference between smooth and striped muscle.

H.B.Waynfirth

6400. IS FUNDAMENTAL ELECTRICAL RESPONSE OF SINGLE HEART MUSCLE CELL A SPIKE POTENTIAL?

L.Churney and H.Ohshima: J. gen. Physiol., 1962, 46, 1029-1046 (Dept. Physiol., Louisiana State Univ. Sch. Med., New Orleans, La., U.S.A.) Spike potentials, not plateau forms, were recorded from bundles of

5 to 10 heart fibres of *Amphiuma* and *Necturus*. These spikes failed to overshoot. The plateau form, and this only, was recorded from large tissue masses. Bundles of intermediate size showed an intermingling of spikes and plateau-shaped action potentials. Configuration of the recorded action potential curve is contingent upon the mass and geometry of the tissue impaled by the micro-electrode.

K.Jones

BLOOD

6401. RHEOLOGY OF HUMAN BLOOD, NEAR AND AT ZERO FLOW, EFFECTS OF TEMPERATURE AND HAEMATOCRIT LEVEL. E.W.Merrill, E.R.Gilliland, G.Cokelet, H.Shin, A.Britten and R.E.Wells, jun.: Biophys. J., 1963, 3, 199 (Dept. Chem. Eng., Massachusetts Inst. Technol., Boston, Mass., U.S.A.)

Static normal human blood possesses a distinctive yield stress. When the yield stress is exceeded the same blood has a stress-shear-rate function under creeping flow conditions closely following Casson's model, which implies reversible aggregation of r.b.c. in rouleaux and flow dominated by movement of rouleaux. The yield stress is essentially independent of temp, and its cube root varies linearly with haematocrit value. The dynamic rheological prop. in the creeping flow range are such that the relative viscosity of blood to water is almost independent of temp. Questions raised by these data are discussed, including r.b.c. aggregation promoted by elements in the plasma.

6402. BLOOD VOLUME FOLLOWING HYPOPHYSECTOMY IN MAN. T.Falkheden, B.Sjogren and H.Westling: Acta endocr. Kbh., 1963, 42, 552-563 (Med. Clin., Sahlgrenska Sjukhuset, Goteborg, Sweden) Using 51Cr labelled r.b.c. it was shown that hypophysectomy produced a decrease in r.b.c. vol., total blood vol. and total Hb.

H.B.Waynfirth

6403. PLASMA AND BLOOD VOLUME OF RABBITS.

E.Regoezzi: Z. Ges. exp. Med., 1963, 136, 606-618 (Innere Abt., St3dt. Wenckebach Krkh., Berlin-Tempelhof, Germany) The plasma vol. was

PHYSIOLOGY

determined in 28 healthy rabbits with the Evans Blue method and normal values were established. [51cr]r.b.c. were used for determining the plasma vol. in 6 rabbits, and the results were in agreement with the Evans-Blue method. False low values for plasma vol.* were obtained when blood was withdrawn from constricted veins of chilled ears. (German) P.F.Meyer

6404. BLOOD LOSS IN BURNS. E.Topley and J.Frost: J. Path. Bact., 1963, 85, 103-111 (M.R.C. Industr. Injuries and Burns Res. Unit, Accident Hosp., Birmingham, England) Blood outside the active circulation in normal and burned skin of d* albino rats is estimated by measuring the 59Fe content at various periods from 2 hr. to 10 days after i.v. injn. of 59pe-labelled r.b.c. and measuring the blood in active circulation with 51cr-labelled r.b.c. R.b.c. accumulate outside active circulation in burned skin to a marked degree, especially within the first 24 hr. Histol. study of burned skin confirms this. The timing is similar to the average timing of r.b.c. loss from general circulation in selected patients with burns. D.Murray

6405. ANALYSIS OF ERYTHROCYTE MEAN VALUES. K.G.v.Borviczeny. Blut, 1963, 9, 85-95 (Med. Clin., Univ. Freiburg/Br., Germany) A nomogram combining various measurements to give characteristic curves for erythropathies is described.

(German) A. J. Wansbrough

6406. EFFECT OF THYROID HORMONES ON GLUCOSE UPTAKE AND RESPIRATION OF AVIAN RED CELLS IN VITRO. W.Winkelmann: Z. Ges. exp. Med., 1963, 136, 556-562 (Pharmacol. Inst., Justus-Liebig Univ., Giessen, Germany) Chicken r.b.c. were suspended in Krebs-Ringer-NaHCO₃ soln. wMi added glucose or 2-deoxyglucose and incubated. Hexose uptake was calc. by the fall in hexose concn. in the medium. Under aerobic conditions, glucose uptake was greater than uptake of 2-deoxyglucose. Uptake of glucose, but not of 2-deoxyglucose, was doubled in medium containing 1-thyroxine, dl-thyroxine and dl-triiodotyrorine (10-6-10-8 mg./l.). Under anaerobic conditions, there was no uptake of either hexose, and addition of thyroid hormones was ineffective. Both thyroxine and 2,4-DMP increased respiration. (German) P.F.Meyer

6407. FOETAL ERYTHROCYTES IN MATERNAL CIRCULATION. E.S.Brown Brit. med. J., 1963, i, 1000-1001 (N. of Scotland Blood Transfusion Service, Inverness, Scotland) Foetal cells were found in 50% of samples of venous blood obtained within 24 hr. of delivery from 165 women who had normal pregnancy and delivery. Cause of the transplacental leakage is unknown. It is pos. correlated with large placentae and is found less frequently in cases of ABO incompatibility than when ABO groups are compatible. It is not influenced by parity, duration of labour, condition and method of expulsion of placenta or state of the infant at birth. M.E.Nutt

6408. DIABETES MELLITUS AND PERNICIOUS ANAEMIA. G.Arapakis, O.A.A.Bock, D.L.Williams and L.J.Witts: Brit. med. J., 1963, i, 159-161 (Radcliffe Infirmary, Oxford, England) Observations on 100 diabetics suggest that there may be a genuine association between diabetes mellitus and pernicious anaemia. M.E.Nutt

6409. EFFECT OF NORMAL CELLS ON VISCOSITY OF SICKLE-CELL BLOOD. H.Chaplin, jun., R.Anderson,

M.Cassell and G.L.Mullinax: Arch. intern. Med., 1963, 111, 286-294 (Dept. of Preventive Med., Washington Univ. Sch. Med., St. Louis, Mo., U.S.A.) The addition of normal r.b.c. (final concn. 30%) to r.b.c. obtained from a patient with sickle cell anaemia (final concn. 70%) in vitro decreases the abs. no. of sickled cells and thus reduces viscosity, but has no effect on % of patient's cells that will sickle under given conditions of pH and O₂ reduction. The beneficial effect of a partial exchange of sickle cells by normal cells in vivo is reported. E.E.Hobbiger

6410. SICKLE CELL-HAEMOGLOBIN C DISEASE QUANTITATIVE DETERMINATION OF IRON KINETICS AND HAEMOGLOBIN SYNTHESIS. E.R.Movitt, J.F. Mangum and W.R.Porten Blood, 1963, 21, 535-545 (Radioisotope Lab., V.A. Hosp., Oakland, Calif., U.S.A.) Ferrokinetic determinations in patients with sickle cell-HbC disease indicated a haemolytic process in all cases. The mean r.b.c. life span was very short. Hb synthesis was increased five-fold over the normal. In some patients there was much sequestration of r.b.c. in the spleen. H.B.Waynfor*

6411. EFFECT OF AGE OF HUMAN DONOR ON NUMBER & OF HEINZ BODIES PRESENT IN RED BLOOD CELLS AFTER INCUBATION IN VITRO WITH ACETYL-PHENYL HYDRAZINE. F.Quertodi Palo and M.Ciccona^{II} Atti. Acad. med. Lombarda, 1962, 17, 389-391 (Ist. di Patal. Med., Univ., Milano, Italy) The no. of Heinz bodies present in r.b.c. was determined by incubating a blood sample in acetylphenylhydrazine and then staining with Methyl Violet and counting under a microscope. Using 2 groups of human subjects, one < 30 yr. old and one > 70 yr. old, there was a slight increase in the no. of r.b.c. containing 2 or more Heinz bodies, with age. (Italian) G.N.Godson

6412. HAEMOLYSIS AND ERYTHROPOEISIS. I. INFLUENCE OF INTRAPERITONEAL ADMINISTRATION OF WHOLE HAEMOLYSATES ON RECOVERY OF BLED DOGS AS MEASURED BY CHANGES IN TOTAL ERYTHROCYTE VOLUME. L.Sanchez-Medal, J.Labardini and A.Loria: Blood, 1963, 21, 586-593 (Haematol. Dept., Hosp. de Enfermedades de la Nutricion, Mexico, D.F., Mexico) Anaemia was produced in dogs, by bleeding and the r.b.c. production was subsequently measured by 51cr determinations of circulating r.b.c. vol. Treatment of the anaemic dogs consisted of i.p. injn. of haemolysed r.b.c., control animals were given saline. An enhancing effect on the recovery of the dogs from anaemia was observed. H.B.Waynfor*

6413. INFLUENCE OF CHRONIC HYPO-OXIA EQUIVALENT TO 1000-8000 M. ALTITUDE ON ERYTHROPOEISIS IN THE RAT. B.TribukaiG Acta physiol. scand., 1963, 57, 1-25 (Physio*. Dept., Karolinska Sjukhuset, Stockholm, Sweden) The total Hb of rats held under hypoxia equiv. to 1000-8000 m. altitude showed an increase from the lowest to the highest altitude. The limit of survival was reached at 8000 m. after 40 days of hypoxia new levels of total Hb were reached at 6000 m. Haematocrit values are quoted. Blood vol. increased by 60% at 6000 m. but plasma vol. decreased. H.B.Waynfor*

6414. EFFECTS OF THYROID HORMONE, CORTISONE AND ANDROGENS ON BLOOD RETICULOCYTOSIS AND INCORPORATION OF 59pe BY ERYTHROCYTES AND CERTAIN ORGANS IN PROTEIN DEFICIENT RATS.

PHYSIOLOGY

619

- A.Aschkenas C.R. See. Biol., Paris, 1963, 157, 91-95 (H8p. de la Ktis, Paris, France) A study of blood reticulocytosis and incorporation of ^{59}Fe into r.b.c. showed that the inhibit, of erythropoiesis observed in rats during protein deficiency could be partially prevented by cortisone and thyroxine and to a lesser extent by testosterone and 17-ethyl-19-nortestosterone. The hormones increased ^{59}Fe fixation by the bone marrow but cortisone also reduced the retention of ^{59}Fe by the liver.

⁶6421. PHAGOCYTIC ACTIVITY OF W.B.C FROM BLOODS AND FROM DIFFERENT SPECIES OF Eukaryotes. E.Kapitska.
 ^SaSahSSt^A Polska Atad. Nauk Wroclaw, Poland) Differences in phagocytic activity of anulocytes in man and various animal spp. were observed J en SS at the homologous and heterologous sera. The neutrophilic granulocytes showed much higher phagocytic

activity than eosinophilic granulocytes from the same sp. The phagocytic indices of guinea-pig neutrophilic and eosinophilic granulocytes in heterologous sera were low or equal to zero.
 H.Osowiecki

6422. FLOCCULATION OF SHEEP LEUCOCYTES. I. ELECTROPHORETIC STUDIES. D.J.Wilkins and R.H.Ottewill. H. STABILITY STUDIES. D.J.Wilkins, R.H.Ottewill and A.D.Bangham: J. theor. Biol., 1962, 2_f, 165-175, 176-191 (Colloid Sci. Dept., Univ., Cambridge, England) I. Electrophoretic properties of polymorphonuclear leucocytes are investigated as a function of pH and ionic strength. The influence of certain cations on the electrophoretic mobility of the cells was examined. Sp. binding of these ions occurred and the free energies of adsorption evaluated. Adsorption of bovine serum albumin by the cells was measured. The effect of metal ions on these cells was investigated.

II. Combination of stability data with electrophoretic data enables curves of stability ratio against zeta potential to be constructed, and the effective London - van der Waals const. of attraction to be calc. J.A.Dawson

6423. LEUCAPHAERESIS IN MAN. IE. HAEMATOLOGICAL OBSERVATIONS IN PATIENTS WITH LEUKAEMIA AND MYELOID METAPLASIA. H.R.Bierman, G.J. Marshall, K.H.Kelly and R.L.Byrnes: Blood, 1963, 21, 164-182 (Cancer and Blood Res. Inst., Beverly Hills, Los Angeles, Calif., U.S.A.) Patients with leukaemia or myeloid metaplasia were subjected to leucaphaeresis after which a continued decline of peripheral w.b.c. concn. was observed. Pretreatment levels were reached however with in 1 hr. to 22 days after treatment. No changes in marrow population were observed. Evidence showed a lack of replenishment of w.b.c. after leucaphaeresis indicating a block in the transfer of w.b.c. from the tissues of the blood. The platelet count dropped during the treatment returning to normal within 7 hr. to 9 days.
 H.B.Waynforth

6424. ACUTE PROMYELOCYTIC LEUKAEMIA ASSOCIATED WITH HYPOFIBRINOGENAEMIA. R.L.Rosen-thai: Blood, 1963, 21, 495-508 (Haematol. Dept., Hosp. Joint Dis., New York, U.S.A.) The distinctive features of this condition are the presence of abnormal promyelocytic cells in the bone marrow and an unexplained hypofibrinogenaemia. No fibrinolysin could be found. The response to therapy is poor. H.B.Waynforth

6425. NON-SPECIFIC ESTERASE ACTIVITY OF THE MONOCYTE: A FURTHER CONTRIBUTION TO THE MYELOID ORIGIN OF MONOCYTES. D.Bakalos and P.Petropoulos: Blut, 1963, 9, 7-20 (Evangelismos Hosp., Athens, Greece) Monocytes could be distinguished from other leucocytes in peripheral blood by their characteristic non-sp. esterase activity studied with a simplified method. Promyelocytes in haemopoietic tissue were the only precursor cells with corresponding activity, and are considered to be the monocyte precursors.
 AJ.Wansbrough

6426. BRADYKININ AND EOSINOPHILS. R.K.Archer and J.Broome: Nature, Lond., 1963, 198, 893-894 (Equine Res. Sta., Animal Hlth. Trust, Newmarket, Suffolk, England) Oedema produced in horse skin by bradykinin was markedly reduced by superinjn. of an aq. extract of horse eosinophils. Extracts from horse neutrophils and lymphocytes had no effect. Bradykinin produced leucocytosis of subcuticular tissue but never eosinophilia.

PHYSIOLOGY

The role of the eosinophil in the control of local inflammatory response is discussed. G.M.Lewis

6427. MECHANISM OF ACUTE EOSINOPHILIA. J.Bir& Acta physiol. Acad. Sci. hung., 1963, 23, 105-114 (Dept. Urol., Med. Univ., Budapest, Hungary)

In rats, stimuli causing acute eosinophilia raise the no. of eosinophils very considerably if the latter is originally low while the eosinophilia becomes less marked the higher the initial prestimulus eosinophil count and with high initial counts there may even be eosinopenia. Changes in eosinophil counts in response to stimuli are variable and in particular depend on initial levels. The eosinophil changes seem to be due to (a) a direct increase in eosinophils and (b) an inhibn. of eosinopenia the relation between the two actions not being understood.

H.G.Bevan

6428. FURTHER OBSERVATIONS ON PLATELET AGGREGATION INDUCED BY ADP, THROMBIN AND TRIETHYL TIN. J.R.O'Brien: J. clin. Path., 1963, 16, 223-226 (Pathol. Service, Portsmouth, England)

ADP-induced platelet aggregation in human citrated, platelet-rich plasma was inhib. by adenosine, AMP and ATP. Thrombin-induced aggregation was inhibited by adenosine or AMP, but not ATP. Tri-ethyl tin-induced aggregation was inhib. by 5HT or tryptamine.

J.B.Derbyshire

6429. AGGREGATION OF BLOOD PLATELETS.

G.V.Born and M.J.Cross: J. Physiol., Lond., 1963, 168, 178-195 (Dept. Pharmacol., Royal Coll. Surg., Lincoln's Inn Fields, London, England) A turbidimetric method is described for following quant. the aggregation of blood platelets in vitro. The method depends on the decrease in optical density of stirred plasma which occurs when the platelets in it aggregate. When CaCl₂ was added to platelet-rich plasma there was an immediate small increase in optical density. No such increase was observed when CaCl₂ was added to platelet-free plasma. Platelets in citrated human or pig plasma could be made to aggregate sometimes by adding Ca and always by adding ADP. The initial rate of aggregation by added ADP was linearly related to the log of its concn. Platelets which had aggregated in the presence of low concn. of ADP dispersed again after a few min., ifd when ADP was added repeatedly its effectiveness in causing aggregation decreased. The aggregation of platelets in plasma containing Na EDTA required ADP and Ca or Mg. Adenosine and AMP inhib. aggregation by ADP; adenosine was about 10 times more active than AMP. The inhibitory effect increased the longer the time between their addition to plasma and the subsequent addition of ADP. ATP, deoxyadenosine, and purine riboide also inhib. aggregation but much less than adenosine. Adenine, IMP, inosine, guanosine, cytidine and ribose were ineffective.

6430. THROMBELASTOGRAPHIC STUDIES ON THE CONSERVED BLOOD PLATELETS. Z.J.Jopaciuk, B.Kotelba-Witkowska and A.Majda: Pol. Tyg. Lek., 1962, 17, 1537-1543 (Inst. Haematol., Warszawa, Poland)

Thrombelastographic examination by the Harter method of the conserved blood platelets suspended in the platelet-poor plasma showed the highest biol. value of platelets suspended in citrate media and stored at 4°. Lyophilisation, freezing or suspending in gelatin were less efficient. (Polish) E.G.^bicka

6431. EFFECT OF SMOKING ON BLOOD COAGULABILITY AND PLATELET SURVIVAL IN MAN. J.F.Mustard and E.A.Murphy: Brit. med. J., 1963, i, 846-849 (Dept.

Med., Univ., Toronto, Canada) In 7 white d subjects aged 35-72 yr. platelet survival was significantly shorter, and turnover correspondingly greater, during periods of habitual smoking than when they did not smoke at all. Blood coagulation and blood lipid level* showed only minor associated changes. M.E.Nutt

6432. SEPARATION AND PURIFICATION OF CLOTTING FACTORS FROM INBRED MICE. H.Meier, R.C.Allen and W.G.Hoag: Clin. chim. Acta, 1963, '8, 137-140 (R.B.Jackson Mem. Lab., Bar Harbor, Maine, U.S.A.)

A method involving continuous flow electrophoresis and starch gel electrophoresis is described for an improved purification of clotting factors from mice plasma. Short comm. K.Brew

6433. HAEMORRHAGIC THROMBOCYTHAEMIA.

A.T.Webb, F.L.Meyer and E.R.Lonsen: Arch. intern. Med., 1963, 111, 280-285 (Dept. of Pathol., Univ., Loma Linda, Los Angeles, Calif., U.S.A.) A patient with haemorrhagic thrombocythaemia was treated with busulphan (Myleran). This caused a reduction to normal of the concn. of platelets in plasma and alleviation of the haemorrhagic manifestations. E.E.Hobbiger

6434. PURIFICATION OF FACTOR V. B.BlobmSck and M.BlobmSck: Nature, Lond., 1963, 198, 886-887

(Coagulation Res. Lab., Chem. Dept. n, Kafoliuska Inst., Stockholm, Sweden) Procedures fo; the parti* purification of factor V are described. A significant stabilisation of this labile factor was produced by Mg²⁺, Ca²⁺ or Sr²⁺, 0.1M Ca acetate at pH 5.7 giving optimal stabilisation. Other divalent ions, ascorbic acid, cysteine, trypsin inhibitors and e-aminocaproic acid wer< ineffective. G.M.LewU

6435. ACTIVATION OF ANTIHAEMOPHILIC GLOBULIN AND PROACCELERIN BY TRACES OF THRQMBIN IN GENERATION OF INTRINSIC PROTHROMBINASE ACTIVITY. S.I.Rapaport, S.Scheiffnan, M.J.Palch and S.B.Ames: Blood, 1963, 21, 221-236 (Med. Dept., Southern California Univ. Med. Sch., Los Angeles, Calif., U.S.A.) In studies on intrinsic

Glutting In vluo it wad shown that when plasma contains activation product activity, activated anti-haemophilic globulin, activated proaccelerin and free platelet factor-3-like activity, all the reactions required to generate powerful intrinsic prothrombinase activity take place within 12 sec. after recalcification. H.B.Wayforth

6436. ROLE OF CALCIUM IN FIBRIN FORMATION.

P.H.Koppen: Nature, Lond., 1963, 198, 493-494 (Stormont-Vail Hosp., Topeka, Kans., U.S.A.)

The activity of salts of Ca, Ba and Sr in mixtures of clotting factor with plasma or bovine fibrinogen was investigated.

G.M.Lewis

6437. SELECTIVE INACTIVATION O? FIBRIN STABILISING FACTOR [FSF] CONTAMINANT IN FIBRINOGEN.

S.Swigert, J.L.Koppel and J.H.Olwin: Nature, Lond., 1963, 198, 797-798 (Coagulation Res. Lab., Dept.

?T?7 ^esbyterian-St. Lukes Hosp., Chicago, HI., U.S.A.) Mercaptide-forming agents (p-chloromercuri benzoate, Salyrgan^f) inactivate bovine or human serum FSF activity without affecting fibrinogen. The inactivation is reversed by cysteine, glutathione or BAL. By inactivating die FSF and labelling the fibrinogen with fluorescein simult., a product is obtained suitable for quart-assay of FSF activity. G.M.Lewis

6442. CELLULAR LOCALISATION OF PROFIBRINOLYSIN
(PLASMINOGEN). M.L.Barnhart and J.M.Riddle:
ood, 1963, 21, 306-321 (Physiol. Dept., Wayne
State Univ. Med. Coll., Detroit, Mich., U.S.A.)
g^{ne} Realisation of profibrinolysin within the eosinophilic
canules of bone marrow cells was demonstrated by the
orescent Ab technique. The greatest intensity of
luorescence indicating the greatest content of profibrino-
lysin was seen in mature eosinophils. Profibrinolysin is
released into the circulation only when it is needed.
H.B.Waynforth

6443. ANTIGENIC ANALYSIS OF PLASMINOGEN AND
JASMIN. U.Rife, F.Milgrom and S.Shulman: Blood,
^ 3 , 21, 322-334 (Biophysics Lab., Univ. Med. Sch.,
gen^{ouffao}, N.Y., U.S.A.) Antisera to Kline plasmino-
gen were P^{re}P- ^ rabbits. Analysis of the plasminogen
showed that it had 3 distinct components of which one was
thAD^{ical} to rum v-globulin and the other two were in
V^a 'TTglobulin mobility category. One of these latter
was identified as plasminogen. Plasmin showed a similar
pattern except for the absence of the y-globulin consti-
uent. H.B.Waynforth

6444. EXISTENCE AND SIGNIFICANCE OF A REFLEX-
HUMORAL ANTIPLASMIN SYSTEM IN THE ORGANISM.
B.A.Kudrjashov and T.M.Kalishevskaya: Nature, Lond.,
1963, 198, 763-764 (Fac. Biol., State Univ.,
Moscow, U.S.S.R.) Addition of human plasmin to
rabbit blood in vitro retarded coagulation, but when inj.
i.v., the initial retardation was followed in 3-5 min. by
a sharp acceleration of clotting. This 'anti-plasmin'
effect was prevented by bilateral section of the sympathetic
chain at the neck. Expt. on 1 kidney isolated from
the systemic circulation, indicated that in the vascular
bed, there are receptors reacting to a relative excess of
plasmin, and that chemoreception calls forth a protective
reaction of the reflex-humoral type resulting in a sharp
decrease of the blood fibrinolytic activity and an increase
in coagulating potency. G.M.Lewis

6445. METHOD FOR COMPARISON OF ANTIPLASMIN
ACTIVITY OF TWO GROUPS OF BLOOD SERA.

M. Howell: J. clin. Path., 1963, 16, 289-290 (St.
George's Hosp. Haematol. Dept., London, England)
Serum antiplasmin activity was estimated by a clot lysis
method using streptokinase-activated serum euglobulin as
the plasmin source, and human plasma euglobulin as the
fibrinogen source. e-Aminocaproic acid was used to
prevent residual activator activity in the clot.

J.B.Derbyshire

6446. EFFECT OF PYRIDOXAL PHOSPHATE ON BLOOD
COAGULATION AND FIBRINOLYTIC SYSTEM.

K.Yamada, H.Kuzuya, M.Noda, T.Yokoyama,
T.Oguri and S.Hanai: J. Vitaminol., 1962, 8, 262-
267 (Third Dept. Int. Med., Univ. Sch. Med., Showa-
ku, Nagoya, Japan) At high concn. pyridoxal phos-
phate [PAL-PO4] inhibited the coagulation of rabbits'
blood bothan vivo and in vitro. At very low concn. PAJ,
PO4 whom inj. i.v. (ncr*noed th* fibrinolytic activity of
the plasma euglobulin of 3 normal students. Whole
plasmin activity was parallel with the fibrinolytic activity
of plasma euglobulin, suggesting that PAL-PO4 increased
the fibrinolytic activity in vivo too. From absorption
spectra, it was demonstrated that e-aminocaproic acid
combined with PAL-PO4 in vitro. E.Parkinson

6447. ANTITHROMBIC ACTIVITY OF CARRAGEENIN
IN HUMAN RLOOn. W.W.Hawkins and V.O.Tennard:
Canad. J. Biochem., 1963, 41, 1325-1327 (Atlantic
Res. Lab., Nat. Res. Council, Halifax, Nova Scotia,
Canada) Heparin, X-, unfractionated, and H-carrageenin
were added to human plasma, the prothrombin was
thrombin times then being measured for each mixture.
The amounts of anticoagulant, in the above order,
required to double the normal prothrombin time were
3*0, 10*0, 40*0 and 50*0 jg./0.1 ml. plasma. Doubling
of thrombin time was caused by 0*15, 2*5, 7*5 and
15*0 pg. of the respective anticoagulants/0#1 ml. of
plasma. A.M.Gibbins

6448. IMPORTANCE OF SERUM PROTEIN PATTERN
DURING EARLY PHASES OF HEART INFARCTION.

G.Barbi and C.Maggi: Atti. Acad. med. Lombarda,
1962, 17, 418-422 (1st. Ospitalieri di Milano, Italy)
In 275 cases of acute myocardial infarction, the pattern
of serum protein was obtained as early as possible in the
initial phases. The amount of serum albumin decreased
constantly and to such a marked extent that this aspect of
dysproteinaemia must play an important role in infarction.
Electrophoretic analysis showed that in some cases, there
was a grave hyperlipaemia and a great increase in CC2-glo-
bulin. The possibilities of using serum protein changes for
diagnosis and prognosis of infarction are discussed.

PHYSIOLOGY

6449. SURFACE CHARACTERISTICS OF DOC' CHYLOMICRA AND SOME LIPID MODELS. G.V.F. Seaman and R.L. Swank: *J. Physiol., Lond.*, 1963, 168, 118-128 (*Physiol.-chem. Inst. Univ. K81n, K81n-Lindenthal, Germany*) The pH-mobility relationships of dog chylomicra and some model fat and oil particles dispersed in physiol. saline are reported. The electrokinetic prop. of plasma treated model particles and the chylomicra are similar. The fractions of whole canine plasma which actively absorb are probably of the α and B globulin type. The mobilities of the chylomicra particularly those obtained after a cod-liver oil meal, increase about 5 hr. after washing. Treatment with canine plasma restores the original electrokinetic prop. of the chylomicra. Chylomicra contain 2-5-5% phospholipid 3-8% cholesterol, those from plasma 5% sugar and 5-6% N, whilst those from chyle contain 0<4-0% sugar and about 0-4% N.

BODY FLUIDS AND ELECTROLYTES

6450. PASSAGE OF CERTAIN SUBSTANCES OUT OF THE CS F. M.Pollay and H.Davson: *Brain*, 1963, 86, 137-150 (Dept. Physiol., Univ. Coll., London, England) By means of the inulin diln. technique in a controlled ventriculocisternal perfusion system, the rate of c.s.f. formation in the rabbit was 0.0088 ml./min. The rapid loss of 1311, CNS" and PAH from the perfusion soln. was investigated suggesting an active process situated in the epithelial cells of the choroid plexuses.

R.H.Kimberlin

6451. EFFECT OF ACUTE HAEMODYNAMIC CHANGES ON C.S.F. PRESSURE. W.Baust, H.Niemczyk and H.Schaefer: *Z. Ges. exp. Med.*, 1963, 136, 619-629 (*Physiol. Inst., Univ., Heidelberg, Germany*)

In anaesthetised cats, c.s.f. pressure and internal jugular venous and arterial pressures were measured; cerebral blood flow was recorded with a calorimetric probe introduced bilaterally into the basal ganglia. Aortic pressure was controlled by varying the pressure inside a windkessel connected with the aorta by T-tube. A rise in cerebral perfusion pressure caused a parallel rise in c.s.f. pressure. Increase in cerebral blood flow without significant rise in pressure after CO₂ breathing caused a rise in c.s.f. and venous pressure. Adrenaline i.v. caused a rise in c.s.f. pressure, but if the rise in arterial pressure was prevented, there was a fall in c.s.f. and venous pressure. ACh caused a rise in c.s.f. and venous pressure if the fall in arterial pressure after ACh was prevented. C.s.f. pressure is determined by the intracranial blood vessel vol. which in turn depends on arterial inflow and venous outflow.

(German) P.F.Meyer

6452. CHANGES IN DISTRIBUTION OF WATER AND ELECTROLYTES IN PLASMA AND OTHER TISSUES IN DOGS WITH PROTRACTED NEPHROGENIC HYPERTENSION. U.Marini, F.Gilardi and R.Beretta: *Atti. Acad. med. Lombarda*, 1962, 17, 263-271 (1st. di Patol. Speciale Med., Univ., Milano, Italy) When lasting arterial hypertension was induced in dogs by constrictive perinephritis (Page's method), the Na⁺, Cl⁻ and H₂O content of the femoral arterial wall tissue increased, the "corrected" Na⁺/Cl⁻ ratio increased and the K⁺ content decreased. These electrolyte changes

were exclusive to the arterial wall and did not occur in the plasma. It is suggested that such ionic changes are due to the hypotonic state of the myoepithelial cells which are responsible for the vasoconstriction.

(Italian) G.N.Godson

6453. EFFECT OF HYPOPHYSECTOMY ON DISTRIBUTION OF WATER AND ELECTROLYTES IN PLASMA AND ARTERIES OF DOGS WITH PROTRACTED NEPHROGENIC HYPERTENSION. F.Gilardi, U.Marini and R.Beretta: *Atti. Acad. med. Lombarda*, 1962, 17, 283-285 (1st. Patol. Spec. Med., Univ., Milano, Italy) In dogs with nephrogenic hypertension, induced for 3 months, by Page's method, the arterial pressure, Na, K, Cl and H₂O content and Na/Cl ratio of the arterial wall tissue remained the same as in animals that had been similarly treated, but simul. hypophysectomised. Thus, pituitary hormones have little influence on the metabolism of this kind of expt; hypertension.

(Italian) G.N.Godson

6454. ALDOSTERONE AND WATER AND SODIUM DISTRIBUTION IN NORMAL AND ADRENALECTOMISED RATS. P.J.Leonard: *J. Endocr.*, 1963, 26, 525-530 (Dept. Med., Univ., Royal Hosp., Sheffield, England)

An increase of intracellular Na, both total and relative concn. in heart tissue, and a decrease of both in abdominal muscle occurred in adrenalectomised rats. Aldosterone reversed these changes although it had no such effect in normal animals. The suggestion is made that total Na and the intracellular concn. in muscle are influenced by the availability of aldosterone and Na.

G.F.Blane

6455. ELECTROLYTE DISTURBANCES SECONDARY TO PROLONGED GLUCOSE INFUSIONS. W.Malaisse, J.R.M.Francckson and V.Conard: *Arch. int. Physiol.*, 1963, 71, 64-72 (Lab. Expt. Med., Free Univ., Brussels, Belgium) Hypertonic glucose (50%) was given lly continuous i.v. infusion, at 3 g./kg./hr. for 4-7 hr. to 6 dogs, wt. 16-25 kg. anaesthetised with Na pentobarbitone. The water diuresis consequent on glycosuria was maintained throughout the period of infusion whatever the degree of dehydration. In the initial phases water diuresis was accompanied by increased urinary loss of K and Na, resulting in hypo-electrolytaemia:water depletion at this stage being confined to the cellular compartment. After 2-3 hr. excretion of ions became min. and independent of urinary vol. Hypokalaemia increased, but plasma Na level returned to its initial value or above secondarily to whole body dehydration.

(French) M.E.Nutt

6456. ACCELERATOR REFLEX IN NORMAL AND DEHYDRATED DOGS. S.Kumar and P.M.Lahiri: *Indian J. Physiol. Pharmacol.*, 1963, 7, 59-62 (Dept. Physiol., King George's Med. Coll., Lucknow, India)

A study was made of the superimposed reflex of opening the mouth, which accelerates the already rapid respiration rate in hyperthermic dogs. Both these responses were suppressed in dehydrated dogs and exaggerated by saline infusion. The suggestion is therefore made that dogs conserve fluids in preference to the maintenance of a normothermic state.

G.F.Blane

6457. SPECIES DIFFERENCES IN THE DERANGEMENT OF MINERAL METABOLISM AFTER ADRENALECTOMY.

T.Fukuda and T.Koyama: *Jap. J. Physiol.*, 1963, 13, 187-195 (Dept. Physiol., Univ. Sch. Med., Chiba, Japan) A spp. difference appears to exist among expt. animals in necessitating Na salts after adrenalectomy. While the necessity of mineralocorticoids in rabbits is limited to emergency cases of enforced Na loss,

PHYSIOLOGY

623

dogs require them for preserving NaCl and NaHCO₃. This difference appears to be related to the degree of development of the renal tubular absorption mechanism for NaCl and NaHCO₃.

M.J.Bell

6458. THEORY OF ELECTRONIC CONDUCTION THROUGH MEMBRANES, AND OF ACTIVE TMN8-PORT OF IONS. BASED ON REDOX TRANSMEMBRANE POTENTIALS. T.L.Jahru J. theor. Biol., 1962, 2, 129-138 (Zool. Dept., California Univ., Los Angeles, Calif., U.S.A.) Modern theories of electron transport in org. compounds should be reconsidered, so as to include electron flow through the lipid subsiances of the membrane. The apparent rapid transport of H, the less rapid transport of Cl, and the movement of Na and Cl in the same direction can be accounted for.

J.A.Dawson

6459. UREA DISTRIBUTION IN BODY AFTER HAEMODIALYSIS. R.Shackman, G.D.Chisholm, A.J.Holden and R.W.Pigott: Brit. med. J., 1962, u. 355-f58 (Postgrad. Med. Sch., London, England) Determinations of intra and extracellular urea concn. in muscle biopsy and plasma samples indicated that haemodialysis may result in intra/extracellular concn. rate > 1, due to delayed diffusion of urea across cell membranes. This finding may explain the development of cerebral oedema during dialysis and its subsequent spontaneous regression, also the accelerated rise in plasma urea concn. on the first post-dialysis day.

M.E.Nutt

RESPIRATION

6460. AN EVALUATION OF MECHANICAL VENTILATING DEVICES. J-D-Elder, jun., Duncalf, L.S. Binder and M.H.Harmel: Anaesthesia, 1963, 24, 95-100 (Dept Anaesthesiol., State Univ. New York, U.S.A.) The ability of 7 ventilators and manual inflation to maintain a const. output with change in compliance has been evaluated in a dummy system. Under conditions of test, the Engström ventilator produced the most const. output.

A.A.Zimmerman

6461. DETECTION OF HALOGENATED HYDROCARBONS IN THE EXPIRED AIR OF HUMAN BEINGS USING THE ELECTRON CAPTURE DETECTOR. R.-D-Stewart, J.D. Swank, C.B.Roberts and H.C.Dodd: Nature, Lond., hem. of detection, breath r several breaths. G.M.Lewis

may be detected in the weeks in the post-exposure period.

6462. AIRWAY RESISTANCE AND PEAK EXPIRATORY FLOW-RATE IN SMOKERS AND NON-SMOKERS. N.Zainel, H.H.Youssef and F.J.Prime: Lancet, 1963, 2, 1237-1238 (Dept. Mea., Inst. for Chest. Brompton Hosp., London, England) Airway resistance was

increased in both smokers and non-smokers. Inhalation of isoprenaline reduced the airway resistance in both groups.

G.H.Bell

6463. EFFECTS OF CIGARETTE SMOKE ON AIRWAY CONDUCTANCE IN SMOKERS AND NON-SMOKERS.

F.W.Lovejoy and L.Dautrebande: Arch. int. Pharmacodyn., 1963, 143, 258-267 (Dept. Med., Univ., Rochester, N.Y., U.S.A.) Inhalation of cigarette smoke by smokers caused mild airway constriction which could be abolished by isoprenaline or atropine aerosols. After these drugs, cigarette smoke did not cause airway constriction. Three out of 5 non-smokers did not have airway constriction, but suffered from syncope and profuse perspiration.

T.J.Sullivan

6464. PRESSURE-VOLUME CURVES IN ISOLATED ATELECTATIC RAT LUNGS AFTER ALUMINIUM OXIDE MICROPARTICLE INHALATION. E.Robillard and Y.Alarie: Canad. J. Biochem. 1963, 41, 1257-1265 (Physiol. Dept., Univ., Montreal, Quebec, Canada) A dilating effect was recorded in the lungs of rats exposed to inhalation of submicronic Al₂O₃ particles, contrasting with the reported constricting effect of this treatment on guinea-pig, dog, cat, and human lungs. Inhalation of fine Al particles before or after inhalation of sympathomimetic aerosol resulted in a more intense dilation. The constricting effect of carbachol was antagonised by prior inhalation of Al₂O₃ dust and enhanced when the order of inhalations was reversed.

A.M.Gibbins

6465. INTERMITTENT DEEP BREATHS AND COMPLIANCE DURING ANAESTHESIA IN MAN.

L.D.Egbert, M.B.Laver and H.H.Bendixen: Anesthesiology, 1963, 24, 57-60 (Anaesthesia Lab., Harvard Med. Sch., Massachusetts Gen. Hosp., Boston, Mass., U.S.A.) A fall in compliance may reflect pulmonary atelectasis. Intermittent passive hyperinflations are suggested as an important prophylactic measure to prevent atelectasis during anaesthesia.

A.A.Zimmerman

6466. ACTION OF ACETALDEHYDE ON CHEMORECEPTORS OF THE CAROTID GLOMUS. N.Joels and E.Neil: J. Physiol., Lond., 1963, 168, 234-237 (Dept. Physiol., Middlesex Hosp. Med. Sch., London, England) Inj. of acetaldehyde into the local circulation of the carotid glomus causes reflex hyperventilation, abolished by cutting the sinus nerve. The drug causes vigorous chemoreceptor impulse activity. In perfusions of the vascularly isolated carotid body with Krebs-Henseleit soln., acetaldehyde also produces chemoreceptor nerve activity which is greatly reduced when the O₂ tension of the perfuse is raised. Similar concn. of formaldehyde do not share this stimulant action. *

6467. DISCHARGE PATTERN RECORDED IN CHEMORECEPTOR AFFERENT FIBRES FROM THE CAT CAROTID BODY WITH NORMAL CIRCULATION AND DURING PERfusion. T.J.Biscoe and A.Taylor: J. Physiol., Lond., 1963, 168, 332-344 (War Dept., C.D.E.E., Porton Down, Nr. Salisbury, England)

Recordings were made of the pattern of discharge of nerve impulses in single chemoreceptor afferent fibres from the carotid body of the cat with the circulation intact and when the body was perfused with Krebs* soln. plus 7.5 g./l. dextran. In the former case the pattern of impulses possessed some prop. of a random process for mean intervals longer than 120 msec.; the distribution for shorter mean intervals was not symmetrical. The impulse pattern with the perfused body had random prop. above 310 msec, and showed significant differences from that recorded with the intact circulation. Impulse initiation in the carotid body may be a random process at all freq. subject to

PHYSIOLOGY

restriction in shortness of interval by the refractory period of the nerve endings. *

6468. HYPERCAPNIC STIMULATION OF RESPIRATION.

G.Torelli, A.Pini and G.Vercesi: Atti. Acad. med. Lombarda, 1962, 17, 461-465 (1st. di Fisiol Umana, Univ., Milano, Italy) Administration of 50 mg. i.v. of diethiadone to healthy c? subjects between 18-25 yr. old, increased the hyperventilation induced by 2-83-4*32% CO₂ gas mixtures, but did not have this effect with a 6*5% CO₂ gas mixture. (Italian) G.N.Godson

6469. SINGLE BREATH DIFFUSING CAPACITY AND THE PERMEABILITY OF THE LUNGS OF NORMAL MAN. E.Rosenberg: Canad. J. Biochem., 1963, 41, 1283-1292 (Riysiol. Dept., Fac. Med., Univ., Montreal, Que., Canada) The single breath diffusing capacity for CO, [DLL] and the permeability of the lungs, [K_L] were measured in 6 c'and 2 ? . The test gas consisted of 0*3% CO, 0*3% SF₆ 20% O₂ and the balance N₂-^bL contrary to K which decreased towards a const. value as lung vol. increased, varied with the surface area of the subjects as well as with alveolar vol. The average permeability was 0*0715 ml. CO/sec./ml. alveolar vol. Alveolar vol. calc. from the SF₆ diln., [V_{Plt}] were not measurably different in the cffrom those calc. from max. lung vol., and the evaluation of K and VD was suggested as being a useful diagnostic tool. A.M.Gibbins

6470. DIFFUSION OF GASES FROM ALVEOLUS TO PRECAPILLARY ARTERIES. A.G.Jameson: Science, 1963, 139, 826-828 (Cardiovascular Lab., Presby* terian Hosp., New York, U.S.A.) A cardiac catheter with a Pt electrode just proximal to its tip, 'wedged*' in a branch of the pulmonary artery, was used to demonstrate the appearance of H₂ or O₂ at the tip of the catheter after inhalation of these gases. It is concluded that these gases can diffuse directly from the alveoli through the walls of adjacent pulmonary arteries as large as 2 mm. in diam. Diffusion into arterial walls may play some role in the control of pulmonary circulation through changes produced in vasoconstrictor activity of the pulmonary arteries. G.M.Lewis

6471. EXPERIMENTAL STUDIES ON HYPO-OXAEMIA IN RATS. L.Myszkowski and P.Opaliński: Ginek. pol., 1962, 33, 481-484 (H Klin. Płoznictwa i Chorób Kobiecych, Akad. Med., Warszawa, Poland) Injn. of glucose, niacin or cysteine to rats in state of hypo-oxaemia increased their swimming activity by about 20%. T.Qifbicki (Polish)

6472. HYPO-OXIA, ATELECTASIS AND PULMONARY OEDEMA. J.S.Lance and H.Latta: Arch. Path. Chicago, 1963, 75, 375-377 (Dept. of Path., Sch. of Med., Univ. California, Los Angeles, Calif., U.S.A.) Lung wt. is increased by up to 33% following exposure of rats to 4-5% O₂ for 24 hr. Newborn rats exposed to 3-4% O₂ for 24 hr. showed pulmonary oedema and patchy atelectasis. No evidence of hyaline membrane was found and this could not be produced expt. by intrathoracic injn. of human and rabbit sera. R.Mitchell

6473. PROLONGATION OF SURVIVAL TIME IN ASPHYXIATED IMMATURE FOETAL LAMBS. G.S.Dawes, J.C.Mott, H.J.Shelley and A.Stafford: J. Physiol., Lond., 1963, 168, 43-64 (Nuffield Inst. Med. Res., Univ., Oxford, England) Foetal lambs of 74-92 days gestation, asphyxiated by tying the

umbilical cord, can maintain their b.p. above 10 mm. Hg for 50-60 min. The blood glucose falls to zero and the arterial pH to 6*8 or less. I.v. infusion of glucose together with enough base to prevent the fall in pH produced a two-threefold increase in survival time and reduced the rate of rise of plasma K+. Both these effects were dependent on the maintenance of a high rate of anaerobic glycolysis. Infusion of either glucose or base was ineffective. *

6474. CHANGES IN OXYGEN CONSUMPTION OF NEW-BORN GUINEA-PIGS AND RABBITS ON EXPOSURE TO COLD. G.S.Dawes and G.Mestyám: J. Physiol., Lond., 1963, 168, 22-42 (Nuffield Inst. Med. Res., Oxford, England)

The effects on O₂ consumption were described of exposure to cold (with and without urethane anaesthesia) and of infusion of noradrenaline or adrenaline* Curariform paralysis did not alter the "rise in O₂ consump" tion on cold exposure, provided there was no fall in arterial b.p. The cardiovascular effects of hexamethonium^{f1} may contribute to its action in reducing the metabolic response to cold. *

6475. INITIAL RISE IN OXYGEN CAPACITY OF BLOOD OF RATS SUBJECTED TO HYPO-OXIA. B.Tribukart: Acta physiol. scand., 1963, 57, 90-98 (Physiol. Dept., Karolinska Sjukhuset, Stockholm, Sweden)

In rats submitted to hypo-oxia comparable to 6000 m. altitude, the Hb- and plasma protein concn. increased significantly. The sp. activity of haemin was unchanged. The total Hb also showed an increase.

(German) H. B. Waynfirth

6476. ARTERIAL BLOOD GAS TENSIONS IN ACUTE DISEASE OF THE LOWER RESPIRATORY TRACT IN INFANCY. E.O.R.Reynolds: Brit. med. J., 1963, i, 1192-1195 (St. Thomas's Hosp., London, England)

Arterial pO₂ was low in 12 babies aged 5 weeks to 7 months with acute disease of the lower respiratory tract and in 6 of these there was CO₂ retention. Low pO₂ and high pCO₂ are the consequence of uneven ventilation/ perfusion ratios due to airway obstruction. In most cases cyanosis and respiratory rate are a good guide to degree of hypo-oxia, but can mislead. Arterial pO₂ increased to >100 mm. Hg in all cases after breathing 100% O₂ for 30 min. and there was no clinically significant rise in PCO₂. M.E.Nutt

6477. INFLUENCE OF SIMULTANEOUS, INDEPENDENT CHANGES IN pH AND CARBON DIOXIDE TENSION ON IN VITRO OXYGEN TENSION-SATURATION RELATIONSHIP OF HUMAN BLOOD. N.Naeraa, E.Strange-Petersen and E.Boye: Scand. J. clin. Lab. Invest., 1963, 15, 141-151 (Central Lab. Dept., Kommune-hospitalet, Aarhus, Denmark) Samples of human blood with different artificially induced metabolic acid-base abnormalities were equilibrated with different gas mixtures of known composition (O₂ +CO₂ +N₂) at 4 different pCO₂ and at 2 different pO₂. pH and O₂ satn. were then determined. The expt. procedure was such as to keep other factors affecting the O₂ dissociation curve under strict control. An increase in pCO₂ (apart from the concomitant change in pH) caused a decrease in the O₂ satn. value. This effect was most pronounced at a pH below 7*3 and low pO₂. At a pO₂ of about 90 mm. Hg ft was hardly significant. E. Parkinson

6478. DECOMPRESSION IN ACUTE AND CHRONIC EXPERIMENTS. L.Kenedi, I.R5zsahégyi and V.Fáben: Acta physiol. Acad. Sci. hung., 1963, 23, 199-204

(Hungarian Army Med. Corps, Budapest, Hungary) Guinea-pigs were exposed to 3*3 atm. with rapid decompression after 4 hr., more than half developed severe symptoms or died. 77% showed e.c.g. changes (severe disturbances of conduction, Q waves, inversion of T and "labile" e.c.g.). AH animals showed serious changes in cardiac muscle and the coronary vessels. Shorter periods at pressure produced less changes on decompression although e.c.g. were abnormal. Bubble formation occurred in the arteries and veins of the heart. Animals showed very marked individual differences in their responses but in all surviving animals the e.c.g. returned to ^{JAG}
^{JG} Svan

6479. TESTOSTERONE AND ASTHMA. EjR.Trethewie: Nature; Lond.. 1963. 198. 290 (Dept. Physiol., Univ. of Melbourne, Australia) The sensitivity of the guinea-pig jejunum to histamine was markedly depressed by testosterone but not influenced by . " ^ ^ finding could explain the reduction of incidence of status asthmaticus in /during the sexually active period. G.M.Lewis

6482. MPPHANTSM OF CALCIUM-INDUCED POSITIVE Cl ECT IN ISOLATED MAMMALIAN A' C. L. Sperti: Nature, Lond.. 1963, 198, 792 (Inst. Fisiol. umana, Univ., Padova, Italy) Expt. on the effect of ephedrine, ergotamine and reserpine on the Ca-induced pos. otropic effect in rabbit atria or atria-sj. The nerve prep. indicated that the in vitro J S a o n of ft. trial pacemaker induced by increased concn. of Ca²⁺ is adrenesic in nature. G.M.Lewis

6483. EFFECT OF INCREASED SERUM POTASSIUM IN DIGOXIN CONTENT OF CANINE HEART. P.A.Ebert, L.J. and W.G.Austen: Bull. Johns Hopkins Hosp. 112, 151-154 (Surg. Dept., Johns Hopkins Univ. Med. Sch., Baltimore, Md., U.S.A.)

Elevating serum K from 6*2 to 9*2 mequiv./l. produced a 14% decrease in the radioactivity of the heart of dogs, who had been given [³H]digoxin. It is suggested that an actual loss of glycosides may occur from the myocardium.

H.B.Waynfirth

6484. CARDIOVASCULAR RESPONSES IN 'DIVING*' AND DURING STRAIN STIMULATION IN DUCKS. E.Feigl and B.Folkow: Acta physiol. scand., 1963, 57, 99-110 (Physiol. Dept., Univ. Gtteborg, Sweden) 'Diving*' bradycardia in ducks results from a sp. nervous reflex resulting from submersion of the head. There is a progressive hypercapnia during the asphyxia with an increasing anoxia at this time. Results from brain stim'n. are described.

H.B.Waynfirth

6485. COMPARISON OF ACTION OF OUABAIN ON HEART IN HYPOTHYROID, EUTHYROID AND HYPERTHYROID DOGS. A.Rosen and N.C.Moran: Circular Res., 1963, 12, 479-486 (Dept. Pharmacol., Emory Univ., Atlanta, Ga., U.S.A.) Ouabain increased contractile force in all groups of dogs studied under anaesthesia with open chests. Arrhythmias were produced with smaller doses in euthyroid than in either hypo- or hyperthyroid animals.

R.E.Moore

6486. EFFECT OF CARDIOACCELERATION BY METHYLSCOPOLAMINE NITRATE ON CIRCULATION AT REST AND DURING EXERCISE IN SUPINE POSITION WITH SPECIAL REFERENCE TO STROKE VOLUME. S.Beregarde: Acta physiol. scand., 1963, 57, 61-80 (Clin. Physiol. Dept., Karolinska Sjukhuset, Stockholm, Sweden) After injn. of methylscopolamine nitrate (MSN) the work intensity at pulse rate 170/min. in healthy c? decreased. At rest, after MSN injn. the heart rate increased while the stroke vol. decreased. The latter increased during work however. The duration of the mechanical diastole of the heart both at rest and at work was significantly shorter after MSN. H.B.Waynfirth

6487. ARTIFICIAL PACEMAKER FOR TREATMENT OF ADAMS-STOKES SYNDROME AND SLOW HEART RATE. R.Elmqvist, J.Landegren, S.O.Pettersson, A.Senning and G.William-Olsson: Amer. Heart J., 1963, 65, 731-748 (Dept. Med., Serafimerlasarettet, Stockholm, Sweden) Long-term cardiac pacemaking with an external or an implantable pacemaker was used with good success in 16/18 patients. The authors used relatively large Pt electrodes of 9 mm. diam. which were sewn to the epicardial surface of the heart near the apex. The problems of long-term pacemaking are discussed.

P.F.Meyer

6488. FREQUENCY RESPONSE OF CARDIAC CHRONOTROPIC ACTION OF VAGUS. J.PertSz: Arch. int. Physiol., 1962, 70, 636-650 (Inst. Physiol., Fac. Med., J.E.Purkinj8 Univ., Brno, Czechoslovakia) Rabbits were anaesthetised with urethane and the vagus nerves stim. by rectangular pulses of const. amplitude, but sinusoidal modulating freq. Stimn. elicited oscillatory variations of the heart rate the amplitude and phase shift of which could be precisely estimated. Results were plotted as a freq.-response characteristic and as a Nyquist diagram. Both of these represent the transfer function of the system, where freq. of stimuli to efferent nerve and pacemaker is the input variable and heart rate the output. The system of efferent fibre and pacemaker is comparable to a single time const. element acting with a dead time identical with the latent period. Importance of the findings in relation to control mechanisms in the circulation is discussed. This may be another example of the application of automatic control theory to biol. regulations.

M.E.Nutt

PHYSIOLOGY

6489. ACTION OF RESERPINE ON CARDIOACCELERATOR TONE. P.DuchSne-Marullaz and J.Lavarenne:

C.R. Soc Biol., Paris, 1962, 156, 2052-2054 (Lab. de Physiol., Fac de MSd., Clermont-Ferrand, France) I.m. injn. of 0-15 mg. reserpine/kg. during 3 days, decreased the cardioaccelerator tone of the non-anaesthetised dog. There was an increase in the permanent action of cardioinhibitor fibres on cardiac freq. This action was marked in bisterectomised animals. Reserpine increased the freq. of beat of the denervated heart.

(French) M.A.Price

6490. ROLE OF AUTONOMIC AND MYOCARDIAL

FACTORS IN CARDIAC CONTROL. T.A.Bruce, C.B. Chapman, O.Baker and J.N.Fisher: J. clin. Invest., 1963, 42, 721-726 (Dept. Int. Med., Univ. Texas

* Southwestern Med. Sch., Dallas, Tex., U.S.A.)

In anaesthetised dogs the elimination of rate response by denervation does not entirely deprive the left ventricle from responding to exercise. This response, an increase in cardiac output and integrated minute work, appears to be initiated by increased ventricular filling.

M.J.Bell

6491. EVALUATION OF DYE DILUTION AND CARDIOMETRIC METHODS OF CARDIAC OUTPUT ESTIMATION IN DOGS. S.Nath: Indian J. Physiol. Pharmacol., 1963, 7, 29-32 (Dept. Physiol., S.M.S. Med. Coll., Jaipur, India) Simult. determinations of cardiac output were made using the Evans Blue dye diln. method and Henderson's cardiometer. Good agreement was obtained between the two methods.

G.F.Blane

6492. CIRCULATORY STUDIES IN WELL-TRAINED

ATHLETE? AT REST AND DURING HEAVY EXERCISE, WITH SPECIAL REFERENCE TO STROKE VOLUME AND INFLUENCE OF BODY POSITION. S.Bevengarf, A.

A.Holmgren and B.Jonsson: Acta physiol. scand., 1963, 57, 26-50 (Clin. Physiol. Dept., Karolinska Sjukhuset, Stockholm, Sweden) Cardiac output at rest and during work in trained athletes showed the same relation to O₂ uptake as in non-athletes. The output was less in the sitting than in the supine position due to a smaller stroke vol. in both groups. The stroke vol. increased on transition from rest to exercise and more so for this sitting position. The relation between the stroke and blood vol. in athletes at work in the supine position was the same as for non-athletes. In athletes the ventricular filling pressure during exercise was higher than in non-athletes.

6493. E.C.G. OBSERVATIONS ON THIAMINE AND

PANTOTHENIC ACID DEFICIENT RATS. N.Valora and A.Fidanza: Quad. Nutr., 1963, 22, 93-105

(1st. di Clinica med. gen., Univ., Roma, Italy) The e.c.g. patterns of thiamine and pantothenic acid deficient rats were slightly different from normal. In pantothenic acid deficient animals there was a noticeable change in the P wave and shortening of the P-Q time. In thiamine deficient animals, after 2-5 weeks of vitamin starvation, bradycardia developed together with a morphol. atypical P deflection, shortening of P-Q time, a broadening of the QRS complex and sometimes a lengthening of the S deflection. In thiamine and pantothenic deficient animals these effects are superimposed.

(Italian) G.N. Godson

6494. E.C.G. NOTCHING IN RATS DEFICIENT IN ESSENTIAL FATTY ACIDS. W.O.Caster and P.Ahn:

Science, 1963, 139, 1213 (Dept. Physiol. Chem., Univ. Minnesota, St. Paul, Minn., U.S.A.) A notch occurring consistently at a point 37% through the QRS

complex of the e.c.g. in the rat was associated with deficiency in essential fatty acids and prevented by addition of small amoants of linoleate, linolenate or arachidonate to the diet.

6495. APEXCARDIOGRAM [A.C.G.] IN NORMAL OLDER

SUBJECTS AND IN PATIENTS WITH ARTERIO-SCLEROTIC HEART DISEASE. EFFECT OF EXERCISE

ON 'A' WAVE. A.Benchimol and E.G.Dimond: Amer. Heart J., 1963, 65, 789-801 (Inst. Cardiopulm. Dis., Scripps Clinic and Res. Foundn., La Jolla, Calif., U.S.A.)

A.c.g. recorded at rest and after exercise

were normal in 64 ageing subjects (range 40-84 yr.) with normal cardiovascular system. In 45 patients with ischaemic heart disease, the a.c.g. was abnormal at rest in 25; in 18, the a.c.g. was abnormal after exercise. Characteristic changes in the a.c.g. were large "a" waves and a prolonged interval between peak of "a" wave to peak of systolic wave. Patients with abnormal a.c.g. had raised pulmonary wedge pressures and raised left ventricular end-diastolic pressures which were further increased after exercise. Cardiac output was normal at rest and responded normally to exercise. Abnormalities in the a.c.g. were more marked in patients with the more severe grades of ischaemic heart disease. It is suggested that the changes in the a.c.g. are due to either increased resistance of the left ventricle to distensibility or incomplete emptying with increased residual left ventricular vol.

P.F.Meyer

6496. TRANSMISSION OF BALLISTOCARDIOGRAPHIC

FORCES TO PLATFORMS MOUNTED ON SPRINGS.

W.Dock: Amer. J. med. Sci., 1963, 245, 449-455

(Dept. Med., State Univ. of New York Downstate Med. Center, Brooklyn, N.Y., U.S.A.) Studies on elderly thin men with large respiratory variations in heights of the systolic waves of the b.c.g. show that when the body lies free on four platforms mounted on springs, so that die ballistic force is transmitted as the shearing force between body and platform, the largest force reaches that under the feet. The effects of restraining the body by a footplate and a shoulder yoke and of body wt. are described.

E.E.Hobbiger

6497. REFLECTED ULTRASOUND IN THE ASSESSMENT OF MITRAL VALVE DISEASE. CRJoyner, jun., J.M.

Reid and J.P.Bond: Circulation, 1963, 27, 503-511

(Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) The ultrasonic reflection pattern was distinctive in pure mitral stenosis, but patients with mitral regurgitation exhibited a normal pattern.

6504. CHANGES IN HYDROELECTROLYTE CONTENT AND SOME PROTEIN COMPONENTS OF FEVER-HYPOTENSION. U.Marini, S.Santa and G.Binaghi: Atti. Acad. med. Lombarda, 1962, 17, 392-398 (Ist. di Patol. Speciale Med., Univ. Milano, Italy) 90 days after the induction of hyper-

tension in dogs by baroceptive deafferentiation, the Na⁺, Cl⁻ H₂O and collagen content of die femoral arterial wall tissue were higher and the elastic content lower than normal. There were no significant differences in the content of these elements in the pulmonary arteries of the hypertensive and control animals. The vascular wall electrolyte changes could be due to the hypertonic state of the myocells and the fibrous protein changes probably contribute to sustain the narrowing of the vascular lumen. (Italian) G.N. Godson

6505. MUCOPOLYSACCHARIDE CONTENT OF FEMORAL AND PULMONARY ARTERIES OF DOGS WITH HYPERTENSION INDUCED BY BAROCEPTIVE DEAFFERENTATION. S.Santambrogio, U.Marini, R.Beretta and G.Binaghi: Atti. Acad. med. Lombarda, 1962, 17, 385-388 (Ist. di Patol. Speciale Med., Univ., Milano, Italy) In 6 dogs with protracted hypertension, 3 months after baroceptive deafferentation, the acid and neutral mucopolysaccharide content of the femoral and pulmonary arterial wall tissue showed no changes. (Italian) G.N. Godson

6506. RELATIONSHIP OF OEDEMATOUS REACTION IN ARTERIES TO ATHEROSCLEROSIS AND THROMBOSIS. T.Shimamoto: J. Atheroscler. Res., 1963, 3, 87-102 (Inst. Cardiovascular Dis., Med. Sch., Med. and Dental Univ., Tokyo, Japan) Attention is redirected in this review to accumulation of oedema fluid in the intima of large arteries as an important factor in the pathogenesis of atheromatous lesions. Substances capable of preventing the oedematous reaction to agents such as cholesterol and adrenaline in rabbits, were also able to prevent expt.-induced thrombosis and atheroma. G.F.Blane

6507. BRAIN STEM MECHANISMS IN REGULATION OF BLOOD PRESSURE IN RABBIT. J.Gutman, Y.Ginath, M.Chaimovitz and F.Bergmann: Arch. int. Physiol., 1962, 70, 583-598 (Hebrew Univ.-Hadassah Med. Sch., Jerusalem, Israel) Stimm. of the brain stem, from hypothalamus to medulla, in conscious rabbits immobilised with succinylcholine (120-240 μ g/min.) showed that rise in b.p. was the most common result of stimm. in all regions. Depressor points were less common and in many cases reaction changed from depressor to pressor on increasing freq. of stimulus, being biphasic at intermediate rates. After administration of Na penta-barbitone many pressor points gave mixed or hypotensive responses, others showed a reduction in the rise of b.p. evoked. The % of mixed + depressor points increased from 17% to 58%. Responses from purely depressor points were never reversed by barbiturate. Vasomotor points are randomly distributed throughout the brain stem with greatest density of depressor elements in the post. medulla. The hypothesis of anat. defined, circumscribed, antagonistic vasomotor centres is untenable. M.E.Nutt

6508. EFFECT OF BRAIN STEM TRANSECTIONS ON BLOOD PRESSURE RESPONSES TO MEDULLARY STIMULATION. J.Gutman, E.Leibowitz and F.Bergmann: Arch. int. Physiol., 1962, 70, 671-681 (Hebrew Univ.-Hadassah Med. Sch., Jerusalem, Israel) Electrical stimm. of the post. medulla of the unanaesthetised rabbit shows diffusely distributed intermingled pressor and depressor points. Transverse sections caudal to the hypothalamus convert most pressor responses into depressor responses, the effect being similar to that of administering barbiturate. Medullary pressor neurones probably act mainly through higher centres in the brain, whereas depressor neurones have mainly descending connections with the spinal cord. M.E.Nutt

PHYSIOLOGY

6509. EFFECTS OF CERVICAL SYMPATHETIC TONE ON BLOOD PRESSURE AND UVEAL FLOW AFTER CAROTID OCCLUSION. A.BUI: *Exp. Eye Res.* 1963, 2, 203-209 (Inst. Physiol., Univ., Uppsala, Sweden) The mean b.p. in a femoral artery, a ciliary artery and in a common carotid artery were measured manometrically, and the uveal blood flow was determined by a calorimetric method. With the ipsilateral cervical chain cut occlusion of a common carotid artery increased the femoral pressure by 9 mm. Hg and reduced the ipsilateral ciliary pressure by 46 mm. Hg. Blood flow through the uvea was reduced by 70%. Subsequent electrical stimm. of the ipsilateral cervical sympathetic chain slightly reduced the femoral pressure, and considerably raised the pressure at the origin of the ciliary arteries and the distal part of the ligated carotid artery. The rise in the ciliary b.p. at physiol. stimm. freq. resulted in increased blood flow through the uvea. With the ipsilateral cervical sympathetic chain intact, carotid occlusion gave a tone in the vasoconstrictor fibres similar to that produced by electrical stimm. of the chain at freq. of 0.3-2 impulses/sec. J.Whiting

6510. ABSENCE OF REFLEX CIRCULATORY EFFECTS OF GROUP I AFFERENT FIBRES. Y.Laporte, L.M. Leitner and B.Pages: *C.R. Soc. Biol.*, Paris, 1962, 156, 2130-2133 (Lab. Physiol., Fac. de Méd., Toulouse, France) Repetitive stimm. of lumbar dorsal roots containing group 1 fibres of heparinised and chloralose anaesthetised cats, did not produce reflex circulatory effects in the muscles of the ipsilateral leg. Circulatory changes were measured as variations in venous blood flow. (French) M.A.Price

6511. EFFECT OF CHANGES IN SALT INTAKE ON ARTERIAL PRESSURE AND RENAL FUNCTION IN PARTIALLY NEPHRECTOMISED DOGS. J.B.Langston, A.C.Guyton, B.H.Douglas and P.E.Dorsett: *Circulat. Res.*, 1963, 12, 508-515 (Dept. Physiol., Univ. Missouri Med. Center, Jackson, Mo., U.S.A.) Subtotal nephrectomy (1 kidney) was carried out in 2 stages in dogs. The unanaesthetised animals on a high NaCl intake developed hypertension with concomitant increase in plasma Na⁺ concn. The latter even so was no higher than preparative levels, having fallen post-operatively. R.E.Moore

6512. A VASCULAR ABNORMALITY IN HYPERTENSION. J.Conway: *Circulation*, 1963, 27, 520-529 (Univ. Michigan Med. Center, Ann Arbor, Mich., U.S.A.) In various types of hypertensive subjects a relative increase in the resistance to arterial blood flow in the forearm was demonstrated by procedures leading to max. hyperaemia. The increase in resistance was related to the level of arterial pressure rather than to the duration of the hypertension. The findings are interpreted as evidence of an abnormality of the blood vessels themselves in hypertension, but not necessarily in smooth muscle. R.S.Duff

6513. HAEMODYNAMIC CHANGES IN ADRENALECTOMISED DOGS. M.M.Reidenberg, E.A.Ohler, R.W. Sevy and C.Harakab: *Endocrinology*, 1963, 72, 918-923 (Pharmacol. Dept., Temple Univ. Med. Sch., Philadelphia, Pa., U.S.A.) Dogs, 3 days after adrenalectomy showed consistent decreases in cardiac output, stroke vol. and arterial pressure, with increases in heart rate and peripheral resistance. Dextran infusion reversed these effects. Programmes of steroid therapy all

failed to restore completely the haemodynamic effects of adrenalectomy. H.C. Jones

6514. EFFECT OF ANGIOTENSIN. II. ON SYSTEMIC AND PULMONARY PRESSURE AND ON EXCRETION AND DISTRIBUTION OF HYDROELECTROLYTES IN TISSUES OF DOGS. F.F.Gilardi, U.Marini, R.Beretta and P.Lanucara: *Atti. Acad. med. Lombarda*, 1962, 17, 339-346 (1st. Patol. Spec. Med., Univ., Milano, Italy) Infusion of normal dogs with Angiotensin n induced a rapid increase in systemic arterial pressure, which progressively decreased as the infusion continued. Redistribution of ionic content of the femoral arterial tissue also occurred. No change in pressure of ionic distribution in the wall of the pulmonary artery or in the blood plasma was observed. During infusion, diuresis and excretion of water, Na, K and Cl markedly fell. (Italian) < G.N.Godson

6515. POTENTIATION EFFECT OF ALDOSTERONE AND CORTISONE ON THE VASOCONSTRICITIVE ACTION OF NORADRENALINE ON CONJUNCTIVAL BULBAR VESSELS, IN NORMOTENSIVE AND HYPERTENSIVE PATIENTS. U.Marini, E.Vigorelli and R.Beretta: *Atti. Acad. med. Lombarda*, 1962, 17, 347-354 (1st. Patol. spec. Med., Univ., Milano, Italy) In 15 hypotensive and 15 normotensive patients, topical application of aldosterone (2 drops of a 2% soln.) and hydrocortisone (2 drops of a 0.5% soln.) to the conjunctival sac increased the reactivity of the bulbar conjunctival vessels to noradrenaline (2 drops of a 1:400000 or 1:100000 soln.) of both groups to the same degree. Aldosterone had a slightly greater potentiation than hydrocortisone. (Italian) G.N.Godson

6516. REACTION OF CONJUNCTIVAL BULBAR ARTERIES TO TOPICAL APPLICATION OF NORADRENALINE AND HYPERTENSIN IN NORMAL SUBJECTS AND PATIENTS WITH ESSENTIAL HYPERTENSION. U.Marini, E.Vigorelli and F.F.Gilardi: *Atti. Acad. med. Lombarda*, 1962, 17, 355-360 (1st. Patol. spec. med., Univ. Milano, Italy) In 15 hypotensive patients the vascular reactivity of the bulbar conjunctival vessels to topical application of hypertensin (2 drops of a 1:200000 soln.) and noradrenaline (2 drops of a 1:400000-1:100000 soln.) was greater than in 15 normotensive patients. The vasoconstrictive effect of noradrenaline and hypertensin were similar. (Italian) G.N.Godson

6517. REACTIVITY OF SKIN AND MUSCULAR BLOOD VESSELS TO NORADRENALINE DURING INDUCED RESPIRATORY ACIDOSIS IN CATS. S.Bygdemar: *Nature*, Lond., 1963, 198, 491-492 (Dept. Physiol., Fac. Med., Karolinska Inst., Stockholm, Sweden) During expt. produced acidosis in cats, the overall response of the peripheral blood vessels to noradrenaline decreased much more in the whole leg prep. than in the skinned leg prep. After denervation, the difference was less obvious but still noticeable on ventilation with 20% CO₂ in O₂. These results suggested a marked difference in the change of reactivity between skin and muscular blood vessels during acidosis. G.M.Lewis

6518. CORONARY BLOOD FLOW OF ISOLATED, BEATING RABBITS' HEARTS. W.Gebhard: *Z. Ges. exp. Med.*, 1963, 136, 589-605 (Inst. Animal Physiol. Frankfurt am Main, Germany) Beating rabbits' hearts were suspended in Locke's soln. under conditions which controlled aortic pressure and left atrial filling pressure, and permitted registration of ventricular

PHYSIOLOGY

629

vol. and stroke vol. Coronary outflow was measured by *e outflow from the pulmonary artery. Perfusion was with a blood da. with Locke's soln. Coronary blood flow increased when the hearts recovered from the hypo-oxia caused during manipulation. Coronary blood flow was Proportional to aortic mean pressure. ATP (20 mg.) and Persantin (25 mg.) caused an increase, cortisol a fall in coronary blood flow. (German) r.f.Meyer

6519. AORTIC CARTILAGE PRODUCED BY INTRAMURAL CARRAGEENAN. E.L.McCandlws. J.M. Lehoczky and S.Rodbard: Arch. Path. Chicago. 1963, 75, 507-516 (Univ. Buffalo, PubUc Health Res. Inst. Chronic Disease. U.Y., U.S.A.) Cartilage-like tissue was produced in the thoracic aorta of 8 chickens

nation
of smooth muscle cells to chondrocytes. R.Mitchell

6520. TECHNIQUE FOR VISUALISATION AND PERFUSION OF BRONCHIAL ARTERIES; SUGGESTED CLINICAL AND DIAGNOSTIC APPLICATIONS. Philad., 1963, Mem. Center for J.S.A.)

A on of the thoracic aorta with the aid of a double-balloon, quadruple-lumen wthetqr is.the basis for the visualisation of bronchial arteries and for their infusion with ^ J ^ < 2 E ? : u^ further application of this technique and the possible use » diagnosis is discussed. D.LConneU

6521. HAEMODYNAMIC REGULATING MECHANISM COMPENSATING FOR DECREASED BLOOD SUPPLY TO CEREBRAL CORTEX. G-LMcheduhviU and L.G. Ormotsadze: Physiol. Bohem.. 1963, 12, 100-105 Sci. several pial

Uon,blood flow increased in neighbouring arteries. B.P. fforded in the aorta and the circle of Wilh^s were un- Ranged. The compensatory action of * P** ^ es ^ vented the development of ischaemia g* J.L. Verack rtex.

6522. ANGIOGRAPHIC METHODS OF CHOICE EVALUATION OF STROKE PATIENTS. R.A.Kuhn and H.Kugler. Bull. Johns Hopkins Hosp., 1963, 112, 59-76 Surgery Dept., U.S.A. SSS Sasa -was studied in human patients by retrograde injn. of opaque media through the brachial artery. The only complications that generalised seizures in a very few patients. H.B.Waynfirth Patients is suggested.

6523. MEASUREMENT OF RENAL SHUNTING BLOOD FLOW IN MAN. K.Ito. Nature, Lond., 1963, 198, 105 (Japan) Med., Tohoku Univ. Sch. Med., 1963, 10, 108- Quant. estimation of renal shunted blood flow may be made by a method based on the fact that N₂O is completely removed from the blood by the renal tissue when the N₂O concn. in renal tissue is zero; the extraction ratio of N₂O at the initiation of the sarn. process represents the rate of effective blood flow. This is 108% in normal subjects, but in the terminal stages of chronic glomerular nephritis, nephrosclerosis and chronic pyelonephritis, 8-17%, 7% and 35% respectively of shunted blood was observed. G.M.Lewis

6524. ROLE OF DISTENSION OF VEINS OF PORTAL SYSTEM IN RENAL CIRCULATION. A.Cheruy.

H.Lemarchands, B.Potocki, J.Reynier and M.Tanche: C.R. Soc. Biol., Paris, 1962, 156, 2087-2090 (Lab. de Physiol., Fac. de Med., Grenoble, France)

Occlusion of the portal vein of ffaibarbiturate anaesthetised dogs during interruption of the arterial mesenteric circulation did not result in a decrease in renal vol. Removal of arterial occlusion resulted in an immediate decrease in renal vol. accompanied by a marked decrease in arterial pressure. (French) M. A. Price

6525. NERVOUS AND LOCAL CHEMICAL CONTROL OF PRE-CAPILLARY SPHINCTERS IN SKELETAL MUSCLE AS MEASURED BY CHANGES IN FILTRATION CO-EFFICIENT. A.Cobbald, B.Folkow, LKjellmer and S.Mellanden. Acta physiol. scand.. 1963, 57, 180-192 (Physiol. Dept., Univ., Goteborg, Sweden)

It is shown that vasoconstrictor nerve fibres affect the pre-capillary sphincters. This effect is "overcome" rapidly by Vasodilator metabolites* accumulating when flow in the capillaries is reduced. The filtration coeff. in skeletal muscles tends to rise at any decrease of blood flow or tissue metabolism. H.B.Waynfirth

6526. MEASUREMENT OF CAPILLARY PERMEABILITY IN RAT. R.Charlier, A.Hosslet and L.Canivec Arch,

int. Physiol., 1963, 71, 51-63 (Société Beige de l'Azote et des Produits Chimiques du Marly, Ave. de Béjar, 1, Brussels, Belgium) Capillary permeability has been measured in the rat by injecting Trypan Blue i.p. and measuring the intensity and spread of blue colour from dye leakage, in an area of shaved skin, at different time intervals after local application of CHCl₃. Effect of various agents on capillary permeability can be assayed by giving the substance concerned i.p. just prior to injn. of Trypan Blue and comparing rate of dye leakage with that in control animals. (French) M.E.Nutt

6527. EXPERIMENTAL INVESTIGATION OF VASCULAR FRAGILITY. R.Charlier, A.Hosslet and M.Colot:

Arch. int. Physiol., 1963, 71, 1-45 (SociStS Beige de l'Azote et des Produits Chimiques du Marly, Ave. de Béjar, 1, Brussels, Belgium) Capillary resistance was measured by determining the neg. pressure required to produce petechiae in the skin of the shaved rat. Rats fed a diet deficient in vit. P develop increased capillary fragility. Administration of known factors in vit. P (hesperidine-methyl-chalcone or rutine) decreases fragility. This effect can be measured quant. and a satisfactory do^e/response relationship demonstrated. The method is suitable for assay of substances capable of restoring normal resistance to capillaries made fragile on the P-deficient diet. (French) M.E.Nutt

NERVOUS SYSTEM

6528. REACTION OF VATER-PACINI CORPUSCLES TO CHEMICAL AND PHYSICAL FACTORS ACTING ON SMALL INTESTINE MUCOSA. A.Danysz and M.Malofiejev: Arch. int. Pharmacodyn., 1963, 143, 34-40 (Pharmacol. Dept., Med. Acad., Bialystok, Poland)

Vater-Pacini corpuscles in the mesentery of the cat react to different stimuli acting on the mucosa of the small

PHYSIOLOGY

intestine by changing their diam. Catecholamines and temp, changes caused a decrease; ACh, hypertonic saline and raised intraluminal pressure caused an increase in diam.

T.J. Sullivan

6529. CODING MECHANISMS OF ELECTRORECEPTOR FIBRES IN SOME ELECTRIC FISH. S.Hagiwara and H.Morita: *J. Neurophysiol.*, 1963, 26, 552-567 (Zool. Dept., UCLA, Los Angeles, Calif., U.S.A.)

Prop. of electroreceptor were analysed by recording impulse discharge of single lat. line nerve fibres of Staetogenes (electric organ discharge of 40-60 c/s), Gymnotus (40-60 c/s), Eigenmannia (250-400 c/s), and Sternopygus (60-100 c/s). The intensity of the potential field produced by the electric organ pulse is coded by a single lat. line nerve fibre principally by the gradation of no. of impulses in a train produced by each pulse in fishes having a low freq. discharge of the electric organ such as in Staetogenes and Gymnotus. However, in fishes of a high freq. electric organ discharge such as in Eigenmannia the coding is performed by grading the probability of impulse initiation after each pulse of the electric organ. In Sternopygus both mechanisms are operative. Small conducting or dielectric objects in the water just over the receptor respectively suppress or enhance the nerve response and ant. or post, to the receptor area gives rise to the opposite type of responses. The threshold for an imposed electric pulse to produce one nerve impulse is about 10 mV/cm. along the long axis of the fish and is the same for a pulse of any duration above 5 msec in Staetogenes and Gymnotus. The threshold for an imposed a.c. field is about mV/sec. in Eigenmannia is higher when the freq. of a.c. departs far from that of the electric organ discharge. *

6530. EFFECTS OF ACh ON AXONAL CONDUCTION OF LOBSTER NERVE. W.-D.Dettbarn and F.A.Davis: *Biochim. biophys. Acta*, 1963, 66, 397-405 (Dept. Neurol., Coll. Physn. and Surgn., Columbia Univ., New York, U.S.A.) 5×10^{-3} - 10^{-2} M ACh decreased membrane potentials recorded by the "sucrose-gap" technique in walking leg nerve bundles. Simult. recorded action potentials initially showed increased amplitude and prolongation and elevation of the descending phase which appeared oscillatory. Later spike height and effects on the descending phase decreased. Finally conduction was reversibly blocked. 10^{-2} M d, 1-acetyl-g-methylchoiine affected action potentials similarly but decreased membrane potentials only slightly. 0^01 M choline, but not acetate or Br", changed action potentials slightly. 5 mM physostigmine resembled ACh in effect; lower concn. inhib. ACh action. Atropine and tetracaine reversibly blocked conduction and irihib. ACh action. Curare inhib. ACh without blocking conduction. Phospholine and Paraoxan blocked conduction irreversibly. Membrane potential was reversibly decreased 20-30 mV.

B.M.Stevens

6531. SCHWANN CELL AND AXON ELECTRICAL POTENTIAL DIFFERENCES; SQUID NERVE STRUCTURE AND EXCITABLE MEMBRANE LOCATION. R.Villegas, L.Villegas, M.Gimenez and G.M.Villegas: *J. gen. Physiol.*, 1963, 46, 1047-1064 (Dept. Biofis., Inst., Venezolano de Invest. Cient., Caracas, Venezuela) Three p.d. levels were recorded from resting nerve fibres of Sepioteuthis septoldeia impaled from outside to inside. The first p. d. level of -10 to -26 mV was located in the endoneurium cells, the second level of -33 to -46 mV, in the Schwann cell, and the third level of -50 to -65 mV in the axon, as shown

histol. using carmine. When the axon was depolarised n< p.d. change was observed both in the endoneurium cell and the Schwann cell. In all nerve fibres action potentials were registered from the axon only. K.Jones

6532. DEMONSTRATION OF INCREASED PERMEABILITY AS FACTOR IN EFFECT ACh ON ELECTRICAL ACTIVITY OF VENOM-TREATED AXONS. P.Rosenberg and F.C.G.Roskin: *J. gen. Physiol.*, 1963, 46, 1065-1072 (Dept. Neurol., Coll. Physn. and Surgn., Columbia Univ., New York, U.S.A.) The penetration of externally applied [¹⁴C]dimethylcurare, ACh, choline and trimethylamine into the axoplasm was determined in the squid giant axons treated with cottonmouth, rattl* snake or bee venom. The results showed that when ACh and curare, following venom treatment, affected electrical activity, they also penetrated into the axon. Treatments which did not increase penetration were also ineffective in rendering the compounds active. Kjon<

6533. DEPOLARISATION OF CENTRAL TERMINALS OF CUTANEOUS AFFERENT FIBRES. J.C.Eccles, R.F. Schmidt and W.D.Willis: *J. Neurophysiol.*, 1963, 26, 646-861 (Physiol. Dept., Aust. Nat. Univ., Canberra Australia) The depolarising action of cutaneous an muscle afferent volleys on the central terminals of cutaneous fibres has been studied directly by intracellular recording, and also indirectly by testing for increases in excitability as measured by responses to applied current pulses. Group Ia afferent volleys from muscle had no action, but all other medullated afferents from muscle Groups Ib, II and III, regularly had a depolarising actio particularly when applied by brief high freq. bursts, though it was usually smaller than the depolarisation produced by single cutaneous volleys. The dorsal root potentials produced by prolonged tetanisation of cutane nerves, declined from an initial peak to a plateau whid may be as large as SW/o of the peak height, and which continued at a steady level for several sec. These prolonged depolarisations give a continued presynaptic inhi and hence are a very effective neg. feed-back device that operates upon all flexor reflex afferents. •

6534. SPONTANEOUS MINIATURE POTENTIALS IN SPINAL MOTONEURONES. B.Katz and R.MiledL-J. *HiysiOL*, Lond., 1963, 168, 389-422 (Dept. Biophysics, Univ. Coll., London, England) Spontaous subthreshold potentials were recorded intracellularly from motoneurones of the frog's isolated spinal cord. The discharge of spontaneous potentials persists when reflex activity has been abolished by Mg and even after impulse conduction in the cord has been eliminated by excess K. Much of the spontaneous activity normally recorded is independent of impulse bombardment and its origin locally, within synaptic terminals. Amplitu* and time courses of individual spontaneous potentials va greatly; this may depend on cable prop. of dendrites as well as on differences between individual synaptic actions. •

6535. THE EFFECTS OF END-TIDAL CO₂ ON THE V/I CHARGE OF INDIVIDUAL PHRENIC MOTONEURONE. P.K.Gill: *J. Physiol.*, Lond., 1963, 16, 239-257 (Dept. Physiol., Univ. Utah Coll. Med., Salt Lake City, Utah, U.S.A.) Discharge of individual phrenic motoneurones in response to different levels of end-tida CO₂ was examined in decerebrate cats in which the tft X, XI and XII cranial nerves were cut and the spinal c& sectioned at C7-8. Phrenic units Showed different

thresholds for initiation of discharge as end-tidal CO₂ was raised. Further increments of CO₂ increased the no. of impulses per cycle and their average freq. until some max. was reached. The freq. of bursts fell as CO₂ was raised. Recruitment of additional units as well as increase in discharge of units already active determine the increase in total phrenic discharge to increasing levels of end-tidal CO₂. The end-tidal CO₂ associated with initiation of discharge in a phrenic unit, as CO₂ was increased and was usually higher than the end-tidal CO₂ associated with cessation of discharge when the CO₂ was reduced. The relation of these findings to the functional organisation of respiratory neurones is discussed.

6536. PROPERTIES OF PHRENIC MOTONEURONES. P.K.Gilliland and M.Kunos. J. Physiol., Lond., 1963, 168, 258-273 (Dept. Physiol., Univ. of Utah Coll. Med., Salt Lake City, U.S.A.) ^{**} ^{f m} ^{oneutones}
of the cat were studied with intracellular electrode. The antidromic spikes showed an inflection in the rising phase. The duration of the after-hyperpolarisation was comparable with Zt of phasic to ^{*^} ^{%.%%} g5Z~. There was no correlation between the duration of after-hyperpolarisation of phrenic motoneurones and their axonal conduction velocities. There was no evidence that phrenic motoneurones receive recurrent inhibitory actions. The membrane resistance and time const. of phrenic motoneurones were both greater than those for lumbosacral motoneurones. Phrenic motoneurones showed little accommodation to continuous depolarising currents. It was concluded that phrenic motoneurones cannot be grouped with either the phasic or the tonic motoneurones of the lumbosacral cord. *

6537. EXCITATORY AND INHIBITORY ACTIONS ON PHRENIC MOTONEURONES. P.-E.GiU and MjKuno: J. Physiol., Lond., 1963, 168, 274-289 (Dept. Physiol., Univ. Utah, Coll. Med., Salt Lake City, Utah, U.S.A.) Synaptic actions on phrenic motoneurones of the cat were studied with taw^{LST} electrodes. Stimulation of the medulla at about 1 mm. cranial and 2 mm. lat. to the obex produced a P « » 8 [] phrenic motoneurones. Stimulation of the Ae "M^{*}jUa^tabom 2 mm. caudal and 3 mm. lat. to Ae obex PTM" evoked a prolonged IPSP in phrenic motoneurones. Stimulation of the contralateral phrenic nerve evoked IPSP in phrenic motoneurones. It is concluded that phrenic motoneurones are excited by descending impulses from the premotor cortex and inhibited by impulses from the expiratory centre.

6538. TRANSMISSION THROUGH CILIARY GANGLION OF THE CHICK. A.R.Martin and G.Pilar. J. Physiol., Lond., 1963, 168, 568-588. (Dept. Physiol., Univ. Tokyo, Japan) Using cats as subjects, recordings were made of single muscle spindle discharge, muscle tension, and the e.e.g. In the absence of muscle tension change, alterations in spindle discharge were attributable to gamma-motoneurones. Efferent motor activity was transiently depressed, » « - in extensors and extensors, during spontaneous spindle bursts. Pericranial cortex as well as dorsal horn bursa triggered by single pulses to caudate and thalamic nuclei. Low freq. stimm. of caudate and thalamic nuclei, inducing recruiting and augmenting waves, was also accompanied by depression of gamma-motor activity. The depressing effect was freq.-sensitive, reaching its max.

at stimulus freq. approx. 50% and 100% the freq. of spontaneous spindle waves. The magnitude of the depression was also correlated with the amplitudes of spontaneous or triggered spindle bursts. The results were discussed from the viewpoint that both spindle bursts and gamma-motor depression were the expression of a change of activity in an unidentified locus. *

6539. INHIBITION OF DISCHARGES INTO DORSAL AND VENTRAL SPINOCEREBELLAR TRACTS. J.C.Eccles. R.F.Schmidt and W.D.Willis: J. Neurophysiol., 1963, 26, 635-645 (Physiol. Dept., Aust. Nat. Univ., Canberra, Australia) Mass discharges in the dorsal spinocerebellar tract (DSCT) were evoked by Group I muscle volleys and were inhibited for more than 100 msec, by brief repetitive trains of Group I muscle afferent volleys, and also by single cutaneous volleys. The excitability of the presynaptic fibres in the region of DSCT cells showed that there was a primary afferent depolarisation with a similar time course, which is the characteristic test for presynaptic inhibition. Mass discharges in the ventral spinocerebellar tract of the contralateral side were also evoked by Group I muscle afferent volleys and likewise were similarly inhibited, but usually the inhibitory curve was briefer than for the DSCT discharge. Sometimes the inhibition reversed to a late facilitation; otherwise it may have had the characteristic duration of presynaptic inhibition. *

6540. DUAL MODE OF SYNAPTIC TRANSMISSION IN THE AVIAN CILIARY GANGLION. A.R.Martin and G.Pilar: J. Physiol., Lond., 1963, 168, 443-463 (Dept. Physiol., Univ. Utah Coll. Med., Salt Lake City, Utah, U.S.A.) Intracellular records were obtained from both pre- and post-synaptic elements in the isolated ciliary ganglion of the chick. In many ganglion cells the excitatory post-synaptic potential was preceded by a more rapid depolarisation which appeared to be due to electrical coupling between the presynaptic nerve terminals and the post-synaptic cell. This 'coupling potential' was independent of membrane polarisation and was unaffected by (+)-tubocurarine chloride. At resting membrane potential, it usually initiated the action potential. Responses to antidromic stimulation recorded from presynaptic terminals consisted of a similar coupling potential, indicating that the coupling was bi-directional. *

6541. TRANSMISSION THROUGH CILIARY GANGLION OF THE CHICK. A.R.Martin and G.Pilar. J. Physiol., Lond., 1963, 168, 464-475 (Dept. Physiol., Univ. Utah Coll. Med., Salt Lake City, Utah, U.S.A.)

Transmission through the isolated ciliary ganglion of the chick was studied by stimulating and recording from the pre- and post-ganglionic nerves. In preparation, from chicks 3-5 days old, the post-ganglionic response to pre-ganglionic stimulation contained two components. These were conducted at similar velocities but were separated by an interval of 1.6-3.0 msec. The addition of ganglionic blocking agents to the bathing solution abolished only the second component. Post-ganglionic stimulation produced a response in the preganglionic nerve, conducted antidromically through the ganglion. The results were consistent with the hypothesis that at many of the ganglionic synapses, synaptic transmission was due to electrical coupling between pre- and post-synaptic elements. In ganglia from older preparations, the coupling appeared to occur at a greater fraction of the synapses. *

PHYSIOLOGY

6542. FIXATION OF EXPERIENCE IN THE RAT SPINAL CORD. T.J.Chamberlain, P.Halick and R.W.Gerard: *J Neurophysiol.*, 1963, 26, 662-673 (Mental Health Res. List., Ann Arbor, Mich., U.S.A.) When an asymmetry in descending physiol. activity is produced by unilat. cerebellar or other lesion, the resulting asymmetrical activity in spinal motor centres is seen in postural asymmetries of the hind legs. High spinal section abolishes the descending nerve impulses and the asymmetry, providing the situation has not persisted in the rat, for 45 min. An asymmetry that has endured over 45 min. remains indefinitely. This 'fixation time' is comparable to that of other learning experiences; and the cord 'engram' is a type of fixing of experience or learning. This prep. is being studied electrically, morphol., and behaviourally, and especially for drug effects on fixation time. •

6543. A SINGLE-NEURONE INVESTIGATION OF SOMATOTOPIC ORGANISATION WITHIN THE CAT'S TRIGEMINAL BRAIN-STEM NUCLEI. LDarian-Smith, R.Proctor and R D.Ryan: *J. Physiol.*, Lond., 1963, 168, 147-157 (Sch. Physiol., Univ. New South Wales, Kensington, N.S.W., Australia) Neurones activated by electrical stimm. of each of 10 sites on the face and tongue of the cat were identified in transverse planes through the ipsilat. brain stem over the rostro-caudal extent of the trigeminal nuclei. Within the main sensory nucleus and nucleus tractus spinalis oralis there was a common pattern of projection approx. an inversion of the face with the circumoral region projection to the dorso-medial quadrant. Receptive fields (for mechanical stimm.) of these units were small. Within nucleus tractus spinalis interpolaris most neurones had large receptive fields, precluding somatotopic organisation. In nucleus tractus spinalis caudalis the projection was similar to that observed rostrally except that the density of projection from different cutaneous regions varied along the rostro-caudal axis.

6544. FUNCTIONAL ORGANISATION IN TRIGEMINAL MAIN SENSORY AND ROSTRAL SPINAL NUCLEI OF THE CAT. LDarian-Smith, G.Phillips and R-D.Ryan: *J. Physiol.*, Lond., 1963, 168, 129-146 (Sch. Physiol., Univ. New South Wales, Kensington, N.S.W., Australia) 99% of neurones excited by electrical stimm. of the ipsilat. lip within the main sensory nucleus, nucleus tractus spinalis oralis, and nucleus tractus spinalis interpolaris [NTSI] also fired on lightly touching the same area of skin. The majority of cells so identified within the main sensory nucleus and nucleus tractus spinalis oralis had an axon projection to the contralat. arcuate nucleus of the thalamus, identified by antidromic discharge of the cell following electrical stimm. of the thalamus. Along the ventro-medial margin of these nuclei neurones were trans-synaptically activated by this stimulus. Cells within NTSI did not have an axon projection to the contralat. arcuate nucleus; they were trans-synaptically excited from this region. Their receptive fields were large and included most of the ipsilat. face. •

6545. ACh SENSITIVITY OF CAT'S MEDULLARY NEURONES. G.C Salmoiragh and F.A.Steinen *J. Neu-ophysiol.*, 1963, 26, 581-597 (Clin. Neuropharmacol. Res. Cente., NIMH, NIH. St. Elizabeths Hosp., Washington, D.C, U.S.A.) The presence of ACh-sensitive neurones in the cat's medulla was demonstrated by means of electrophoretic administration of

chem. substances in the immediate vicinity of individual nerve cells using five-barrelled micropipette electrodes. Of 819 nerve cells tested, 21 • 9% increased and 6•7% decreased their rate of activity during ACh administration. Onset and disappearance of change werft delayed with respect to duration of ACh tests. Response of ACh sensitive nerve cells to ACh was enhanced by electrophoretic administration of physostigmine to the cell and could be blocked by administration of dihydro-8-erythroidine and hexamethonium. Only two of the 34 respiratory nerve cells investigated were ACh sensitive, both were expiratory neurones. Of these, one unit decreased while the other increased its discharge rate during ACh tests. *

6546. EFFECTS OF SUSTAINED PERfusion COOLING OF SUBARACHNOID SPACE. M.S.Albin, RJ.White and C.S.MacCarty: *Anaesthesiology*, 1963, 24, 72-80 (Sect. Neurol. Surg., Mayo Clinic, Rochester, Minn-t U.S.A.) The temp. of the spinal cord in the dog was reduced selectively by perfusion of cold fluid through the subarachnoid space. Sustained cooling of the spinal cord to mean temp, as low as 5•86° and 6•33° had no deleterious effect on the spinal cord of dogs which could be attributed to cold per se. Spinal cords of dogs were maintained at low temp, for 4 hr., without any neurol. sequel* and with little histopathol. evidence of cord damage. AU 5 animals so treated survived the 4 hr. subarachnoid cooling. A.A.Zimmerman

6547. ANTIDROMIC ACTIVATION OF NEURONES OF RETICULAR FORMATION OF BRAIN STEM. F.Magni and W.D.Willis: *Nature*, Lond., 1963, 198, 592-594 (Inst. Fisiol. Umana Univ. Pisa, Italy) In adult cats from which the cerebellum was removed by suction, reticular neurones could be identified, by intracellular recording techniques, after antidromic activation. Some cells were found to send axons both rostrally and caudally* G.M.Lewis

6548. ANALYSIS OF INHIBITORY INFLUENCE OF BULBAR RETICULAR FORMATION UPON SUDOMOTOR ACTIVITY. T.Yokota, A.Sato and B.Fujimori: *Jap. J. Physiol.*, 1963, 13, 145-154 (Dept. Physiol., Hokkaido Univ. Sch. Med., Sapporo, Japan)

Response patterns of skin potential due to brain stimm. in cats immobilised with Flaxedil showed inhibitory response marked with increase in strength, pulse duration and freq., elicited from the bulbar ventromedial reticular formation. In parts of the medulla surrounding the inhibitory area inhibitory response was evoked at high freq. Analysis of post-inhibitory rebound following bulbar stimm. revealed that there existed an optimum duration of brain stimm. which causes a max. of rebound.

MJ.Bell

6549. INHIBITION OF SYMPATHETIC ACTIVITY BY STIMULATION OF LIMBIC SYSTEM. T.Yokota, A.Sato and B.Fujimori: *Jap. J. Physiol.*, 1963, 13, 138-144 (Dept. Physiol., Hokkaido Univ. Sch. Med., Sapporo, Japan) Vasomotor and sudomotor activities were investigated by recording b.p. and skin potential on bilaterally vagotomised cats. Results suggest that the limbic system areas involved are divided into two groups * the hippocampus-fornix, stimm. inhibiting both vaso- and sudomotor activities, and the amygdala and lat. pre*optic area, stimm. affecting sudomotor activity only. These results show that as far as sympathetic inhibbn. is concerned, effects of brain stimm. are not always diffusely observed on some effector organs. MJ.Bell

6550. SOME FUNCTIONS OF THE SUPERIOR OLIVARY COMPLEX IN AUDITORY INTENSITY DISCRIMINATION. G.L.Fisher and J.M.Harrison: *J. comp. Neurol.*, 1962, 119, 269-279 (*Psychol. Lab., Boston Univ., Boston, Mass., U.S.A.*) Complete bilat. destruction of the accessory superior olive and/or the nucleus of the "apezoid body had no material effect on the auditory discriminative threshold. Extensive bilat. damage to all components of the superior olivary complex raised the auditory discriminative threshold to values between 58 and 100 decibels, about the same as by cutting the acoustic nerve. The dorsal acoustic pathway does not appear to have any function in auditory intensity discrimination, nor did the region of origin of the ohvo-cochlear tract. G.M.Lewis

6551. NEUROPHYSIOLOGICAL INVESTIGATIONS OF THE BAT, MYOTIS LUCIFUGUS, STIMULATED BY FREQUENCY MODULATED ACOUSTICAL PULSE. A.D.Grinnell and J.J.G.McCue: *Nature, Lond.*, 1963, 198, 453-455 (*Harvard Univ., Cambridge, Mass., U.S.A.*) Neural responses to freq. modulated [FM] pulses were investigated in *M. lucifugus* by means of electrodes in the post. colliculus. Segments of the pulse were separated by const. freq. [CF] segments bating 0<5 msec, or longer, separate evoked potentials were evoked. Responses to passage through a particular frequency were noted. The presence of units preferentially sensitive to either CF or FM pulses was indicated. FM was more effective than CF in evoking potentials and facilitated response to pulses following at short intervals. Two potential could be elicited even when 2 pulses overlapped. G.M.Lewis

6552. FINE STRUCTURE OF TAPETUM CELLULOSUM. C.Pedlen *Exp. Eye Res.*, 1963, 2, 189-195 (*Dept. Anat., Inst. Ophthalmol., London, England*) This paper reports detailed observations on the fine organisation of the tapetal cell in the cat. describes some Ganglion structures produced by immersion fixation of varying tonicity and discusses their relevance. Mechanism of tapetal reflection. J.Whiting

6553. PLASMA CORTICOSTEROIDS: CHANGES IN CONCENTRATION AFTER STIMULATION OF HIPPOCAMPUS AND AMYGDALA. A.J.Mandell, L.F. Chapman, R.W.Rand and R.D.Walter: *Science*, 1963, 139, 124 (*Neuropsychiatric Inst., Calif., U.S.A.*) Electrical stimulation of the hippocampus and amygdala was followed by elevation of plasma corticosteroids. Hippocampal stimulation resulted in a decreased corticosteroid level, followed in 2 instances by a secondary elevation. These results support the view that the hippocampus and amygdala of the brain are closely related to the adrenal stress response mechanism. O.M.Lewis

6554. HIPPOCAMPUS OF THE BRAIN. I. INHIBITION IN HIPPOCAMPUS WITH IDENTIFICATION OF THE INHIBITORY CELL AND ITS APSES. P.Andersen, J.C.Eccles and Y. Yamada: *Ultrastructure of Hippocampal Axo-Somatic Synapses*. T.W.Blackstad and P.R.Flood: *Nature, Lond.*, 1963, 198, 540-542, 542-543 (*Dept. of Anatomy, Australian Nat. Univ., Canberra, Australia*) In anaesthetised cats in which the neocortex had been sucked away to expose the hippocampal formation, recordings were made with microelectrodes from the commissural, septal and fissural areas. Large inhibitory postsynaptic

potentials of long duration were produced and the inhibitory pathway identified. It is suggested that the basket cells receive excitatory synapses from axon collaterals of pyramidal cells and form inhibitory synaptic endings on the somas of pyramidal cells.

II. ULTRASTRUCTURE OF AXO-SOMATIC JUNCTIONS IN THE HIPPOCAMPUS OF GUINEA-PIGS AND RATS. E.M. in section stained with uranyl acetate or PbO. G.M.Lewis

6555. HIPPOCAMPUS AS SITE OF ORIGIN OF SEIZURE DISCHARGE PRODUCED BY TUBOCURARINE ACTING FROM THE CEREBRAL VENTRICLES. W.Feldberg and K.Fleischhauer: *J. Physiol., Lond.*, 1963, 168, 435-442 (*Nat. Inst. Med. Res., Mill Hill, London, England*) The electrical activity of the occipital cortex, amygdala and hippocampus is recorded monopolarly, in cats anaesthetised with chloralose or pentobarbitone Na whilst tubocurarine is perfused from one, and artificial c.s.f. from the other lat. ventricle to aqueduct. The abnormal discharge recorded in the cortical e.e.g. under this condition originates in the hippocampus, where it appears first; it then spreads to the ipsilateral occipital cortex. There is little spread to the contralateral cortex. The abnormal discharge in the amygdala which appears last of all is also explained by spread of the hippocampal discharge. The abnormal discharge in the hippocampal lead is of opposite polarity to that in the cortical and amygdaloid leads.

6556. RESPONSES OF MITRAL CELLS TO STIMULATION OF THE LATERAL OLFACTORY TRACT IN THE RABBIT. C.G.Phillips, T.P.S.Powell and G.M.Shepherd: *J. Physiol., Lond.*, 1963, 168, 65-88 (*Dept. of Physiology, Univ., Oxford, England*) Mitral cells in the olfactory bulbs of anaesthetised rabbits have been localised by a physiol. method and identified by their antidromic responses to lat. olfactory tract volleys. "Giant spikes", with prop, similar to those of motoneurones, have been obtained with extracellular micropipette recordings. Weak volleys, below threshold for a mitral cell axon, often exert a long-lasting blockage of subsequent antidromic invasion into that cell, and intracellular recordings show a corresponding hyperpolarisation of the cell membrane. It is suggested that the blockage is mediated by polysynaptic intrabulbar neuronal systems.

6557. RESPONSES OF MITRAL CELLS TO OLFACTORY NERVE VOLLEYS IN THE RABBIT. G.M. Shepherd: *J. Physiol., Lond.*, 1963, 168, 89-100 (*Physiol. Lab., Univ., Oxford, England*) "Giant" extracellular spikes have been recorded extracellularly with micropipettes from identified mitral cells in the olfactory bulbs of anaesthetised rabbits. They respond singly to each volley in an olfactory nerve rootlet, with prop, of synaptic excitation similar to those in motoneurones. Conditioning volleys, too weak to activate a mitral cell, sometimes produce a long-lasting blockage of testing antidromic impulses. This blockage closely resembles that which follows conditioning volleys in the lat. olfactory tract. It is concluded that common intrabulbar pathways ending on mitral secondary dendrites are involved.

6558. NEURONAL SYSTEMS CONTROLLING MITRAL CELL EXCITABILITY. G.M.Shepherd: *J. Physiol., Lond.*, 1963, 168, 101-117 (*Physiol. Lab., Univ., Oxford, England*) In anaesthetised rabbits, olfactory nerve volleys elicit extracellularly-recorded spikes in units which have been localised in the olfactory bulb by a physiol. method. The responses of presumed glomerular short-axon cells range from single spikes to high-freq.

PHYSIOLOGY

bursts. Presumed tufted cells respond singly to a volley in either olfactory nerves or lat. olfactory tract. Presumed granule cells respond singly or repetitively to these volleys. It is concluded that axon collaterals of mitral cells excite granule cells and tufted cells, and that these cells depress mitral cell excitability. The physiol. results largely confirm the anat. pathways proposed by Cajal, and provide evidence for the excitatory or inhibitory nature of the connections.

6559. OLFACTORY BULB RESPONSE TO ANTIDROMIC OLFACTORY TRACT STIMULATION IN RABBIT.

J.OchL Jap. J. Physiol., 1963, 13, 113-128 (Dept. Physiol., Kyoto Prefectural Univ. Med., Kyoto, Japan) Typical tract response consisted in the shallower layers of an initial pos.-neg.-spike, a second ieg. component and a slow neg. wave; in the deeper layers the 2 early components were followed by an initial neg. sp?ke and , slow pos. wave, while the slow neg. wave increased in size. The deep initial sp?ke v/a* a.i. i.r.; idromic volley in mitral cell axons and became through the mitral cell bodies the shallower initial pos.-neg. spike propagated at about 0'5 m./sec towards the apical dendrites. The second neg. component was shown - by the effects of asphyxia, local curarisation, and behaviour to repetitive stimn. of the ant. commissure and olfactory tract - to be due to basal dendrite activities activated synaptically through recurrent axon collaterals of the mitral cells. The deep slow pos. wave was the condensed source of the second neg. component of the whole bulb cortex and the slow neg. wave was due to activity of interval granular cells.

M.J.Bell

6560. DISTRIBUTION OF ACETYLCHOLINE IN BRAIN DURING VARIOUS STATES OF ACTIVITY.

M.Kurokawa, Y.Machiyama and M.Kato: J. Neurochem., 1963, 10, 341-348 (Inst. Brain Res. and Dept. Neuropsych., Med. Fac, Tokyo Univ., Japan) Over 50% of the 20 μ jimoles ACh/g. fresh wt. mouse brain homogenised in O'32M sucrose-essene was found in the 22500 £ 20 min. residue. Resuspension of the pellet in 0'032M sucrose-essene caused partial solubilisation of ACh referred to as 'labile' ACh. Labile ACh was higher in a convulsive strain of mouse although bound ACh was normal. Evidence is presented which suggests that changes in total ACh values during convulsion and anaesthesia are due 'o changes in 'labile' ACh only.

R.Woodman

6561. RAPID CHANGES IN CREATINE [CP] AND ADENOSINE PHOSPHATES OF CEREBRAL CORTEX SLICES ON ELECTRICAL STIMULATION WITH SPECIAL REFERENCE TO EFFECT OF ETHANOL [ET].

H.Wallgren: J. Neurochem., 1963, 10, 349-362 (Res. Lab., State Alcohol Monopoly (Alko) Helsinki, Finland) A new and cheaper apparatus for the electrical stimm. of cerebral slices in Warburg vessels is described with an automatic device for rapid injn. of fixing fluid at a preset time into the flasks. Using rat brain adenosine phosphates were unaffected by stimm. or 0^04% ET. CN* (5mM) plus μ -chloromercuribenzoate [PCMB] at 2mM produced a sharp fall in ATP after 90 sec. exposure but AMP and ADP rose slightly. Stimn. increased this loss. CP fell at 1250 μ jimoles/g. fresh wt./hr. between 2 and 4 sec. stimn. and recovered from a 7 sec. stimn. period at 270 μ jimoles/g./hr. 04 μ f_y ET halved the role of fall but recovery was unaffected. CP was depressed by CN" and PCMB. Sp. activity of the terminal phosphate of AT 32p attained by metabolic turnover of H₂³PO₄" was depressed by stimn. but this could be prevented by ET

R.Woodman

6562. CHARACTERISTICS REQUIRED IN ELECTRICAL PULSES OF RECTANGULAR TIME-VOLTAGE RELATIONSHIPS FOR METABOLIC CHANGE AND ION MOVEMENTS IN MAMMALIAN CEREBRAL TISSUES.

H.McIlwain and Pjoanny: J. Neurochem., 1963, 10, 313-323 (Biochem. Dept., Inst. Psych. Maudsley Hosp., London, England) The loss of K+, gain in intracellular Na+and increased respiration of guinea-pig cerebral slices in response to pulses began at applied

potentials of 1-2V and were max. at 7 $\frac{1}{2}$ V. -Response increased to a max. with pulse duration from 0'03 to 0'4 msec, and with freq. from 2 to 30 c/s. Rates of K+and Na⁺ changes were equiv. only up to 5 c/s when respiratory responses were half max. Respiratory response v/as diminished with 30 μ M chlorpromazine, 500 μ M phenobarbitone and 65 μ M tetrahydroaminoacridine. 2 pM protoveratrone A increased respiratory response at 2 c/s but not at 20 c/s. No effects were observed with 1 and 3mM trimethadione, pitressin(0'4 or 2 U/ml.), oxytocin (1 and 5 U/ml*), or a certain uterine muscle stimulant.

6564. CORTICAL STEADY POTENTIAL CHANGES: EXTRACELLULAR MICROELECTRODE INVESTIGATIONS. C.-L.Li and G.-C.Salmoiragh; Nature, Lond., 1963, 198, 858-859 (Nat. Inst. Hlth., Bethesda, Md., U.S.A.)

Cortical steady potential recorded in cats from the surface showed localised and neg. shifts following direct cortical, transcallosal or thalamic stimn., but recordings from the depth of the somatosensory cortex showed no clear relation to changes at the surface or to discharge activity of cortical nerve cells.

G.M.Lewis

6565. INTRACELLULAR POTENTIALS OF CORTICAL NEURONES DURING FOCAL EPILEPTOGENIC DISCHARGES. E.S.Goldensohn and D.P.Purpura: Science, 1963, 139, 840-842 (Dept. Neurol., Coll. Phys. and Surg., Columbia Univ., New York, U.S.A.) Focal e.e.g. discharges in lesions of cat cortex induced by freezing are associated with prolonged membrane depolarisations and hyperpolarisations in neurones located & various depths in the lesion sites. Transmembrane potential changes have prop. similar to those of post-synaptic potentials. The temporal relationship between intracellular potentials and paroxysmal discharges indicates that the latter are extracellularly recorded summations of synchronously developing depolarisations and hyperpolarisations in complex synaptic organisations of neurones.

G.M.Lewis

6566. EFFECT OF EXTRACTS FROM URINE OF SCHIZOPHRENIC PATIENTS ON EVOKED CORTICAL RESPONSES IN THE RAT. G.A.German and D.Kemali: Nature, Lond., 1963, 198, 791-792 (Dept. Physiol., Univ. Aberdeen, Scotland) Extracts from the urine of

schizophrenic patients in contact with the exposed cerebrf cortex of the rat significantly increased the amplitude of evoked responses to electrical somatic stimn. Urine frofl normal persons produced a slight and transient increase & amplitude of the responses. The results are in agreement with previous observations on the effect of sera from schizophrenics.

6572. AUDITORY PATHWAY OF THE EPILEPTIC WALTZING MOUSE. I. A COMPARISON OF THE ACOUSTIC PATHWAYS OF THE NORMAL MOUSE WITH THOSE OF THE TOTALLY DEAF EPILEPTIC WALTZER. M.D.Ross: J. comp. Neurol., 1962, 119, 317-339 (Dept. Anat., Med. Center, Univ. Michigan, Ann Arbor, Mich., U.S.A.) In deaf, epileptic waltzer mice, there is a lack of organisation in the acoustic centres, and atrophy of the ventral cochlear nuclei. Older epileptic waltzers evidently become deaf due to degenerative changes throughout the entire auditory system, particularly in the primary acoustic nuclei. G.M.Lewis

6573. FUNCTIONAL SIGNIFICANCE OF RECRUITING POTENTIAL MECHANISM WHEN USED AS CONDITIONAL STIMULUS FOR ELABORATION OF AVOID-ANCE REFLEX. E.GrastaySn, G.T.Sakhiulina and L.AngySru Acta physiol. Acad. Sci. hung., 1963, 23, 155-167 (Inst. Physiol., Med. Univ., PScs, Hungary) Stimn. of the thalamus in cats which elicits recruiting potentials can be used for conditioning. It appears however that the essential factor involved is the after effect of the stimn. rather than stimn. per se. In cond. refl. with const. latencies it is possible to show that stimn. itself had a direct inhibitory effect on the cond. refl. H.G.Bevan

6574. REVERSIBLE SECTION OF THE BRAIN BY A WALL OF COLD. R.Byck and P.Dirilit Science, 1963, 139, 1216-1218 (Clin. Neuropharmacol. Res. Center, Nat. Inst. Mental Hlth., St. Elizabeth's Hosp., Washington, U.S.A.) A fork constructed of stainless steel hollow tubing may be chronically implanted in the cat's brain. When cooling fluid is pumped through the fork, a reversible plane lesion is formed. By this method functional parts of the c.n.s. may be analysed in unanaesthetised animals. G.M.Lewis

6575. PENETRATION OF LIGHT INTO BRAIN OF MAMMALS. W.F.Ganong, M.D.Shepherd, J-R-Wall, E.E.Vanbrunt and M.T.Clegg: Endocrinology, 1963, 72, 962-963 (Physiol. Dept., California Univ., San Francisco Med. Cen., San Francisco, Calif., U.S.A.) A light sensitive photo voltaic cell has been implanted in the hypothalamus and temporal lobe of sheep and dogs and in the hypothalamus of a rabbit and a rat. The amount of light entering the brain was found to be inversely proportional to animal size. H.C.Jones

SENSE ORGANS

6576. IMBIBITION PRESSURE OF CORNEAL STROMA. B.O.Hedbys, S.Michima and D.M.Maurice: Exp. Eye Res., 1963, 2, 99-111 (Corneal Res. Unit., Dept. Clin. Eye Res., Inst. Biol. and Med. Sci., Retina Found., Boston, Mass., U.S.A.) A fine saline-filled cannula connected to a manometer of very low vol. displacement and leakage is introduced into an excised corneal stroma. A neg. pressure is recorded equal to the swelling pressure of the tissue at all values of its hydration. Cannulation of the cornea of a living rabbit results in a neg. pressure which, allowing for intraocular pressure, corresponds to the swelling pressure of the excised tissue. Thus the stroma has a tendency to swell in vivo which must be countered by an active transport mechanism

PHYSIOLOGY

located in the limiting layers of the cornea. Only a fraction of the imbibition pressure can arise from osmotic forces, the remainder probably arising from internal structural forces required to maintain the transparency of the tissue.

J. Whiting

6577. CORNEAL RESISTANCE TO FLOW OF WATER AFTER ENZYMIC DIGESTION. B.O.Hedbys: *Exp. Eye Res.*, 1963, 2, 112-121 (Corneal Res. Unit, Dept. Clin. Eye Res., Inst. Biol. and Med. Sci., Retina Foundn., Boston, Mass., U.S.A.) The resistance of the corneal stroma to the flow of water has been studied. A method previously described for measuring the flow of water across the stroma was employed. To evaluate the role of the interfibrillar substance in the resistance, the flow conductivity was determined in stroma gradually digested with testicular hyaluronidase or trypsin. A considerable increase in flow conductivity was observed and could be related to a reduced polysaccharide content. The expt. support the assumption that polysaccharides constitute an important factor in the corneal resistance to the flow of water. The possibility that the non-collagenous proteins also are important cannot be excluded.

J.Whiting

6578. NEW METHOD FOR DETERMINATION OF SWELLING PRESSURE OF CORNEAL STROMA IN VITRO. B.O.Hedbys and C.H.Dohlmaier: *Exp. Eye Res.*, 1963, 2, 122-129 (Corneal Res. Unit, Dept. Clin. Eye Res., Inst. Biol. and Med. Sci., Retina Foundn., Boston, Mass., U.S.A.) A new method for determining the swelling pressure of the corneal stroma and sclera has been developed. A tissue button of any degree of hydration is placed between two glass filters, the upper movable and connected to a capacitance transducer, the lower fixed. The force produced by slight swelling when the tissue is in contact with 0.9% NaCl is recorded. The transducer restricts the swelling, therefore a steady force is rapidly reached. Sheep, rabbit and human corneal stroma and sclera were used over a wide range of hydration. The swelling pressure of normal corneal stroma was about 60 mm. Hg and that of normal sclera was about 17 mm. Hg. The swelling pressure of the sclera showed greater dependence on hydration than did that of the corneal stroma.

J.Whiting

6579. ELASTIC PROPERTIES OF LENS. Y.Kikkawa and T.Sato: *Exp. Eye Res.*, 1963, 2, 210-215 (2nd Dept. Physiol., Univ., Osaka, Japan) The visco-elastic prop. of the cryst. lens have been studied with the use of a mechano-electric transducer. Applications of an external force to the lens caused rapid deformation followed by a second phase of further deformation. On removal of the force, a rapid partial reversal of the deformation occurred and was followed by gradual restoration; complete recovery was not achieved. It was also found that the lens capsule has true elasticity, whereas the lens substance has plastic prop.

J.Whiting

6580. ADRENAL CORTEX AND AQUEOUS HUMOUR DYNAMICS. E.Linnerand P.J.Wistrand: *Exp. Eye Res.*, 1963, 2, 148-159 (Dept. Ophthalmol., Univ., Gothenburg, Sweden) The intraocular pressure was recorded manometrically or tonometrically in anaesthetised and unanaesthetised rabbits. Facility of aq. humour outflow was measured by an in vivo perfusion technique and by tonography. The rate of aq. humour flow was calc. from direct measurement of intraocular pressure, episcleral venous pressure and facility of outflow. Bilat.

adrenalectomy lowered the intraocular pressure by decreasing the aq. production, but hardly affected the facility of outflow and episcleral venous pressure. There was no significant correlation between the degree of reduction of flow or pressure and the concn. of Na, K, and Cl⁻ in venous plasma. Systemic administration of corticosteroids over both short and long periods did not influence the resistance to outflow or significantly restore the pressure and flow in adrenalectomised animals. No correlation of the eye parameters with plasma-electrolytes was found.

6581. CONSENSUAL INTRAOCULAR PRESSURE CHANGES RESULTING FROM UNILATERAL EXTRAOCULAR MUSCLE CONTRACTION. N.Krishna and S.Y.Botelho: *Exp. Eye Res.*, 1963, 2, 173-181 (Dept. Ophthalmol., Graduate Sch. Med., Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) Direct stimn. of one lat. rectus muscle produced an increase in ipsilat. intraocular pressure and changes in the contralat. intraocular pressure, which were both independent of changes in respiration and systemic arterial pressure. The magnitude and type of consensual response varied and were not correlated with either the increase in ipsilat. muscle tension or ipsilat. intraocular pressure. Evidence is presented to support the hypothesis that the consensual response is neurogenic. The adequate stimulus for the reflex appeared to be increased tension produced by contraction of an attendant increase in * ipsilat. intraocular pressure, suggesting the receptors lie at or near the junction of the muscle and sclera and respond more readily to changes in tension rather than in length. The afferent pathway appeared to be other than the sixth cranial nerve and the efferent pathway was not somatic.

6582. REFRACTION OF PREMATURE BABIES' EYES. M.V.Graham and O.P.Gray: *Brit. med. J.*, 1963, i, 1452-1454 (Welsh Nat. Sch. Med., Cardiff, Wales) Cycloplegia was obtained by instillation of 0.05% hyoscine and retinoscopy performed in 150 premature and 98 full term babies. Moderate hypermetropia was the rule in the full term group whereas premature infants showed a tendency to low myopia or emmetropia. There was no relationship between the refractory state of premature infants and the duration of their exposure to O₂ not > 38% in incubators.

M.E.Nutt

6583. QUANTAL ABSORPTION AND ELECTRORETINOGRAM. T.P.Williams: *Nature*, Lond., 1963, 198, 964-965 (Psychol. Dept., Brown Univ., Providence, R.I., U.S.A.) The hypothesis is presented that the individual electrical responses in the retina are related to the individual acts of quantal absorption. A mathematical model is constructed which calculates the distribution of absorbed quanta over a group of receptors and also relates the no. of quanta in each outer segment to discrete increments of electrical response, the summation of which is taken to be the overall e.r.g. response. The model is used to calculate both a- and b-wave magnitude as functions of input density.

J.R.Sargent

6584. INDEPENDENCE AND INTERDEPENDENCE IN ON AND OFF VISUAL STIMULI. R-H.Peckham, W.H.Hart and J.K.Peckham: *Vision Res.*, 1963, 3, 187-188 (Eye Res. Foundn., Bethesda, Md., U.S.A.) The ON and OFF responses have been considered previously to be phases of a single stimulus, but different effects are observed especially in the study of e.r.g. Other workers have shown that spike discharges occur separately for ON and

PHYSIOLOGY

637

OFF. The results of the authors' geometrical analysis of Photopic frog e.r.g. are described, and from these records they conclude that the ON-continuing-OFF stimulus complex is quite different from the OFF-continuing-ON complex. They further conclude that the ON and OFF instants each represent a discrete stimulus.

Flicker* stimn. is described in terms of the hypothesis, the advantages of which are stated. J.Whiting

6585. EFFECT OF LOCAL LIGHT ON DIFFUSE OFF-RESPONSE OF EXCISED FROG RETINA. G.Kiebel and J.H.Jacobson: Vision Res., 1963, 3, 131-134 (Dept. Res., New York Eye and Ear Infirmary, U.S.A.)

The OFF-response to diffuse light of the excised retina of *Bana pipie* recorded by a 250 μ Pt-Ir electrode on receptor side and a Ag plate electrode covering the vitreous side, receptor side placed upward toward the air. The electrical response to a diffuse light going off was "eg., receptor relative to vitreous side. If a local light of greater intensity than the diffuse light is applied to the retina in the region of the Pt electrode, at the time the diffuse light is turned off the electrical response of the retina is now pos. receptor relative to vitreous side. Changes in this effect with changes in intensity of local and diffuse lights have been observed. The significance of this effect is discussed. J. Whiting

6586. OSCILLATORY POTENTIAL IN ELECTRORETINOGRAM. D.Yonemura, Y.Masuda and M.Hatta: Jap. J. Physiol., 1963, 13, 128-137 (Dept. Ophthalmol., Sch. Med. Univ., Kanazawa, Japan) A no. of vertebrates (cat, rabbit, guinea-pig, Pigeon, chicken, tortoise, frog and lamprey) were studied. Special ref. is made to multiple wavelet! which are comparable with the oscillator⁷pSteUal in the human e.r.g. These wavelets were superimposed on the slow waves and spaced at nearly 1 S T S with little ref. to the intensity of light. Evidence suggests that the oscillatory Potential *h* located in or near the bipolar cell layer and that it may actually be a distinct component. M.J.I.

6587. INTERACTION OF X-RAYS AND LIGHT IN PRODUCTION OF ELECTRORETINOGRAM. C.S.Bachofer and S.E.Wittry: Exp. Eye Res., 1963, 2, 141-147 (Dept. Biol., Univ. N.Y.U. N.Y., U.S.A.) E.r.g. in response to single flashes « X-rays and

ability of the retina to respond to short stimulus. The retina recovered compicixjr i»" *")J" echoes of X-r V at different freq. of summ. Thuadaptation.

Flashes of X-rays delivered to the retina during adaptation.

The pattern[^] adaptation was different in these situations, but in both the retina was incapable of adapting. Efficient adaptation to produce an e.r.g. of max[^] amplitude under these conditions.

6588. CONTACT SUCTION FOR ELECTRORETINOGRAPHY. J.SvXrsk and J.Peregin: Vision Res., 1963,

Inst. Physiol., Králové, Czechoslovakia contact electrode for e.r.g. purposes has been designed consisting of a plate of the bulb 6 mm. in diam., which clings to the bulb. Suction of the examined eye when pressure has been produced by means

eye dropper. The device permits simult. e.r.g. records from both eyes; it is well tolerated and has proved useful in clinical trials. J. Whiting

6589. EFFECTS OF GLUCOSE AND OXYGEN DEPRIVATION ON FUNCTION OF ISOLATED MAMMALIAN RETINA. A.Ames, m and B.S.Gurian: J. Neurophysiol., 1963, 26, 617-634 (Massachusetts Gen. Hosp., Boston, Mass., U.S.A.) Light-evoked compound action

potentials were recorded from the optic nerve of isolated rabbit retina, maintained at 3(f. The evoked potentials disappeared after 4 min. of anoxia, but when O₂ was resupplied recovery was rapid and complete even after 60 min. deprivations. Without glucose, response amplitude fell to 40% in 4 min. and to 0% in 60 min.; about 66% of the initial amplitude was recoverable after 60 min. deprivations. Recovery after simult. deprivation of O₂ and glucose was markedly delayed but finally as complete as after deprivation of glucose alone. Elevating the temp. 7° reduced by threefold the duration of the combined deprivation that could be reversibly sustained. Effects of reducing O₂ and glucose to intermediate levels and of adding other nutrients were also examined.

6590. OSCILLATORY POTENTIALS IN VISUAL SYSTEM OF CATS AND MONKEYS. R.W.Doty and D.S.Kimura: J. Physiol., Lond., 1963, 168, 205-218 (Center Brain Res., Univ., Rochester, N.Y., U.S.A.) Retinal

ganglion cells discharge in grouped bursts at rhythms of 50-160 groups per sec. following or during a brief, brilliant flash. Stimn. of the optic nerve can block a grouped burst, but does not reset the rhythm. It can also elicit a moderate degree of rhythmic burst activity in the retina of cats unanaesthetised following midpontine pre-trigeminal transection of the brain stem. The grouped activity is recorded from the optic tract or nerve as a sinusoidal potential. In unanaesthetised monkeys with permanently implanted electrodes the rhythm is preserved to the level of the striate cortex. Under light barbiturate anaesthesia continuous sinusoidal rhythms at 3-30/sec. sometimes appear in the optic tract after several sec. of darkness.

6591. ELECTRORETINOGRAM OF THE SQUIRREL MONKEY. G.H.Jacobs, A.E.Jones and R.L.de Valois: J. comp. physiol. Psychol., 1963, 56, 405-409 (Indiana Univ., Ind., U.S.A.) E.r.g. recordings from squirrel monkeys of responses to monochromatic light showed basically the same characteristic wave form as the human e.r.g., except that x-wave components were found. Demonstration of a Purkinje shift showed differentiation of the scotopic and photopic components. J.R.Broome

6592. EFFECTS OF ETHYL ALCOHOL ON EVOKED POTENTIAL OF HUMAN EYE. H.Ikeda: Vision Res., 1963, 3, 155-169 (Dept. Expt. Ophthalmol., Inst. Ophthalmol., Judd St., London, England) The effect of ethyl alcohol on the human e.r.g. was studied. The amplitude of the Jb-wave evoked by a single flash under a state of complete dark-adaptation was increased, both the rise and recovery times were slowed, and no change in the amplitude of the ji-wave was observed after administration of alcohol. The amplitude of the t-wave decreased in the flicker e.r.g., and the e.r.g. fusion freq. was lowered. The observed effects indicate that the eye influenced by alcohol is highly sensitive to light, but so slow in response that it is incapable of following a rapidly repetitive stimulus. These effects are essentially similar to dark-adaptation. The effects appear to occur in the

PHYSIOLOGY

neural layer of the retina. It is suggested that a change in neural organisation similar to that occurring in dark-adaptation can be expected to occur with alcohol, the change appearing to be an increase in summative mechanism of the receptor neurones at the bipolar cells*

6595. A CONE PIGMENT IN THE PROTANOPE.

W. A. H. Rush ton; J. Physiol., Lond., 1963, 168, 345-359 (Physiol. Lab., Univ., Cambridge, England)

The method of reflection densitometry was applied to the fovea of protanopes (red-blind dichromats), since in these subjects only one sensitive pigment is found and the analysis is consequently easier. Details of the apparatus and its application are given. Prelim. investigation shows that the foveal pigment so measured bleaches in the light and regenerates in the dark in the manner to be expected of the cone pigment. Only one pigment is present, for bleaching either by red light or blue-green results in the same difference spectrum. This photo-sensitive pigment is the visual pigment by means of which the protanope judges brightness, for lights of various wavelengths matched by the protanope as to brightness were found all to bleach the pigment with equal efficacy. This protanope cone pigment has its max. sensitivity at 540 mji, it is probably the 'green pigment*' of the Young-Helmholtz 3-colour theory, and hence it is named •Chlorolabe* (=green catching). •

6596. DENSITY OF CHLOROLABE IN FOVEAL CONES OF THE PROTANOPE. W.A.H.Rushton: J. Risiol., Lond., 1963, 168, 360-373 (Physiol. Lab., Univ., Cambridge, England)

A double differential densitometry technique was devised to estimate the true density of a visual pigment in the cone by its self-screening. This was applied to the foveal cones of protanopes where only one pigment, chlorolabe, is detectable. Its density was about 0.15 which is similar to that of rhodopsin in rods. It is probable that both rods and cones absorb about 10% of the light incident upon the cornea with wavelengths corresponding to peak absorption. A nomogram is given to convert densitometer measurements into true values of chlorolabe density. •

6597. CONE PIGMENT KINETICS IN THE PROTANOPE.

W.A.H.Rushton: J. Physiol., Lond., 1963, 168, 374-388 (Physiol. Lab., Univ., Cambridge, England)

The level of cone pigment (chlorolabe) on the protanope's fovea was measured in bleaching and regeneration by the technique of retinal densitometry, and the readings converted into density of chlorolabe by the appropriate nomogram. The bleaching rate was proportional to light intensity and pigment concn. (as it is in rhodopsin soln.) and the photosensitivity was about 8 times as great as it is

in soln. The rate of the regeneration process w#s measured both in darkness and in various strong lights and depended upon the amount of pigment still bleached, but not upon the presence of light. Bleaching and regeneration are independent processes and a very general equation is derived which describes the kinetics with no arbitrary const. The visual dark-adaptation curve plotted as log threshold against time fits the time course of regeneration so that cone log threshold is linear with the amount of chlorolabe present as rod log threshold is with rhodopsin. The high photosensitivity of chlorolabe is attributed to orientation of the mol. in cone structure and to funnelling of light from the wide inner into the narrow outer segment of the cones. •

6598. OPTOKINETIC NYSTAGMUS AND ITS INTERACTION WITH CENTRAL NYSTAGMUS. F.Bergmann, M.Chaimovitz, J.Gutman and S.ZelJg: J. Physiol., Lond., 1963, 168, 318-331 (Dept. Pharmacol., Hebrew Univ.-Hadassah Med. Sch., Jerusalem, Israel)

Central nystagmus was evoked by electrical stimm. of the nystagmogenic area in the diencephalon of the rabbit, medial to the lat. geniculate body. Optokinetic nystagmus was elicited by a rotating drum, equipped inside with black stripes on a white background. The optokinetic response increases with the angular velocity of the drum, until a max. rate is reached. Beyond the max., the response declines again to vanish at the optokinetic fision limit. Optokinetic stimm. activates central nystagmus irrespective of the relative direction of the two responses. Enhancement of central by optokinetic nystagmus is observed even beyond the optokinetic fusion limit, but decreases at still higher angular velocities to reach finally the 'optokinetic activation limit'. Optokinetic fusion cannot be a consequence of failure of the retina to follow very rapid stimm. by moving objects, but must be ascribed to a central inhibitory process. •

6599. VISUAL PERCEPTION OF SIZE AND DISTANCE.

W.C.Gogel: Vision Res., 1963, 3, 101-120 (Civil Aeromed. Res. Inst., Federal Aviation Agency, Oklahoma City, Okla., U.S.A.)

The concept of egocentric localisation has been a central assumption in attempts to understand visual perceptions in a three dimensional environment. This assumption is rejected in favour of the assertion that relative retinal events are the only events which can be stimuli for perceptions. These events are organised by a factor termed the adjacency principle, which states that the apparent size or position of any object in the field of view is determined by whatever size or distance cues occur between it and adjacent objects. Some evidence for the adjacency principle is discussed and some consequences of the principle are considered.

J. Whiting

6600. INDUCTIVE BRIGHTNESS DEPRESSION AS

INFLUENCED BY CONFIGURATIONAL CONDITIONS. H.W.Horeman: Vision Res., 1963, 3, 121-130 (Inst. voor Perceptie Onderzoek, Eindhoven, Netherlands)

Inductive brightness depression has been described using different configurations of the stimulating fields. Using a haploscopic brightness-matching technique, expt. were performed to establish the influence of the luminances and of the configurations of the stimulating fields. Four configurations were tested and compared, one of which had not previously been studied. It can be concluded that: (1) the configuration in which the test field is completely enclosed by a ring-shaped inducing field results in contr-st effects impairing the brightness judgment/brightness

PHYSIOLOGY

639

hatching becomes ambiguous where effects such as opposite contrasts occur, when there is a wide separation between the 2 fields to be matched; (2) the amount of 4e inductive effect is greatly influenced by the extent ^ which the inducing field encloses the test field. . . .

605. MORPHOLOGICAL CHANGES IN THE MANDIBULAR GLANDS OF CASTRATED MALE RABBITS IN RELATION TO HORMONAL STIMULATION. C.Zearot: *Cad. med. Lombarda, Univ., Milano,* 1962, 17, 441-446 (Clin. ...)

Italy) Castrated rats (24) were treated with 10 mg. of testosterone (i.m.) or 12.5 mg. of progesterone (i.m.) or with an extract from 2 g. of prehypophysis (i.m.) or 10 mg. progesterone (i.p.) and changes in the histology of various glands studied. Modifications in the mandibular glands, such as a development of an irregular eosinophilia and an enlargement of the nuclei with testosterone and progesterone, were more marked than in the parotid glands. No appreciable changes were observed in the glands in animals treated with pituitary extracts. (Italian) G.N.Godson

606. RELEASE OF SUBSTANCE P ON NERVOUS AND ELECTRICAL STIMULATION OF FROG'S STOMACH MUSCLE. I.Singh: *Arch. int. Pharmacodyn.*, 1963, 143, 138-143 (Physiol. Dept., Med. Coll., Agra, India) Electrical or nervous stimm. of frog's stomach caused release of substance P, which appears to be partly responsible for the mechanical response of the muscle to nervous stimm. T.J.Sullivan

607. GASTRIC SECRETION AND BLOOD FLOW IN THE ANAESTHETISED DOG. J.D.Cumming, A.L.Haigh, E.H.L.Harries and M.E.NutC J. Physiol., Lond., 1963, 168, 219-233 (Dept. Physiol., Univ., Birmingham, England) A method for studying simult. the rate of gastric blood flow and gastric secretion in the anaesthetised dog is described. Lv. infusions of histamine acid phosphate which produced secretion of acid by the stomach did not significantly alter the rate of gastric blood flow. Infusions of 1-adrenaline tartrate increased the rate of gastric blood flow significantly but had very variable effects upon the rate of histamine induced acid secretion. I.v. infusions of 1-noradrenaline tartrate caused a significant decrease in both the rate of gastric blood flow and histamine induced acid secretion. No correlation was found between the rate of gastric blood flow and acid secretion. *

608. EFFECT OF PORTACAVAL SHUNTING ON GASTRIC SECRETION IN CIRRHOTIC DOGS. M.F.Hein, W.Silen, J.Skillman and H.A.Harper: *Gastroenterology*, 1963, 44, 637-641 (Dept. Surgery, Univ. California Med. Center, San Francisco, Calif., U.S.A.) After CCI4 and alcohol treatment of dogs, portacaval shunt was performed. The resulting gastric hypersecretion was increased by some 200 to 500%. The liver bypass transposition itself did not induce greater hepatic injury. D.N.Wheatley

609. COMPARISON OF HISTALOG AND HISTAMINE AS STIMULANTS FOR MAXIMAL GASTRIC SECRETION IN HUMAN SUBJECTS AND IN DOGS. S.Ward, LE. Gillespie, E.P.Passaro and M.L.Grossmire: *Gastroenterology*, 1963, 44, 620-626 (Dept. Med., Univ. California Med. Center, Los Angeles, Calif., U.S.A.) Studies on man and dogs with Histalog (3-g-aminoethyl pyrazole dihydrochloride) at doses of 50, 100 and 200 mg. s.c. showed a comparison with the effect of 0.04 mg. histamine acid phosphate administered s.c. also in their ability to induce gastric secretion. Doses of 100 and 200 mg. Histalog were more effective than a 50 mg. dose. Compared with histamine, Histalog caused a more prolonged stimn. of gastric secretion at these dose levels. D.N.Wheatley

610. TRANSMURAL POTENTIAL DIFFERENCE, SHORT CIRCUIT CURRENT AND SODIUM TRANSPORT IN ISOLATED RABBIT ILEUM. S.G.Schultz and R.Zalusky: *Nature*, Lond., 1963, 198, 894-895 (Bionucleonics Dept., Brooks A.F.Base, Tex., U.S.A.) Evidence is

PHYSIOLOGY

presented to support the hypothesis that the absorption of NaCl across the small intestine occurs by the active transport of Na followed passively by an equiv. of Cl".

G.M.Lewis

6611. INTESTINAL ABSORPTION OF AMINO ACIDS IN RATS. I. INFLUENCE OF FASTING ON ABSORPTION OF GLYCINE. G.Peres, M.Buclon and D.Carruge: C.R. Soc. Biol., Paris, 1962, 156, 2080-2081 (Lab. Physiol., Fac. Sci., Lyon, France) In normal rats deprived for 48-96 hr. of solid food there was no significant variation in the intestinal absorption of glycine after introduction of 2 ml. 0[#]25M glycine into the intestine. (French) M. A. Price

6612. LOCATION OF FUNCTION IN INTESTINAL EPITHELIAL CELL IN RELATION TO CARBOHYDRATE ABSORPTION. H.Newey P.A.Sanford and D.H.Smyth: J. Physiol., Lond., 1963, 168, 423-434 (Physiol. Lab., Univ. Sheffield, England) A study was made of the effects of glucose and maltose on fluid transfer by the rat intestine in vitro. Phlorrhizin inhib. fluid transfer when glucose or maltose was initially present on the mucosal side and when maltose was initially present on the serosal side, but not when glucose was initially present on the serosal side. The results are explained by postulating three zones in the epithelial cell in order from the luminal border (1) maltase activity, (2) phlorrhizin-sensitive glucose entry mechanism, (3) glucose-dependent fluid transfer mechanism. For this type of relative localisation of cellular function the term functional topography is suggested. *

6613. GLUCOSE AND FRUCTOSE ABSORPTION IN UNANESTHETISED DOG. W.CShoemaker, H.M. Yanof, L.N.Turk, m and T.H.Wilson: Gastroenterology, 1963, 44, 654-663 (Dept. Surg. Res., M.Reese Hosp., Chicago, 111., U.S.A.) By means of catheters installed in dogs in their portal veins, hepatic veins and splenic arteries, the absorption and distribution of glucose and fructose was followed after 50 g. per os. For 1 hr. after administration sugar absorption was high and mainly as free sugar in the portal blood (77%). Glucose absorption was associated with an increased lactic acid production by the gut. The release of glucose from the liver was decreased. Fructose absorption appeared in the blood plasma as 42% ketose and the rest as glucose.

D.N.Wheatley

6614. ABSORPTION OF GLUCOSE AND (+)-XYLOSE FROM DIFFERENT PARTS OF SMALL INTESTINE OF RAT IN VITRO. LSkSla, V.KujalovS and E.SegovS: Physiol. Bohem., 1963, 12, 112-117 (Inst. Human Nutr., Prague, Czechoslovakia) A method is outlined by which the active uptake of materials into the intestine can be measured. This involved the inversion and later ligation of the intestine in several different regions, followed by incubation in medium containing glucose or (+)-xylose. Little glucose transfer was found to occur in the distal part of the intestine of rats, with max. uptake occurring in the middle region. (+)-xylose is taken up at virtually the same rate over the whole length of the intestine with die exception of the last fifth. Glucose transport is affected by changes in the bathing medium, though lowering of the O₂ tension had no effect upon the uptake in the last fifth of the gut.

M.S.Laverack

6615. EFFECT OF INCUBATION MEDIUM ON ACTIVE TRANSPORT OF GLUCOSE BY SMALL INTESTINE OF RATINVTRO. LSkSla, V.KujalovS, E.SegovS, V-Hramadbfva and H.YaYrinkfiY3: Physiol. Bohem., 1963, 12, 118-123 (Inst. Human Nutrition, Prague,

Czechoslovakia) Uptake of glucose by the intestine of the rat was affected by the composition of the bathing medium. The rate of uptake was greatest in Robinson's medium, followed by Krebs phosphate and Krebs bicarbonate. Lactic acid production was lowest in Robinsons fluid. The protein, Na and K content of the intestine wall was not changed by bathing in different media. The transport of L-tyrosine was not altered by change of composition of the medium. M.S.Laverack

6616. ABSORPTION OF IRON FROM HUMAN LARGE INTESTINE. Y.Ohkawara, M.Bamba, LNakai, S.Kinka and M.Masuda: Gastroenterology, 1963, 44, 611-614 (Dept. Int. Med., Kyoto Prefectural Univ. Med., Kyoto, Japan) 59pe studies have been used to show that Fe uptake can occur in the large intestine from FeCl₂ and FeC₁₂ enemas. Fe 2 was absorbed more efficiently than Fe³⁺. Patients fed normal diets without enemas had Fe²⁺ in their faeces, suggesting that Fe can pass through the gut in the bivalent form. It was further found that feeding diets with Fe²⁺ present resulted in detectable Fe³⁺ in the faeces also. D.N.Wheatley

6617. INTESTINAL ABSORPTION OF BILE PIGMENTS. I. ENTEROHEPATIC CIRCULATION OF BILIRUBIN IN THE RAT. R.Lester and R.Schmid: J. clin. Invest., 1963, 42, 736-746 (Thorndike Mem. Lab., Boston City Hosp., Boston, Mass., U.S.A.) InSpragufi-Dawley rats provided with an external biliary fistula intestinal absorption of unconjugated and conjugated [14c]bilirubin occurred. Considerable amounts of labelled pigment appeared in the bilej biliary excretion greatly exceeding urinary excretion. Using isolated intestinal loops of Gunn rats with intact blood supply absorption of bilirubin was demonstrated throughout the small and large intestine after intraduodenal administration, but although unconjugated [14c]bilirubin was absorbed unaltered it appeared that the coiyugate form must first be hydrolysed-

M.J.Bell

6618. INTESTINAL REABSORPTION OF UNCONJUGATED BILIRUBIN: A POSSIBLE CONTRIBUTING FACTOR IN NEONATAL JAUNDICE. R. Brodersen and L. S. Hermann: Lancet, 1963, i, 1242 (Dept. Biochem., Univ., Copenhagen, Denmark). G.H.Bell

6619. INHIBITION OF PERISTALSIS IN GUINEA-PIG ILEUM BY STEROIDS AND ALLIED SUBSTANCES.

M.L.Sharma and R.S.Grewal: Indian J. Physiol. Pharmacol., 1963, 7, 22-28 (Med. Coll., Nagpur, India) The following substances, listed in order of decreasing potency, were found to depress peristalsis and inhibit longitudinal movements in the Trendelenburg prep.: stilboestrol, ouabain, ethisterone, cortisone, Na taurocholate and vit. D. Stilboestrol also caused blockade of the superior cervical ganglion in the cat without affecting directly the adrenergic nerve endings. It is suggested that an effect on intestinal ganglia may be responsible for the observed block of peristalsis.

LIVER AND BILE

6622. SOME ASPECTS OF CHEMICAL AND CELLULAR COMPOSITION OF RAT UVB. J. Bhargava: *Life Sci.*, 1963, 1, ax* <> £ note. Res. Lab., Hyderabad, India) Prelim. K.Jones
6623. USE OF A SOLUTION OF PLANT EXTRACTS IN DEMONSTRATION OF CHOLECYSTIC ACTIVITY BY CHOLECYSTOGRAPHY. A.Limentani and F.Costa: ^{nd P.M.} ^{egior} ^{17, 489-495} ^{no, Italy)} When a mixture of plant extracts containing in g. Menta Piperita, 0.18275, Ocimum basilicum 0.56950, Caly- Caudatus floridus, 0.46750, Ononis spinosa, 0.65875, Pyscidea erythrina, 0.09775, Corydalis formosa, 0.57375, alk. soln., 85-45 and glycerin 12.00 is given orally to human subjects, the cholecystogram, is increased in density. This observation may be of great diagnostic use. G.N.Godson (Italian)
6624. MODIFICATIONS IN PHOSPHORUS CONSTITUENTS OF LIVER AND PANCREAS IN RATS RECEIVING INJECTION OF ETHANOL. F.Decloitre and R.Lowy: *C.R. Soc. Biol., Paris*, 1963, 157, 46-51 (Inst. Nat. d'Hygiène, Paris, France) Rats received i.p. injn. of 2-3 g. ethanol/kg. 1 hr. before sacrifice. Compared with injn. 0.85% NaCl there was an increase in nucleotides and RNA liver of rats receiving 2 g. kg. There was no increase in total P compounds of the liver. M.A.Price (French)

KIDNEY AND URINE

- * * • L^APH FORMATION IN JIGEADNEY AFTER ^ ^ URETERAL OBSTRUCTION. M.Pa^A Apt. Med. Szilagyi: *Szeged*, 1963, 19, 1-38 (Acad. Sci., Budapest, Hungary) Lymph production was studied after ureteral obstruction in Jigs with intact or absent renal function. The findings discussed in terms of the role of the kidney lymph circulation with G.F.Blane ** role of urine osmolarity. (German)

6626. REPLACING URETER DEFECTS BY USE OF POLY-CHLORIDE VINYL PROSTHESIS. W.Twardosz: *Pozn. Towarzy. Przyjac. nauk, Wydz. lek.*, 1962, 22, 295-341 (I Klin. Chirurg. Akad. Med., Poznan, Poland) A polyvinyl tube replacing part of ureter in dogs was not resorbed remaining patent and elastic 341 days after operation. Inulin and PAH clearance was not disturbed and no increase of plasma urea, uric acid, creatinine, P and K level was observed. The results were confirmed by (Polish) T.qfbicki

6627. STRUCTURE OF KIDNEY IN RELATION TO AGE AND DIET IN WHITE RATS DURING THE WEANING PERIOD. J.M.N.Boss, H.DlouhS, M.Kraus and J.Kfetek: *J. Physiol., Lond.*, 1963, 168, 196-204 (Physiol. Dept., Univ., Bristol, England) Between 11 and 23 days of age, when weaning normally begins, the loops of Henle differentiate, the spaces between them become reduced with the disappearance of loose connective tissue, the vasa recta become as densely distributed as in the adult, and the outer medullary stripe, consisting of the second segments of prox. tubules, forms. The cortex loses the nephrogenic zone in the same period. Since this is the time at which the kidney first responds to ADH by making a cone, urine, the medullary changes are consonant with the countercurrent hypothesis. Forced weaning at 14 days, raised salt intake and a high-fat diet do not affect these changes.

6628. EFFECT OF OESTROGENS ON KIDNEY WEIGHT IN MICE. M.B.Shimkin, P.M.Shimkin and H.B.Ander: *vorts. J. nat. Cancer Inst.*, 1963, 30, 135-141 (Nat. Cancer Inst., Bethesda, Md., U.S.A.) In intact cf. oestrogens produce a rapid decrease in kidney wt., expressed either as abs. wt. or as a ratio of body wt., the effect is seen after continuous or single treatment, but not when oestrogen is given intermittently.

- J.G.Bennette
6629. OBSERVATIONS ON FUNCTION OF A TRANS-PLANTED KIDNEY. J.B.Dossetor, R.O.Morgen and J.C.Beck: *Canad. J. Biochem.*, 1963, 41, 1409-1422 (McGill Univ. Clinic, Royal Victoria Hosp., Montreal, Canada) The transplanted kidney functioned well during the first 24 hr. after implantation, but suffered decrease in function during the second and third days followed by subsequent gradual improvement. During the first 24 hr. osmotic diuresis occurred, with release of Na and Cl, in the presence of an antidiuretic stimulus. Azotaemia returned during the fourth week after operation, causing osmotic diuresis with increased urine vol., Na and Cl excretion, and rapid wt loss. Secondary hyperparathyroidism of chronic uraemia was believed to have been detected. Data relating to the diurnal rhythm of electrolyte excretion are presented.

A.M.Gibbins

6630. ADULT TOLERANCE INDUCED BY 6-METHYL MERCAPTOPURINE TO A CANINE RENAL HOMOGRAFT. C.F.Zukoski and J.M.Callaway: *Nature, Lond.*, 1963, 198, 706-707 (Surg. Service, V.A.Hosp., Nashville, Tenn., U.S.A.) Renal homotransplants in dogs were rejected at an average of 15 days. In 9 dogs treated with 6-methylmercaptopurine orally (10 mg./kg. for 2 days, 5 for 4 days, and 2-5 thereafter) the grafts survived an average 34 days in 8 of the dogs, but in the 9th, the dog remained alive for 570 days with the drug, and more than 372 days after withdrawal of the drug. There was no evidence of homograft rejection and it was considered that in this case, adult tolerance had been achieved.

G.M.Lewis

PHYSIOLOGY

6631. EFFECT OF MINERALOCORTICOID AND OF ACTH ON GRANULARITY OF JUXTAGLOMERULAR CELLS. F.W.Dunihue, M.Bloomfield and B.Machanic: *Endocrinology*, 1963, 72, 963-966 (Univ. Vermont Med. Coll., Burlington, Vt., U.S.A.) The mean juxtaglomerular granular cell indices of rats varied inversely with the mineralocorticoid level and were unaffected by ACTH. ACTH potentiated the action of the mineralocorticoids.
H.C.Jones

6632. RENAL FUNCTION IN ACUTE ISCHAEMIA OF THE [HIND] LIMBS. J.Hryniwiecki: *Pozn. Towarzy. Przyjac. nauk. Wydz. lek.*, 1962, 23, 117-142 (El Klin. Chir., Akad. Med., Poznań, Poland) Ligation of the proximal section of the abdominal aorta caused total paresis of hind legs and death in few days. The decreased excretion of urine was associated with the lowered clearance of Na, PAH, endogenous creatinine and K. Microscopic examination of kidney showed anaemic state of glomeruli, local necrosis of tubules and congestion of liver. (Polish) T.qlfbicki

6633. RENAL FUNCTION FOLLOWING HYPOPHYSECTOMY IN MAN. T.Falkheden: *Acta endocr. Khb.*, 1963, 42, 571-590 (Med. Clinic II, Sahlgrenska Sjukhuset, Göteborg, Sweden) In hypophysectomised patients, the GFR and renal plasma flow [RPF] as measured by clearances of inulin and PAH were much less than in normal subjects. Although thyroid therapy increased the GFR and RPF, preoperative levels were never reached. Hypophysectomy also decreased the max. rat^{**} of tubular excretion of PAH.
H.B.Waynfirth
V.

6634. ION MOVEMENTS AND OXYGEN CONSUMPTION IN KIDNEY CORTEX SLICES. R.Whittam and J.S. Willis: *J. Physiol.*, Lond., 1963, 168, 158-177 (Dept. Biochem., Univ., Oxford, England) The interrelationship between O₂ consumption and active cation transport in incubated slices of rabbit-kidney cortex was studied by determining the effects of ouabain and Na on K uptake and O₂ consumption. Ouabain inhibits K-uptake and Na⁺ stimulates it; each agent produces a parallel and proportional effect on the QO₂. The rates of net uptake or loss of K are proportional to the associated change in O₂ consumption. The results indicate that, above a basal level, O₂ consumption of kidney slices is controlled by the rate of Na and K transport. •

6635. KINETICS OF AMINO ACID TRANSPORT, INCORPORATION INTO PROTEIN AND OXIDATION IN KIDNEY CORTEX SLICES. L-E.Rosenberg, M.Berman and S. Segal: *Biochim. biophys. Acta*, 1963, 71, 664-675 (Metab. Serv., Nat. Cancer Inst., Bethesda, Md., U.S.A.) Using inulin and a-aminoisobutyric acid [AABA] amino acid uptake in rat kidney was characterised by a 3 compartment 'parallel' model representing the medium, extracellular space and intracellular space. Influx and efflux rate const. were calc. DNP and incubation at 27° affected the rates of influx and efflux of AABA for the intracellular space. Kinetic studies with glycine and L-lysine indicated that equilibration of exogenous amino acid with the intracellular pool need not occur before incorporation into protein. Kinetics of ¹⁴CO₂ evolution from L-[14C]lysine indicated that the rate of amino acid oxidation reflected the build up of the intracellular lysine pool.
B.M.Stevens

6636. EFFECT OF PHLORRIZIN ON AMINO ACID TRANSPORT IN RAT KIDNEY SLICES. S.Segal, A.Blair and L.E. Rosenberg: *Biochim. biophys. Acta*, 1963, 71, 676-687 (Clin. Endocrinol. Branch, Nat. Inst. Arthritis and Metabolic Dis., Bethesda, Md., U.S.A.).

Phlorrizin was shown to have r.o effect on the affinity of the carrier sites for amino acids but to inhibit the efflux of amino acids from the intracellular fluid, possibly by increasing their intracellular binding. Incorporation of amino acids into protein was decreased by phlorrizin; amino acid oxidation was increased. B.M.Stevens

6637. EFFECT OF MASSIVE NaHCO₃ INFUSION ON RENAL FUNCTION. G.S.Kanten: *Canad. J. Biochem.*, 1963, 41, 1399-1408 (Physiol. Dept., Albany Med. Coll., Albany, New York, U.S.A.) Twelve anaesthetised dogs were i.v. inj. with a max. load of 50 g. NaHCO₃ over a period of 4 hr. at 2⁵5 Fiequiv./min. Plasma K fell from 3⁸-2⁷ mequiv./l. and plasma Na increased from 144⁴-170⁸ mequiv./l. with max. NaHCO₃ loading. There was no apparent acute detrimental renal effect, and no depression of GFR or renal plasma flow, although the pH increased from 7³2 to 7⁶1. No significant effect was seen on b.p., haematocrit, filtration fraction, heart rate, or rectal temp. Urine flow and pH increased with higher loading rates and concn.
A.M.Gibbins

6638. URINE TITRATABLE ACIDITY AND NH₃-EXCRETION DURING HYPOTHERMIA. G.S.Kanten: *Canad. J. Biochem.*, 1963, 41, 1201-1206 (Physiol. Dept., Albany Med. Coll., Albany, New York, U.S.A.)

H excretion by the kidneys of anaesthetised hypothermic dogs was measured as the sum of total titratable acid and NH₃ excreted during a const. saline infusion of 2 ml./min. Anaerobic arterial pH fell from 7⁴1 to 7²7 at 27°, but urinary pH remained at approx. 6⁸. Total titratable acid excretion fell from 0⁰11 to 0⁰005 mequiv./min. at 27°. It was suggested, therefore, that the renal acidification mechanism was temp. dependent as excess H⁺ had not been excreted. NH₃ excretion, after a mild increase from 0⁰008 mequiv./min., fell to 0⁰006 mequiv./min. at 27°.
A.M.Gibbins

6639. ACUTE RENAL CONSERVATION OF SODIUM IN HYPERTENSION. S.Papper, L.N.Sporn, R.G.Lancaster and C.A.Vaamonde: *Arch. intern. Med.*, 1963, 111, 439-442 (Dept. Med., Univ. New Mexico Sch. Med., 2211 Lomas Blvd., Albuquerque, N.Mex., U.S.A.) No evidence for any limitation in the ability to conserve Na in the absence of a Na-load could be found in hypertensive patients with an exaggerated natriuresis following acute salt administration. The tests employed were change in posture, cuffing of the thighs and ingestion of 2 mg. 9a-fluorohydrocortisone.

6640. INSTIGATION OF ACTION OF ALIX)STERONE 9JJ PERFUSED CAT KIDNEY BY URETERIC STOP-FLOW ANALYSIS. T.de Lima and M.F.Lockot: *Arch. int. Physiol.*, 1963, 71, 83-92 (Chelsea Coll. Technol., London, England) Stop-flow methods indicate that the supranormal excretion of Na and water from cat kidneys perfused with blood from headless or hypophysectomised donors results from impaired proximal reabsorption of Na. Distal Na reabsorption proceeds normally. Aldosterone in blood from headless animals further depresses proximal Na reabsorption and produces an overall diuresis and loss of Na. Aldosterone in blood from intact animals increases both distal and water-linked

PHYSIOLOGY

643

Proximal Na reabsorption, thus producing an antidiuretic effect. Oxytocin enhances the effect of aldosterone in blood from intact donors. It converts the diuretic action of aldosterone in blood from headless donors into an antidiuretic one by sensitising proximal segments to the Na and water retaining action of aldosterone. M.E.Nutt

6641. PROXIMAL RENAL TUBULAR TRANSPORT OF α-OXOGLUTARIC ACID. P.Vishwakarma: Canad. J. Biochem., 1963, 41, 1099-1104 (Dept. Pharmacol., Fac. Med., Queen's Univ., Kingston, Ont., Canada) α-Oxoglutaric acid transport along the renal tubule in the dog was studied by the stop-flow method during infusion of Na α-oxoglutarate. The acid was excreted by a combined process of glomerular filtration and tubular reabsorption, the latter being confined to the prox. tubule. No tubular secretion was seen in any part of the nephron. The concn. gradient between the plasma and extracellular fluid was favourable to the uptake of the acid by the cell. It is suggested that there is active reabsorption of α-oxo-glutarate in the proximal tubule from the lumen into the cell, and active transfer of the acid from the blood into the cell. A.M.Gibbins

6642. COMPARATIVE EFFECTS OF SOME M₁ ANALOGUES ON RENAL REABSORPTION OF GLUCOSE. D.F.Diedrich: Biochim. biophys. Acta, 1963, 71, 109-116 (Med. Fac. of

a na of coside related to phlorizin on renal reabsorption in the dog were examined. Conclusions were drawn as to the critical structure and geometrical conformation of the inhibitor molecule and the nature and position of the membrane receptor site to which the TM bound. B.M.St.

6643. URINARY EXCRETION OF TRYPTOPHAN-RICH PRE-ALBUMIN AFTER STRENuous PHYSICAL EFFORT. J.Poortmans: Life Sci., 1963, 5, 334-336 (Semse d'Etudes, test. Nat. de l'Educ. Phys. et des Sports, Bruxelles, Belgium).

ENDOCRINE GLANDS

6644. REACTION OF HYPOTHALAMIC-NEUROHYPOTHALAMIC SYSTEM OF RATS TO CORTISONE AND ACTH. E-LZubkova-Mikhaflova: Dokl. Akad. Nauk SSSR, 1962, 144, 2452. Increased concn. of cortisone in the rat & the SL dorsal septal nucleus of the neurohypothalamus, whereas: A decrease in the lobe of secretory substance. C. ain dep. diff. noted between the paraventricular and supraoptic nuclei. B.J.Cooper (Russian)

6645. CEREBRAL INVOLVEMENT IN INHIBITION OF ACTH SECRETION BY HYDROCORTISONE. J.M.Davidson and S.F. Rosen: Endocrinology, 1963, 72, 936-946 (Dept. Dis., Hadassah Univ. Hosp., Jerusalem, Israel) In rats of crystalline hydrocortisone acetate in the median eminence and anteromedial hypothalamus resulted in the abolition of compensatory adrenal hypertrophy following unilat. adrenalectomy. The remaining adrenal atrophied and the ventral prostate wt. decreased. H.C.Jones

6646. NEURAL CONTROL OF ACTH SECRETION: EFFECT OF ACUTE DECEREBRATION IN RAT. K.Matsuda, J.W.Kendall, jun., C.Duyck and M.A. Greco: Endocrinology, 1963, 72, 845-852 (Endoc. Div., Med. Dept., Oregon Univ. Med. Sch., Portland, Ore., U.S.A.) Removal of the cerebral cortex and subadjacent brain in the rat did not lead to an increase in plasma corticosterone concn. The median eminence, stalk, and pituitary appeared to be necessary for pituitary adrenocortical activation. H.C.Jones

6647. CORTICOTROPHIN-RELEASING ACTIVITY OF SYNTHETIC NEUROHYPOPHYSAL HORMONES AND SOME RELATED PEPTIDES. W.Doeppner, E.Sturmer and B.Berde: Endocrinology, 1963, 72, 897-902 (Pharmacol. Lab., Sandoz Ltd., Basle, Switzerland) A comparative study has been made of the corticotrophin-releasing, pressor, antidiuretic and oxytocic activities of the neurohypophyseal hormones and some synthetic analogues and homologues in rats. The corticotrophin-releasing activity correlated well with the pressor activity of the naturally occurring hormones but not for the synthetic analogues. H.C.Jones

6648. PITUITARY-ACTH RESPONSE TO METOPIRONE AND ENDOTOXIN ADMINISTRATION IN DOG. J.E.Plager, G. A.Bray and J.E.Jackson: Endocrinology, 1963, 72, 876-883 (Med. Dept., Univ. Rochester, Rochester, N.Y., U.S.A.) Expt. on the rate of adrenal production of cortisol and 11-deoxycortisol in dogs during ACTH and metopirone administration that the plasma level of 11-deoxycortisol reflected its adrenal production rate. The plasma level of cortisone did not reflect the adrenal cortisone production rate. Endotoxin was a more effective stimulus of ACTH release than metopirone. H.C.Jones

6649. STATISTICAL EVALUATION OF EFFECT OF ACTH STIMULATION ON PATIENTS WITH CUSHING'S SYNDROME AND HIRSUTISM. R.Litta-Modignani, D.Gelli and G.Cecchetti: Atti. Acad. med. Lombarda, 1962, 17, 290-298 (1st. di Clin. Med., Univ., Milano, Italy) In 15 hirsute and 7 Cushing's syndrome [CS] patients, the 17-KS, 17-OHCS and pregnanediol excretion were estimated by Callow's, Silber's and Klopper's methods respectively. Under basal conditions the pregnanediol and 17-KS were high in the hirsute and CS patients and the 17-OHCS high in CS and normal and hirsute patients. After ACTH stimm. the 17-KS excretion was high in both hirsute and CS patients and the pregnanediol normal in all cases except for a slight increase in hirsute patients at the end of stimm. suggesting delayed metabolism. (Italian) G.N. Godson

6650. EFFECTS OF ADRENAL ENUCLEATION AND OF SPIRONOLACTONE SC-8109 ON GRANULARITY OF RAT JUXTAGLOMERULAR CELLS. F.W.Dunihue, W.Van B.Robertson and B.Machanic: Endocrinology, 1963, 72, 859-864 (Anat. Dept., Univ. Vermont Med. Coll., Burlington, Vt., U.S.A.) The granular cell index of the juxtaglomerular cells was determined at intervals after uninephrectomy, unilateradrenalectomy, and enucleation of the remaining adrenal in rats drinking 1% saline. A transient rise followed by a reduction in the index was seen, which appeared to be produced by an ACTH dependent hormone secreted by the generating adrenal. H.C.Jones

PHYSIOLOGY

6651. INFLUENCE OF CHRONIC HEAT EXPOSURE ON ADRENOCORTICAL SECRETION. S.Iton and Y.Nishimura: Jap. J. Physiol., 1963, 13, 182-186 (Dept. Physiol., Hokkaido Univ. Sch. Med., Sapporo, Japan) With chronic heat exposure in rats there was a lowered adrenal response to exogenous ACTH in both normal and hypophysectomised animals. This may be related to the decreased secretion of thyroid hormone also found in rats kept at 32°. MJ.Bell

6652. EFFECTS OF ALTERATIONS OF PLASMA SODIUM AND POTASSIUM CONCENTRATION ON ALDOSTERONE SECRETION. J.O.Davis, J.Urquhart and J.T. Higgins: J. clin. Invest., 1963, 42, 597-609 (Lab. Kidney and Electrolyte Metab., Nat. Heart Inst., Bethesda, Md.^f U.S.A.) In hypophysectomised dogs K directly effects aldosterone secretion: increasing K either by i.v. infusion or by a high K diet augmenting aldosterone production. An increase in the secretion of aldosterone also occurred with a lowering of plasma Na. After removal of kidneys the K effect still occurred suggesting a direct influence of K on the adrenal cortex. Further evidence for this was obtained when infusion of KC1 and K₂SO₄ into the arterial supply of isolated adrenals gave increased aldosterone secretion. MJ.Bell

6653. ALDOSTERONE AND ELECTROLYTES DURING VACCINATION SHOCK. M.Perrini, N.Piliego and L.Pinta Biochim. appl., 1963, 10, 24-33 (1st. Clin. Med. Generale e Terapia, Univ., Bari, Italy)

Urinary aldosterone levels increased 4-fold in patients suffering hypersensitivity reactions from Brucella Ag and in patients with typhoid fever. Urinary Na excretion doubled in that period but K remained unchanged.

(Italian) J.&Crawhall

6654. ADRENAL CORTICAL FUNCTION IN BENIGN ESSENTIAL HYPERTENSION. A.Vermeulen and M.Van der Straeten: J. clin. Endocr., 1963, 23, 574 (Med. Clin. State Univ., Ghent, Belgium) No significant difference could be shown between controls and hypertensive subjects in the daily excretion of cortisol, corticosterone or in the free or conjugated Porter-Silber chromogens. The excretion of pregnanetriol and pregnanediol was depressed in the hypertensives.

G.F.Blane

6655. SEASONAL ADJUSTMENTS IN CAPTURED WILD NORWAY RATS. III. PRODUCTION OF ADRENAL STEROIDS IN VITRO. J.S.Willmen Canad. J. Biochem., 1963, 41, 1147-1153 (Animal Res. Inst., Dept. Agric., Ottawa, Canada) The in vitro adrenal steroid secretion of wild Norway rats (Rattus norvegicus), of both sexes, captured during the winter differed in quantity, but not in quality, from that of similar rats captured during the summer. There was no evident seasonal effect on adrenal wt., merely on rate of secretion, the predominant steroid secreted being corticosterone. This seasonal adjustment was similar to that of caged white rats exposed to natural winter and summer conditions, but differed from that of rats cold-acclimated in the laboratory, these having lower than normal adrenal activity.

A.M.Gibbins

6656. EXCRETION OF ALDOSTERONE AND SODIUM AND POTASSIUM AFTER LARGE DAILY DOSES OF PROGESTERONE. G.Stark and H.Kossmann: Acta endocr. Khb., 1963, 42, 537-551 (Univ.-frauenklinik, Mainz, Germany) Daily injn. of progesterone (200 mg.) were given i.v. to pregnant women. The patients' NaCl intake was kept const, during this time. Only in 1/3 of the patients did this treatment produce

higher aldosterone excretion and in only a few cases was a Na diuresis observed. (German) H.B.Wayforth

6657. STUDY OF VARIOUS INDICES OF ADRENOCORTICAL ACTIVITY DURING 23 HAYS AT HIGH ALTITUDE. P.C.B.Mackinnon, M.E.Monk-Jones and K.Fotherby: J. Endocr., 1963, 26, 555-566 (Dept. Anat., Royal Free Hosp. Sch. Med., London, England)

The study was made on 4 men and 3 women who ascended rapidly from sea level and remained for 23 days on Mont Blanc at 4333 m. The subjectively recorded responses of lassitude, nausea and vomiting which occurred over the first few days were accompanied by a rise in urinary 17-OHCS, fall in circulating eosinophils, and a rise in palmar sweat index which was taken as an assessment of emotional activity. Minor changes took place in the excretion pattern of 17-oxysteroids but pregnanetriol and pregnanediol levels remained steady. All these indices of stress began to approach the sea level control values within 5 days. G.F.Blane

6658. EFFECT OF PROLONGED TREATMENT WITH HUMAN CHORIONIC GONADOTROPHIN HCG ON ENDOGENOUS STEROID HORMONE METABOLISM OF PHYSICALLY AND MENTALLY RETARDED BOYS.

M.Reiss, J.Hillman and R-H.Davis: J. clin. Endocr., 1963, 23, 11 (Neuro-Endocrine Res. Unit, Willowbrook State Sch., Staten Island, N.Y., U.S.A.) -The influence of HCG on excretion of 17-KS and 17-OHCS of 42 mentally and physically retarded boys between the ag⁸ of 8 and 15 yr. was studied. The HCG treatment resulted in an increased amount of the steroid metabolites appearing in the urine and the appearance of a normal pattern of diurnal activity in the excretion rate which was absent before treatment. G.F.Blane

6659. DETERMINATION OF URINARY 17-KETOGENIC STEROIDS BY MEANS OF SODIUM METAPERIODATE OXIDATION. E.R.Rutherford and D.H.Nelson: J. clin. Endocr., 1963, 23, 533 (Dept. Med., Univ. S. California, Los Angeles, Calif., U.S.A.) Marked improvement in reproducibility and avoidance of procedural difficulties associated with the bismuthate methods is claimed for the technique described. G.F.Blane

6660. EXCRETORY FORMS OF CORTISOL, CORTISONE, CORTICOSTERONE AND 11-DEHYDROCORTISONE IN HUMAN URINES. J.R.Pasqualini and M.F.Jayle:

C.R. Soc. Biol., Paris, 1963, 157, 96-99. After administration of cortisol and corticosterone, 21-cortisol sulphate and 21-corticosterone sulphate were identified in human urine. The major part of corticosterone and dehydrocorticosterone was excreted in the form of sulphate esters. Cortisone and cortisol appeared in three fractions: free, sulphate esters and glucuronates.

(French) M.A.Price

6661. PATTERN OF EXCRETION OF URINARY HORMONES RELATED TO CORTISOL OR CORTICOSTERONE AFTER THE ADMINISTRATION OF ACTH.

J.R.Pasqualini: Bull. Soc. Chim. biol., Paris, 1963, 45, 277-300 (Lab. Chim.-Biol., Fac. Méd., 45, rue des Sts, -Pères, Paris, France) The distribution of cortisol, corticosterone and their metabolites between *e unconjugated, ester sulphate and glucuronide fractions in human urine after ACTH stimn. were studied. Corticosterone and 11-dehydrocorticosterone were found mainly in the ester sulphate fractions, whereas cortisol and cortisone were identified in all these fractions.. 46% of the unreduced hormones were in the ester sulphate fraction,

PHYSIOLOGY

645

whereas the reduced metabolites were in the glucuronate fraction. After administration of ACTH the corticosterone metabolites were only 30% of the amount of cortisol metabolites. (French) J.C.Crawhall

6662. URINARY EXCRETION OF 17-HYDROXY-20-OXO-20-METHYL STEROIDS IN NORMAL WOMEN AND IN WOMEN WITH ALTERED ANDROGEN EXCRETION. J.Zander, G.Schroder, B.Walter and R.Borth: -Acta endocr. Kbh., 1963, 42, 321-8*

(Univ.frauenklinik, Köln, Germany) In healthy women the excretion rate of 17-hydroxy-20-oxo-20-methyl steroids measured by the method of Appleby and Norymberski is below 100 ($\mu\text{g}/\text{day}$) at puberty rising to 300 μg . at 30 yr. and falling at ≈ 30 "KWUMi. A b" * excretion rate which can be controlled wrt cortisone is seen in women with congenital adrenocortical hyperplasia. Hirsute women and those with die Stein-Leventhal syndrome have normal excretion^{aau}. H.B.Waynforth

6663. OCCURRENCE OF DEHYDROISOANDROSTERONE GLUCURONOSIDE IN NORMAL HUMAN URINE.

P-K.Siteri, R.L.Vande Wiele and S-Lieberman: J. clin. Endocr., 1963, 23, 588 (Dept. Obstet., Coll. Phys. and Surg., Columbia Univ., New York, U.S.A.)

The isolation of dehydroisoandrosterone glucuronoside from human urine is described. Isotope studies showed *at the urinary sulphate is derived not only from dehydroisoandrosterone but from the sulphate >**•*** appears to be secreted by the adrenals. G.F.Biane

6664. SUPRARENAL FACTORS CONDITIONING RESISTANCE TO HISTAMINE POISONING IN RAT.

ID. EFFECT OF ANTI-PERTUSSIS VACCINATION ON SUPRARENAL MEDULLA. $\Delta^{\text{comt}} \frac{\text{nd}}{\text{A.C.}} \frac{\text{ion}}{\text{tg}}$ Fossion: Arch. int. Physiol., 1962, 70, 651-659. Adrenaline content of rat suprarenal* decreased slightly during the first 48 hr. after vaccination with Haemophilus suis. Vaccination increases the sensitivity of rats to the histamine action of histamine and cystamine and depletion of the adrenaline content of the adrenals is abolished in vaccinated animals than in controls. Vacen. of histamine, direct stimm. of adrenaline secretion on injn. small doses out sensitivity of peripheral blood vessels to suprarenal of adrenaline and histamine is unchanged. Alteration specific? Jgdillary function does not seem to be altered specifically by H. pertussis vaccn. (French) M.E.Nutt

6665. URINARY EL^INATIO^ CATECHOLAMINES IN RAT DURING EXPERIMENTAL HYPERTENSION INDUCED BY HYDROXYCORTICOSTERONE. CMasse and M.L.Chollet: C.R. Soc. BtoL. Paris, 1962, 2102-2104 (Lab. de Pathol. méd., Fac. de Med. Nancy, France) Unilat. nephrectomised rat received in Jn. of 45 mg. DOCA during 1 month. During the first week there was a slight increase in total $\text{M.M.J.C.}^{\text{catechol}}$ ajinette compared with control nephrectomised rat. In the second week there was no difference between the urinary catecholamines of the 2 groups. MA>Price

6666. URINARY CATECHOLAMINES IN HYDROXYMANDELIC ACID IN TENSION. P.Lanucara, U.Marini and F.F.Gimidi: Atti. Acad. med. Lombarda, 1962, 369-3/Z

(list, patol. spec, med., univ. TO...) Italy) The urinal excretion of 3-methoxy-4-uyu.**,-acid, an important metabolite of adrenaline, in hypertensive patients was within the normal limits. Tim

result does not, however, rule out the author's hypothesis that the adrenergic and neurohormonal system, including noradrenaline, are involved in hypertension, as title actual vascular changes only occur in limited areas.

(Italian) G.N. Godson

6667. URINARY ELIMINATION OF 3-METHOXY, 4-HYDROXYMANDELIC ACID AFTER INFUSION OF NORADRENALINE AND ADRENALINE IN HUMAN SUBJECTS. P.Lanucara, U.Marini, F.F.Gimidi and R.Beretta: Atti. Acad. med. Lombarda, 1962, 17, 373-377 (1st. patol. spec, med., Univ., Milano, Italy)

The urinary recovery of 3-methoxy, 4-hydroxy-mandelic acid [HMA] was studied in two groups of normal subjects, one hr. after infusion of 1-noradrenaline bitartrate and 1-adrenaline bitartrate, respectively. The urinary recovery of HMA was 33 and 38% respectively of the administered steroid dose and the increased HMA excretion lasted for 24 hr. and return to normal within 48 hr.

(Italian) G.N.Godson

6668. HORMONES AND RELATED SUBSTANCES IN LYMPH LEAVING FOUR ENDOCRINE GLANDS - TESTIS, OVARY, ADRENAL AND THYROID. P.M.Daniel, M.M. Gale and O.E.Pratt: Lancet, 1963, i, 1232-1234

(Dept. Neuropathol., Inst. Psychiatry, Maudsley Hosp., London, England) Hormones are carried away from testis, ovary, adrenal, and thyroid by the lymphatics which drain them, as well as by the veins. In the testicular, ovarian, and adrenal lymph, the quantity of hormone was higher than it was in the peripheral-blood plasma leaving the gland. In the thyroid lymph, the level of radioactivity of the org. compounds (and even of that proportion of it present as thyroxine) was much higher than it was in the plasma from thyroid-venous blood or peripheral-venous blood. G.H.Bell,

6669. ISOLATED PANCREATIC ISLETS OF MAMMALS.

I. PEPTIDASE ACTIVITY IN NORMAL AND OBESE-HYPERGLYCAEMIC MICE. C.Hellerstrom and B.Hellman: Acta endocr. Kbh., 1963, 42, 615-624 (Histol. Dept., Univ., Uppsala, Sweden) Microtitrimetric assays for dipeptidase showed that there was much activity of the enzyme in endocrine and exocrine pancreas of normal mice; the activity was greater in the latter. In obese-hyperglycaemic mice with free access to food, the islets of Langerhans had a greater activity than in normal animals. An explanation for this is suggested. Histochemical studies for leucine aminopeptidase were carried out.

H.B.Waynforth

6670. EFFECT OF THYROID ADMINISTRATION ON PANCREATIC AMYLASE ACTIVITY OF HYPOPHYSECTOMISED AND INTACT RATS. M.O.Maykut, M.T. Nishikawara and R.E.Haisu: Canad. J. Biochem., 1963, 41, 1373-1379 (Physiol. Dept., Univ., Toronto, Ont., Canada)

Administration of desiccated thyroid gland to hypophysectomised rats prevented the marked atrophy of the pancreas which was consistently observed following hypophysectomy. Thyroid feeding at 2 dose levels led to a significant increase in the pancreatic amylase activity of hypophysectomised rats, and, except for the activity per unit of body wt., this was significantly lower than that in untreated, intact controls. Thyroid administration in intact rats results in a decrease in the pancreatic amylase activity.

6671. COMPARISON OF EXPERIMENTALLY INDUCED

AND NATURALLY OCCURRING SENSITIVITY TO LEUCINE HYPOGLYCAEMIA. R.F.Knopf, S.S.Fajans, J.C.Floyd and J.W.Conn: J. clin. Endocr., 1963, 23,

PHYSIOLOGY

579 (Dept. Int. Med., Univ. Michigan, Ann Arbor, Mich., U.S.A.) A series of amino acids as well as the first 2 metabolites of L-leucine, OL-ketoisocaproate and isovalerate, were given to sulphonylurea pretreated normal healthy subjects. Of the amino acids only iso-leucine produced any hypoglycaemia comparable to that seen after administration of leucine. The metabolite - OL-ketoisocaproate - was also partially effective but probably by virtue of its transamination to leucine *in vivo*. Leucine itself is responsible for the known release of insulin under these conditions. G.F.Blane

6672. INVESTIGATION OF INSULIN-LIKE ACTIVITY IN HUMAN SERUM AFTER ORAL ADMINISTRATION OF GLUCOSE TO ELUCIDATE PANCREATIC FUNCTION. H.Daweke: *Acta endocr. Kbh.*, 1963, 42, 437-452 (Med. Klinik, Akad., Dusseldorf, Germany) The insulin-like activities (ILA) in serum before and after oral administration of glucose was studied using the method of [$1-14\text{C}$]glucose oxidation to 14CO_2 on the rat epididymal adipose tissue. Mean fasting values in maturity-onset diabetes were below normal and in insulin-requiring diabetes above normal. After glucose, the values in maturity-onset diabetes rose but to a much lower level than that in normal subjects while the blood sugar level was markedly greater. In the other type of diabetes the ILA decreased but the blood sugar rose greatly. Severity of pancreatic disease which is inversely proportional to the index of insulin reserve was indicated for insulin-requiring diabetes in which the reserve was very low. (German) H.B.Waynforth

6673. CARDIAC INFARCTION AND INSULIN ANTAGONISM. J.Vallance-Owen and W-L Ashton: *Lancet*, 1963, i, 1226-1228 (Dept. Med., King's Coll. Hosp., London, England) Nineteen out of 28 unselected patients with cardiac infarction, compared with 6/28 controls matched for age and sex, have increased antagonism to insulin associated with their plasma-albumin. This same abnormality is found in essential diabetics, including prediabetics, and many consanguineous relatives of diabetic patients. G.H.Bell

6674. CHEMOCYTOLGY OF PARATHYROID GLANDS OF RAT AFTER BILATERAL NEPHRECTOMY. J.Hara, K.Yamada and T.Hotta: *Z. Zellforsch.*, 1963, 59, 804-819 (Dept. Anat., Univ. Sch. Med., Nagoya, Japan) The chemocytol. aspects of the parathyroid gland of bilaterally nephrectomised rats were examined in specimen taken at 3 postoperative periods to examine the development of the glandular cell hyperfunction. The parathyroid cells contained 2 types of protein granules as demonstrated by the dihydroxy-dinaphthyl-disulphide [DDD]diazo blue B and the hydroxy-naphtholic acid hydrazide [HNAH]diazo blue B methods. Both the DDD diazo blue B and the HNAH diazo blue B reactive granules increase in no. as well as in stainability in the parenchymal cells at 12-24 hr. after the operation. Glycogen granules disappear almost completely 12 hr. after the bilat. nephrectomy but reappear later on; the amount of pyronin stainable cytoplasmic RNA and the activity of alk. phosphatase increase after 12-24 hr. after the operation. J.E.Linder

6675. NEUROSECRETION ON THE HYPOPHYSO-THALAMUS SYSTEM IN GUINEA-PIGS UNDER INFLUENCE OF ACETATE CL-TOCOPHEROL. K.Miftkiewski and M.Kozik: *Pozn. Towarzy. Przyjac. nauk. Wydz. lek.*, 1962, 22, 131-162 (Zaklad histol.

Prawicpowej i Embriol. Akad. Med., Poznań, Poland) *Histochem. examination of hypophysio-thalamus system in guinea-pigs receiving 30 mg./kg. daily doses of a-tocopherol acetate for 5, 10 or 15 days showed irreversible destruction of neurocytes. Neurosecretion is gradually < decreased in the neurocytes of the supra-optic and peri-ventricular nuclei and neurosecretin is accumulated in the middle part of hypophysis. A pos. PA-Schiff reaction after prolonged administration of a-tocopherol acetate extended to the peripheral zone of neuroplasma, nucleus wall and the cell nucleus.* (Polish) T.G. Lipicki

6676. MECHANISM OF REGRESSION¹ OF DIABETES INSIPIDUS AFTER PITUITARY STALK LESIONS IN RATS. K.Kovács, M.A.D.Svid and F.A.László: *Acta med. Acad. Sci. hung.*, 1963, 19, 95-108 (1st. Dept. of Med., Univ. Med. Sch., Szeged, Hungary) The polyuria which developed in rats after pituitary stalk section was found to regress. One to 2 months after operation urine production was not significantly greater than that of unoperated controls. There was no evidence that the secretion of ADH in these animals had been resumed and the cessation of polyuria is attributed largely to reduction in glomerular filtration, possibly as a consequence of the reduced activity of the pituitary-adrenal axis. G.F.Blane

6677. PITUITARY GLAND AND IRON ABSORPTION. B.F.Chow, S.D.J.Yeh and H.Eberspaecher: *Endocrinology*, 1963, 72, 871-875 (Biochem. Dept., Sch. Hygiene and Public Hlth., Johns Hopkins Univ., Baltimore, Md., U.S.A.) Hypophsectomy, but not adrenalectomy or thyroidectomy resulted in impaired ^{59}Fe absorption in rats. Administration of crude pituitary extract, but not ACTH, TSH or GH resulted in improved Fe absorption. H.C.Jones

6678. EFFECTS OF OESTRADIOL ON PITUITARY ADRENAL FUNCTION IN MALE AND FEMALE RATS. J.LKitay: *Endocrinology*, 1963, 72, 947-954 (Med. Dept., Univ. Virginia Med. Sch., Charlottesville, Va., U.S.A.) Injn. of polyoestradiol phosphate increased the pituitary wt. in <? and ? rats. Pituitary ACTF, and RNA increased in ?, and pituitary RNA and DNA increased in <?. Oestradiol reversed the sex differences in adrenal secretion and peripheral metabolism of corticosterone. H.C.Jones

6679. DIRECT MAMMOTROPHIC EFFECT OF PITUITARY HOMOGRAFT IN RATS. T.L.Dao and D.Gawlalec: *Endocrinology*, 1963, 72, 884-892 (Roswell Park Mf Inst., Buffalo, N.Y., U.S.A.) S.c. pituitary graft in rats had a direct mammotrophic effect, independent of the presence or absence of pituitary or ovaries *in situ*. H.C.Jones

6680. EFFECT OF RABBIT ANTISERUM TO SHEEP PITUITARY INTERSTITIAL CELL STIMULATING HORMONE IN ADULT FEMALE RATS. G.Bourdel and C.H.Li: *Acta endocr. Kbh.*, 1963, 42, 473-479 (Hormone Res. Lab., Univ., California, Berkeley, Calif., U.S.A.) Antiserum to sheep ICSH counteracted endogenous ICSH in ? rats. It prevents the occurrence of oestrus if given 36 hr. before ovulation. The ovaries, uterus and vaginae became atrophied. H.B.Waynforth

6681. EFFECT OF VARIOUS HORMONES UPON RESPONSIVENESS OF HYPOPHSECTOMISED RAT TO DOCA IMPLANTATION. R.J.Girerd and C.L.Rassaer: *Acta endocr. Kbh.*, 1963, 42, 337-347 (Warner-Lambert

PHYSIOLOGY

647

Res. Inst.. Morris Plains, N.J.. U.S.A.) Pituitary extracts induced a b.p. elevation in DOCA implanted hypophysectomised rats sensitised by unilat. nephrectomy, comparable to that present in normal DOCA-implanted sensitised rats Hypophysectomy and ACTH treatment increased DOCA-induced polydipsia while vasopressin reduced it. The absence of the pituitary prevented renal and cardiac pathol. changes which occur on treatment with DOCA to normal animals but its absence did not Prevent the production of vascular lesions.

H.B.Waynforth

6682. HYPOPHYSECTOMY IN PREGNANT RATS.

L.Angerrall and P.M.Lundin: *Acta endocr. Kbh.*, 1963, 42, 591-600 (Path. Dept., Univ. GSteborg, Sweden) Hypophysectomy of pregnant rats causes a decrease in the birth wt. of the foetuses. The foetuses also showed hypoplastic thyroids, pancreatic islets and gonads at birth.

H.B. Waynforth

6683. MELANOCYTE STIMULATING HORMONES [MSH] FROM SHEEP PITUITARY GLANDS. T.H.Lee, A.B.

Lerner and V.Buettner-Janusch: *Biochim. biophys. Acta*, 1963, 71, 706-709 (Section of Dermatol.. Dept. Med., Yale Univ. Sch. Med., New Haven, Conn.. U.S.A.) Ovine a-MSH had the same amino acid sequence as a-MSH from other animals. Three varieties of ovine 0-MSH were studied; 1 appeared to be identical with bovine 0-MSH.

6688. EFFECT OF BILATERAL ABLATION OF HABENULAR NUCLEUS ON THYROID FUNCTION IN ALBINO RAT. K.Matsuda: *Endocrinology*, 1963, 72, 972-973 (Med. Dept., Univ. Oregon Med. Sch., Portland, Ore., U.S.A.) Bilat. electrolytic destruction of the habenular nucleus in cf rats did not significantly alter the rate of 1311 secretion from the thyroid.

H.C.Jones

6689. THYROID AUTOGRaFTS IN HYPOPHYSECTOMIZED AND IN THYROXINE TREATED RATS.

E.D.Williams and I.Doniach: *J. Endocr.*, 1963, 26, 479-488 (Baron Inst., Pathol., London Hosp., London, England)

Lobes of thyroid gland autotransplanted s.c. to the ant. abdominal wall took* well both in hypophysectomised animals and in animals in which the TSH production had been suppressed by administration of exogenous thyroxine. It appeared from autoradiographic studies that the rapid reparative growth in the transplants was accompanied by an increased org. binding of I compared to that seen in the undisturbed thyroid tissue of the neck. It is suggested that in the graft, stimuli to thyroid growth other than TSH may lead to a concomitant increase in thyroid function.

G.F.Blane

6690. THYROID FUNCTION AND IODINE METABOLISM

IN IODINE-INDUCED HYPOTHYROIDISM. M.T.Harrison, W.D.Alexander and R.McG.Harden: *Lancet*, 1963, i, 1238-1241 (Univ. Dept. Med., Gardiner Inst., Western Infirmary, Glasgow, Scotland)

Four patients with I-induced goitre and hypothyroidism were studied. In all of them the uptake of 1311 by the thyroid gland was not normally suppressed after triiodothyronine, indicating abnormal pituitary-thyroid control. In each case I uptake was high during the period of ingestion, owing to ? abnormally high thyroid clearance and to high levels of plasma-inorg. I When I was discontinued I uptake and plasma-inorg. I fell rapidly, but the thyroid clearance increased still further.

G.H.Bell

6691. ACTION OF PITUITARY TSH ON THE INORGANIC PHOSPHORUS OF THYROID TISSUE IN VITRO.

N.Freinkel: *Nature, Lond.*, 1963, 198, 889-891 (Thorndike Mem. Lab., Boston City Hosp., Boston, Mass., U.S.A.) In sheep thyroid slices, addition of purified pituitary TSH caused a rise in inorg. PO4,

presumably due to activation of thyroidal phosphatases; this parallels the stimn. of O2 consumption and glucose assimilation.

G.M.Lewis

6692. EFFECT OF TSH ON IN VIVO IODINE BINDING IN THYROID SUBCELLULAR FRACTIONS. V.Pantić and R.Ekholm: *Nature, Lond.*, 1963, 198, 903-905

(Dept. Anat., Univ., Gothenburg, Sweden) In guinea-pigs inj. with NaI311 single and repeated doses of TSH increased the protein-bound 1311 content of both micro-sornal-postmicrosomal and supernatant fractions in the thyroid gland.

G.M.Lewis

6693. INTRACARDIAC LOCALISATION OF THYROID HORMONES IN RAT. E.Gravina, A.Tomaselli,

L.Covelli and J.Roche: *C.R. Soc. Biol.*, Paris, 1963, 157, 67-68 (Inst. General Pathol., Univ., Naples, Italy) Inj. of [131I]3,5,3-triiodo-L-thyronine in rat resulted in localisation of radioactivity in the region under the endocardium which contained the Purkinje fibres. L-thyroxine was evenly distributed throughout the myocardium while 3,5,3-triiodothyroacetic acid became localised in a narrow band beneath the epicardium.

6695. METHOD FOR IODINE-131 CONVERSION RATIO UTILISING THE PLASMA INORGANIC IODINE-131 FRACTION. H.Oyamada and E.L.Pentz: *J. clin. Path.*, 1963, 16, 244-247 (Chicago Wesley Mem. Hosp., Chicago, Ill., U.S.A.) 1011 conversion ratios were measured by utilising the inorg. 131i counts in plasma 24 hr. after oral administration of NaI311. The method depended on pptn. of 131I by AgNO₃ and was useful in low conversion ratios because it eliminated the error due to background fluctuations when low protein-bound 131I counts occur. It was confirmed that low conversion ratios frequently occur in euthyroid patients. J.B.Derbyshire

6696. SURVEY OF THYROID ENLARGEMENT IN TWO GENERAL PRACTICES IN GT. BRITAIN. R.Kilpatrick, J.S.Milen, M.Ruchbrooke, E.S.B.Wilson and G.M. Wilson: *Brit. med. J.*, 1963, i, 29-33 (Dept. Pharmacol. and Therapeut., Univ., Sheffield, England)

In Sheffield 12% of men and 25% of women in a general practice had visible thyroid glands. Corresponding values in Ormiston, Scotland, were 0·3% and 4·2%. Thyroid enlargement in Sheffield was commonest between 10 and 49 yr. and declined after 50 yr. in both sexes. In Ormiston incidence rose gradually with increasing age. Examination of mothers, daughters and sisters gave some evidence of familial incidence. Incidence was not increased by childbearing. Prevalence of goitre was not significantly less in women who had spent their first 20 yr. outside Sheffield and had subsequently lived there for several yr. Incidence of thyrotoxicosis and treatment for thyroid disorders was much greater in Sheffield than in Ormiston.

6698. DIFFERENTIAL EFFECTS OF PERMANENT HYPOTHALAMIC LESIONS ON REPRODUCTION AND LACTATION IN RATS. R.L.W.Averill and H.D.Purves: *J. Endocr.*, 1963, 26, 463-477 (Endocr. Res. Dept., Otago Univ. Med. Sch., Dunedin, New Zealand)

The subsequent reproductive and lactational performances of rats with thermal hypothalamic lesions made at the time of puberty are described. Large bilat. ant. lesions were associated with failure of lactogenesis while mating and gestation in these animals remained unaffected.

G.F.Blane

6699. INTRAPERITONEAL FOREIGN BODY* EFFECT ON PREGNANCY IN RAT. L.L.Doyle and A.J.Margolis: *Science*, 1963, 139, 833-834 (Dept. Obstetrics,

Univ. California Sch. Med., San Francisco, Calif. U.S.A.) A silk suture placed in the lumen of one uterine horn before mating prevented pregnancy in that horn by interfering with implantation. It did not interfere with fertilisation or tubal transport of ova nor induce a decidual reaction. " G.M.Lewis

6700. A SEROLOGICAL PREGNANCY TEST. III.

S.Kaivola, U.Kirstala and E.Axelom: *Acta endocr. Kbh.*, 1963, 42, 395-402 (State Serum Inst., Helsinki Finland) Highly purified chorionic gonadotrophin [HCG] has been used in the prep. of antisera and in the coating of r.b.c. and this has resulted in an improvement in the determination of HCG in urine by the haemagglutin. inhibn. method. Gel diffusion tests have been carried out in order to clarify the immunol. nature of the HCG used.

H.B.Waynforth

6701. PREGNANCY DIAGNOSIS BY ONE-STAGE PASSIVE HAEMAGGLUTINATION INHIBITION

METHOD. AJ.Fulthorpe, J.A.C.Parke, J.E.Tovey and J.C.Monckton: *Brit. med. J.*, 1963, i, 1049-1054 (Wellcome Res. Lab., Beckenham, Kent, England)

Haemagglutin. of sheep cells sensitised to human chorionic gonadotrophin [HCG], and agglutinated by rabbit antisera to HCG, is inhib. by HCG present in pregnancy urine. Of 126 clinically confirmed pregnancies 124 were pos. by this test and all of 211 urine samples from non-pregnant controls, aged 17-54 yr. were neg. Tests were made on 388 samples also tested by the toad test and in 380 of these the tests were in agreement. In 12 of the remaining the toad test was pos. and haemagglutin. inhibn. neg., 7 of the 12 subsequently proved to be pregnant. The 26 remaining tests were pos. to haemagglutin. and neg. to the toad test, 23 of these patients were pregnant and 3 untraced. Assuming that results of tests which agree are correct the overall accuracy is 98·2% for haemagglutin. and 92·8% for the toad test. Quant. assay of the urine samples by haemagglutin. did not agree with bioassay, possibly due to differing proportions of hormonally and immunol. active HCG in the samples, or to interference by non-sp. Ag and Ab. HCG rendered biol. inactive by treatment with KIO₃ retained its capacity to combine " i * Ab.

6709. INDUCTION OF OVULATION BY SMALL DOSES OF TESTOSTERONE CTCWHEXANE PROPIONATE. A DELAYED-ACTION LUTEINISING AN DROGEN. P.Simom J. Reprod. Fertil., 1963, 5, 465 ^.Jones

6710. SUPEROVULATION AND RELATED PHENOMENA S BEF COW. B S IULATORY RESPONSES S FOLLOWING PRE S LARES SERUM [PMS] AND HUMAN CHI GONADOTROPHIN [HCG] INJECTIONS Hafez, T.Sugie and L.Gordon. II. EFFECT OF OESTROGEN ADMINISTRATION ON

*h*ch the corpora lutea had been enucleated as in the

normal ovary of the same cow. When the corpus luteum was incompletely expressed fewer follicles developed. No advantage was obtained by giving the injn. earlier than the 16th day after oestrus or by giving the total dose over a no. of days. Response was greater in animals that underwent corpus luteum enucleation than in those that remained intact. The total no. of follicles developed was greater with 5000 I.U. than with 3000 I.U. and there was also an increase in % of luteinised and haemorrhagic follicles. There was no consistent relationship between the fertilisation rate and the no. of ovulations.

II. When 20 mg. oestradiol-17⁸ was inj. after 3000 I.U. PMS a greater no. of follicles developed than in untreated cows or cows given PMS alone. The oestrogen appears to augment the output of endogenous gonadotrophin.

H.E.H.Jones

6711. STIMULATION OF GLYCOLYTIC ACTIVITY OF RAT CORPUS LUTEUM TISSUE BY LUTEINISING HORMONE. D.T.Armstrong, Endocrinology, 1963,

72, 908-913 (Biol. Res. Lab., Harvard Sch. Dental Med., Boston, Mass., U.S.A.) Rat luteinised ovary tissue metabolised a large % of C labelled glucose to lactic acid. The rate of lactic acid formation increased with the medium glucose concn. LH treatment in vivo stim. lactic acid formation and it was more effective in * anaerobic than aerobic incubation conditions.

H.C.Jones

6712. CORPUS LUTEUM-PITUITARY RELATIONSHIPS INDUCTION OF PSEUDOPREGNANCY IN RAT 3Y PROGESTERONE. I.Rothschild and R. Schubert:

Endocrinology, 1963, 72, 969-972 (Dept. Obstet. and Gynec., Western Res. Univ. Med. Sch., Cleveland, Ohio, U.S.^AT) Rats inj. with progesterone showed the largest # of pseudopregnancies when inj. during oestrous, end the lowest % when the injn. was given during prooestrous. Injn. during dioestrous gave intermediate results.

H.C.Jones

6713. BIOLOGICAL ACTIVITY IN VITRO OF GONADOTROPHIC HORMONES, m. EFFECT OF INCUBATION TEMPERATURE ON STEROID METABOLISM OF CORPUS LUTEUM OF RAT. IV. SYNERGISTIC ACTION OF PROLACTIN AND CHORIONIC GONADOTROPHIN ON RAT CORPUS LUTEUM. D.Gospodarowicz and J.Legauet-Demare: Acta. endocr. Khb., 1963, 42, 498-508, 509-513 (Biochem. Lab., Curie Fndn.,

26 Rue d*Ulm, Paris, France) m. Variations in temp, greatly affected die incorporation of [14C]acetate into progesterone and androstenedione. Cyclic and pseudo-pregnant corpora lutea studied at different temp, also showed differences. These suggest that the synthesis of die two steroids is by different pathways.

IV. Incorporation of [14C]acetate into cholesterol of normal rat corpora lutea was enhanced only by simult. addition of chorionic gonadotrophin (HCG) and lactogenic hormone (LTH) to the culture medium. However HCG alone also enhanced incorporation in pseudopregnancy corpora lutea. LTH by itself was ineffective.

6714. CAPACITATION OF RABBIT SPERMATOZOA IN FALLOPIAN TUBE AND IN UTERUS. C.E.Adams and M.C.Chang: J. exp. Zool., 1962, 151, 159-165 (Worcester Foundn. for Expt. Biol., Shrewsbury, Mass., U.S.A.) 79 sexually mature crossbred does were used in this study. By laparotomy at exact intervals, varying from 6 hr. before i.v. injn. of 30 I.U. LH to 14 hr. after, semen were introduced into the left Fallopian tube and the right uterine horn, or into both uterine horns, or whole and dil. semen was deposited into the Fallopian tubes. Eggs

PHYSIOLOGY

collected 22-40 hr. following ovulation were examined for evidence of fertilisation. Deposition of semen into the uterus 10 hr. or less before ovulation promoted a higher level of fertilisation than did similar deposition into the Fallopian tubes. Tubal insemination from 6 hr. before to 45 min. after LH injn. resulted in 93[#]2% of the eggs being fertilised. The proportion of eggs fertilised decreased from 69% to zero when insemination took place from 3-12 hr. after LH injn.

R.J.Walker

6715. EFFECT OF DELAYED MATING ON FERTILISATION IN THE RABBIT. C.E.Adams and M.C.Chang; *J. exp. Zool.*, 1962, 151, 155-158 (A.R.C. Unit of Reproductive Physiol., Univ., Cambridge, England) Female rabbits inj. i.v. with 25 I.U. LH were mated at exact intervals varying from 8-14 hr. with fertile c? 25-40 hr. after injn., ova were removed from the Fallopian tubes and examined for evidence of fertilisation. When mating occurred 8-12 hr. following the injn., 87-100% of the eggs recovered were fertile. After 12 hr. the proportion fell rapidly until at 14 hr. it was zero. The results are discussed in relation to the fertilisable life of the egg, sperm capacitation, and embryonic development.

6716. DYNAMICS OF DEVELOPMENT OF MORPHOLOGICAL LESIONS AND HISTOCHEMICAL ALTERATIONS OF UTERUS IN COURSE OF PREGNANCY AND Puerperium. Vin. NUCLEIC ACIDS AND PROTEINS. Z.Torzecki: *Ginek. pol.*, 1962, 33, 507-518 (Zaklad Anat. Patol., Akad. Med., Jlodz, Poland) The amount of DNA in the uterine muscle increased during first days of pregnancy, then declined and increased again between the 5th and 10th-day after puerperium. (Polish).- *Webicki

6717. ACTION OF OESTROGENS AND PROGESTERONE ON UTERINE EPITHELIAL MITOSIS IN ORGAN CULTURE. J.Everett: *Nature*, Lond., 1963, 198, 896 (Dept. Anat., Charing Cross Hosp. Med. Sch., London, England) Uterine horns of foetal guinea-pigs in which glands had not developed were grown in organ culture. The no. of mitoses was significantly depressed by addition of progesterone to the medium, oestrone or oestradiol had no effect.

G.M.Lewis

6718. UTEROTROPHIC ACTIVITY IN HUMAN EjACULATE. J.Rabock and K.Rezabek: *J. clin. Endocr.*, 1963, 23, 28 (Sexological Inst., Charles Univ., Prague, Czechoslovakia) The uterotrophic activity in semen collected from men with a variety of somato-sexual disturbances was assayed on spayed ♀ rats. Activity equiv. to 2-5 fig. oestradiol monobenzoate/1. of semen was found in most groups studied, with a tendency towards higher values in bilaterally cryptorchid subjects. It is postulated that the testicular oestrogens originate in the Leydig cells.

G. Blane

6719. EFFECT OF HISTAMINE AND SHT IN STIMULATING PHOSPHORYLASE ACTIVITY IN RAT UTERUS. S.I.Leonard: *Endocrinology*, 1963, 72, 865-870 (Zool. Dept., Cornell Univ., Ithaca, N.Y., U.S.A.) Lp. injn. of histamine resulted in increased active phosphorylase per total uterine wt. in the uterus of spayed rats, and oestradiol given s.c had the same effect. Intrauterine histamine showed results the same as control injn. SHT did not affect uterine phosphorylase activity. Antihistamines antagonised the effects of oestradiol on uterine phosphorylase.

H.C.Jones

6720. EXTRAUTERINE RECIRCULATION OF IODINE-131 FROM THE YOUNG TO MOTHER IN RATS. M.Samel, A.Caputa and L.StruhSrová: *Nature*, Lond*, 1963, 198, 489 (Czechoslovak Acad. Sci., Endocrinol. Inst., SAV, Bratislava, Czechoslovakia) Suckling rats were inj. i.p. with 131I. After suckling, the mother was transferred to uninj. young; 131I was then detected in the stomach, serum and thyroid gland of the young. A rapid recirculation of materials in the urine of the young therefore occurs through the mother's milk. -Digestion of urine of immature animals by their mothers must maintain their internal environment in a manner similar to that occurring in intrauterine life.

G.M.Lewis

6721. INFILTRATION OF LEUCOCYTES INTO UTERINE LUMEN OF GOLDEN HAMSTER DURING OESTROUS CYCLE AND FOLLOWING MATING. R.Yanagimachi and M.C.Chang; *J. Reprod. FertU.*, 1963, 5, 391-398 (Worcester Fndn. for Expt. Biol., Shrewsbury, Mass., U.S.A.) In the unmated hamster the highest no. of leucocytes (308000) in one horn of the uterus appeared soon after oestrus. After mating the highest no. (1497000) appeared 12 to 14 hr. after mating, i.e., 6 hr. earlier than in the unmated 2. The quicker infiltration with leucocytes is due to the presence of semen and spermatozoa in the uterus. Rapid disappearance of spermatozoa from the uterus the day after mating is due to both phagocytic activity of leucocytes and drainage through the cervix.

H.E.H.Jones

6722. PERIOD OF SENSITIVITY OF ENDOMETRIUM TO TRAUMA INDUCED EXPERIMENTAL DECIDUA IN THE GOLDEN HAMSTER DURING EXPERIMENTAL LUTEAL PHASE. J.C.Czyba, M.Chiris and P.Dubois: *C.R. Soc. Biol.*, Paris, 1962, 156, 2074-2076 (Lab. d'Histo., Fac. de Méd., Lyon, France) Bilat. ovariectomised hamsters received injn. of 2 mg. progesterone per day. Expt. decidua could be induced by piercing the uterus with a wire during the 1st to 12th day of the luteal phase. (French) M. A. Price

6723. MECHANISM OF DECIDUALISATION. IV. SYNTHETIC PROCESSES IN DECIDUALISING UTERUS. M.C.Shelesnyak and L.Tic: *Acta endocr. Khb.*, 1963, 42, 465-472 (Biol. Reproduction, Weizmann Inst. Sci* Rehovoth, Israel) During decidualisation produced by systemic means, there is an increase of protein, RNA and DNA content of the rat uterus. High values for these and the uterine wet wt. were found at pro-oestrous and during days 4 and 5 of the w.b.c. phase of pseudopregnancy.

H.B.Waynfirth

6724. EFFECT OF PROGESTATIONAL STAGE OF ENDOMETRIUM ON IMPLANTATION, FOETAL SURVIVAL AND FOETAL SIZE IN THE RABBIT, ORYCTOLAGUS CUNICULUS. E.S.E.Hafez: *J. exp. Zool.*, 1962, 151# 217-226 (Dept. Animal Sci., Washington State Univ. Pullman, Wash., U.S.A.) "Embryos of a known developmental stage were transferred from donor to recipient rabbits at different progestational stages of the endometrium. If the development of the embryo and the endometrium is slightly asynchronous, implantation occurs but if synchronisation is severe e.g. 2 days, then implantation is inhibited, or may fail altogether. Embryonic survival is not favoured when the development of the ova was ahead of uterine development of the recipient. In a second series of expt. it was found that the cervical end <> the endometrium was as favourable as the tubal end for the survival of embryos." R.J.Walker

PHYSIOLOGY

**** MAMMOGENIC EFFECTS OF METHANDROSTENOLONE IN CASTRATED RATS.* K.Ahren, A.Arvidsson and A.Hjalmarsson: Acta endocr. Kbh., 1963, 42, 601-604 (f^yolo Dept., Univ., Gfleborg. Sweden) Androstenolone was inj. into gonadectomised rats and the mammary glands and sex organs was assessed. A dose-response relationship was observed between the drug and the response of the seminal vesicles and levator ani muscle of the rat, the latter organ being more sensitive. The effect of the drug indicated that it possessed oestrogenic activity, of which caused lobule-alveolar development and growth of the ducts of the mammary glands.

H.B.Waynfirth

6729. PLASMA PROGESTERONE CONCENTRATION AFTER REMOVAL OF THE CORPUS LUTEUM IN THE FEMALE. J.A.McCracken: Nature, Lond., 1963, 198, 507-508 (Univ. Glasgow, Vet. Hosp., Bearsden, Glasgow, Scotland) Removal of the corpus luteum of cows per vaginum on day 12 of the oestrous cycle caused an initial rapid fall in progesterone level followed by a more gradual decline. Similar results were obtained after ovariectomy.

G.M. Lewis

6730. FAILURE OF PROGESTERONE TO PROLONG PREGNANCY IN THE GUINEA-PIG. M.X.Zarrow, N.C. Anderson jun. and M.R.Callantine: Nature, Lond., 1963, 198, 690-692 (Dept. Biol. Sci., Purdue Univ., Lafayette, Ind. U.S.A.) Injn. of ovariectomised female guinea-pigs with 4-20 mg. progesterone or 4 mg. rovera s.c. after the 55th day of pregnancy failed to prolong gestation time. Addition of 0.4-4 pg. oestrogen to 4 mg. progesterone was also ineffective in prolonging gestation. Systemic Progesterone level clearly has little effect on uterine motility and the hormone may be effective only locally in the myometrium.

G.M.Lewis

6731. PSEUDOPREGNANCY IN RAT FROM BRIEF TREATMENT WITH PROGESTERONE* EFFECT OF ISOLATION.

J.W.Everett: Nature, Lond., 1963, 198, 695-696 (Dept. Anat., Duke Univ. Sch. Med., Durham, N.C., U.S.A.) S.c. injn. of 10 mg. progesterone into rats on the day of oestrous induced pseudopregnancy in 70% of 4-day cyclic rats when subjected to daily vaginal lavage and not isolated from other 2. When similar animals were isolated without vaginal lavage, only between 10-40% became pseudopregnant. Most rats with 5-day cycle became pseudopregnant in either circumstance. G.M.Lewis

6732. PROGESTERONE AND ACCOMPLISHMENT OF PARTURITION IN SHEEP. L.Ph.Bengtsson and B.M. Schofield: J. Reprod. Fertil., 1963, 5, 425-433 (Riysiol. Dept., Royal Vet. Coll., London, England)

The time and course of pregnancy were unaffected in sheep given daily injn. of 2.5 mg. and 10 mg. 6a-methyl-17a-hydroxy progesterone acetate [6-MAP] and 10 and 40 mg. progesterone for 14 days starting 1 week before the expected date of delivery. In the following season 25 and 40 mg. 6-MAP, and 80 and 160 mg. progesterone were given daily and a high proportion of pregnancies was affected, with a higher mortality of lambs delivered than in the control group. In all cases of delayed parturition die lambs died in utero, though foetal death was not considered to be due to post-maturity. The results are discussed and it is suggested that placental progesterone in the ewe is not replaceable by systemic progesterone.

H.E.H.Jones

6733. PREGNANCY MAINTAINING EFFECT OF SYNTHETIC PROGESTOGENS IN RAT. G.K.Suchowsky: Acta endocrin^bh., 1963, 42, 533-536 (Schering AG, West Berlin, Germany) Ten steroids were tested for their pregnancy-maintaining effect in spayed pregnant rats and some of these the progestogen-oestrogen ratio for maintenance was determined.

H.B.Waynfirth

6734. OESTRIOL METABOLISM IN PREVIALE HUMAN FOETUS. G.Mikhaie, N.Wiqqvist and E.Diczfalusi: Acta endocr. Kbh., 1963, 42, 319-332 (Hormone Lab., Dept. Women's Dis., Karolinska Sjukhuset, Stockholm, Sweden) [16-14c]Oestriol inj. into

human foetuses at about the 20th week of gestation was found in the different organs almost entirely in a conjugated form. This was identified as oestriol-3-sulphate. Small amounts of a glucosiduronate and sulpho-glucosiduronate and an unknown metabolite were also detected in liver, gut and blood.

H.B.Waynfirth

6735. CONCENTRATION OF OESTRONE, 17-OESTRADIOL AND OESTRIOL IN UMBILICAL ARTERIES AND VEINS. W.Schild, K.SchQrholz and A.Seukeic: Z. Ges. exp. Med., 1963, 136, 552-555 (Frauenklinik and Physiol.-Chem. Inst., Med. Acad., Dflseldorf, Germany) Determination of oestrogens in the umbilical vessels of neonates showed that the arteries had a lower concn. of oestrone and probably also of 17@-oestradiol than the veins.

P.F.Meyer

6736. EFFECT OF OESTRIOLS ON PLASMA LIPOID LEVELS. M.Julesz, M.B.FrShlich, L.K.liszlo, LT6th, G.Szepessy and M.A.David: Acta med. Acad. Sci. hung., 1963, 19, 161-168 (1st Med. Clinic, Univ., Szeged, Hungary) Oestriol administration to 6 women with a variety of clinical conditions resulted in a significant fall in the serum a-lipoprotein with a rise in the 3-fraction. The role of oestrogens in affecting systems other than genital structures is emphasised.

PHYSIOLOGY

6737. ASSAY OF PROLACTIN BASED ON DIRECT EFFECT OF THIS HORMONE ON CELLS OF CORPUS LUTEUM. O.L.Wolthuis: *Acta endocr. Khb.*, 1963, 42, 364-379 (Pharmacol. Dept., Boeraavekwartier Univ., Leiden, Netherlands) The method is based on the reduction of the no. of corpus luteum cell nuclei, produced by the injn. of prolactin into hypophysectomised immature rats treated with high doses of HCG and pregnant mares serum. Correlation between the dose and the response is discussed as is also the practicability of the test. H.B.Waynforth

6738. NEW PROLACTIN ASSAY METHOD. SOME EXPERIMENTS WHICH PROVIDE ARGUMENTS FOR ITS SPECIFICITY. O.L.Wolthuis: *Acta endocr. Khb.*, 1963, 42, 380-388 (Pharmacol. Dept., Boerhaavekwartier Univ., Leiden, Netherlands) It is shown that in a new prolactin assay method based on the reduction of the no. of rat corpus luteum cell nuclei induced by prolactin, no interference was obtained by administration of other pituitary hormones or by oestrogens. Growth hormone, ACTH, TSH, LH and FSH did not influence the result produced by the injn. of prolactin and it is concluded that the method is sp. for prolactin. H.B.Waynforth

6739. EFFECT OF URINARY GONADOTROPHIN INHIBITOR ON MOUSE UTERINE RESPONSE TO VARIOUS GONADOTROPHINS. W.Futterweit, S.A.Margolis, L.J.Soffer and R.I.Dorfman: *Endocrinology*, 1963, 72, 903-907 (Worcester Fndn. Expt. Biol., Shrewsbury, Mass., U.S.A.) Urinary gonadotrophin-inhibiting material prevented the action of LH on ventral prostate in the immature rat intact and hypophysectomised rat, as well as on the uterus of the immature mouse. It did not inhibit the action of testosterone on the ventral prostate of the castrated rat nor inhibit the action of FSH. H.C.Jones

6740. BIOLOGICAL ASSAY OF LUTEINISING HORMONE BY OVARIAN HYPERAEMIA METHOD OF ELLIS: AN EVALUATION. A.F.Parlow and L.E.Reichert jun.: *Endocrinology*, 1963, 72, 955-961 (Physiol. Dept., Div. Basic Hlth. Sci., Emory Univ., Atlanta, Ga., U.S.A.) An evaluation of the biol. assay of LH by the ovarian hyperaemia method has been made with 101 assays using 5000 animals. The index of precision and mean % of standard error has been calc. The presence of FSH interfered with the assays. H.C.Jones

6741. URINARY EXCRETION OF OESTRONE IN SOW AFTER ADMINISTRATION OF OESTRADIOL-17 β . T.Lunaas: *Acta endocr. Khb.*, 1963, 42, 314-318 (Reproductive Physiol. and Path. Dept., Veterinary Coll., Oslo, Norway) Oestrone was identified by the method of Brown as the main urinary metabolite after i.m. injn. of oestradiol-17 β into the sow. The implication of these findings is discussed. H.B.Waynforth

6742. EFFECT OF OESTRADIOL BENZOATE TREATMENT IN NEWBORN MALE RAT. F.A.Kincl, A.Folch Pi and L.Herrera Lasso: *Endocrinology*, 1963, 72, 966-968 (Res. Lab., Syntex, S.A. Mexico, D.F., Mexico) A single injn. of oestradiol benzoate to 5-day cT rats produced infertility, inhibn. of spermatogenesis and atrophy of accessory sex tissue*. H.C.Jones

6743. SEMINAL DEGENERATION IN RAM AND ITS RELATION TO TEMPERATURE OF SCROTUM.

G.R.Moule and G.M.H.Waites: *J. Reprod. Fertil.*, 1963, 5, 435-448 (I.C.Ross Animal Res. Lab., C.S.L.R.O., P.O.Box 144, Parramatta, N.S.W., Australia) Semen of decreased quality containing abnormal spermatozoa was obtained from rams 13 to 21 days after they had been exposed to temp. of 40 $^{\circ}$ 5 $^{\circ}$. The change varied in severity and duration and was related to the temp, rise of the scrotum during exposure and not to changes in rectal or flankskin temp. The concn. and total content of fructose in the semen of the treated rams also started to rise 13 to 21 days after exposure. When the scrotum was kept cooled by water at 1ST throughout the period of exposure to a temp. of 40 $^{\circ}$ 5 $^{\circ}$ abnormalities of semen were not obtained. It was concluded that the efficiency of the heat-dissipating prop. of the scrotum alone determined the magnitude of the adverse effects of short periods of exposure to high temp, on the quality of semen produced by rams. H.E.H.Jones

6744. RELATION BETWEEN FRUCTOSE CONTENT OF SEMEN AND FERTILITY IN MAN. C.Schirren: *J. Reprod. Fertil.*, 1963, 5, 349-360 (Univ.-Haut-klinik-Pdliklinik, Martinistraße 52, Hamburg, Germany) Fructolysis of human semen is only seen in the presence of normal spermatozoa. Abs. fructose concn. in semen was inversely proportional to the no. of spermatozoa. Values below 1200 pg. fructose/ml. were considered to be abnormal and due to inflamma&iop of the seminal vesicles or to androgen deficiency. The fructose concn. was diminished following abstinence of more than 8 days. Patients with normospermia with postpubescent interstitial cell insufficiency* are infertile but after treat*ment with methyltestosterone or chorionic gonadotrophin became fertile and fructose values normal. H.E.H.Jones

6745. ESTIMATION FROM OPTICAL DENSITY OF DRY WEIGHT AND NUMBERS OF SPERM IN SUSPENSIONS OF FOWL SPERMATOZOA AND THE ZOO [OXYGEN UPTAKE PER 108 SPERMATOZOA PER HOUR] - QO2 RELATIONSHIP. G.V.Quicke and B.R.Tulloch: *S. Afr. J. agric. Sci.*, 1963, 6, 135-140 (Fac. Agric., Univ. Natal, Pietermaritzburg, S. Africa). I.A.B.S.

6746. STUDIES ON ARTIFICIAL CRYPTORCHIDISM: MORPHOLOGICAL AND QUANTITATIVE CHANGES IN SERTOLI CELLS OF RAT TESTIS. E.J.Clegg; J.Endocr. 1963, 26, 567-574 (Dept. Anat., Univ., Liverpool, England) Removal of the testis from the scrotum to the abdominal cavity of the adult rat results in degenera^{li} chan^ges of the spermatogonia and spermatocytes while there is a corresponding increase in the no. of Sertoli cells. Microscopic evaluation and studies confirmed their phagocytic nature. It is suggested that the Sertoli cells may be involved in the phagocytosis of the cells of the germinal epitheliuni. G.F.Blane

6747. EFFECTS OF CASTRATION ON MITOCHONDRIA OF RAT VENTRAL PROSTATE. J.C.Edelman, H.Brend^{le} & A.W.Zorgniotti and P.M.Edelman: *Endocrinology* 1963, 72, 853-858 (Biochem. Dept., New York Univ. Med. Cen., New York, U.S.A.) Castration resulted in a decrease in the no. of mitochondria in the cells of rat prostate glands. The enzyme activity of isolated prostatic mitochondria was not different from that of intact rats. H.C.Jones

6753. BEHAVIOURAL DIFFERENCES BETWEEN MUANT AND NON-MUTANT MICE. v ^ ^ ? e r-t g f S. S. and M.Blumenfield: J. comp. Physiol. PsychoL. 1963, 56, 290-293 (R.B.Jackson Mem. Lab., Bar

Harbor, Maine, U.S.A.) Four strains of mice, each having 2 kinds differing only in one gene, were tested on several behavioural measures. Significant differences between the mutant and non-mutant genotypes were found in the Hairless and Pintail strains, but none between the Short-ear or Tale-ear strains. J.R.Broome

6754. EFFECT OF EARLY EXPERIENCE UPON THE FORMATION OF ENVIRONMENTAL PREFERENCES IN RATS. R.A.Soskin: J. comp. physiol. PsychoL. 1963, 56, 303-306 (Washington Univ., Wash., U.S.A.)

Rats were subjected to const, mild vibration at the ages of 1-21, 22-43 or 44-65 days. No group preferred vibration to a stable environment. Animals raised in a vibrating environment, however, showed less tendency to avoid vibration than controls. J.R.Broome

6755. EFFECTS OF INFANTILE STIMULATION AND AGE UPON BEHAVIOUR. V.H.Denenberg and S.A. Smith: J. comp. physiol. PsychoL, 1963, 56, 307-312 (Purdue Univ., Lafayette, Ind., U.S.A.) Rats received either shock or handling on days 11-20 of life, and a control group was not disturbed. The non-handled controls were less active in the open field and had a higher defaecation rate than the 2 expt. groups throughout the age range studied. J.R.Broome

6756. MATERNAL EMOTIONALITY, MULTIPLE MOTHERING, AND EMOTIONALITY IN MATURITY. D.R.Ottinger, V.H.Denenberg and M.W.Stephens: J. comp. physiol. PsychoL, 1963, 56, 313-317 (Purdue Univ., Lafayette, Ind., U.S.A.) The open-field behaviop of rats showed that offspring emotionality is directly related to both prenatal and postnatal emotionality of the mothers. Multiple mothering (mother rotated between her own litter and one foster litter) significantly increased offspring emotionality. J.R.Broome

6757. TRANSFER BETWEEN HABITS BASED ON SHOCK AND THIRST. H.Babb: J. comp. physiol. PsychoL, 1963, 56, 318-323 (Hobart and William Smith Coll Colleges, Geneva, N.Y., U.S.A.) Rats were run in a straight alley on thirst motivation, shock motivation or on successive combinations of these conditions, and were then extinguished half on and half not on thirst drive. Extinction data indicated incomplete summation in transferring from shock to thirst or from thirst to shock. Transfer from shock to thirst training produced a general inhibn. of running speed. J.R.Broome

6758. GENETIC AND ONTOGENETIC DETERMINANTS OF ADULT BEHAVIOUR IN THE RAT. S.Levine and P.L.Broadhurst: J. comp. physiol. PsychoL, 1963, 56, 423-428 (Inst. Psychiatry, Univ. London, England)

Rates of the Maudsley Reactive and Non-reactive strains, selected for emotional defaecation, were subjected to infantile stimm. Tests for open-field behaviour and conditioned avoidance learning showed that both heredity and environment had significant effects; the open-field tests showed that infantile stimm. caused a significant decrease in emotionality. J.R.Broome

6759. EFFECTS OF DEPRIVATION SCHEDULE AND REWARD MAGNITUDE ON ACQUISITION AND EXTINCTION PERFORMANCE. W.B.Pavlik and W.F. Reynolds: J. comp. physiol. PsychoL. 1963, 56, 452-455 (Rutgers Univ., N.J., U.S.A.) Rats were trained in a runway under 2 conditions of food deprivation combined factorially with 2 levels of reward magnitude.

ANIMAL BEHAVIOUR

Both deprivation time and reward magnitude were found to have significant effects on asymptotic running speed and running speed during extinction, and these effects are statistically independent.

J.R.Broome

6760. EFFECT OF FOOD DEPRIVATION UPON THE RAT'S BEHAVIOUR IN ITS HOME CAGE. R.C.Bolles: *J. comp. physiol. Psychol.*, 1963, 56, 456-460 (Hollins Coll., Va., U.S.A.) The activity in their home cages of rats deprived for 12 days was compared with their own ad lib. baseline activity and that of a control group maintained on ad lib. food and water. The hungry animals showed significantly more activity on the last 4 deprivation days only, but this effect appears to be due to conditioning.

J.R.Broome

6761. GENETIC VARIATION IN A MEASURE OF AVOIDANCE LEARNING IN SWINE. R.L.Willham, D.F.Cox and G.G.Karas: *J. comp. physiol. Psychol.*, 1963, 56, 294-297 (Iowa State Univ., Iowa, U.S.A.) Measurement of the no. of avoidance responses made by pigs in the third set of 10 trials showed that nearly 50% of the variance among pigs belonging to relatively homogeneous groups was attributable to additively genetic causes.

J.R.Broome

6762. RESPONSE SHIFT LEARNING SET IN RHESUS MONKEYS. W.L.Brown and A.A.McDowell: *J. comp. physiol. Psychol.*, 1963, 56, 335-336 (Univ. Texas, Austin, Tex., U.S.A.) Rhesus monkeys were trained on object-quality discrimination problems. Response to either of two stimulus objects was rewarded on the initial trial of each problem, and response to die 'c'Mect not responded to on the initial trial was rewarded on the second trial. The results indicated that rhesus taonkeys can acquire a 'response shift learning set*.

J.R.Broome

6763. DISCRIMINATION LEARNING-SET PERFORMANCE UNDER INTERMITTENT AND SECONDARY REINFORCEMENT. R.E.Bowman: *J. comp. physiol. Psychol.*, 1963, 56, 429-434 (Univ. Wisconsin, Madison, Wis., U.S.A.) The latencies and % of correct responses of rhesus monkeys were measured at reward % of 100:0, 75:0, 50:0 and 25:0 on discrimination learning-set problems, both in the presence and absence of secondary reinforcing stimuli. Latencies increased significantly at the 2 lower reward %. The % of correct responses decreased with decline in reward % below 75:0.

J.R.Broome

6764. LEARNING-SET FORMATION AND DISCRIMINATION REVERSAL: LEARNING PROBLEMS TO CRITERION IN THE SQUIRREL MONKEY. D.M.Rumbaugh and J.A. McQueeney: *J. comp. physiol. Psychol.*, 1963, 56, 435-439 (San Diego State Coll., San Diego, Calif., U.S.A.) The development of learning-set [LS] and discrimination reversal [DR] were studied in squirrel monkeys (Saimiri sciurea) by training them to a criterion on each problem of a series. Rapid development and high level performance in both LS and DR were observed.

J.R.Broome

6765. MASSING AND WITHIN-DELAY POSITION AS FACTORS IN DELAYED-RESPONSE PERFORMANCE. H.Gleitman, W.A.Wilson, jun., M.M.Herman and Rta.Rescorla: *J. comp. physiol. Psychol.*, 1963, 56, 445-451 (Swarthmore Coll., Swarthmore, Pa., U.S.A.) The performance of rhesus monkeys tested on delayed response was poorer when the trials were massed than when they were widely spaced. A series of long delay durations led to poorer performance on

subsequent trials than a series of short delay durations. It is concluded that the deleterious effect of massing is due to the frustrating effect of previous long delays.

J.R.Broome

SPECIES STUDIES

6766. SOCIAL ORGANISATION AND TERRITORIAL BEHAVIOUR IN THE WILD HOUSE MOUSE (MUS MUSCULUS L.). P.Crowcroft and F-P.Rowe: *Proc. zool.-Soc., Lond.*, 1963, 140, 517-531 (Infest. Cont. Lab., Min. Agric., Tolworth, Surbiton, Surrey, England) The social organisation of colonies of the house mouse are described. It has been shown that aggressive behaviour is used in territory defence. The fighting is almost exclusively between the ♂ but pregnant ♀ also fight.

D.N.Wheatley

6767. SOCIAL BEHAVIOUR AND MOVEMENT OF RATS. D.C.Drummond: *Ann. appl. Biol.*, 1963, 51, 343-345. A small sample of moving rats was trapped and a study of burrow structure was made. There were indications that ♂ rats move more often than ♀.

J.R*Cocbbain

6768. EFFECTS OF ENVIRONMENTAL RESTRICTION UPON THE CHIMPANZEE'S RESPONSIVENESS IN NOVEL SITUATIONS. E-W.Menzel, R.K.Davenport, jun. and C.M.Rogers: *J. comp. physiol. Psychol.*, 1963, 56, 329-334 (Yerkes Lab. Primate Biol., Orange Park, Fla., U.S.A.) The behaviour of several groups of restricted and wild-born chimpanzees in an unfamiliar room was observed*. The wild-born animals differed from the restricted ones in postural behaviour, locomotion, climbing, manipulation, self-directed responses, vocalisation, and the patterning and temporal trend of activity.

J.R.Broome

6769. DIFFERENTIAL RESPONSES OF CHIMPANZEES TO SOCIAL STIMULATION. W.A-Mason, J.H.Hollis and L.G.Sharpe: *J. comp. physiol. Psychol.*, 1962, 55, 1105-1110 (Yerkes Lab. Primate Biol., Orange Park, Fla., U.S.A.) The responses of both lab.-reared and wild born young chimpanzees to various forms of social stimn. including play, petting, grooming and being groomed, presented by a stimulus-person acting in accordance with a pre-determined role were investigated. It was found that sp. forms of social stimn. similar to those commonly occurring in chimpanzee social interactions have definite and differential rewarding effects.

J.R.Broome

GENERAL

6770. MATERNAL BEHAVIOUR IN THE DOMESTIC HEN: THE ROLE OF PRETEST RESTRICTION OF MOVEMENT. R-A.Maien *J. comp. physiol. Psychol.*, 1963, 56, 350-356 (Kansas State Univ., Kan., U.S.A.) Pretest restriction of movement of broody hens while the chicks were unrestricted resulted in indiscriminate brooding when the hens were released. Restriction of both hens and chicks resulted in longer periods of

of cues emanating from familiar chicks produce tenance of broodiness regardless of prior conditions leading to MATERNAL BEHAVIOUR. THE DOMESTIC HEN: THE ROLE OF PHYSICAL CONTACT

R A Maien J. comp. physiol. 1963 357-361 (Kansas State Univ, M) I u - ; Elation of hen anaesthetising confinement in separate cages air

contactual ventral surface to eliminate contact cues development of broodiness, main-

CYTOLOGY

CELL STRUCTURE AND CYTOCHEMISTRY

6773. SUBMICROSCOPIC CHANGES IN PENETRATING SPERMATOZOOON OF RABBIT R.Hadek: J. ultrastructure Res., 1963, 18, 161-169 (Anat. Dept., Stritch Med. Sch., Loyola Univ., Chicago, IL, U.S.A.)

Penetration changes of mature rabbit spermatozoa could not be induced by *in vitro* incubation with freshly shed ova or with oviducal washings. While passing through the zona pellucida, the spermatozoon loses its cell membrane and its head cap. Before reaching the vitelline membrane it also loses its cytoplasm and the 'apical body*' becomes elongated. H.B.Waynforth

6774. SUBMICROSCOPIC STUDY ON CORTICAL GRANULES IN RABBIT OVUM. R.Hadek: J. ultrastructure Res., 1963, 8, 170-175 (Anat. Dept., Stritch Med. Sch., Loyola Univ., Chicago, IL, U.S.A.)

Round granules were observed in the rabbit ovum just prior to ovulation. These increased if fertilisation did not occur. The granules were mainly confined to the cortex of the egg. H-B.Waynforth

6775. FINE STRUCTURE OF GERM CELLS AND SERTOLI CELLS DURING THE CYCLE OF THE SEMINIFEROUS EPITHELIUM IN THE RAT. J.BrOkemann: Z. Zellforsch., 1963, 59, 820-850 (Dept. Anat., Univ. Kiel, Germany) The fine morphology of germ cells and of Sertoli cells was examined in testicular material obtained from 8 mature albino rats and the 2c Interrelationship to die cycle of the seminiferous epithelium investigated. The cycle could be divided into 2 phases; the nuclear material of the developing spermatids condenses and changes; changes also occur in the acrosome cap. Lipid droplets in the Sertoli cells increase rapidly during the first phase whilst numerous inclusion bodies resembling lysosomes are present during the 2nd phase. Steroid hormone production during the first phase and phagocytosis of residual bodies by Sertoli cells are discussed. J.E.Linder

6776. LIPID GRANULES OF UTERINE EPITHELIUM IN SPAYED MOUSE. K-Fuxe and O-Nilsson: J. ultrastructure Res., 1963, 8, 379-390 (Anat. Dept., Karolinska Inst., Stockholm, Sweden) Three types of lipid granules were demonstrated by fluorescence microscopy, histochem. and E.M. (a) Dark bodies, found mainly in the base of the cell; (b) membrane-surrounded bodies; and (c) dense bodies found in the apical part of the cell. These granules may contain phospholipids. H.B.Waynforth

6777. E.M. OBSERVATIONS OF NUCLEAR REMNANTS IN HORNY CELLS OF FEATHERS. W.J.Schmidt and H.Ruska: Z. Zellforsch., 1963, 59, 700-707 (Zool. Inst., Univ. Giessen, Germany) Nuclear remnants could be seen in cross sections through lipochrome-containing feathers of a pheasant. Their outline is irregular due to the drying effects at the termination of the development of the feather. Nuclear contents may be either homogeneous or granular. (German) J-E.Linder

6778. ON NUCLEAR STRUCTURE IN THE VENTRAL NERVE CORD OF THE LEECH HIRUDO MEDICINALIS. E.G. Gray and R-W.Guillery: Z. Zellforsch., 1963, 59, 738-745 (Dept Anat., Univ. College, London, England) A thick lamina which is lining the inside envelope of the large neuroglial cells and nerve cells of the ganglia, is described. It is similar to a membrane

which had been reported by earlier workers in the amoeba. This lamina has openings which are opposite the nuclear pores. J.E.Linder

6779. FURTHER EXAMINATIONS OF THE FINE STRUCTURE OF THE NEUROSECRETORY CELLS IN THE NUCLEUS SUPRAOPTICUS OF GECKO JAPONICUS. M.Murakami: Z. Zellforsch., 1963, 59, 684-699 (Anat. Inst., Kurume Univ., Kurume, Japan)

Neurosecretory granules are osmophilic and are found together with other types of osmophilic granules in the Golgi zone of the perikaryon. In order to distinguish these neurosecretory granules from the other osmophilic granules, the neurosecretory cells of the nucleus supraopticus were examined after injn. with histamine. The author describes three different types of granules; the granules of type 1 increase in no. whilst those of type 3 decrease in animals inj. with histamine*

(German) J.E.Linder

6780. CORRELATED LIGHT AND ELECTRON MICROSCOPE STUDY ON PECTEN OCULI OF DOMESTIC FOWL(GALLUS DOMESTICUS). A.R.Seaman and H.Storm: Exp. Eye Res., 1963, 2, 163-172 (Dept. Surg., Sinai Hosp., Inc., Baltimore, Md., U.S.A.)

Comparisons and contrasts are made to relate th^ authors E.M. observations with those of Tanaka. Marked changes in the ultrafine morphology of the membrane system of the pectineal endothelial cell are caused by a reduction in intraocular pressure. The ultrafine morphology of the membrane systems of the endothelial cells of the pectineal capillaries suggests a device for increasing cell surface and a probable concern in active fluid transport. J.Whiting

6781. E.M. STUDIES ON SALIVARY GLAND CELLS. I. NUCLEUS OF BRADYSIA MYCORMUS FREY (SCIARIDAE) WITH SPECIAL REFERENCE TO NUCLEOLUS. JJacob and J.L.Sirlire J. cell Biol., 1963, 17, 153-165 (Inst. Animal Genet., Univ. Edinburgh, Scotland) The origin, development and later transformations of the nucleoli were studied in electron micrographs of OsO₄-fixed glands embedded in methacrylate or Araldite. Elementary nucleoli consisting of aggregations of a few paired 40A fibrils and 150A particles appear within the chr. bands. These become detached and coalesce, forming dense particles of nucleolar material at the chr. surface. The fully-formed nucleoli have a dual structure with a narrow dense periphery and a broader, less-dense internum which disappears in later stages. P.Barlow

6782. E.M. OBSERVATIONS ON THE SALIVARY GLAND OF THE COCKROACH PERiplaneta americana. R.G.Kessel and H.W.Beams: Z. Zellforsch., 1963, 59, 857-877 (Dept. Zool., State Univ. Iowa, Iowa City, Iowa, U.S.A.) The fine-structure of the secretory tissue and of the duct system were examined; 2 montfiol-distinct cell types are described. The possible interrelation between structural features and function is discussed* J.E.Linder

6783. LAMPBRUSH CHROMOSOMES OF RANA CYANOPHYCTIS. M.D.L-Srivastava and A.N.Bhatnagan Cytologia, 1962, 27, 60-71 (Zool. Dept., Allahabad Univ., India) Frog oocyte lampbrush chr. were studied by phase contrast microscopy, and some stages in their development to metaphase-I bivalents followed. Problems concerning the nature of the chromomeres, chiasmata and loops are discussed in the light of some of these observations. C-A.Stace

6784. SIZE OF CELLULOSE MICROFIBRIL. J-R-Colvire
J. cell Biol., 1963, 17, 105-109 (Div. Appl. Biol.,
Nat. Res Council, Ottawa, Canada) Microfibrils
were produced in drops on Formovar fibres from cells of
AcetohactPr vyiinnm stored in phosphate-citrate buffer
«pHd «6. Shadow photographs were compared with
direct photographs of microfibrils parallel to and Perpen-
dicular to the direction of shadowing using silver-stained
and unstained segments. No evidence of metal layers
being deposited during shadowing was found. The lat.
width of 150-200A and not of 30A appears to be correct.

P. Barrow

6789. FINE-STRUCTURE OF CELL BOUNDARY OF BLUE-
GREEN ALGA ANACYSTIS MONTANA. P. Echlin:
J. cell Biol., 1963, 17, 212-213 (Dept. Bot., Univ.
Cambridge, England) 6% glutaraldehyde-fixed
material exhibited a cell boundary of 3 layers. Convolu-
tions of 400-800A on the outer cell layer were spaced
evenly around the cell periphery. These may represent
a structural li between the outer rane and the cell
separate mucous sheath lying ie the cell
boundary or they may be connected with the synthesis of
the cell envelope. P. Barrow

6790. STRUCTURE AND FUNCTIONS OF BIOLOGICAL
MEMBRANES. J.L. Kavanau: Nature, Lond., 1963,
198, 525-530 (Dept. Zool., Univ. California, Los
Angeles, Calif., U.S.A.) A discussion of recent
evidence on the structure of biol. membranes and its
implications for membrane-associated phenomena such
as contraction, expansion, growth and degrowth,
coalescence and fragmentation of membrane-encapsulated
organelles, impulse conduction, active transport and
facilitated diffusion. 55 ref. G.M. Lewis

6791. E.M. OF PERMSELECTIVE MEMBRANES.

(Negev Inst. Arid Zone Res., Beersheba, Israel).

G.M. Lewis

6792. HISTOTOPOGRAPHIC AND CYTOLOGICAL
STUDIES OF THE EMBRYONIC MEMBRANES OF THE
GUINEA-PIG. G-Petry and W. Kiffler: Z. Zellforsch.,
1963, 59, 625-662 (Anat. Inst., Univ. Marburg a.d.
Lahn, Germany) Histotopographic, cytol. and E.M.
techniques revealed the existence of structural differences
in the various regions of the amnion and yolk-sac. The
differences in the development of cytoplasmic structures
as seen with the E.M. are regarded as an expression of
their different functional stages. (German) J.E. Linder

6793. QUANTITATIVE ASPECTS OF ISOLATION OF
NUCLEOLI OF THE WALKER CARCINOSARCOMA AND
LIVER OF THE RAT. M-Muramatsu, K. Smetana and
H. Busch: Cancer Res., 1963, 23, 510-518 (Dept.
Pharmacol., Baylor Univ. Coll. Med., Houston, Tex.,
U.S.A.) NK&ti were sonicated at 2° after initial
tissue homogenisation in 0*25M sucrose containing
0*0033M C-AJ12. The vol. was maintained at 20 ml.
Destruction of more than 99.8% of nuclei required 25-40
sec. The sonicate was centrifuged at 2500 x g for 5 min.
and rehomogenised in 0*88M sucrose. Nucleoli were
sedimented by 15 min. at 800 x g for tumour and 1000
x g for liver. Repetition of the last step gave a prep.
95-99% pure by direct particle counts. The prep. was
further purified with DNase I or 2M NaCl. Tumour
nuclei purified with DNase contained an average of 1*8
x 10⁻⁶ pg. of RNA and 16*1 x 10⁻⁶ jig. of protein/nucleo-
lus. Liver nucleoli had 17% of these amounts of RNA and
protein. RNA made up approx. 10% of the dry wt. of
nucleoli from either tissue. B.M. Stevens

6794. EFFECT OF INFLAMMATORY PROCESS ON
NUCLEUS NUMBER, DNA CONTENT AND DRY
WEIGHT OF MOUSE LIVER CELLS. R. Rigler, jun.:
Exp. Cell Res., 1963, 30, 160-170 (Inst. Cell Res.
Genet., Karolinska Inst., Stockholm, Sweden)

Non-sp. inflammation produced by s.c. injn. of a buffered
NaOH soln. resulted in an increase of binucleate cells in
the mouse liver. At the same time, higher DNA classes
increased, the increase being correlated with the forma-
tion of binucleate cells. The freq.-distribution of dry wt.
of the liver cells exhibited 2 freq. maxima with a relation
of 1:2 during the entire expt* period. With increase of
die no* of binucleate cells, an increase of the higher dry
wt. class occurred.

(German, English summary) K. Jones

6795. DNA CONSTANCY IN HETEROCHROMATIN OF
GLYPTOTENDIPES. H.-G. Keyk: Exp. Cell Res.,
1963, 30, 245-247 (Max-Planck-Inst. Meeresbiol.,
Abt. H. Bauer, TQbingen, Germany). Prelim, note*
(German) K.Jones

6796. MORPHOLOGICAL AND CYTOCHEMICAL STUDIES
ON CYTOPLASMIC INCLUSIONS OF INTESTINAL

CYTOLOGY

GOBLET CELLS OF RATS WITH PARTICULAR REFERENCE TO PHYSIOLOGY OF MUCINOGENESIS.
 K.C.Kanwar. *Cytologia*, 1962, 27, 233-247 (Dept. Zool., Panjab Univ., Chandigarh, India) Mucus secretion by goblet cells of rat intestine was studied by various cytochem- procedures. Early on, the phospholipoproteinous mitochondria are very conspicuous as long filaments which 'almost fill' the supranuclear zone and each have a distinct terminal granule*. Later the latter separate from the mitochondria and increase in size and no., while the mitochondria disappear. The granules become vacuolated, and in them mucinogenesis occurs. Cytochem. tests showed the mucus to be muco-poly-saccharide. The mucous bodies migrate towards the theca, coalesce to form large droplets, and are ultimately released by thecal rupture. Golgi-like bodies were not seen. CA.Stace

6797. CYTOCHEMICAL INVESTIGATIONS ON THE BALBIANI RINGS OF THE FOURTH SALIVARY GLAND CHROMOSOME OF CHIRONOMUS TENTANS. L.Vogt-Kühne and L.Carlson: *Chromosoma*, Berlin, 1963, 14, 186-194 (Inst. Zellforsch- und Genet., Karolinska Inst., Stockholm, Sweden) The nucleic acid concn. of the 2. Balbiani ring was determined with the aid of an u.v. microspectrophotometer and a microinterferometer. In larvae subjected to a cold shock there was a doubling of the dry wt. and an approx threefold increase in the nucleic acid concn. in the Balbiani ring.

(German) S.A.Henderson
6798. BARR BODIES AND NUCLEAR SIZE IN CULTURED HUMAN FIBROBLASTS. U-Mittwoch: *Nature*, Lond., 1963, 198, 975-977 (Galton Lab., Univ. Coll., London, England) Nuclei with Barr bodies were, on average, smaller than those without. It is suggested that the Barr body appears at telophase, disappears during DNA replication when the nucleus is at max. size, then reforms after replication. G.M.Lewis

6799. SEX CHROMATIN OF INTERPHASE NUCLEI IN PLATYRRHINE MONKEYS. M-M-Beath and K.Benirschke: *Cytologia*, 1962, 27, 1-10 (Dept. Pathol., Dartmouth Med. Sch., Hanover, N.H., U.S.A.) Tissues of various organs of 31 monkeys of 5 different spp. were fixed, sectioned, stained and examined for evidence of interphase chromatin, which was found underlying the nuclear membrane, in ? only. In most nuclei the chromatin was in the form of a single plano-convex body, and recognisable at all embryonic stages, but in one animal some nuclei possessed two bodies. The origin of the sex chromatin mass and of its abnormal duplication is discussed. C - A. Stace

NUCLEO-CYTOPLASMIC RELATIONS

6800. TRANSFER OF NUCLEOLAR MATERIAL TO CYTOPLASM OF CITRUS CELLS. H.A.Kordan and L.Morgenstern: *Exp. Cell Res.*, 1963, 30, 98-105 (Dept. Surg., Cedars Lebanon Hosp., Los Angeles, Calif., U.S.A.) Marked cytoplasmic and nuclear transformations were observed in citrus tissue growing *in vitro* and *in vivo*, resulting in the transfer of nuclear material, in die form of discrete packets, to the cytoplasm. The cytoplasmic transformations were responsible

for the transfer of the nuclear material to the cytoplasm, the structures involved in the transfer mechanism being suggestive of a Golgi complex. K.Jones

6801. CHROMOSOMAL AND EMBRYOLOGICAL ANALYSES OF NUCLEAR CHANGES OCCURRING IN EMBRYOS DERIVED FROM TRANSFERS OF NUCLEI BETWEEN RANA PIPiens AND R. SYLVATICA. S.Hennen: *Develop. Biol.*, 1963, 6, 133-183 (Inst. Cancer Res., Philadelphia, Pa., U.S.A.) Diploid *pipiens* nuclei were allowed to undergo 10-12 divisions in *sylvatica* cytoplasm and were then transferred back to enucleated *pipiens* eggs. Subsequent development of these back-transfer embryos is compared with that of nuclear transfer controls and nuclear transfer hybrids. The occurrence of abnormalities in the no. and type of chr. in transfer-hybrid and back-transfer embryos is reported and discussed. J.W.S.Harris

NUCLEAR AND CELL DIVISION

6802. CYTOLOGY AND KINETICS OF SPERMATOGENESIS IN RABBIT. E.E.Swierstra and R.HiFoote: *J. Reprod. Fertil.*, 1963, 5, 309-324 (Dept. Animal Husbandry, Cornell Univ., Ithaca, N.Y., U.S.A.) The development of the seminiferous epithelial cells was divided into 8 stages on the basis of the shape of the spermatid nucleus, the location of the spermatids and spermatozoa in relation to the basement membrane, the presence of meiotic figures and the release of spermatozoa from the lumen. These 8 stages were present as 27 • 7, 13*4, 7-3, 11-0, 4*1, 15-7, 12-2 and 8*6% of the cell population. It was estimated that only 3*1 spermatids were produced from each primary spermatocyte, suggesting considerable degeneration of spermatogenic cells during the 2 maturation divisions. H-E.HJones

6803. MEIOTIC PARTHENOGENESIS AND HETEROCHROMATINISATION IN A SOFT SCALE, PULVINARIACOCCOIDAE(HOMOPTERA). U.Nur. *Chromosoma*, Berlin, 1963, 14, 123-139 (Genet. Dept., Univ. California, Berkeley, Calif., U.S.A.) Meiotic parthenogenesis of a type not previously described was found. After meiosis the egg pronucleus divides and the 2 haploid products fuse to restore the diploid chr. no. Some of the embryos possessed a heterochromatic chr. set, characteristic of cf, which were apparently produced parthenogenetically.

G. A. Henderson

6804. TRIVALENT FORMATION IN MULTIPLE TRISOMICS OF CLARKIA UNGUICULATA. F.OVasek: *Amer. J. Bot.*, 1963, 50, 244-247 (Piv- Life Sci., Univ. California, Riverside, Calif., U.S.A.) A series of multiple trisomics, ranging from $2n+1$ to $2n+7$, was scored for univalents and trivalents at 1st metaphase. The mean no. of trivalents/cell/extrachr. was calc. The trivalent freq. fell into 2 classes, indicating that the cytol. differences between triploids and single trisomics may be based on a threshold effect. A comparison with data from other genera suggested that the observed increase in trivalent formation/extrachr. may be associated with an increase in chiasma freq. T-H.Thomas

6805. MITOTIC RATE OF SPONTAOTOUS MAMMARY GLAND'ADENOCARCINOMA IN C³ " / " * ^ ^ F.D-Bertalanffy: Nature. Lond., 1963, 198, 496-497 (Dept: Anat.. Univ. Manitoba, WMW*^ Canada) Using a colchicine technique, the doubling time was found to be 8'5 JJays. G.M.Lewis

6807. 14C- AND 3H-THYMIDINE DOUBLE[^] LABELLING TECHNIQUE IN STUDY^{i ^ 1 * S} RATION IN RADESCANTIA^{if J. E.W. Ser and Quastler Exp. J} 1963, 30, 8-22 (Biol. Dept. Brook Nat. Lab., Upton, N.Y., U.S.A.) A technique using both [14C]- and [3H]thymidine for determining the duration of the nuclear cycle and its subdivision is described. The normal nuclear cycle was estimated by this method in T. paludosa root-tips. The cycle at 21° was G₁, 1 hr.; M, 3 hr.; S, 10⁵ hr.; a total of 17 hr. General applications of this technique are also discussed. K.Jones

6808. MITOTIC ACTIVITY AND RESPIRATION IN THE EXCISED PEA ROOT MERISTEM. P.A.Van Dreal and G.B.Wilson: Caryologia, 1962, 15, 421-433 (Dept. Bot., Michigan State Univ., East Lansing, Mich., U.S.A.) Various carbon sources were compared with glucose for mitotic activity and O₂ uptake. The effects of S_{MS}_{SS}_S : inhibitors and of using [1-14C]-glucose were also studied. Results require a certain amount to indicate that the mensteliⁱ takes place. J.L.Batten level of O₂ uptake before M * " " 0.8" of mitosis does not affect O₂ uptake.

6809. OBSERVATIONS ON CELL GROWTH, MITOSIS, S BASIDIOPOLUS RANARUM. 1963, 17, 123-152 (Dept.

Bacteriol., Univ. W. Ontario, London, Ont., Canada) Phase contrast studies of cells grown in agar medium in Petri dish and slide cultures were correlated with sections of fixed, stained cultures. Mitosis of this single-nucleus

a temporary cytoplasm and a cell wall. The decrease in the growth rate of the cell is formed from a large no. of small chr. are present. Thus ungnⁱ physiol. observations on the cell duplication cycle and meⁱ gy of mitosis.

6810. CORRELATED LIGHT AND E-M-STUDY^E NUGLEOLAR MATERIAL[^] J. S. S. I. Vicia faba and Anat.. Pathol. and Anat.. Quebec, Canada, 1963: J-cell for root-tips were O for light microscopy. The structurally distinct com-

ponents consisting of fibrils of 60-100 Å diam., and 150Å granules which persist during prophase and disperse throughout the nucleolar cavity at nucleolar disintegration forming a spindle after nuclear membrane disruption. The next nucleolus appears to be derived from a fibrillar-granular material which collects in the interchromosomal spaces during early and mid telophase. P. Barrow

6811. OBSERVATIONS ON DICENTRICS IN LIVING CELLS. A.Bajen Chromosoma. Berlin, 1963, 14, 18-30 (Plant Physiol. Lab., Jagellonian Univ., Cracow, Poland) Using time-lapse cinematography the anaphase behaviour of dicentric chr. and chromatids was followed in irradiated endosperm cells of Haemanthus katherina. Interlocking dicentrics can break through one another and rejoin almost immediately. Inactivation of one of the two centromeres may also take place.

S.A.Henderson

6812. INDUCTION OF TRIPLOIDY BY HYDROSTATIC PRESSURE IN THE LEOPARD FROG, RANA PIPIENS.

S.Dasgupta: J. exp. Zool., 1962, 151, 105-121 (Dept. Zool., Univ. Indiana, Bloomington, Ind., U.S.A.) Triploid embryos can be produced by subjecting eggs of R.pipiens to hydrostatic pressure of 5000 lb./in² for 6 min. The highest freq. of triploidy occurring when pressure was applied 5 min. after die eggs had been inseminated at 21° when in the metaphase stage of the second meiotic division. 85% of the embryos which developed normally were triploids. Anaphase movements were inhib. in eggs shocked in the metaphase. It is suggested that the metaphase spindle is highly susceptible to hydrostatic pressure. Sensitivity to hydrostatic pressure decreases as anaphase movements ^{?re} in progress. R.J.Walker

EFFECTS OF RADIATION AND CHEMICAL AGENTS

6813. EFFECTS OF IONISING RADIATION ON THE APICAL MERISTEM CELLS OF AVENA STERILIS (2n = 42). G.Martinoli and L.Bagnoli: Caryologia, 1962, 15, 327-333 (Inst. Bot., Univ. Pisa, Italy)

In root-tips treated with X-ray doses varying from 100 to 500 r, several aberrations were found, in particular, damages in spindle formation, chr. bridges, lagging chr., ring chr. and stickiness. (Italian) J.L.Batten

6814. QUIESCENT CENTRE IN ROOT MERISTEMS OF VICIA FABA AND ITS BEHAVIOUR AFTER ACUTE X-IRRADIATION AND CHRONIC Y-IRRADIATION.

F.A.L-Clowes and E.J.Halb Radiat. Bot., 1963, 3, 45-53 (Bot. Sch., Univ. Oxford, England) After acute X-irradiation using a dose of 360 rad. the rate of mitosis in the quiescent centre reached a max. value after it had reached a min. value in the surrounding meristematic cells. The effect of 14 days of continuous irradiation using a 60co source at 2.28 rad/hr. was similar to that of the acute dose. J.R.Broome

6815. RADIOPROTECTIVE EFFECT OF CYSTEINE, AET [S,2-AMINOETHYLISOTHIOURONIUM BROMIDE HYDROBROMIDE] AND CYSTAMINE ON CHROMOSOME DAMAGE IN ALLIUM CEPA ROOT TIPS.

H.Dalen and R.Oftebroc Radiat. Bot., 1963, 3, 59-65 (Norsk Hydro's Inst. Cancer Res., Oslo, Norway)

The temporary depression of mitotic activity produced by

CYTOLOGY

X-irradiation with 150, 300 and 600 r was measured by the no. of anaphases per root-tip. Pretreatment with 5×10^{-6} M cysteine led to a reduction of 53% in chr. damage, 5×10^{-6} M AET to a reduction of 35%. $2 \times 5 \times 10^{-6}$ M cystamine was inactive. J.R.Broome

6816. CHROMOSOME STUDY OF RADIATION SENSITISATION BY 5-BROMODEOXYURIDINE. C.E.Somers and R.M.Humphrey: *Exp. Cell Res.*, 1963, 30, 208-217 (Sect. Cytol., Univ. Tuxas M.D.Anderson Hosp., Houston, Tex., U.S.A.) Max. radiation sensitivity of bromodeoxyuridine [BUDR]-treated and untreated cell populations was found in metaphase cells sampled at the first mitosis following irradiation as studied using mammalian cells grown in vitro. A non-random distribution of chromatid breaks was found in chr. no. 1 of Chinese hamster cells treated with BUDR prior to irradiation. A cell-line, derived from strain L of the mouse, resistant to BUDR did not show max. radiosensitivity. K.Jones

6817. PRODUCTION OF CHROMATID ABERRATIONS BY 5-FLUORODEOXYURIDINE [FUDR] ALONE AND IN COMBINATION WITH X-RAYS AND 8-ETHOXYSACCAFEINE. B-A.Kihlman: *Caryologia*, 1962, 15, 261-277 (Inst. Physiol. Bot., Univ. Uppsala, Sweden)

Cell divisions, with aberrations of gaps and chromatid breaks, appeared in lat. root tips of *Vicia faba* about 3 hr. after immersion of roots in soln. of FUDR in concn. of 0.5M or higher FUDR concn. which produced chr. breakage also inhib. mitosis. The effects of temp., pH and post-treatments with thymidine or J¹⁴romodeoxyuridine were studied. When X-irradiation "rjs combined with FUDR treatment, aberrations increased, ^>ut when 8-ethoxysaccafeine was combined aberrations were reduced. J.L.Batten

6818. RADIOMIMETIC EFFECTS OF NITROGEN MUSTARD ON MULTIPLICATION OF GUINEA-PIG CELL STRAIN. L.Spanio and A.G.Lewis: *Caryologia*, 1962, 15, 551-568 (Inst. Zool. e Anat. Comp., Univ. Padova, Italy) Growth curves give evidence of the inhibn. of cell multiplication which increases with increasing doses until inhibn. is complete. These results are confirmed by a drop in the mitotic index observed in similarly treated cultures. Nuclear damage and giant cell formation which follow treatment were studied. The effects of treatment are compared with those produced by X-irradiation. (Italian) J.L.Batten

6819. CHROMOSOME BREAKAGE IN Vicia faba BY LASIOCARPINE AND MONOCROTALINE. S.Avanzi: *Caryologia*, 1962, 15, 351-356 (Comitato nazionale Energia Nucleare, Roma, Italy) There are no differences in chr. breaking activity between lasiocarpine and monocrotaline-treated lat. root-tips. *V. faba* is more sensitive than *Allium cepa* to the cytol. effect of monocrotaline. The radiomimetic effect of monocrotaline is temp. dependent. J.L.Batten

6820. EFFECT OF COBALT, NICKEL AND IRON ON MITOSIS IN THE ROOTS OF THE BROAD BEAN (Vicia faba). L.Komczynski, H.Nowak and L.Rejniatek: *Nature*, Lond., 1963, 198, 1016-1017 (Dept. Pathol. Anat., Bialystok Med. Acad., Bialystok, Poland) Roots were exposed to soln. of salts of Fe, Co and Ni at concn. 0.1-0.0001%. Fe, at 0.1 and 0.01% caused some inhibn. of growth. Co and Ni stim. growth,

producing pathol. changes in the cell nuclei and causing disturbances in cell division. G.M.Lewis

6821. GERMINABILITY, SEEDLING GROWTH AND FREQUENCY OF CHROMOSOMAL ABERRATIONS IN RELATION TO SEED AGE IN WHEATS. V.N.Ronchi and G.Martini: *Caryologia*, 1962, 15, 293-302 (Inst. Genet., Univ. Pisa, Italy) Germination tests were carried out on *Triticum vulgare* seeds and aberrant anaphases in seedling root-tips were recorded. The freq. of chr. structural changes increases, and seed germinability decreases, with age and observations suggest that a chern. mutagen is responsible. (Italian) J.L. Batten

6822. THE EFFECTS OF WATER-IMMERSION ON THE MEIOTIC DIVISION AND CHROMOSOMES IN TRILLIUM KAMTSCHATICUM. R.Ohno and S.Takehisa: *Bot. Mag. Tokyo*, 1963, 75, 28-31 (Bot. Inst., Hokkaido Univ., Sapporo, Japan) The effects of immersing flower buds in the meiotic late-prophase or metaphase I in tap water at different temp., for varying periods were examined. During immersion meiosis did not proceed, but afterwards the first meiotic division was slower than in the controls. At 25° the immersion also resulted in an increase in the aberrations in telophase I* (Japanese, English summary) N.J.Pinfield

6823. LOCALISATION OF NUCLEI IN BLASTOMERES OF THE EGG OF ARTEMIA SALINA. EFFECT OF 0-MERCAPTOETHANOL [ME] AND DITHIODIGLYCOL [DG] ON THIS LOCALISATION. J.Fautrez and N.Fautrez-Firlefyn: *Develop. Biol.*, 1963, 6, 250-261 (Lab. Anat. Humaine et. Comp., Univ. Gand, Belgium) Both substances blocked mitosis during segmentation. ME produced a diminution in the degree of adhesion between blastomeres, an increase in perinuclear plasm and, after prolonged treatment a migration of nuclei towards the external surface. DG also increased perinuclear plasm but separation of blastomeres was incomplete and the nuclei remained close together. (French) J.W.S.Harris

6824. NUCLEOLAR 'CAPS' - A MORPHOLOGIC ENTITY PRODUCED BY THE CARCINOGEN 4-NITROQUINOLINE N-OXIDE. R.C.Reynolds, P.O'B.Montgomery and D.H.Karney: *Cancer Res.*, 1963, 23, 535-538 (Dept. Pathol., Univ. Texas S.W.Med. Sch., Dallas, Tex., U.S.A.) Histol. stains, E.M. and time lapse motion pictures of phase contrast microscopic images of living cells showed that in Chang liver cells the carcinogen produced a progressive decrease in nucleolar size, fusion of nucleoli and separation of the pars amorphata and the nucleoloneme to produce 2 types of nucleolar 'caps'. B.M.Stevens

6825. EFFECT OF TERRAMYCIN ON THE FINE STRUCTURE OF HeLa CELL MITOCHONDRIA. L.J.Journey and M.N.Goldstein: *Cancer Res.*, 1963, 23, 551-554 (Dept. Expt. Biol., Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.) Bright field and fluorescent microscopy showed that terramycin added to culture media was rapidly and sp. bound to mitochondria. At low concn. no morphol. changes were noted, but at 100 μ g/ml. or higher concn. mitochondria became distended and rounded up. E.M. indicated vacuolation, compression of the cristae and reduplication of mitochondrial membranes. With 300 μ g/ml. no normal mitochondria were found and other cytoplasmic elements degenerated. 1000 μ g/ml. was lethal for all cells. B.M.Stevens

CYTOGENETICS

6826. STRUCTURE AND FUNCTION OF SEX CHROMOSOMES IN MAN. M-D-Hayward: *Cytologia*, 1962, 27, 30-42 (Dept. Genet., Univ. Birmingham, England) A review of various sex-determining systems is presented with special ref. to man, which falls closer to the Melandrium-type than to the *Drosophila*-type. Ref. is made to studies of genotypes with abnormal complements of sex chr. and to intersex and other unusual phenotypes. Studies on the cytomorphology of the X and Y chr. are described, and the extent of differential and pairing segments and the possibility of the occurrence of crossing-over between them. J.R.A. Stace

6827. PR OR LONG ARM O FAMILIES. J.Lindsten, M.Fraccaro, D.Bekos, K.KtaJ, H.P. Klinger and R.Lufe Ann. hum. Genet., 1963, 26, 383-405 (Dept. Endocrin- and Metabolic Karolinska Hosp., Stockholm, Sweden) A cyt. study of 5 human showed iso-chr. for the long arm of f^* & f^{**} . The phenotypes and karyotypes are described. Tte origin of the iso-chr. may be meiotic and paternal. One family provides evidence that the loci of the Xg blood group system and the green colour blindness are located on the short arm of the X chr. J.L.Batten

6828. A LONG Y CHROMOSOME IN MAN. S.Makino, M.Sasaki, K.Sada and T-Kajii: *Chromosoma*, Berlin, 1963, 14, 154-161 (Zool. Dept., Hokkaido Univ., Sapporo, Japan) An unusually long Y chr. was found in individuals and was not always associated with an abnormal phenotype. A.H. Henderson

6829. 45/XOTURNER'S SYNDROME IN THE NEWBORN: REPORT OF TWO CASES. J. clin. Endocr., 1963, Children, Toronto, Canada) Tissue obtained post mortem showed the 45/XO chr. pattern in the bone. S.A. Henderson

6830. NUCLEAR SBC OF EMBRYONIC OTIS.

...mal sex chr. complements. ?<>; X^{O} & X^{T} & X^{F} & X^{M} produced by errors of mitosis at or soon after Nutt inception of the tumour.

***32. SPONTANEOUS TRANSLOCATION IN CELLS.** J. Genet., 1963, 26,

London, England) the mother of

Fibroblast tissue cultures were made J. Ellis and observed in

the 2 Penrose one ceU line which rflay throw some light on

described by Delhanty and Shapiro (1962) and by Gustavson et al. (1962)- J.L.Batten

6833. ANALYSIS OF CHROMOSOME PATTERNS IN ABNORMAL CELL. D.E.Barton and F.N.David: Ann. hum. Genet., 1963, 26, 347-348 (Univ. Coll., London, England) A mathematical analysis of chr. patterns in human cells not containing 23 pairs is given. The criteria described, in which the distances apart of homologous chr. pairs observed in different mitotic figures are standardised by a function of distances between all pairs, are suggested as appropriate for testing the hypothesis of the randomness of position of the two chr. of the homologous pair with respect to each other. J.L.Batten

6834. NUMERICAL ANALYSIS OF CHROMOSOME PATTERNS. D.E.Barton, F.N.David and M.Merrington: Ann. hum. Genet., 1963, 26, 349-353 (Univ. Coll., London, England) Barton and David's methods for analysis of chr. patterns of human cells were applied to photographs of different cells in mitosis. The results showed that elements of homologous pairs for abnormal cells and normal o* cells could be randomly arranged with respect to one another, whereas those for V cells are probably not, and that those in the cf cell may be more variable in their distance apart than those in the Y cell. J.L. Batten

6835. CHROMOSOMAL STUDY IN PATIENTS WITH CYSTS OF THE JAW, MULTIPLE NEVOID BASAL CELL CARCINOMATA AND BIFID RIB SYNDROME. J.J.Yunis and R.J.Gorlin: *Chromosoma*, Berlin, 1963, 14, 146-153 (Univ. Minnesota Hosp., Minneapolis, Minn., U.&ft.) In a patient with multiple abnormalities ifSe arm of chr. no. 1 was unusually long in an otherwise normal complement. However, four close relatives also showed this chr. anomaly with no manifestation of the syndrome. S.A.Henderson

6836. CHROMOSOMES IN NORMAL, PRENEOPLASTIC AND NEOPLASTIC TISSUES OF THE MAMMARY GLANDS OF C3H/Crgl FEMALE MICE. M.R.Banerjee and K.B.DeOme: *Cancer Res.*, 1963, 23, 546-550 (Dept. Zool., Univ. California, Berkeley, Calif., U.S.A.) Normal mammary lobules, precancerous primary hyperplastic alveolar nodules, nodule outgrowths under various transplanted conditions and mammary tumours produced by these outgrowths were mostly diploid, with no detectable structural aberrations. Occasionally aneuploid modal chr. no. were observed in nodule outgrowths and tumours derived therefrom. No correlation of outgrowths and their tumours with regard to aneuploid chr. pattern was found. B.M.Stevens

6837. MAMMALIAN CHROMOSOMES IN VITRO. ON MARKER CHROMOSOMES AND CHROMOSOMAL POLYMORPHISM OF STRAIN L-P59. G.K.Manna: *Cytologia*, 1962, 27, 43-48 (Dept. Zool., Univ. Kalyani, W. Bengal, India) Almost every cell of this strain of mouse tissue had a different karyotype, characterised by the presence or absence of various dicentrics and other markers. The chr. no. varied from 57 to 71- CA.Stace

6838. GYNOGENETIC DIPLOIDS OF MUTANT LEOPARD FROGS. E.P.Volpe and S.Dasgupta: *J. exp. Zool.*, 1962, 151, 287-301 (Dept. Zool., Newcomb Coll., Tulane Univ., New Orleans, La., U.S.A.) Gynogenetic diploid leopard frogs w're obtained by activating eggs of *Rana pipiens* with sperm from *Scaphiopus holbrookii*.

CYTOLOGY

then subjecting the activated eggs to heat shock. The heat treatment inhibits the second meiotic division while the foreign sperm do not participate in the developmental process. These diploid embryos appear normal during gastrulation and neurulation. Following tailbud formation, abnormalities range from severe retardation in growth and conspicuous defects to those with no obvious defects. None the less, the majority perish. Of the 17 which successfully metarrophosed, 11 were S and 6 were Δ . The metamorphosed gynogenetic diploids display spotting patterns which indicate that chromatid exchange occurred between the major burnsi locus and the centromere. Since the freq. of chromatid exchange is great, it is concluded that the burnsi locus is far removed from the centromere.

R. J. Walker

6839. THE SALIVARY GLAND CHROMOSOMES OF DROSOPHILA HYDEI STURTEVANT. H.D.Berendes: Chromosoma, Berlin, 1963, 14, 195-206 (Genet. Lab., Univ- Leiden, Netherlands) A cytol. map of the salivary gland chr. is presented together with other cytol. observations, which include the description of 3 X-ray-induced rearrangements. Two of the linkage groups are attributed to definite chr. S. A. Henderson

6840. ALTERNATION OF GENERATIONS IN A COCOLITHOPHORID, CRICOSPHAERA CARTERAE (BRAARUD AND FAGERL) BRAARUD. D.G.Rayns: J. mar. biol. Ass. U.K., 1962, 42, 481-484 (Lab., Citadel Hill, Plymouth, England) Nuclear division is similar to that found in higher plants. There is a chromosomal alternation of generations correspond! to the morphol. alternation. The motile phase is $2n = 2^2 - ^2$, the non-motile phase $n = 21 \pm 1$. Sfc P.J. Baron

6841. CYTOGENETICS OF THE GRASSHOPPER MORABA SCURRA. Vm. A COMPLEX SPONTANEOUS TRANSLOCATION. M.J.D.White: Chromosoma, Berlin, 1963, 14, 140-145 (Zool. Dept., Univ. Melbourne, Australia) One individual was heterozygous for a complex translocation involving breaks in 4 different non-homologous chr. S.A.Henderson

6842. KARYOTYPE STUDIES IN TWO CYPRINIDS. R.P.Nayyan Cytologia, 1962, 27, 229-231 (Dept. Zool., Univ. Delhi, India) The 2 fishes Labeo gnnus and L. dero both had $2n = 54$ and $n = 27$, all the chr. being rod-like acrocentrics. As in other groups the chr. evolution in Cyprinids can be explained by fusion of some chr. to form V-chr., which accounts for such karyotypes as $2n = 50$ (46 rods +4Vs) which are known in other genera. C.A.Stace

6843. STUDIES OF MEIOSIS IN ORYZA SPECIES, WITH SPECIAL REFERENCE TO SECONDARY ASSOCIATION. Chao-Hwa HIB Cytologia, 1962, 27, 285-295 (Coll. Agric, Chung-Hsing Univ., Taichung, Taiwan) Nine Oryza taxa (8 diploid, 1 allotetraploid) were studied with respect to secondary association of the meiotic bivalents, of which there are 12 in the diploids. Bivalents were single, paired or in threes, but in all 8 diploids the max. association was 3 pairs plus 2 triplets, and the configuration of the tetraploid could be explained on the same basis. This is thought to indicate ancestral polyploidy in the diploid members of Oryza. C.A.Stace

6844. OBSERVATIONS ON SOMATIC AND MEIOTIC CHROMOSOMES OF ORYZA SPECIES. J.Bouharmon C Cytologia, 1962, 27, 258-275 (Inst. Carnoy, Louvain,

Belgium) Chr. no. of 10 spp. of Oryza agreed with previous counts of the genus in having $2n = 24$ or 48*. Meiosis is regular in the diploid spp. and, although some secondary association of bivalents was seen, it was considered that sufficient evidence of a basic chr. no. under 12 was absent. The tetraploids appeared to be allopolyploids since only 0-4 quadrivalents appeared. In diploids there are 2 pairs of nucleolar chr., and the single nucleolus divides by budding in pachytene. C.A.Stace

6845. NATURAL HYBRIDIZATION BETWEEN AEGILOPS SHARONENSIS AND A. LONGISSIMA: MORPHOLOGIC AND CYTOLOGICAL STUDY. H-Ankori and D.Zohar) Cytologia, 1962, 27, 314-324 (Dept. Bot., Hebrew Univ., Jerusalem, Israel) Anderson hybrid indices and pictorial scatter diagrams demonstrated the presence of hybrid swarms between A. sharicensis and A. longissima only in areas of disturbed ground, where introgression occurred. The 2 spp. differ by a reciprocal translocation and the identification of hybrids by the presence of translocation heterozygotes agreed with that by morphol. methods. Artificial F₁ and F₂ hybrids resembled the wild hybrids. C. A.Stad

6846. VARIABILITY IN LENGTH AND ARM RATIO OF PACHYTENE CHROMOSOMES OF CORN. M.P.Maguire Cytologia, 1962, 27, 248-257 (Genet. Fndn-, Univ. Texas, Austin, Tex., U.S.A.) The arm lengths of all chr. of 271 pachytene microsporocytes were measured in 31 related Zea plants which contained varying amount of Tripsacum chr. material due to ancestral hybridisation Results indicated that variability of arm length and arm ratio was due both to a const. variability per unit length of arm and to a characteristic variability of each chr. regardless of length. The presence of Tripsacum chr. material did not alter the variability pattern of the genome. C.A.Stace

6847. CHROMOSOME NUMBERS IN ONCIDIUM ALLIANCE. Y.Sinota Cytologia, 1962, 27, 306-313 (Dept. Biol., International Christian Univ., Mitaka, Tokyo, Japan) Somatic chr. no. in 15 genera and 1* hybrids of 14 genus combinations of this group of orchids were determined, involving about 140 taxa. About 24 different no. were found, in addition to the hybrid no. which were usually averages of those of the 2 parents. Most of the no. could be explained on the basic no. 5 an' 7. Some karyotypes were analysed. C.A.Stace

6848. STUDIES ON SUPERNUMARY CHROMOSOMES IN THE GENUS DACTYLIS. S.S.Shalu Chromosoma, Berlin, 1963, 14, 162-185 (Genet. Dept., Univ. California, Davis, Calif., U.S.A.) Some population of D. glomerata (subsp. lusitanica) possessed supernumerary chr. These were relatively small, somatically stable, heterochromatic and submetacentric. At meiosis they commonly formed bivalents and multivalents. One individual was asynaptic. Data on supernumerary chiasma freq., and their effect on morphol. characters and pollen fertility were examined. S. A. Henderson

6849. EVIDENCE OF RELATIONSHIP BETWEEN EXTRA DIMINUTIVE CHROMOSOMES IN GEOGRAPHICALLY REMOTE RACES OF OENOTHERA. R.E.Cleland and B.B.Hyde: Amer. J. Bot., 1963, 50, 179-185 (Dept. Bot., Univ. Indiana, Bloomington, Ind., U.S.A.) Extra diminutive chr. found in 2 Calif. races of (VhoookgJ are able to synapse with each other and to form ch israt This suggests a partial homology and that they arise from

CYTOLOGY

663

a common source. Two alternate hypotheses for their origin are suggested.

T.H. Thomas

6850. CYTOTAXONOMY OF CIRSIUM MUTICUM, CIRSIUM DISCOLOR AND CIRSIUM ALTISSIMUM. JyFrankton and R.J.Moore: Canad. J. Bot., 1963, 41, 13-84 (Plant Res. Inst., Canada Dept. of Agric., Ottawa, Canada) The morphol. and cytol. evolution of C. muticum, C. discolor (both $2n = 20$) and C. altissimum ($2n = 18$) is discussed. Extra chr., possibly to be considered as accessories, were found in C. muticum and C. discolor. A.Meany

6851. CYTOTAXONOMIC STUDIES ON TWO CULTIVATED SPECIES AND WILD RELATIVES IN GENUS ECHINOCHLOA. T.Yabuna: Cytologia, 1962, 27, 296-305 (Coll. Agric., Univ. Osaka Prefecture, ^{SA-1st Japan}) Four strains of wild E. crus-galli 2 of E. colona arri 5 of cultivated plants E. frumentacea. [^] U had regular meiosis with 27 bivalents. F1 hybrids between E. crus-galli and Indian cultivated E. frumentacea and between E. crus-galli and Sino-Japanese cultivated E. crus-galli had irregular meiosis with 27 bivalents; all [^] combinations (including Indian x Sino-Japanese E. frumentacea) had irregular meiosis. It is concluded that Indian E. frumentacea has been derived from E. colona, and Sino-Japanese E. frumentacea (which is renamed E. utilis) from E. crus-galli. CA.Stace

6851* TKE GENUS COLLINSIA. XIX. NEW GENOMES FROM TWO FERTILE INTERSPECIFIC HYBRIDS. I.S.Dhillon and E.D.Campbell: Cytologia, 1962, 27, 181-197 (Dept. Bot., Univ. Hong Kong) The fertile hybr. [^] C. mids C. corymbosa x C. tinctoria and C. corymbosa x gave [^] C. corymbosa x [^] C. tinctoria interchange complex of six chr. F2 and F3 individuals with bivalents. Two lines of the former hybrid had a new genome like that of C. multicolor, one of the latter with a new genome like [^] C. heteropteris. and the others or the latter had a genome resembling that of either of the parents. More [^] these new lines behaved the same in crosses with Parental or non-parental spp. as did the spp. whose genomes they resembled. The origin of the new lines is unknown, but their significance is discussed.

8053 CYTOGENETICAL STUDIES IN GENUS CITRUS. V. EVOLUTION IN GENUS CITRUS. S.S.Raghuvanshi: Cytologia, 1962, 27, 172-188 (Dept. Bot., Lucknow Univ., India) 25 taxa of Citrus ($2n = 18$) were studied. Abnormalities such as anaphase bridges (inversion), multivalents (translocations), univalents, double pollen restitution nuclei, polyploidy and binucleate pollen mother cells were found, and these, although often [^] present in some parts of the plants are important because commercial propagation is mostly effected. Setatively, the cur. aberrations, as well as hybridity [^] Sene mutations, are thus more important than polypliody in Citrus evolution, although the former would not normally persist. Nucellar embryony is also important.

CA.Stace

68- CHROMOSOMES OF SOME SPECIES OF AGAPANTHUS. H.P.Riley and D.Mukerjee: Cytologia, 1962, 27, 325-332 (Dept. Bot., Univ. Kentucky, Lexington, U.S.A.) Karyotypes of 7 taxa of Agapanthus ($2n = 29$, 30 or 32) are fully described. Two extra and 2 supernumerary chr.

CA.Stace

6855. CYTOLOGICAL STUDY OF INDUCED APOSPORY IN FERNS. C.Takahashi: Cytologia, 1962, 27, 79-96

(Biol. Lab., Nagoya Univ., Japan) Apospory was induced in Pteridium by culturing detached early leaves of young sporophytes. Very clearly defined diploid prothallial outgrowths appeared from all parts. These gave rise, by syngamy, to tetraploid sporophytes, apogamy not occurring. From these, tetraploid prothalli could be obtained by induced apospory, although these have only (/sex organs. The differences between haploid and diploid prothalli are numerous only at the cellular level, but tetraploid sporophytes differed from diploid ones in many macroscopic as well as microscopic features. These differences are described and discussed.

6856. NUCLEAR CYTOLOGY OF SPAEROLEA ANNULINA AND ITS BEARING ON THE SYSTEMATIC POSITION OF SPAEROLEA. Y-S-R-K.Sarma: Cytologia, 1962, 27, 72-78 (Dept. Bot., Banaras Hindu Univ., Varanasi, India) Mitosis was followed in S. annulina var. annulina and var. crassisepta, and the chr. no. found to be 16. One or 2 satellite chr. are present. Gamete formation does not appear to be preceded by meiosis. Cytol. evidence suggests that this genus is closest to the Ulotrichales. CA.Stace

TECHNIQUES

6857- NEW APPARATUS, VIVOTOME, TO OBTAIN THIN SECTIONS FROM FRESH MATERIALS. S.Taraa: Cytologia, 1962, 27, 25-29 (Biol. Sect., Tokyo Woman's Christian Coll., Suginami, Tokyo, Japan) A simple microtome using glass blades is described by which thin sections of living animal tissue may be obtained.

CA.Stace

6858. ESTIMATION OF NUCLEAR RATIOS DIRECTLY FROM HETEROKARYOTIC MYCELIA ON SCHIZOPHYLLUM. P.J.Snider: Amer. J. Bot., 1963, 50, 255-262 (Dept. Bot., Univ. California, Berkeley, Calif., U.S.A.) The principles used to analyse nuclear ratios with macerated mycelia are similar in part to those of classic methods utilising spore suspensions, but some distinctive features are evident in this method. It is simple and probably suitable for the simult. comparison of ratios in mycelium and spores. The technique was combined with others to devise a test suggesting whether random or non-random spacial distributions of nuclei exist in heterokaryons with disparate ratios. Numerous applications in fungi seems probable.

T.H.Thomas

6859. CONSIDERATIONS OF SOME BIOLOGICAL FACTORS OF ANOMALIES WHICH ARISE FROM CYTOPHOTOMETRIC DATA. G.Gerzefc¹: Caryologia, 1962, 15, 507-514 (Inst. Anat. Comp., Univ. Pavia, Italy) Iversen's method for analysis of cytophotometric data of Feulgen-stained nuclei yields evidence of some anomalies of nuclear behaviour. The sum of biol. factors involved is Analysed and this supports the value of cytophotometric measurements. (Italian) J.L. Batten

CYTOTOLOGY

8860. PROTEIN DROPLETS, ESPECIALLY GELATIN, HAEMOGLOBIN AND HISTONE, AS MICROSCOPIC STANDARDS FOR QUANTITATION OF CYTOCHEMICAL REACTIONS. J.W.Kelly and L.Carlson: *Exp. Cell Res.*, 1963, 30, 106-124 (Inst. Med- CellRes., Karolinska Inst., Stockholm, Sweden) Two methods for marking microscopic protein droplets using small transfer rods or emul-

sions, and a method based on protein films were studied*. Protein models were studied by X-ray absorption, interference and microspectrophotometry, and excellent dye-binding curves were obtained in gelatin, Hb and histone*. No significant observations were made to indicate that protein models would not be suitable standards for quant, studies of cytochem. reactions. vjones

MICRO-ORGANISMS

6861. LOCALISATION OF P2 PROPHAGE IN TWO STRAINS OF E. COLI B.Kelly: Virology, 1963, 19, 32-39 (Microbiol. Genet. Dept., Karolinska Inst., Stockholm, Sweden) In K-12 strains, prophage P2 may occupy at least 2 different locations but does not show the strong location preference that it shows in C strains. One of the prophage locations in K-12 appears to be allelic with location H in *E. coli* C. No prophage location in K-12 allelic with the preferred location in C has been detected. J.G.Bennette

6862. AFFINITY OF P2 rd 1 FOR PROPHAGE SITES ON CHROMOSOME OF E. COLI STRAIN C E.Six: Virology, 1963, 19, 375-387 (Microbiol. Dept., Iowa State Univ., Iowa City, Iowa, U.S.A.) Evidence is presented that there is a difference in the lysogenisation pattern of P2 rd 1 phages depending on the lysogenic donor strain used as source of the phage. P2 rd 1 from donor C (P2 rd 1) has a strong preference for establishing as prophage at site I of recipient cells; P2 E₁ from donor C (P2 rd 1) shows neither this preference for site I nor a comparable preference for site II.

J.G.Bennette

6863. MAPPING OF GALACTOSE GENES OF E. COLI BY TRANSDUCTION WITH PHAGE PI J.Adler and A.D.Kaiser: Virology, 1963, 19, 117-126 (Biochem. Dept., Wisconsin Univ., Madison, Wis., U.S.A.) The order of 15 galactose-neg. mutants of *J^coL* has been studied by means of 3-point crosses carried out with transduction by PI phage. Prophage 82 was used as a closely linked marker. The galactose-neg. mutants are jointly transduced with prophage 82 by PI so that their linkage to each other and to prophage 82 is confirmed. A recombinant between the phages 82 and 1 has been prep. and characterised. This phage, called 82 hybrid, has the immunity specificity of 82 but the host range of 1. J.G.Bennette

6864. MUTANTS OF PHAGE T4 WITH INCREASED SENSITIVITY TO ULTRAVIOLET W.Harm: Virology, 1963, 19, 66-71 (Genet. Inst., Cologne Univ., Germany) Expt. on the isolation and u.v. sensitivity of mutants, on genetic crosses, photoreactivation and multiplicity reactivation are described. The mutants were obtained by treatment of phage T4 with nitrous acid. J.G.Bennette

6865. DENSITY MUTANTS OF PHAGE T5 R-Hertel, L-Marchi and K.Mullen: Virology, 1962, 18, 576-581 (Biol. Sci. Div., Purdue Univ., Lafayette, Ind., U.S.A.) Mutational density changes in phage T5 are correlated with changes in temp., sensitivity. Genetic recombination occurs between density markers and a plaque-type marker, but not between pairs of density mutants. No phenotypic fixing of density characters has been found. J.G.Bennette

6866. EFFECTS OF NITROUS ACID ON TRANSDUCTION BY SALMONELLA PHAGE P22 J.Adye: Virology, 1962, 18, 627-632 (Biol. Dept., Johns Hopkins Univ., Baltimore Md., U.S.A.) P22 suspension were treated with HNO₂ and mutations were produced in *Salmonella*. Genetic fragments within free transducing particles. The majority of the 32 histidine mutants produced showed incomplete genetic blocks. Phage inactivation and abortive transductions decreased exponentially with single-hit kinetics during treatment with HNO₂. The no. of com-

plete transductions increased with short HNO₂ treatments and then decreased exponentially. The rate of inactivation of complete transductions was lower when a single-site was used as recipient than when a multi-site mutant was used. HNO₂ treatment caused an exponential decrease in the freq. of joint transduction of 2 histidine markers, the rate of decrease of which being proportional to the map distance separating the 2 markers. From the rates of linkage disruption and the inactivation rates for complete transduction, the 8 linked *Salmonella* histidine genes were estimated as comprising a segment of DNA with a size of about 13000 nucleotide pairs.

J.G.Bennette

6867. EFFECTS OF ULTRAVIOLET LIGHT ON TRANSDUCING PHAGE P22 R.Benzinger and P.E.Hartman: Virology, 1962, 18, 614-626 (Biol. Dept., Johns Hopkins Univ., Baltimore, Md., U.S.A.) Evidence is presented that a single u.v. hit on an abortively transducing element enables it to form a complete transduction, i.e. to undergo recombination with the chr. of recipient bacteria*. During the conversion of abortive transductions to complete ones, jointly transduced markers become less tightly linked. The rate of linkage disruption is proportional to the genetic map distance between linked markers and allows an estimate to be made for the physical size of the histidine (*his*) region of the *Salmonella* chr. A second estimate of the size of this region is obtained from the fact that the rate of inactivation of complete transductions are proportional to die sizes of the genetic defects in the recipients. The coding ratio for the *his* region is about 3 nucleotide pairs per amino acid intie 8 proteins whose structure it controls. J.G.Bennette

6868. REQUIREMENT FOR PROTEIN SYNTHESIS IN TRANSDUCTION H.Reiter and E.P.Goldschmid: Virology, 1962, 18, 633-642 (U.S. Army Chem. Corps, FortDetrick, Frederick, Md., U.S.A.)

Transduction freq. is tenfold higher when infection of *Salmonella typhimurium* LT2 is carried out in a minimal medium plus amino acids than in minimal medium alone. Transductions are lost rapidly in the absence of amino acids*. Methods for preventing this transduction decay are described. Transduction fixation, a second reaction, depends on the presence of amino acids and is inhib. by chloramphenicol. Fixation eliminates the requirement for further nutritional supplementation. Since the establishment of abortive transductions parallels that of complete transductions, it is probable that the amino acid dependent processes occur before the integration of the transducing material into die bacterial genome.

J.G.Bennette

6869. GENETIC RECOMBINATION BETWEEN PHAGES S13 AND (8X174) E.S.Tessman and R.Slesser: Virology, 1963, 19, 239-240 (Biol. Dept., Purdue Univ., West Lafayette, Ind., U.S.A.) Prelim, comm.

PLANT

6871. SOLID STEM: RADIATION INDUCED MUTATION IN TRITICUM DURUM DESF. A.Bozzini and S.Avanzb

GENETICS

Caryologia, 1962, 15, 525-535 (Comitato Naz. Energia Nucleare, Roma, Italy) Data are presented on the inheritance and culm anatomy of a solid stem mutant induced in *T. durum* Capelli by X-irradiation. Cytogenetic information suggests that this neutralised the action of a gene for hollow stem, epistatic, only when homozygous, on one or more genes inducing stem solidness.

J.L. Batten

6872. RADIATION GENETICS IN WHEAT. VIII. THE RELATIVE BIOLOGICAL EFFECTIVENESS [RBE] OF HEAVY PARTICLES FROM 10B (N.d.)⁷Li REACTION FOR CYTOGENETIC EFFECTS IN EINKORN WHEAT. S.Matsumura, S.Kondo and T.Mabuchi: Radiat. Bot., 1963, 3, 29-40 (Nat. Inst. Genet., Misima, Japan)

Wheat seeds were irradiated with a plus ⁷Li recoil nuclei from thermal neutron capture by ¹⁰B. The effects produced by the heavy particles from boron capture were estimated by subtracting the thermal neutron effect on seeds soaked in pure water from those found for seeds soaked in aq. soln. with different concn. of borax and compared with the effects of γ -rays under the same soaking conditions. The RBE values obtained for chr. aberrations in pollen mother cells and for chlorophyll mutations were 23 ± 10 and 29 ± 10 respectively.

J.R.Broome

6873. MUTAGENIC ACTION OF ETHYL METHANE-SULPHONATE IN MAIZE. M.G.Neuffer and G.Ficson Science, 1963, 139, 1296-1297 (Dept. Field Crops, Univ. Missouri, Columbia, Mo., U.S.A.) Pollen of corn plants carrying 3 closely-linked genes (g g Sh2) on chr. 3 were treated by ethyl methanesulphonate. Numerous chr. aberrations were produced with u.v. and X-rays, including some discrete genetic changes.

[^]G.M.Lewis

(3874. ROLE OF THE GENOTYPE IN CONTROLLING ACCUMULATION OF STRONTIUM-89 BY PLANTS. D.C.Rasmussen, L.H.Smith and W.M.Myers: Nature, Lond., 1963, 198, 1008 (Dept. Agronomy, Univ. Minnesota, St. Paul, Minn., U.S.A.) Expt. with 6 varieties of barley and wheat differing in accumulation of 89Sr in the grain indicated that this difference was subject to significant genotypic control as was also accumulation in stems and leaves.

G.M.Lewis

6875. SOLUBLE CARBOHYDRATE CONTENT OF VARIETIES OF TETRAPLOID RYE GRASS. J.W.Dent and D.T.Aldrich: Nature, Lond., 1963, 198, 905 (Nat. Inst. Agric. Bot., Cambridge, England) Sol. carbohydrate content of tetraploid ryegrasses expressed as a % of dry wt. was consistently higher than that of the diploid.

ANIMAL

6876. PROPERTIES OF A SOMATIC HYBRID BETWEEN MOUSE CELLS WITH DIFFERENT GENOTYPES. D.Gershon and L.Sachs: Nature, Lond., 1963, 198, 912-913 (Sect. Genet., Weizmann Inst. Sci., Rehovoth, Israel) A new somatic hybrid is described between strain L cells derived from s.c. tissue of C3H mouse and a polyoma-induced mammary tumour MT1 originating in a SWR mouse; the hybrid had a different karyotype and growth morphology from both parent cells. The hybrid

cells would not grow in C3H or SWR cells, but grew in the Fi hybrid, showing that they contain histocompatibility Ag from both parents.

G.M.Lewis

6877. NEW ALLOTYPIC SPECIFICITY IN THE MOUSE (MuA2). S.Dubiski and B.Cinader: Canad. J. Biochem. 1963, 41, 1311-1315 (Div. Biol., Cancer Inst., Univ. Toronto, Ont., Canada) A new allotypic specificity (MuA2) was obtained by immunisation of mice (BALB/c strain) with serum (from C57BL/6J x C3H/HeN mice) incorporated in Freund's adjuvant or with micro-organism coated with Ab (raised in C57BL/6J x C3H/HeN mice). Allotypic specificity MuA2 was found in C57BL/6J, C57BL/10J, and SJL/J, as well as in some non-inbred 'Swiss' mice. This allotypic specificity was also found in all hybrids which had one of the 3 above mentioned strains in their parentage.

A.M.Gibbins

6878. MA/My STRAIN OF MARSH ALBINO MOUSE. W.S.Murray: J. nat. Cancer Inst., 1963, 30, 605-610 (R.B.Jackson Mem. Lab., Bar Harbor, Maine, U.S.A.) Data on treated and untreated MA/My show that this strain is highly susceptible to the virus-like mammary tumour inciter or milk agent, yet apparently carries none of it. This characteristic has been acquired without expt. manipulation.

J.G.Bennette

6879. CELLULAR NATURE OF GENETIC SUSCEPTIBILITY TO VIRUS. M.Kantoch, A.Warwick and F-B.Bang: I. exp. Med., 1963, 117, 781-798 (Pathobiol. Dept., Sch. Hyg. and Public Hlth., Johns Hopkins Univ., Baltimore, Md., U.S.A.) Both PRI mice and their macrophages in culture were susceptible to mouse hepatitis virus, while C3H mice and their macrophages were resistant. All Fi macrophages and some back-cross cell cultures were susceptible. Segregation of susceptibility occurred in the first back-cross generation, one-quarter of the mice being shown to be susceptible. About 50% of the back-cross mice had the genetic capacity to transmit susceptibility. These results suggest either that there are 2 genes for susceptibility involved, or that a single dominant gene, incompletely expressed, may be responsible. Resistant cells were made susceptible by ingestion of a large heat-stable particle in extracts of susceptible macrophages. The nature of this factor has been discussed.

H. E. H.Jones

6880. GENETIC CONTROL OF A GUINEA-PIG SERUM FACTOR TOWARD WHICH NATURAL DELAYED ISO-HYPERSENSITIVITY OCCURS. J.R.Battisto: Nature, Lond., 1963, 198, 598-599 (Dept. Microbiol., A.Einstein Coll. Mcd., New York, U.S.A.) Interbreeding expt. between the homozygous guinea-pig strain Wright xm and the heterozygous Hartley strain, showed that the presence of 'serum factor' is controlled by an autosomal dominant gene.

G.M.Lewis

6881. STUDIES ON THE EXPRESSION OF LETHAL HEREDITARY FACTORS IN THE EMBRYO OF DROSOPHILA. VI. ON THE LETHAL EFFECTS DUE TO HYPOPOLOIDY AND HYPERPOLOIDY OF CHROMOSOMES IN XXY AND TRANSLOCATION STRAINS OF *D. MELANOGASTER*. T.Imaizumi: Cytologia, 1962, 27, 212-228 (Inst. Zool., Univ. Kyoto, Japan) The types of lethality caused by various degrees of hypoploidy and hyperploidy in *D. melanogaster* was studied in detail. A strain with XXY and 2 translocations and one with one translocation were used initially. Death occurs at successively later stages, for instance, in embryos

with no X chr., with loss of an arm of chr. II or E1, and with duplication of the same arms. The behaviour of aneuploids and flies with duplications and deficiencies was sometimes paralleled by mutated flies with no visible abnormalities, which were perhaps genetic mutants or minutely deficient. Results of the relevant genetic expt. are fully documented. (French) CA.Stace

6882. O-EBONY UTILISATION OF EBONY AND NON-EBONY DROSOPHILA MELANOGASTER. M.E.Jacobs and K.K.Brubaker: Science, 1963, 139, 1282-1263 (E.Mennonite Coll., Harrisonburg, Va., U.S.A.)

9-[14c]Alanine was inj. into newly-formed ? pupae. Homozygous ebony deposited less I^*C in pupal sheaths, deposited more in adult body extracts and wings, and decarboxylated and oxidised O-alanine to excrete $14CO_2$ faster than did non-ebony homozygotes. Heterozygotes were intermediate in all these activities. G.M.Lewis

6883. PENETRANCE OF THE GENE FOR DIELDRIN RESISTANCE IN ANOPHELES ALBIMANUS WIEDEMANN. L.E.Rozeboom: Amer. J. trop. Med. Hyg., 1963, 12, 249-253 (Dept. Pathobiol, Johns Hopkins Univ. Sch. Hyg. and Public Health, Baltimore, Md., U.S.A.) Selection of successive generations of a dieldrin-resistant strain by exposure to dieldrin-impregnated papers resulted in a rapid increase in freq. of the dominant gene for resistance. This gene is estimated to be 100% penetrant in the heterozygous and homozygous resistant mosquitoes. In addition to the single dominant gene, there appeared to be also a selection for ancillary genes conferring additional resistance. There was no loss in the freq. of the single dominant gene for resistance in the parent colony after about 3 yr. of laboratory rearing without selection pressure. A. A. Zimmerman

6884. AN EFFORT TO PRODUCE LICE RESISTANT TO DDT SOAP. H.Nagaj: Przegl. epidem., 1962, 16, 467-471 (Wojewódzka Stacja Sanitarno-Epidemiologiczna, Kraków, Poland) Lice were treated with DDT soaps in various concn. An induced resistance to DDT disappeared in the 9th generation. (Polish) M.Korbec W

HUMAN

6885. SOCIAL DIFFERENCES IN THE DISTRIBUTION OF THE ABO-, MN-, AND Rh FACTORS. H.Walter: Blut, 1963, 9, 1-7 (Anthropol. Inst., Univ. Mainz, Germany) Although no differences were found in M and N distribution in children of working class and other backgrounds in Westphalia, significant differences were found for the ABO and Rh systems. Social and historical effects were postulated, and the significance for study of gene distributions in populations emphasised.

(German) AJ.Wansbrough

6886. HEREDITARY PERSISTENCE OF FOETAL HAEMOGLOBIN: STUDY OF 79 AFFECTED PERSONS IN 15 NEGRO FAMILIES IN BALTIMORE. CLConley, DJ. Weatherall, S.N.Richardson, M.K.Shepard and S.Charache: Blood, 1963, 21, 261-281 (Med. Dept., Johns Hopkins Hosp., Baltimore, Md., U.S.A.) Hereditary persistence of foetal Hb is caused by a mutant gene that inhibits synthesis of Hb A and A2. Alkalidistant Hb is produced and neither anaemia nor hypo-

chromia of die r.b.c. occurs. It is again suggested that function of the loci of the 3 and 6-chains of globin is suppressed. Heterozygotes of the anomaly have a high concn. of Hb F in the r.b.c with uniform r.b.c distribution of the foetal Hb. H.B.Waynfirth

6887. DISTRIBUTION OF SICKLE-CELL Hb IN SAUDI ARABIA. H.Lehmann, G-Marjanian and A.E.Mourant: Nature, Lond., 1963, 198, 492-493 (St. Bartholomew's Hosp., London, England) The freq. of sickle cell Hb in different populations of Saudi Arabia is thought to be related to the incidence of malaria. G.M.Lewis

6888. SECOND AND THIRD ABNORMAL Hb IN NORFOLK. R.G.Hunstman, M.Hall, H.Lehmann and B.K.Sukumarax: Brit. med. J., 1963, i, 720-722 (St. Bartholomew's Hosp., London, England) A survey of 1000 unrelated inhabitants in Norfolk failed to reveal any further examples of Hb Norfolk. Two other abnormal hb were discovered in English families; Hb GaNorfolk had its mutational change in the a-chain and Hb D_g Norfolk in the 6-chain. M.E.Nutt

6889. HAEMOGLOBIN TYPES IN GREEK POPULATIONS. N.A.Barnicot, A.C.Allison, B.S.Blumberg, G.Deliyannis, C.Krimbas and A.Ballas: Ann. hum. Genet., 1963, 26, 229-236 (Dept. Anth., Univ. Coll., London, England) The incidence of abnormal Hb genes was investigated in various populations. The low incidence of Hb H inclusion bodies observed confirms previous findings that detectable a-thalassaemia is much less common than P-thalassaemia in Greece. In regions where the sickle/cell gene freq. is high the freq. of thalassaemia /low and vice versa. High freq. of abnormal Hb are found only in regions that were formerly intensely malarious. J.L. Batten

6890. DEFICIENCY OF GLUCOSE 6-PHOSPHATE DEHYDROGENASE [G6PD] IN GREEK POPULATIONS. A.C.Allison, B-A-Askonas, N.A. Barnicot, B.S.Blumberg and C.Krimbas: Ann. hum. Genet., 1963, 26, 237-244 (Nat. Inst. Med. Res., London, England) R.b.c. G6PD was measured on samples from cf. High proportions of enzyme-deficient subjects were found in some regions. The incidence of enzyme deficiency shows a pos. correlation with the incidence of abnormal Hb genes. J.L.Batten

6891. THEORETICAL EVIDENCE FOR AUTOSOMAL MODIFYING GENE PAIR IN GLUCOSE 6-PHOSPHATE DEHYDROGENASE [G6PD>DEFICIENT FAMILIES. J.E.Bowman and S.Maynard-Smith: Ann. hum. Genet., 1963, 26, 213-218 (Gallon Lab., Univ. Coll., London, England) Various G6PD-deficient pedigrees violating classical patterns of sex-linked inheritance are reviewed. Anomalous phenotypes observed in these families may result from epistatic reactions between the effects of abnormal sex-linked genes or gene and an autosomal pair. J.L.Batten

6892. DATA FOR X-MAPPING CALCULATIONS, ISRAELI FAMILIES TESTED FOR Xg, G6PD [GLUCOSE 6-PHOSPHATE DEHYDROGENASE] AND FOR COLOUR VISION. A.Adam, C.Sheba, R.Sanger, R.R.Race, P.Tippett, J.Hamper, J.Gavin and D.J.Finney: Ann. hum. Genet., 1963, 26, 187-194 (Govt. Hcsp., Tel Hashomer, Israel) Tests were made for the r.b.c. Ag Xg^a on Israeli families of various communities with G6PD members. The results show linkage between Xg and G6PD

GENETICS

and the recombination freq. is estimated. Some of the families had colour vision abnormalities and results from these suggest the order $X\text{fr}$ G6 PD_r cy on the chr.

J.L.Batten

6893. FAMILIAL HYPOHAPTOGLOBINAEMIA.

GENETICALLY DETERMINED TRAIT SEGREGATING FROM GLUCOSE 6-PHOSPHATE DEHYDROGENASE [G6PD] DEFICIENCY. A.Gottlieb, N.Wisch and J.Ross: Blood, 1963, 21, 129-140 (Haematol. Dept., Mount Sinai Hosp., New York, U.S.A.) A family is presented with an inherited deficiency of G6PD and serum haptoglobin. More evidence is given for the hypothesis that modification of the Hp₂ allele is responsible for the low levels of haptoglobin observed. H.B.Waynforth

6894. NEW HAPTOGLOBIN ALLELES: A PREDICTION CONFIRMED. W.E. Nance and O. Smithies: Nature, Lond., 1963, 198, 869-879 (Dept. Med. Genet., Univ. Wisconsin, U.S.A.) Two unusual types of Hp₂ haptoglobin alleles have been detected by starch-gel STelectrophoretic analysis of human sera. These alleles are considered to be the Hp^{FF} and Hp^{2ss} genes which were previously predicted on theoretical grounds. J.R.Sargent

6895 HAPTOGLOBIN TYPES IN BRAZILIAN NEGROES. C.V.Tondo, C.Mundt and F.M.Salzano: Ann. hum. Genet., 1963, 26, 325-331 (Dept. Genet., Inst. Sci. Nat., Univ. do Rio Grande do Sul, Porto Alegre, Brazil) Studies on haptoglobin types of Negroes and Whites show that the incidence of gene H^E increases as the no. of genes for darker pigmentation and other negroid features increases. A difference in haik^Elobin freq. was observed between individuals undergoing net⁺th treatment and healthy ones. ^ J-L. Batten

6896. INCIDENCE OF THE BLOOD GROUP ANTIGEN Dia IN THE TUSCARORA INDIANS OF NORTH AMERICA. J.F.Mohn, R.M.Lambert and C.M. Zmijewski: Nature, Lond., 1963, 198, 697-698 (Dept. Bacteriol., Sch. Med., St. Univ. New York, Buffalo, U.S.A.) An incidence of 11*3% Difaf individuals among the Tuscaroras of Western New York is the highest yet reported for Indians of N. America. G.M.Lewis

6897. INFLUENCE OF RACE AND PHENOTYPE ON ERYTHROCYTE D ANTIGEN STUDIED BY IODINE-101 LABELLED ANTI-D. A.E.Barnes and R.S.Farn: Blood, 1963, 21, 429-446 (Med. Dept., Univ. Pittsburgh, Pa., U.S.A.) A method for the prep. of 131I-labelled anti-D eluates sp. for the D Ag by adsorption and elution from intact D pos. r.b.c. is presented. R.b.c. D Ag determinations of Negroes indicated a heterogeneity of quant. D Ag reactivity consistent with previous 131I-labelled anti-D studies. The r.b.c. D Ag reactivity was enhanced by the E Ag in negro blood. H.B.Waynforth

6898. A 'NEW' ANTIBODY ANTI-Lu^a*Lu^b AND TWO FURTHER EXAMPLES OF THE GENOTYPES Lu^{a-a-b-}. J.Darnborough, R.Firth, C.M.Giles, K.L.G.Goldsmith and M.N.Crawford: Nature, Lond., 1963, 198, 796 (Nat. Blood Transfusion Serv., Sheffield, Yorkshire, England) G.M.Lewis

6899. A NEW TRANSFERRIN IN NEW GUINEA. L.Y.C.Lai: Nature, Lond., 1963, 198, 589 (Dept. ZooL, Univ. W. Australia) Another transferrin of the B series has been detected by vertical starch gel electrophoresis in the serum of a man from New Guinea; the brother and sister were heterozygous, and mother homozygous for the new factor. G.M.Lewis

6900. GENETICAL STUDIES ON NEW VARIANT OF SERUM CHOLINESTERASE DETECTED BY ELECTROPHORESIS. H.Harris, D-A.Hopkinson, E.B.Robson and M.Whittaker: Ann. hum. Genet., 1963, 26, 359-3-12 (M.R.C. Hum. Biochem. Genet. Res. Unit, King's Coll., London, England) Britons and Tristan da

Cunha islanders were tested for the presence of the zone C5 with prop. of serum cholinesterase by electrophoresis. b^2 Jo of the former and ll^2 Jo of the latter were C5+. Studies on relatives of some of these suggest that C5+ individuals may be heterozygous for a gene determining the formation of the component. J.L.Batten

6901. PROBABLE RELATIONSHIP BETWEEN PTC [PHENYLTHIOCARBAMIDE] SENSIBILITY AND Rh FACTOR. E.Messeri: Caryologia, 1962, 15, 545-550 (Inst. di Physiol. Generale dell' Univ., Messina, Italy) From a study on 100 individuals it seems possible that an autosomic linkage between PTC insensibility and Rh blood factor occurs. Probably a physiol. relation between the 2 factors exists. (Italian) J.L.Batten

6902. SEX DIFFERENCES IN TASTING PTC [PHENYLTHIOCARBAMIDE]. A.Leguebe: Life Sci., 1963, No. 5, 337-342 (Inst. Royal Sci. natur. de Belgique, Bruxelles, Belgium) Prelim. note. K.Jones

6903. TASTE SENSITIVITY AND ENDEMIC GOITRE IN ISRAEL. N. Brand: Ann. hum. Genet., 1963, 26, <321-324 (Worker's Sick Fund, Clin. Stat. DAN, Upper Galilee, Israel) Taste thresholds for phenylthiourea were measured in children and adolescents and the incidence of non-toxic nodular goitre among them was investigated. The results suggest that non-tasters may be somewhat more susceptible to the development of nodular goitre than tasters. J.L.Batten

6904. HEREDITARY FACTOR IN ARTERIAL BLOOD PRESSURE. W.E.Miall and P.D.Oldham: Brit. med. J., 1963, i, 75-80 (Llandough Hosp., Penarth, Glam., Wales) Population studies in Rhondda Fach and the Vale of Glamorgan showed that single gene inheritance may be important in determining arterial blood pressure in a very small fraction of the community. In the majority of the population a regression of 0.287 for systolic and 0.224 for diastolic p. best expresses the resemblance of 1st-degree relatives, leaving 55-77% of systolic and 70-87% of diastolic variance to be explained by environmental factors. M.E.Nutt

6905. MONGOLISM AND TURNER'S SYNDROME IN THE SAME SIBSHIP. A.W.Johnston and J.K.Petrakis: Ann. hum. Genet., 1963, 26, 407-413 (Johns Hopkins Hosp., Baltimore, Md., U.S.A.) A family is described which contains a boy with Down's syndrome and a girl with Turner's syndrome. The significance of 2 aneuploid patients in the same family is discussed and comparisons made with other families suggest that in certain families the l^2f^1 , a^5 , l^1h^3 hered. Predisposition to non-disjunction, probably due to an abnormal gene. J.L.Batten

6906. FfS3F^{AL} ORIGIN OF SEX CHROMOSOMES IN XO AND XXY KARYOTYPES IN MAN. G.R.Fraser: Ann. hum. Genet., 1963, 26, 297-304 (Div. Med., i-b⁺V, \wedge Wash^{ung}i^{on}-Se^{*}ttle, Wash., U.S.A.) Max. likelihood methods are described whereby studies of segregation at sex-linked loci may be used to determine the xx^+ -contribution of the parents to individuals of the XO and XXY karyotype. J.L.Batten

6907. SEX-LINKED DEAF-MUTISM. B.W.Richards: Ann. hum. Genet., 1963, 26, 195-199 (St. Lawrence's Hosp., Caterham, Surrey, England) A family containing 6 deaf-mute children in 4 different sibships shows maternal transmission. The disease may be due to a sex-linked recessive gene but sex limitation cannot be excluded. J.L.Batten

6908. FACTORIAL ANALYSIS OF SEX-RATIO DATA. COMMENT ON TWO PAPERS BY EDWARDS. RG.Beilharz: Ann. hum. Genet., 1963, 26, 355-358 (Artificial Stock Breeding Centre, Berry, N.S.W., Australia) Renkonen's data (1956), used by Edwards (1961), are re-interpreted. It is contended that they are readily explained on the assumption that genetic variation in 'sex ratio' exists and that a psychol. process of family planning has occurred so that a consideration of other biol. factors is unnecessary. J.L.Batten

6909. PARENT-CHILD CORRELATIONS FOR BODY MEASUREMENTS OF CHILDREN BETWEEN AGES OF ONE MONTH AND SEVEN YEARS. J-M. Tanner and WJ.Israelson: Ann. hum. Genet., 1963, 26, 245-259 (Dept. Growth and Development, Inst. Child Health, Univ. London, England) Various body measurements

were made on children at intervals from one month to 7 yr. and on their parents. The conclusion is drawn that there are sex-controlled genes affecting physique operating before puberty. J.L.Batten

6910. FAMILIAL HYPOGONADOTROPHIC EUNUCHOIDISM WITH CEREBELLAR ATAXIA. R.Volpe, W-S. Metzler and M.W.Johnson: J. clin. Endocr., 1963, 23, 107 (Dept. Med., Univ. Toronto, Ont., Canada) In the 2 brothers examined the chr. picture appeared normal. Details are given of the clinical condition and it is concluded that the disease could be due to either multiple gene linkage or a single mutant gene. G.F.Blane

6911. FAMILIAL AGGREGATION OF LUNG CANCER IN HUMANS. G.K.Tokutata and A-M.Lilienfeld: J. nat. Cancer Inst., 1963, 30, 289-312 (Publ. Hlth. and Hyg. Sch., Johns Hopkins Univ., Baltimore Md., U.S.A.) A statistical study is presented from which it is concluded that genetic factors may play a role in die etiology of lung cancer, in addition to environmental factors such as cigarette smoking. There was a significant excess in the lung cancer mortality among proband relatives that could not be accounted for by age, sex, generation, or smoking factors. J.G.Bennette

EXPERIMENTAL BOTANY

WATER RELATIONS

6912. CUTICLE STRUCTURE AND WATER RELATIONS OF PINE NEEDLES. L.Leyton and B.E.Juniper: Nature, Lond., 1963, 198, 770-771 (Dept. Forestry, Univ. Oxford, England) An area at the base of Scots pine needles, which is permeable to water, allows absorption of dew. The dew is channeled down the needles which are covered with water-impermeable waxy cuticle. G.M.Lewis
6913. STUDIES ON THE STOMATAL TRANSPERSION FROM THE LEAF SURFACE. I EXPERIMENTAL RESEARCH. Q. THEORETICAL CONSIDERATION. S.Murata: Bot. Mag. Tokyo, 1962, 75, 391-400, 473-482 (Meteorological Res- Inst-, Kyoto Univ., Kyoto, Japan) (Japanese, English summary) N.J.Pinfield
6914. WATER CONTENT OF COLEUS BLUMEI BENTH. 'GOLDEN BEDDER' UNDER DIFFERENT CONDITIONS. M.A.Duperrex: CR. Acad. Sci., Paris, 1962, 225, 3, 558-560. When *Coleus blumei* plants were cultivated in both acid and alk. soils, in wet and sat. soils, with or without the addition of nutritive salts, it was shown that the proportion of water they contained was almost always the same. (French) J.M.Thomas

PERMEABILITY AND SOLUTE UPTAKE

6915. EFFECT OF POTASSIUM, CALCIUM, AND MAGNESIUM IONS ON THE PROTOPLASMIC STREAMING IN ACETABULARIA CALYCULUS. T.Satos Bot. Mag. Tokyo, 1962, 75, 384-390 (Dept. Biol., Fac Sci., Univ. Osaka, Japan) Changes in protoplasmic streaming in stalks of *A. calyculus* were investigated in different concn. of K, Ca and Mg in the external medium. The effects of additional Ca and Mg on the morphological character of the cytoplasm were also examined. N.J.Pinfield
6916. CATION AND GLUCOSE TRANSPORT IN ONION EPIDERMIS. R.T.Jackson and H.D.Browne J. cell, comp. Physiol., 1963, 61, 215-221 (Dept. Biol. Sci., Loyola Univ. South, New Orleans, La., U.S.A.) Onion epidermis actively transports glucose with a QIO of 2²16 in a centrifugal direction. K and Na can move through the membrane in both directions but the movement is mainly centripetal. The flow of Na was about 15% that of K. G.M.Lewis

6917. POTASSIUM AVAILABILITY TO PLANTS. D.J.Eagle: Nature, Lond., 1963, 198, 558-560 (Min. Agric, Nat. Agric- Advisory Serv., Wolverhampton, Staffs., England) It is suggested that the availability of soil K to plants depends on the K-releasing potential of soil minerals and the cation exchange capacity of the soil. G.M.Lewis
6918. OSMOTIC ADJUSTMENT OF PLANTS TO SALINE MEDIA. H. DYNAMIC PHASE. L.Bernstein: Amer. J. Bot., 1963, 50, 360-370 (U.S. Salinity Lab., Riverside, Calif., U.S.A.) The time-course of osmotic adjustment in bean and pepper plants to increased salinity of the medium was determined by periodic sampling of plants

following salt additions to the medium. Bean plants adjusted to 1 atm. osmotic pressure increase within one day, root adjustment occurred mainly at night and leaves and stems mainly in the daytime. Osmotic pressure increased by about the same amount in both spp. Added NaCl caused increased concn. of K in leaves and stems which were more or less replaced by more slowly absorbed ions. In roots, Na uptake predominated if Na salts were added, but K uptake was important on the Cad2 treatment. T.H.Thomas

6919. UPTAKE BY THE ROOT AND SUBSEQUENT DISTRIBUTION WITHIN THE POTATO PLANT OF STRONTIUM-89 LEACHED FROM THE FOLIAGE. R.A.Mecklenburg and H*B.Tukey, jun.: Nature, Lond., 1963, 198, 562-563 (Dept. Floriculture, Cornell Univ., Ithaca, N.Y., U.S.A.) ⁸⁹Sr deposited on potato foliage is accumulated in underground tubers from foliar leaching and root absorption rather than via basipetal transport from the foliage. G.M.Lewis
6920. OXALATES AND IONIC EQUILIBRIA IN AUSTRALIAN SALT-BUSHES (ATRIPLEX). B.Osmond: Nature, Lond., 1963, 198, 503-504 (Dept. Bot., Univ. New England, Armidale, N.S.W., Australia) Levels of oxalate in the leaves of 15 spp. of *Atriplex*, *Bassia*, *Kochia* and *Rhagodia* were investigated under various expt. conditions in soln. culture. It was concluded that oxalates have an important physiol. function in ionic balance and their synthesis may be geared to the same processes as are involved in inorg. ion accumulation. G.M.Lewis

NUTRIENT RELATIONS

6921. INVESTIGATION ON THE INFLUENCE OF FERTILISERS ON THE OCCURRENCE OF MYCORRHIZA IN CUCURBITA PEPO. J.tfanowska: Acta microbiol. pol., 1962, 11, 349-358 (Zalzfad Ekologii Rolniczej, Ptfawy, Poland) The possession of an endotrophic mycorrhiza by *C. pepo* is not necessary when plants grow on soils with sufficient amounts of nutrients, but may be beneficial in non-fertilised soils or in soils fertilised exclusively with mineral fertilisers. (Polish) M.Korbecki
6922. THE EFFECT OF POTASSIUM ON THE GROWTH OF SUGAR-BEET PLANTS INFECTED WITH BEET YELLOWS VIRUS. M.Warchtfowa and J.Bazant: Acta microbiol. pol., 1962, 11, 359-362 (Instytut Uprawy, Nawozenia i Gleboznawstwa, Ptfawy, Pbland) The increase of K fertilisation up to 2000 mg. of K₂O per pot may enhance the root yield of sugar beet plants infected with beet yellows virus¹ ID the level reached by healthy plants receiving 1000 mg. of K₂O per pot. No difference in chlorophyll a content was noted but the amount of chlorophyll b in infected plants receiving 100 mg. of K₂O per pot was half that of healthy plants. The extension of infection in plants grown on K deficient media or media containing 500 mg. K₂O per pot was small and the yield was the same as in control healthy Pk^{nts}. (Polish) M.Korbecki

6923. EFFECTS OF DIFFERENT LEVELS OF ZINC AND H₂gJg₂S ON THE GROWTH OF SSBTE^NEAN CLOVER (TRIFOLIUM SUBTERRANEUM L.).

EXPERIMENTAL BOTANY

671

C-RMillikaiK Aust. J. agile Res., 1963, 14, 180-205
 (Biol. Branch, Victorian Dept. Agric, Burnley,
 Australia) Differences in Zn deficiency symptoms
 are described for a no. of varieties in water culture.
 These symptoms bore no relationship to Zn concn. Highly
 significant Zn x P interactions were recorded. The criti-
 cal Zn level was found to depend on age of plant and
 PO₄ level. Results suggest that Zn is essential to utilisa-
 tion of PO₄ by the plant.
 R.L.Weston

6924. THE COBALT REQUIREMENT OF SUBTERRANEAN CLOVER IN THE FIELD- P.G.Ozanne, E.A.N.Greenwood and T.C.Shaw: Aust. J. agric Res., 1963, 14, 39-50 (Div. Plant Ind., CS.I-R.O., Western Australian Reg. Lab., Nedlands, Australia) Expt. were performed on soils containing only 0*022 and 0*019 p.p.m. Co in the 0-4 in. layer. Increases of 30% were obtained in response to dressings of 2 and 10 oz. CoSQi.7H2p/acre. where a dressing of salts containing Cr, N_x, V, W, Al and I had no effect. N content of clover was increased in all cases by applications of Co, but where adequate N was applied there was no response to Co. Growth of clover was reduced when Co contents fell below 0*04 P-P-m. Less than 0.55% of applied Co was taken up by the pasture although Co was not leached downwards. R.L.Weston

6925. CADMIUM: UPTAKE BY VEGETABLES FROM SUPERPHOSPHATE IN SOIL. H-A.Schroeder and J.J. S E T s d, Z S * 1963, 140, 819-820 (Brattleboro Retreat, Brattleboro, Vt., U.S.A.) Superphosphate fertiliser contained 7.25 p.p.m. cadmium which was absorbed by vegetables. Four out of 5 types of grain, usually containing Cd did not absorb it from unfertilised soil poor in this element. G.M.Lewu

6926. INFLUENCE OF VITAMIN B12 ON THE SIZE AND GROWTH OF EUGLENA GRACILIS. S.E.Stein J.B. Weiss, D.Causeley and P.Bush: J- Protozool., 1962, 9, 336-339 (Dept. Path., Harvard Med. Sen., Children's Hosp. Med. Center, Boston, Mass..U-S-A.) The effect of a wide range of vit. B12 concn. on the size and growth of B₁₂ de_s the Flying Spot Partic

iatteff » » was inversely proportional. generation times Gigantism and prolongation of the vitamin from the resulted from the depletion of the R.J. Walker culture medium.

6927. LABORATORY CULTURE OF DACRYOMYCES DELIQUESCENS(DUBY). I-H-Jg* N*g"i £.j.* 1963, 198, 907 (Handsworth New Rd. Boys Sen., Birmingham, England). G.M.Lewis

6928. TRACE ELEMENT REQUIREMENTS OF GLOEO-SPORIUM FRUCTIGENUM F. CHROMOGENUM* G.J.M.A.Gorten S. Aft, J. agric Sci., 1963, 6, 117-124 (Plant Protection'Res. to*, ^Tatoria, S. Africa) Fe, Zn and Mn were essential for optimum & ovn_h. nd Cu was found essential for the teTMoVTM?JTM*_d quan_tries. Pigmentation but was required in much smaller L.A.B.S.

3929. DEVELOPMENT AND NUTRITION OF A NEW SPECIES OF THRAUSTOCYTA; S.^Idstein. Amer. J. Bot., 1963, 50, 271-87 (Dept. Biol. Brooklyn Coll., Brooklyn, N-Y., U.S.A.) ^Tme lire - cycles of 2 lower Phycomyces; in sea-wate^J1JJTM*_d *re are described and compared ^*TM*j&tZ^!nd a nutrient media. Both fungi were obUgately manne and

stenohaline. NaCl in culture was not replaceable by KC1, but omission of KC1 resulted in reduced yields. Neither organism assimilated N in die form of KNO₃ or (NH₄)₂SO₄. Optimal harvests were obtained with glutamate as the source of N and with C supplied as glucose, maltose, sol. starch, or cellobiose. T.H.Thomas

PHOTOSYNTHESIS AND PHOTOSYNTHETIC PIGMENTS

6930. FORMATION AND FUNCTION OF SOLUBLE PROTEINS IN CHLOROPLASTS. R.M.Smillie: Canad. J. Bot., 1963, 41, 123-154 (Biol. Dept., Brookhaven Nat. Lab., Upton, N.Y., U.S.A.) Symposium on protein metabolism of the Canadian Society of Plant Physiologists, 1962. A.Meany

6931. ISOLATION AND COMPOSITION OF CHLOROPLASTS AND ETIOLATED PLASTIDS FROM CORN SEEDLINGS. G.M.Orth and D-C.Cornwelb Biochim-biophys. Acta, 1963, 71, 734-736 (Dept. Physiol. Chen., Ohio State Univ., Columbus, Ohio, U.S.A.) The ^{io} composition of chloroplasts isolated by a differential p gradient scheme was compared with that of chloroplasts isolated by differential centrifugation alone and that of etiolated plastids isolated by the same differential p gradient method... - B.M.Stevens

6932. CHLOROPHYLL b SYNTHESIS BY GREEN PLANTS IN DARK. A.A.ShylyTand E.M.Stanishevskia: Dokl. Akad. Nauk, 1962, 144, 226-229. Observations ON plants in the dark showed that they synthesised labelled chlorophyll b, with depression of the amount of 14C in chlorophyll a (Russian) BJ.Cooper

6933. CHLOROPHYLL a APPEARANCE IN THE DARK IN HIGHER PLANTS: ANALYTICAL NOTES. D.W.Kupke and J.L.Huntington: Science, 1963, 140, 49-51 (Dept. Biochem., Sch. Med., Univ. Virginia, Charlottesville, Va., U.S.A.) The ratio of chlorophyll a to chlorophyll j₂ in bush bean plants was determined during growth under varying conditions of light and darkness, using chromatographic separation techniques prior to spectroscopy. It was concluded that chlorophyll a arises from chlorophyll b during dark growth of the leaves. G.M.Lewis

6934. E.M. STUDIES ON PLASTID DEVELOPMENT IN VARIEGATED LEAVES OF LIRIOPE PLATYPHYLLA f. VARIEGATA. I. THE NORMAL GREEN CHLOROPLAST. H. ALBICATE PLASTID. S.Murakami: Cytologia, 1962, 27, 49-59, 140-150 (Bot. Inst., Tokyo Univ. Educn., Otsuka, Tokyo* Japan) I. Young leaves contain small amyloid proplastids with a few vesicles whose development in green parts of the leaves was followed. The starch vacuoles disappear and the vesicles increase in no. and aggregate to form a dense 'prolamellar body' of crystal-lattice-like appearance, from which the granum and intergranum lamellae later grow, probably by vesicular coalescence. After the lamellae fill the chloroplast the grana begin to differentiate.

II. Albicate plastids were similar to normal ones when very young, with starch granules, small osmophilic granules and minute vesicles. As in the normal plastids die vesicles aggregate to form a prolamellar body, although

EXPERIMENTAL BOTANY

they are much less regularly orientated and the lamellae which develop by vesicular coalescence are much less abundant and soon cease growth. Mature albicate plastids often still possess large vacuoles and may be classed into 3 types according to the abundance and distribution of chlorophyll. Lamellae are sparse and unorganised.

C.A-Stace

6935. SUBMICROSCOPIC STRUCTURE AND DEVELOPMENT OF CHLOROPLASTS OF FUNARIA HYGROMERICA AND BRYUM SP. S.N.Surc: *Cytologia*, 1962, 27, 333-342 (Sch. Med., St. Louis Univ., St. Louis, Mo., U.S.A.) The chloroplasts consist of ellipsoidal bodies with a dense surface membrane and internal double lamellae arranged in grana which are connected by stromal lamellae. Proplastids contain vesicles which fuse to give rise to lamellae which later organise into grana, but a cryst. structure as seen in some other plants was not observed. Osmophilic (lipid) globules occur throughout development.

C.A-Stace

6936. THE PLASTID SYSTEM OF NORMAL AND BLEACHED EUGLENA GRACILIS. A.Gibor and S.Granick: *J. Protozool.*, 1962, 9, 327-334

(Rockefeller Inst., New York, U.S.A.) The plastid system of 'normal' *E. gracilis* strain Z was very unstable, 1-2% of cells cultured under normal conditions being found to have lost spontaneously the capacity to green on further culturing. Cells treated with streptomycin, heat or u.v all lost the capacity to green on further culturing, though these bleached cells all possessed organelles identified as proplastids. When grown in standard media, the proplastids of some bleached cells were able to synthesise porphyrins while others could only do so when supplied with 6-aminolaevulinic acid. Normal cells grown in darkness possessed proplastids similar to those of the bleached cells. These proplastids when exposed to light enlarged and greened. Continuous light induced a plastid system composed of an interconnected system of tubules while those cells maintained on 12 hr. light and 12 hr. dark had plastids detached from one another.

R.J.Walker

RESPIRATION

6937. EFFECT OF ASCORBIC ACID AND DEHYDRO-ASCORBIC ACID ON ANAEROBIC RESPIRATION OF THE SEED OF NELUMBO NUCIFERA. K.Toyoda: *Bot. Mag. Tokyo*, 1963, 76, 41-47 (Kugenuma, Fujisawashi, Japan) The seed of *N. nucifera* was shown to liberate more gas in ascorbic acid soln. than in water, while dehydroascorbic acid causes even greater gas evolution. This is interpreted as an effect on respiration. The ratio of ascorbic acid to dehydroascorbic acid was observed to decrease on maturation, but increases again on germination. Homogenates of the seed behaved in the same way as the intact seeds. The *Nelumbo* plumule was shown to contain large amounts of dehydroascorbic acid and also some ascorbic acid. It is concluded that these conditions are favourable for the germination and respiration of the plant in water.

N.J.Pinfield

METABOLISM

6938. ON THE DISTRIBUTION IN VARIOUS PLANTS OF CHLOROPLAST PHENOLOXIDASES. Y.Mino and S.Hattori: *Bot. Mag. Tokyo*, 1963, 76, 1-5 (Dept. Bot., Fac Sci., Univ. Tokyo, Hongo, Tokyo, Japan)

The occurrence of the chloroplast phenoloxidases, di-phenolase, monophenolase and laccase in a large no. of plant spp. was investigated. It was shown that their distribution varied even between spp. of the same family, and also appeared to be independent of terrestrial/oraquatic habit. No correlation between the occurrence of these enzymes and systematic position of the plants has yet been established.

N.J.Pinfield

6939. STUDIES ON REDUCTION OF TETRAZOLIUM SALT BY PLANT TISSUES. I. REDUCTION OF TTC BY PLANT TISSUE HOMOGENATE, WITH SPECIAL REFERENCE TO ITS RELATION TO PLANT AGE AND CYANIDE EFFECT. E. EFFECT OF PLASMOLYSIS ON REDUCTION OF TTC IN PLANT CELL. S.Sata: *Cytologia*, 1962, 27, 97-105, 158-171 (Bot. Inst., Univ. Tokyo, Japan)

I. The reduction of 2,3,5-tri phenyltetrazolium chloride [TTC] by homogenates of *Phaseolus* seedlings and seeds was compared and the effects of time, age of seedling, age of homogenate and various additives studied. Seedling homogenate began to, lose its activity after a time, but this was prevented by the addition of hypertonic sucrose. Studies on the effects of succinate, malonate, oxaloacetate and cyanide indicated that TTC reduction is brought about by succinic dehydrogenase. The effect of the various additives varied with the age of the seedlings.

n. Reduction of TTC by *Phaseolus* embryos was followed colorimetrically under various conditions of plasmolysis. Results differed according to the type of plasmolyticum. Sucrose and maltose were strong inhibitors of the reaction even when hypotonic, while glucose was weaker and only inhibited when hypertonic. Urea and certain alcohols strongly accelerated the reaction in tissue, probably due to increased permeability, but were inhibitors in homogenates. Plasmolysis due to inorg. salts produced very varied effects, mostly dependent upon the anion. These results are discussed in relation to the enzyme site.

C.A.Stace

6940. DEVELOPMENTAL AND RIPENING PROCESSES IN GRAPES OF VITIS. G.Geisler and F.Radlen: *Ber. dtsch. bot. Ges.*, 1963, 76, 112-119 (Forsch. Rebenzuchtung Geilweilerhof, Siebeldingen über Landau/Pfalz, Germany)

Measurements of respiration, photosynthesis, sugar content and acid content were made from 10 days after flowering till harvest. There is first a transition phase during which the rates of respiration and photosynthesis fall steeply, then a ripening phase during which org. acid content first increases, then falls, and sugar content increases. Finally comes a post-ripening phase, marked by stoppage of photosynthesis and steady acidity, though sugar still increases. The photosynthesis in the grapes is far too low to account for the sugar and acid accumulation.

(German) H.-Opik

6941. iJSSPSSJ¹ THE PHYSIOLOGY OF LICHENS.

IV. CARBOHYDRATES IN PELTIGERA POLYDACTYLA AND THE UTILISATION OF ABSORBED GLUCOSE.

D.C.Smith: *New Phytol.*, 1963, 62, 205-216 (Dept. Ague., Univ. Oxford, England) The alcohol sol. and ^{mo}-carbohydrates in *P. Polydactyla* were investigated and the utilisation of glucose absorbed by the lichen in

EXPERIMENTAL BOTANY

673

24 hr. was followed. No free glucose was detected in discs fed with labelled glucose. There were no qual. differences between carbohydrate of the 'algal zone' and medulla. The role of mannitol in the metabolism of *P. polydactyla* is possibly that of a storage carbohydrate. T.H. Thomas

6942. RESIN METABOLISM IN THE SAPWOOD OF PINUS RADIATA. A-T.Wilson, J.M.Gumbley and D.J. Spedding: Nature, Lond., 1963, 198, 500 (Dept. Chem., Victoria Univ. Wellington, New Zealand)

Measurements of the ^{14}C content of annual rings of a *P. radiata* tree indicated that the resin in the sapwood is not in metabolic equilibrium with the metabolism of the tree and that any circulation laterally through interconnected resin canals is very slow. G.M.Lewis

6943. CHANGES IN METABOLISM OF ISOLATED ROOT SYSTEMS OF SOY BEAN. A-L.Kosten: Nature, Lond., 1963, 198, 709-710 (Bot. Lab., Dept. Expt. Bot., Univ. Leyden, Netherlands)

After excision of the shoot of soybean plants, the transpiration stream was artificially induced by application of pressure and analysed. A rapid decline in respiration was observed after excision and a rapid decrease in uptake of O_3 and NH_4^+ , although uptake of PO_4 was not affected. The same effects were observed when phloem only was removed by ringing and the xylem left intact. Addition of 0.025M succinate to the medium surrounding the roots maintained respiration at a high level and largely prevented the decreased absorption of NH_4^+ . G.M.Lewis

6944. CONVERSION OF PROTEINS AND NITROGEN-CONTAINING SUBSTANCES IN RIPENING BEANS.

V.G.Klimenko and A.D.Berezovikov: Biokhimia, 1963, 28, 238-245. The total N, protein N, eiec⁻ ttophoreric fractions of saline extracts and total globulin were determined at various phases of ripening in fresh and dried, intact and skinned beans (*Vicia faba*). The content of the substances was found to be affected by both the stage of ripening and the condition of the beans. H-j-cooper (Russian)

TRANSLOCATION

6945. TRANSLOCATION IN THE GIANT KELP MACROCYSTS. B.C.Parker: Science, 1963, 140, 891-892 (Univ. California, Los Angeles, Calif.)

^p ~~all tissue of *Macrocystis*. Depending on con of wh transp~~ all ^{all} ~~fully ascertained, the direction of Sbf pred~~ ^{no} ~~ominantiyapical or towards the base~~ G.M.Lewis of the plant.

6946. TRANSLOCATION OF DIQUAT [1,1'-ETHYLENE-2,2'-BIPY]

B-C.Baldwin: Nature, 1963, 198, 873 (Hill Res. Sta., I.C.I., Bracknell, Berks., U.K.). When [^{14}C]diquat dibromide was applied to a leaflet of tomato plants in darkness no movement of the compound was observed. However, after only 5 hr., the herbicide has been completely distributed through the plant. xylem, this compound which probably occurs through Lewis is discussed.

6947. MOVEMENT OF GROWTH REGULATORS IN PLANTS. III. COMPARATIVE STUDIES OF TRANSPORT IN PHASEOLUS VULGARIS. E.C-S.Little and G.E. Blackman: New Phytol., 1963, 62, 173-197 (Dept. Agric, Univ. Oxford, England)

The courses of initiation of bending and subsequent rates of curvature of the petiole and stem of *P. vulgaris* have been followed when growth substances are applied to different sites in the seedlings. 2,4-D and 2,4,5-T had longer initiation times than IAA and much greater doses were needed. Autoradiography was used to demonstrate the time taken for entry into the vascular strands, of growth regulators applied at different sites. The velocity of growth regulator movement was calc and the amounts of regulator present in the tissues was also followed. T.H.Thomas

GROWTH AND DEVELOPMENT

(GENERAL)

6948. LENGTH OF THE LIGHT-DARK CYCLE AND PLANT GROWTH. H-B.Tukey, jun. and H.J.Ketellappen: Amer. J. Bot., 1963, 50, 110-115 (Div. Biol., California Inst. Technol., Pasadena, Calif., U.S.A.)

Max* growth of tomato, pea, peanut, and soybean plants is obtained with a light-dark cycle of approx- 24 hr. for cycles consisting "5 equal periods of light and darkness. The exact opj&num for tomato plants was determined by temp, but i&s were less sensitive to cycle length. Response to cycle length was not influenced by conditions prior to treatment. Response to cycle lengths of 18, 24*, 36 and 48 hr. was not changed qual. by temp. Stem elongation showed a rapid and initial increase in rate when the light was turned off. It was concluded that plants possess an endogenous time-measuring device with a period of 24 hr. T.H.Thomas

6949. STUDIES ON THE GIANT KELP, MACROCYSTIS.

I. GROWTH OF YOUNG PLANTS. H. REPRODUCTION. M.Neushul and F-T-Haxo: Amer. J. Bot., 1963, 50, 349-353, 354-359 (Scripps Inst. Oceanography, La Jolla, Calif., U.S.A.) I. Growth of young plants of *Macrocystis pyrifera* was studied in the lab. and in the sea. Plants were raised in lab. tanks under controlled conditions of light and temp. Max. growth rates in the lab. paralleled those observed in the sea. Transplant expt. and diving observations demonstrated the important influence of biol. activity on the establishment and growth of young plants in the sea.

II- Reproduction of *M. pyrifera* was studied in the sea and in the laboratory. The max. time needed for completion of the sexual life history was from 12-14 months. The behaviour of abscised sporophylls in laboratory tanks, as well as their morphology and coloration, suggests an interrelationship between the translocation of synthetic products and fructification. T.H.Thomas

6950. A TENDENCY TO PERENNATION IN THE CEREALS. A.Joffe and J.C.G.Smal: Nature, Lond., 1963, 198, 768-770 (Dept. Agric. Technical Serv., Pretoria, South Africa)

Expt. on oat plants show that even if die late tillers do flower for prolonged periods, this need not lead to the death of the plant in spite of an adverse seed to shoot wt. ratio. With adequate nutrition, the oat plant can

EXPERIMENTAL BOTANY

behave as a perennial grass in that periods of reproductive growth can be readily alternated with periods of predominantly vegetative growth, simply by changes in day-length.

C.M.Lewis

6951. MARSILEA VESTITA: CONVERSION OF THE WATER FORM TO THE LAND FORM BY DARKNESS AND BY FAR-RED LIGHT. JJ.Gaudet: Science, 1963, 140, 975-976 (Dept. Bot., Univ. California, Berkeley, Calif., U.S.A.) A period in darkness or, more effectively, in continuous far red light, causes the fern *M. vestita* Hook and Grey to develop as a land form in a medium which normally allows only the water form to develop.

G.M.Lewis

6952. EXPERIMENTAL INVESTIGATIONS OF FLORAL MORPHOGENESIS IN PETASITES HYBRIDUS.

C.W.Wardlaw: Nature, Lond., 1963, 198, 560-561 (Dept. Bot., Univ. Manchester, England) Defoliation and bisection of the apices of *P. hybridus* plants prevented the formation of inflorescences and induced a return to the vegetative condition. Application of gibberellic acid to such plants caused inflorescence production and precocious flowering.

G.M. Lewis

6953. CHARACTERISTICS OF DOUGLAS-FIR ROOT SYSTEMS. R.G.McMinn: Canad. J. Bot., 1963, 41, 105-122 (Forest Entomol. and Path. Lab., Victoria, B.C. Canada) The root systems of 28 Douglas fir in four stands, aged 10, 25, 40 and 35 yr. were excavated hydraulically to determine the rooting characteristics of trees in different crown classes at various ages. The extent, depth, configuration, rooting density and mycorrhizal component of root systems were examined. The size of root systems is shown to be related to crown rather than bole size.

A.Meany

6954. ROOT PRODUCTION AND THE ESTIMATION OF NET PRODUCTIVITY. J.R.Bray: Canad. J. Bot., 1963, 41, 65-72 (Dept. Bot., Univ. Toronto, Ont., Canada) Data on the net production of oven-dry org. matter from 28 temperate herbaceous spp. and 4 temperate arboreal spp. have been analysed to determine the relationships between below-ground and above-ground yearly increment. Mean below-ground/above-ground ratio and mean below ground production was significantly higher for herbaceous spp. Mean above-ground production was higher for arboreal spp. There was no significant difference between total herbaceous and total arboreal production. Root production decreases with age in herbaceous spp. The below-ground/above-ground ratio increased from moist to mesic to xeric spp. Arboreal spp. were uniform in below-ground/above-ground ratios.

A.Meany

6955. GROWTH CHARACTERISTICS OF CITRUS FRUIT TISSUE IN VITRO. H.A.Kordan: Nature, Lond., 1963, 198, 867-869 (Dept. Bot., Univ. California, Los Angeles, Calif., U.S.A.) Cultures of excised vesicle stalks from mature lemon fruits (Eureka var.) are described.

G.M.Lewis

6956. INCORPORATION OF PHOSPHORUS-32 INTO NUCLEIC ACIDS DURING EMBRYONIC DEVELOPMENT OF BARLEY. C.W.Chang: Nature, Lond., 1963, 198, 1167-1169 (Dept. Bot. and Plant Pathol., Michigan State Univ., E.Lansing, Mich., U.S.A.) Abs.

amounts of ³²P incorporated into nucleic acids increased continuously during embryonic development while relative rates of incorporation into DNA/cell/unit of time and/or

the relative no. of cells engaged in incorporation of ³²P into DNA decreased as embryonic differentiation became more advanced. Rates of incorporation of ³²P into DNA in maturing embryos reflected the degree of tissue differentiation, while rates of incorporation of ³²P into RNA seemed independent of die level of embryo differentiation. RNA and DNA synthesis do not occur at the same time either in a single cell or the tissue as a whole.

J.R.Sargent

6957. DNA CONTENT AND CELL AND NUCLEAR VOLUME GROWTH IN THE DEVELOPING XYLEM CELLS OF CERTAIN HIGHER PLANTS. A.Iist, jun.: Amer. J. Bot., 1963, 50, 320-329 (Dept. Bot., Douglass Coll., Rutgers Univ., New Brunswick, NJ., U.S.A.) Observations were made on DNA content and cell and nuclear vol. growth in developing xylem cells of *Acorus calamus* roots, *Peltandra*, *Eleocharis*, *Dennstaedtia*, *Marsilea* and *Arisaema*. In *Zea* cell and nuclear vol. for metaxylem cells fit a fluctuating envelope better than a straight line and cell vol. probably fall into size classes related to nuclear vol. class. DNA content of nuclei was determined to fall into a freq. distribution having peaks at the 4-, 8-, 16- and 32-ploid equiv. DNA content was highly correlated with nuclear vol. in the overall growth of the metaxylem cells*

T.H.Thomas

6958. ROLE OF LIGHT IN HISTOGENESIS AND DIFFERENTIATION IN SHOOT OF PISUM SATIVUM, HI. INTERNODE. B.F.Thomson and P.Monz Miller: Amer. J. Bot., 1963, 50, 219-227 (Dept. Bot., Connecticut Coll., New London, Conn., U.S.A.)

P. sativum seedlings were exposed daily to red or white fluorescent light or kept in total darkness. Light did not alter the sequence or pattern of tissue differentiation, but did accelerate the rate of a const. course of differentiation. Light advanced cell division and enlargement in the longitudinal direction but reduced the final no. and final length attained. It was concluded that light accelerates all phases of shoot growth and differentiation and that cell division and elongation in later phases of internodal growth are reduced by light because of accelerated cell maturation.

T.H. Thomas

6959. PHOTOOHIBITION OF GROWTH IN ETIOLATED STEM SEGMENTS. II. GROWTH CAUSED BY COBALT IN PISUM. W.F.Bertsch: Amer. J. Bot., 1963, 50, 213-219 (Dept. Bot., Yale Univ., New Haven, Conn., U.S.A.) The effects of various metal ions on the red, far-red photoinhibin. of stem growth were studied using etiolated pea stem sections. Excision of immature tissue resulted in loss of photosensitivity but growth caused by Co in the presence or absence of sugar was inhibited by red light. Either sugar or Co induced photosensitivity in this immature tissue. Ni also promoted growth but this was not photosensitive. The photoinhibin. of a growth system which utilises sugars and is promoted by Co and the relationship of this system to certain de-etiolation phenomena are discussed.

GROWTH SUBSTANCES

6960. EVIDENCE FOR INDOLE-3-ACETIC ACID IN BALSAM FIR, ABIES BALSAMEA (L) MILL. J.Clark and J.M.Bonga: Canad. J. Bot., 1963, 41, 166-173

EXPERIMENTAL BOTANY

675

(Forest Entomol. and Pa*. Branch, Dept. Forestry, Ottawa, Canada) An ether extractable auxin was obtained from the inner bark of balsam fir. Characterisation of the auxin by paper chromatography, *Avena* bio-assay and chromogenic tests indicated that it was IAA. An inhibitor which counteracted the growth-promoting effects of the auxin and authentic IAA was also extracted.

A.Meany

6961. GIBBERELLOFIC-EFFECTON DIFFUSIBLE AUXIN IN FRUIT DEVELOPMENT. K.K-S-tostry and R.M.Muir. *Science*, 1963, 140, 494-495 <sup>D e ^ . ^ " * £ in ,, Iowa, Iowa City, Iowa, U.S.A.) Diffusible auxin is not Un*xnSwlo*versatanW **, ** amounts can be obtained after the plane ~~are treated with gibberellins.~~ lants growth treated with

Maturation and fertilisation; the amounts of diffusible auxin are not being significantly different over a period of 22 days. G.M.Lewis

6962. STUDY OF X-RAY DIFFRACTION ON CELL WALL OF STEM INTERNODE C? What TREATED WITH GIBBERELLIN. Cytologia, 1962, 27, 106-110 (Biol. Inst., Univ. Shizuoka, Japan) X-ray diffraction studies showed that cellulose micelles first normally er at about 45° to the long axis, but after treatment with gibberellin the arrangement appeared much more random and amorphous material was evident.

6963. QUANTITATIVE DIFFERENCE OF GIBBERELLIN-LIKE SUBSTANCES IN NORMAL AND DWARF VARIETIES OF PHARBITIS. rfuU : T - Q g ** <pt. Mag. Tokyo, 1962, 75, 449-450 (Lab. Agric. JBot., Fac. Agric., Univ. Kyoto, Japan) By means of rice seedling bioassay following paper d w n « *W*aphy of the aq.-ethanol sol. fraction from hypocotyl of *P. nil*, 2 found to be present.

- 1 max. on the 2nd day after germination, while 'Pharbitis factor III' (Rf 0.1) reached a max. on the 4th day after germination. Both extracts from the *ent* of the gibberellin-like activity of the normal variety. (Short N.J.Pinfield comm.).

6964. OCCURRENCE OF 'WATER SOLUBLE' GIBBER-

- ta-ku, Tokyo, Japan) water ected in seeds of *Pharbitis nil* and by the rice leaf sheath assay method. two zones of gibberellin activity were detected at Rf 0.2 and Rf 0.4 on the chromatograms. (Short N.J.Pinfield comm.).

6965. EXPERIMENTAL MODIFICATION OF THE PATTERN OF ORGANOGENESIS IN HYDROCHARIS. E.G.Cutter. *Nature*, Lond., 1963, 198, 504-505 (Dept. Bot., Univ. Manchester, England) Modification of the usual pattern of leaves and buds in *Hydrocharis* is achieved by treatment with Kinetin or gibberellic acid. G.M.Lewis

6966. EFFECTS OF KINETIN ON GROWTH AND FLOWERING OF INTACT GREEN P^TS. H.Wittwer and R.f.Dedolph: Amer. J. Bot., 1963, 50, 330-336 (Dept. Hort., Michigan State Univ., East Lansing, Mich., U.S.A.) Dry matter accumulation of aerial

parts, and height of tomato, cucumber and pea plants were reduced on adding kinetin to the culture soln. root medium in concn. from 10⁻⁵ to 10⁻⁷M. Concn. suppressing top growth had lesser effects on root growth and in some instances, enhanced it. Flowering was inhibited in tomatoes and accelerated in peas. There were changes in root morphology. Kinetin had an effect opposite to that of gibberellin on internode elongation, root extension, top/root ratio and flowering of dwarf peas. N⁻Benzyladenine was more active than kinetin in suppressing growth of intact green plants.

T.H.Thomas

6967. THE EFFECT OF THE EXTRACELLULAR SUBSTANCES PRODUCED IN CULTURE BY NOSTOC SP. AND CHLORELLA VULGARIS ON THEIR GROWTH. G.S.Venkataramarc Indian J. Microbiol., 1962, 2, 121-126 (Divn. Microbiol. Indian Agric. Res. Inst., New Delhi, India) *Nostoc* sp. produces in culture medium a thermolabile growth-promoting substance which accelerates its growth and that of *C. vulgaris*. Chlorella produces a thermolabile inhibitory substance.

G.M.Lewis

6968. INHIBITING SUBSTANCES IN IMMATURE CARYOPSES OF WHEAT (FYLGIA). CHubacs C.R. Acad. Sci., Paris, 1962, 255, 4, 758-761. In the immature caryopses of wheat there is a germination inhibiting complex, comprising 2 kinds of substances, the one fat-sol, and the other water-sol. The latter can be divided by chromatography into 2 separate fractions. (French) J.M.Thomas

6969. INTRAMOLECULAR CATALYSIS OF THE HYDROLYSIS OF N-EthylETHYLAMINOMALEAMIC ACID. G.Dahlgren and N.L.Simmermans Science, 1963, 140, 485-486 (Dept. Chem., Univ. Alaska College, Alaska, U.S.A.) The retardation of plant growth by N-dimethylaminomaleamic acid is considered to be due to some of the products of its decomposition in aq. soln* by an intramolecular reaction, the kinetics of which are studied.

G.M.Lewis

6970. STRUCTURE AND PLANT GROWTH-REGULATING ACTIVITY OF SOME 2-BENZOTHIAZOLYLOXYACETIC ACIDS AND 2-OXOBENZOTHIAZOLIN-3-YLACETIC ACIDS. R.F.Brookes and E.L.Leafe: Nature, Lond., 1963, 198, 589-590 (Chem. Divn., Boots Pure Drug Co., Ltd., Nottingham, England) A compound thought to be 2-benzothiazolyloxyacetic acid [I] was shown unambiguously to be 2-oxobenzothiazolin-3-yl-acetic acid [II]. When tested for their effect on the growth of wheat coleoptile and for their activity against 4 common weeds, I and its chloro deriv. were inactive while II and its chloro deriv. were highly active.

6974. CELLULAR RESPONSES TO THERMAL AND PHOTO STRESS. I. EUGLENA AND CHLAMYDOMONAS. J.A.Gross and T.L.Jahrn: J. Protozool., 1962, 9, 340-346 (Life Sci. Sect., Armour Res. Fndn., Illinois Inst. Tech., Chicago, Ill., U.S.A.) Both spp. were cultured in the dark and at 15, 60 and 150 ft. candle light intensities and at temp. in the range from 20-35°. Growth of *Euglena* below 32.5° was independent of light while *Chlamydomonas* was light dependent at all temp., at which growth occurred. *Chlamydomonas* failed to grow in the dark and at 15 ft. candles and at temp. above 32.5°. At 35° die growth of *Euglena* decreased as the intensity of illumination was raised. At this temp., multi-nucleated giant specimens of this sp. appeared but monsters were not found in cultures of *Chlamydomonas*.

To explain the monster specimens of *Euglena*, it is suggested that a dark-formed thermosensitive protein, essential for normal division, is denatured at high temp.

DORMANCY AND GERMINATION

6975. GERMINATION OF MELAMPYRUM LINEARE: INTERRELATED EFFECTS OF AFTER-RIPENING AND GIBBERELLIC ACID. E.J.O'Curtis and J.E.Cantlonz: Science, 1963, 140, 407-408 (Dept. Bot., Michigan St. Univ., East Lansing, Mich., U.S.A.) Seed germination of *M. lineare* proceeds only after activation followed by an extended period of chilling. Up to 1/3 of seeds can be activated by storage at room temp., while all seeds are activated by gibberellic acid. Chilling before activation is ineffective.

G.M.Lewis

6976. IRON DISTRIBUTION DURING WHEAT SEED GERMINATION. P.A.Kolesnikov and A.A.Mutuskin: Biokhimiia, 1963, 28, 216-223. Dipyridyl and spectrophotometry were used for determining Fe distribution during wheat seed germination and seedling growth. A large amount of Fe^{2+} was accumulated in the scutellum of the germinating grain (up to one seventh of the total Fe of the grain). During the growth of seedlings there is variation in the Fe distribution; during the first days more Fe is consumed by the roots, and then by the leaves, little Fe is taken up by the coleoptile.

(Russian) BJ. Cooper

6977. PHASE CONTRAST MICROSCOPIC STUDY OF POLLEN-GRAIN GERMINATION, NUCLEAR MOVEMENT AND POLLEN-TUBE MITOSIS IN TRADESCANTIA VIRGINIANA. G.Venema and A.Koopmans: Cytologia, 1962, 27, 11-24 (Genet. Inst., Govt. Univ. Groningen, Haren, Netherlands) The elongate generative and rounded vegetative nuclei exist in a single body of cytoplasm. Pollen-grain germination and pollen-tube growth are described, the former being accompanied by the formation of a vacuole in the cytoplasm which enlarges as the latter proceeds. Some of the kinetics of pollen-tube growth and nuclear movement were analysed, and it was shown that although the vegetative nucleus enters the pollen-tube first it is overtaken by the generative nucleus. Pollen-tube mitosis of the generative nucleus has been followed, and it is noted that vegetative nuclear degeneration does not commence until that stage.

MOVEMENT

6978. RED LIGHT, AUXIN RELATIONSHIPS, AND THE PHOTOTROPIC RESPONSES OF CORN AND OAT COLEOPTILES. W.R.Briggs: Amer. J. Bot., 1963, 50, 196-207 (Dept. Biol. Sci., Univ. Stanford, Calif., U.S.A.) Red light decreased the phototropic sensitivity of corn and oat coleoptiles. White light-dosage after 2 hr. red-light treatment induced almost max. first pos. curvature in both corn and oat coleoptiles. Increase in curvature obtained reflects the decreased phototropic sensitivity of both plants shown by a dosage-response curve shift. After red treatment, the effect of red light remains max. for one hr. red light suppresses auxin production by corn coleoptiles but this effect decays after the end of red treatment. Some results obtained can be accounted for by the hypothesis that red light induces an increase in the amount of pigment mediating second pos. curvature.

RADIATION EFFECTS

6979. CHEMICAL PROTECTION AGAINST THE EFFECTS OF α -RAYS AND OF THERMAL NEUTRONS IN PLANT CELLS BY PRE- AND POST-TREATMENTS. R.Biebl and W.Urfc: Radiat. Bot., 1963, 3, 67-73 (Inst. Plant Physiol., Univ. Vienna, Austria) Cells of the outer epidermis of scales of *Allium cepa* were irradiated with

EXPERIMENTAL BOTANY

677

(X-rays and thermal neutrons and pre- or post-treated with various chem. substances. Thioacetamide, thiourea, methylthiourea, AET [S-[3-aminoethylisothiouronium bromide HBr] and MAT [methylallylisothiourea] afforded protection in pretreatment and when present during irradiation. Hypotoilic soln. of glucose, fructose, sucrose, glycerine, CaCl₂ and KC₁ afforded protection by post-treatment only. It is suggested that different mechanisms are responsible for the protective effects of pre- and post-treatment respectively.

J.R.Broome

6980. INHIBITION OF FLOWER INITIATION OF PHARBITIS NIL BY Y'IRRADIATION. K.Wada: Bot. Mag. Tokyo, 1962, 75, 483-484 (Biol. Inst., Fac Liberal Arts and Sci., Univ. Shizuoka, Japan)

Seedlings of *P. nil* were subjected to Y'rays from a ⁶⁰Co source in the dose range of 300-600 r at a dose rate of 44 r/min. This specifically affected flower initiation and had no effect on stem elongation. Irradiation immediately at the end of a 16 hr. dark period had a much more inhibitory effect than irradiation prior to a 16 hr. dark period. When irradiation subsequent to the dark period was delayed the inhibitory effect diminished until it disappeared after 48 hr. (Short comm.) N.J.Pinfield

6981. RADIOSENSITIVE OF SEEDS. III EFFECTS OF PRE-IRRADIATION HUMIDITY AND Y'RAY DOSE ON SEEDS FROM FIVE BOTANICAL FAMILIES. T-S.Osborne, A.O.Lunden and M.J.Constantin: Radiat. Bot., 1963, 3, 19-28 (Agric Res. Lab., Univ. Tennessee, Oak Ridge, Tenn., U.S.A.)

The seeds of 5 spp. of plants from different families were equilibrated at relative humidities of from 10% to 85% and then exposed to doses of from 0 to 400 kr of oOco Y-rays at 450 kr/min. Except for *Festuca elatior* L., growth of both irradiated and control seeds was affected by storage humidity, higher humidities being generally more damaging than lower humidities. The humidity resulting in max. growth varied with the sp., from 9 to 38% R.H. in the controls and 42% to 53% R.H. in the irradiated seeds at the highest doses tolerated.

J.R.Broome

6982. INFLUENCE OF PARAMAGNETIC IONS ON THE RADIATION SENSITIVITY OF PLANT SEEDS.

Y.Hazama, K.Hazama and L.Ehrenberg: Radiat. Bot., 1963, 3, 7-18 (Inst. Org. Chem. and Biochem., Univ. Stockholm, Sweden) Barley seeds were soaked in soln. of paramagnetic ions, desiccated to low water content and then irradiated with 60Co γ -radiation at a dose rate of 9000 rad/min. In dry seeds paramagnetic ions exerted a protective action against ionising radiations under one atm. of air, but in some cases, e.g. at a high water content, in the absence of O₂ or under high O₂ Pressure, this protection could not be detected. j.R.Broome

6983. IRRADIATION OF SEED WITH RELATIVELY SMALL Y'RAYS SOURCES. ^w*^{*} ^w? ^m ^f ^y ^{Sr} ¹¹³ ^C Vermaak: S.Afr. J. agric. Sci., 1963, 6, 91-102 (Radioactivity Div., S.African Nat. Physical Res. Lab., Pretoria, S. Africa). LA.B.S.

6984. ACTION OF Y'RAYS ON FIRST STAGES OF DEVELOPMENT OF EMBRYO OF NICOTIANA RUSTICA L. M.Devreux and G.T.S-Mugnozza: Caryologia, 1962, 15, 279-291 (Lab. Appl. in Agric C-N-t-w. Centra di Studi Nucleari della Casaccia, Roma, Italy)

Several different grow* anomalies were Pn^{affJ?} Objecting *N. rustica* to y-radiation from J ^w g J * " . source). Endosperm formation seemed to be particularly

affected and large polyploid nuclei were produced by endopolyploidy. (French) J.L.Batten

PLANT CONSTITUENTS

6985. D-TRYPTOPHAN IN HIGHER PLANTS. M.H.Zenk and H.Scherf: Biochim. biophys. Acta. 1963, 71, 737-738 (Bot. Inst. Univ., Mlinchen, Germany). (German) B.M.Stevens

6986. CHOLESTEROL IN HIGHER PLANTS. D.F.Johnson, R.D.Bennett and E.Heftmann: Science, 1963, 140, 198-199 (Nat. Inst. Arthr. and Metab. Dis., Bethesda, Md., U.S.A.) Cholesterol has been identified by chromatographic and other techniques in the sterol fraction from *Solanum tuberosum* and *Dioscorea spiculiflora*. G.M.Lewis

MISCELLANEOUS

6987. BUILD-UP AND DECLINE OF AMMONIA AND ACIDITY IN GRASS AFTER SUCCESSIVE SOWINGS AND REGROWTH. H.F.Birch and H.W.Dougall: Nature, Lqfd., 1963, 198, 506 (Makerere Univ. Coll., Kampala, Uganda) The concomitant build-up and decline of ammonia and acidity in the grass *Setaria sphacelata* has been observed through 3 successive sowings and during regrowth, but never occurred in the grass *Brachiaria razizensis*. G.M.Lewis

6988. MINERALISATION OF NITROGEN IN SOILS UNDER GRASS. J.J.Theron: S.Afr. J. agric. Sci., 1963, 6, 155-164 (Transvaal Reg.. Dept. Agric Tech. Serv., Pretoria, S. Africa). LA.B.S.

6989. SOME CONSEQUENCES OF BITUMINOUS MULCHES. N.Collis-George, B-CDavey, D.R.Scott and D.R. Williamson: Aust. J. agric. Res., 1963, 14, 1-11 (Sect. Soil Sci., Sch. Agric., Univ. Sydney, Australia) Unlike conventional mulches incorporating an 'air-blanket', bitumen mulches increased soil temp, as a result of colour and surface contact. They also conserved soil moisture, whether in a continuous surface, or in a cultivated and admixed form. Field expt. with a sandy soil and pot expt. with a sandy and a clay soil under different temp. regimes are described and effects of various concn. of bitumen-in-water emulsion on temp, moisture, and plant behaviour are noted. When vegetation cover was sparse, physical conditions imposed by the bitumen mulch in the soil dominated plant behaviour.

R.L.Weston

6990. THE GREEN LEAF AS A HEAT ENGINE.

D.CSpannen: Nature, Lond., 1963, 198, 934-937 (Dept. Bot., Bedford Coll., Univ. London, England) Analogies are drawn between the green leaf and a heat engine. Thermodynamics of photosynthesis, temp, of radiation, entropy of radiation and max. thermodynamic efficiency are discussed. The problems of heat loss in the green leaf appear to have been overcome by using working parts of microscopic dimensions which operate at

EXPERIMENTAL BOTANY

exceedingly large speeds. Energy efficiency considerations suggest that the quantum requirement for photosynthesis is unlikely to be 4. J.R.Sargent

6991. BEHAVIOUR OF GRAFT PARTNERS AND DISTRIBUTION OF CHEMICAL ELEMENTS IN TOMATO GRAFTS. D.Scheidecker, M.Bouloux-Hardy and G.Billarcf. C.R. Acad. Sci- Paris, 1962, 255, 555-557. Autografts and heterografts were made, using 2 spp. of Lycopersicum. After 3 months no morphol. modification was apparent. In die autografts, H₂O content and composition of elements showed little difference in both stock and scion; in heterografts greater differences were observed. (French) J.M.Thomas

6992. ROOT HAIRS, CUTICLE AND PITS. F.M.Scott, B.G.Bystrom and E-Bowler: Science, 1963, 140, 63-64 (Dept. Bot., Univ. California, Los Angeles, Calif., U.S.A.) An E.M. study of root hairs of Ranunculus sativus, Brassica nigra and Triticum aestivum.

6993. ABNORMAL STOMATA ON DIPLOID AND TETRAPLOID BRACKEN FERNS. C.Takahashi: Cytologia, 1962, 27, 151-157 (BioL Lab., Univ. Nagoya, Japan) Three types of anomalous stomata were found on tetraploid plants produced sexually from aposporously formed prothallia: a circular undivided stomatal mother cell, also found rarely on diploid sporophytes; an 'epidermised' poreless stoma, where the 2 products of stomatal mother cell division resembled epidermal cells rather than guard-cells, confined to tetraploids; and an irregularly multiullular poreless stoma formed by guard-cell division, four*4 on 3 tetraploid plants only. These 3 plants had no normal stomata, yet grew healthily. C.A.Stace

6994. OBSERVATIONAL AND EXPERIMENTAL STUDIES OF SENSITIVE PLANTS. XIV- ON CHANGES IN A NEW CELLULAR ELEMENT OF MIMOSA PUDICA IN DIURNAL AND NOCTURNAL CONDITIONS.

H.Toriyama: Cytolojda, 1962, 27, 276-284 (Biol. Sect., Tokyo Women's Christian Coll., Tokyo, Japan)

The presence of a new organelle, the carotenoid-body, in motor cells of Mimosa pulvini is reported. Suitable fixation enabled them to be observed without staining, but they were stained with brilliant Cresol-Blue, iodine and Carr- Price reagent, and were observed also in the petiole and mesophyll, and similarly in three other leguminous genera. In the daytime the carotenoid bodies are more inflated (spherical, 2-7 11 diam.) than at night. They are gradually dissolved in ethanol. C.A.Stace

6995. STUDIES ON GAMETE COPULATION IN HETEROTHALLIC CHLAMYDOMONADS. L.Wiese and R.F. Jones: J. cell. comp. Physiol., 1963, 61, 265-274 (Biol. Dept., Princeton Univ., Princeton, N.J., U.S.A.)

The mating process in 3 spp. of Chlamydomonas involves a flagella aggln. reaction dependent on divalent cations (Ca, Mg) followed by pair formation, which is inhibited by Na laurylsulphate and sulphhydryl reagents.

6999. RADIOACTIVITY IN SOME AQUATIC PLANTS. P.R.Burkholder: Nature, Lond., 1963, 198, 601-603 (Lamont Geological Observ. Columbia Univ., Palisades, N.Y., U.S.A.) 3- and γ -radiation emitted by representative aquatic vegetation during 1962 was measured, γ Spectra showed the presence of common fission products and induced radioactive elements, but short-lived elements were not detected. G.M.Lewis

7000. ENZYME-COENZYME RELATIONSHIPS IN GLUTAMIC ACID METABOLISM OF RUST-INFECTED SUNFLOWER COTYLEDONS. J.E.Smith and E.R.Waygood: Canad. J. Bot., 1963, 41, 41-54 (Dept. Bot., Univ. Manitoba, Winnipeg, Manitoba, Canada)

The activities of glutamate decarboxylase [GDC], GOT and glutamate dehydrogenase [GDH] were determined in cell free extracts of healthy and rust-infected sunflower cotyledons and uredospores. Uredospores contained an active NAD-linked GDH but little GDC or GOT activity. GDC activity was lower and GOT was higher in rust-infected tissue as compared to healthy tissue as a result of redistribution of pyridoxalphosphate- GDH activity was higher in extracts of infected tissue as a result of the presence of the fungal enzyme.

A.Meany

7001. GLYCOLIC ACID OXIDASE AND FUSARIOSE WILT OF TOMATOES. B.D-Sanwal and E.R.Waygood: Canad. J. Bot., 1963, 41, 55-63 (Dept. Bot., Univ. Manitoba, Winnipeg, Manitoba, Canada)

Roots of tomato plants were infected with Fusarium and changes in the glycolic acid oxidase [GAO] - glyoxylic acid reductase [GAR] system of the leaves was followed. GAO activity decreased 8-16 days after inoculation when the leaves showed chlorotic symptoms. GAR showed an increase in activity 20 days after infection. These alterations in enzymic activity resulted in an accumulation of glycolic acid even though the fungus was never present in the leaves. Both FMN and FAD decreased after 8 days - the depr^sed activity of GAO, is due to the decreased concn. of its FMN coenzyme.

TECHNIQUES

7002. METHOD FOR DETERMINATION OF FAT PERCENTAGE p UNICELLULAR ALGAE. D.M.Collyer: J. Mar. biol. Ass. U.K., 1962, 42^ 485-492 (Fish. Lab-i

EXPERIMENTAL BOTANY

679

Burnham-on-Crouch, England) The method is suitable for algae down to 2 μ diam. and determines the wt. of total fatty acids and total unsaponifiable fat-sol. matter in fresh algal material which contains 20-280 mg. total dry matter. Chem. treatment is based on the method of Belin (1926). P.J. Baron

7003. EFFECT OF VARYING RESIDUAL MOISTURE CONTENT ON THE VIABILITY OF LYOPHILISED ALGAE. O.Holm-Hansen: Nature, Lond., 1963, 198, 1014-1015 (Dept. Bot., Univ. Wisconsin, Madison, Wis., U.S.A.) There was no difference in viability of *Nostoc muscorum* or *Chlorella* sp. after freeze drying at -21°C or at room temp. Removing progressively more of the bound water by heating at 10°C markedly reduced the viability. G.M. Lewis
7004. IMPORTANCE OF ELECTROLYTE IN THE DETERMINATION OF MOLECULAR WEIGHTS BY 'SEPHADEX' GEL FILTRATION, WITH ESPECIAL REFERENCE TO HUMIC ACID. A.M.Posnen: Nature, Lond., 1963, 198, 1161-1163 (Dept. Agric Chem., Waite Agric.

Res. Inst., Univ. Adelaide, Australia) Humic acids could be separated on Sephadex columns into 2 bands when NH₄Cl was used as eluant, but not when water was used as eluant. Average mol. wt. for the 2 humic acid fractions were 70000 and 200000. Cultivation of soils under continuous pasture of wheat fallow rotation leads to a shift in the humic acid components from a high to a low mol. wt. group.

J.R.Sargent

7005. FUCHSIN STAINING FOR NaOH CLEARING FOR LIGNIFIED ELEMENTS OF WHOLE PLANTS OR PLANT ORGANS. CFuchs: Stain Technol., 1963, 38, 141-144 (Lab. Biol. VSgStale Appl., MusSum Nat. Hist. Naturelle, 61 rue Buffon, Paris, France) The author has developed a method whereby die lignified or suberous elements of plant tissue are stained without the staining of hairs and parenchymal tissues which so impedes observations to any appreciable depth. The principle of this method is to stain with basic Fuchsin and clear with NaOH. Three procedures are given suitable for tissues of soft or hard consistency.

EXPERIMENTAL ZOOLOGY

CYTOLOGY

7006. LOCOMOTION OF AMOEBA PROTEUS.

L.G.E.Bell and K.W.Jeon: Nature, Lond., 1963, 198, 675-676 (Dept. Zool., King's Coll., Univ. London, England) Locomotion of A. proteus, A. dubia and Pelomyxa carolinensis was observed in Chalkey's medium on clean glass both from above and from the side. Components of the locomotory system identified include: - (1) an extension of surface to provide a main exploratory pseudopod which is not in contact with the substratum, (2) streaming of cytoplasm into the exploring pseudopod, (3) formation of small adhesive pseudopods from the ventral surface of the main pseudopod, which stick to the bottom and support the amoeba, (4) the eventual detachment of these supporting pseudopods from the substratum and their incorporation into a tail region which is carried off the bottom. G-M-Lewis

7007. ARREST OF PLASMODIAL MOTILITY DURING MITOSIS IN PHYSARUM POLYCEPHALUM.

E.Gutté and S.Gutté: Exp. Cell Res., 1963, 30, 242-244 (Dept. Biol., Brown Univ., Providence, R.I., U.S.A.) During mitosis, locomotion, expansion and internal shifting of material were completely arrested in all plasmodia, whereas the rhythm of protoplasmic streaming remained unchanged* K.Jones

7008. CELL DIVISION; DIFFERENTIAL EFFECTS OF HEAVY WATER UPON MECHANISMS OF CYTOKINESIS AND KARYOKINESIS IN EGGS OF AKACIA PUNCTULATA. D.Marsland and A.M.Zimmerman: Exp. Cell Res., 1963, 30, 23-35 (Biol. Dept., New York Univ., New York, U.S.A.) The 2H₂O treatments exerted a stabilising action on the nuclear membrane and various cell structures of inseminated eggs of A. punctulata, as studied by pressure-centrifugation and by isolation of the mitotic apparatus. The gel structure of the peripheral cytoplasm became firmer, the value of die gel strength at 2f being about 24% higher than normal. However, the 2H₂O treatment did not abolish the furrowing capacity of the eggs. The anti-mitotic effects of the heavy water are interpreted in terms of changes in the chem. bonding of gel structures. K.Jones

7009. RETARDATION OF DIVISION OF THREE CILIATES BY INTERMITTENT AND CONTINUOUS ULTRAVIOLET RADIATIONS AT DIFFERENT TEMPERATURES.

A.C.Giese, B.McCaw and ^Cornell: J. gen. Physiol., 1963, 46, 1095-1108 (Dept. Biol. Sci., Stanford Univ., Stanford, Calif., U.S.A.) The same dosage of u.v. radiation retarded the division of several protozoans more effectively when the light was intermittent than when it was continuous, and especially at temp. of 25-35°. At lower temp., the difference in effectiveness was less marked. The result indicated that thermochem. dark reactions succeed the absorption of u.v. radiations by the cell. In Blepharisma, besides initial delay in division, the cells stopped dividing after one or two divisions, a stasis ensuing. K.Jones

7010. ULTRASTRUCTURE OF CUTICLE OF FASCIOLA HEPATICA. L.T.Threadgould: Exp. Cell Res., 1963, 30, 238-242 (Dept. Zool., Queen's Univ., Belfast, N. Ireland) Prelim. note. K.Jones

7011. E.M. STUDY OF THE FORMATION AND STRUCTURE OF THE PELLUCID MEMBRANE OF THE TELEOST,

LEBISTES RETICULATA (POECHIDAE). P.Chambolle, RtCambar and P.Gendre: OR. Soc. Biol. Paris, 1962, 156, 2018-2020 (Centre E.M., Fac Sci., Bordeaux, France) Between the ovocyte and the basal membrane of the follicle in L. reticulata were villi which developed from the ovocyte. Between these villi was an osmophilic substance, secreted by the follicle. There was no noticeable variation in structure of this layer during development of the embryo. (French) M.A.Price

7012. HISTOLOGICAL AND HISTOCHEMICAL STUDY OF THE EPITHELIUM OF THE WALLS OF THE URODAEUM OF BLINDWORM EMBRYOS, (ANGUIS FRAGILIS, L.). J.Raynaud and A.Raynaud: OR. Soc. Biol., Paris, 1963, 157, 8-13 (Inst. Pasteur, Sannois, S.-et-O., France) The epithelial cells of the walls of the urodaeum of A. fragilis embryos weighing 80 mg. stained red with Best's Carmine and gave pos. PA-Schiff reaction. The staining material was situated in the basal part of the cell, below the nucleus. Incubation of sections with saliva decreased the intensity of colour after staining. (French) M. A. Price

7013. DEPOSITION OF SKELETAL STRUCTURES IN CRUSTACEA. IV. MICRORADIOGRAPHIC STUDIES OF GASTROLITE OF CRAYFISH ARCONECTES VIRILIS HAGEN. D.F.Travio and U.Friberg: U. ultrastructure. Res., 1963, 8, 48-65 (Orthopaedic Res. Lab., Harvard Med. Sch., Massachusetts Gen. Hosp., Boston, Mass., U.S.A.) In the early gastrolith, microradiographs with soft X-rays have shown loosely packed globular centres of mineralisation to be present along the less dense lamellae^ giving an overall picture of globular prisms. The matrix contains non-uniformly spaded lamellae. In mature gastroliths the mineral distribution becomes more dense and arranged along the lamellae to give an alternate dense and less dense lamellar picture. H.B.Waynfirth

7014. CALCIFICATION OF KERATIN. P.f.C.Blakey, C.Earland and J.G.P.Stell: Nature, Lond., 1963, 198, 481 (Dept. Textile Ind., Inst. Technol., Bradford, Yorks., England) The X-ray diffraction patterns of platypus hair, lion whisker and goose feather calamus show apatite reflections. Similar reflections were observed in X-ray diffraction patterns of 16% of human finger nails. G-M.Lewis

7015. A JMMORPMC SPERMS OF RHINOPOMA KINNEARI (CHILOPTERA). R.S.Mathur and T.C.A.Kumar: Experientia. Basel, 1962, 18, 570-571 (Dept. Zool., Univ. Rajasthan, Jodhpur, India) The 2 types of sperm differ in their shape and length of tail, but it is not known whether the dimorphism is due to differences in the chr. complement. R.S. Tonics

METABOLISM

7016. CO₂ FIXATION STUDIES WITH THE CULTURE FORM OF TRYPANOSOMA CRUZI. I.B.R.Bowman, E.J. Tobie: Physiol., 1963, 19, U.S.A.)

EXPERIMENTAL ZOOLOGY

681

CO₂ as dissolved CO₂, carbonic acid or bicarbonate affected *xh6* production of succinate. When glucose was present succinate production depended on a source of CO₂* in absence of glucose no succinate at all was formed. Expt. with [14C]glucose indicate that metabolism proceeds to a large extent via the Embden-Meyerhof scheme, followed by the tricarboxylic acid cycle, forming succinate. Succinate formed either via Krebs cycle or fixation is partly excreted into the medium. Malonate increases the yield of succinate without affecting production of CO₂* M.S.Laverack

7017. ISOLATION AND CHARACTERISATION OF MEMBRANE OF LEISHMANIA DONOVANI. B.K.Ghosh:

Ann. Biochem., 1963, 23, 159-168 (Indian Inst.

Biochem. and Expt. Med., Calcutta, India)

The membrane was isolated in the form of a ghost and was found to make up about 1Qrfa of the dry wt. of the cell. On analysis the membrane was found to have a predominantly lipoprotein structure, but an unexpected finding was the presence of carbohydrate in the form of mannose.

L.Barnes

7018. COLD AND ANAEROBIA ON TOTAL TREHALOSE OF BOMBYX MORI. J.Dutrieu: CR. Soc Biol. Paris,

1962, 156, 2020-2023 (Lab. Physiol. Gen., Fac Sci., Bordeaux, France)

Trehalose was absent from the egg of *B. mori* after laying, during pre-diapause and summer diapause*. During development the trehalose content was 10-15%. Cold increased the trehalose content. Trehalose decreased at the resumption of development, increased during later developmental stages and decreased at hatching. Trehalose was present in the haemolymph of larvae. (French) M. A. Price

7019. UTILISATION OF NUCLEOSIDES IN THE CRICKET OVARY AND THEIR VARIATIONS DURING OOGENESIS. I. INCORPORATION IN RNA. II. INCORPORATION IN DNA. CFavard-S&r&io and M.Durand:

Develop. Biol., 1963, 6, 184-205, 206-218 (Lab.

Physique Atomique et MolSculaine, Coll. de France, Paris, France)

I. In follicle cells PHcfidine and cytidine were incorporated in chr. and there was a progressive accumulation of labelled RNA in the nucleolus. Cytoplasmic labelling occurred later, associated with a loss of nucleolar RNA which occurred more rapidly when follicle cells were active. In the oocyte, uridine and cytidine were first seen in the nuclear saR and subsequently labelled RNA accumulated in chr. and ooplasm. KNA activity remained high during cytoplasmic growth, but declined after the onset of vitellogenesis.

H- No* of follicle nuclei labelled with PHjthymidine increased with onset of secretory activity and after 5 min. incorporation approx. 30% of nuclei were labelled during middle period of vitellogenesis. No further rise in no. of labelled nuclei occurred following increased treatment ^me during later stages of development. No uptake was observed in germinal vesicle, but during max. follicle cell activity labelled DH was present in follicle cell Ooplasm and in the ooplasm. Following long incorporation times pHjuridine and cytidine were used for Y^NA synthesis. Incorporation of uridine was similar to that of thymidine but incorporation of cytidine followed a special pattern. (French) j.W.S.Harris

7021. ENZYME CHANGES IN FLIGHT MUSCLE CORRELATED WITH AGEING AND FLIGHT ABILITY IN THE MALE HOUSEFLY. M.Rockstein and K.F.Brandt:

Science, 1963, 139, 1049-1050 (Univ. Miami Sch.

Med., Coral Gables, Fla., U.S.A.) Mg-activated

ATPas e in flight muscle sarcosomes of ageing c? houseflies decreases concomitantly with failure in flight as reflected in the loss of wings during die 2nd week of adult life. Preceding the loss of wings, there is a rapid decline in (X'glycerophosphate dehydrogenase activity in the extra-mitochondrial fraction which is dependent on NAD.

G.M.Lewis

7022. CHEMICAL CHANGES WITH REPRODUCTIVE ACTIVITY OF THE CHITONS, KATHERINA TUNICATA AND MOPALIA HINDSH. A.CGiese and

G.Araki: J. exp. Zool., 1962, 151, 259-267 (Dept.

Biol. Sci., Stanford Univ., Calif., U.S.A.) Analysis was made of the protein, non-protein nitrogen, lipid and glycogen of the gonads, hepatic gland, foot and mantle of both spent and gravid specimens of *K.tunicata* and

M.hindsi. In these spp. lipid plays a more important role than glycogen as a storage material. There were no striking changes observed in organs other than gonads between spent and gravid animals. The ovaries store a large amount of lipid most of which passes into the eggs. In addition the protein content of the ovaries falls from 42% to 20-1%. There was little difference in the hepatic gland content of org. nutrients between spent and gravid specimens. During prolonged starvation, the lipid content of some of the tissues of *K.tunicata* decreased. It is concluded that lipids play an important role in the life cycle of these animals.

R.J.Walker

7023. EFFECT OF FASTING ON THE GLYCOGEN LEVEL OF THE MYOCARDIUM OF THE TENCH (TINCA TINCA L.). G.Peres and A.Suard: CR. Soc. Biol.,

Paris, 1962, 156, 1431-1432. In tench, 15 days after the initiation of fasting, there was an increase in the glycogen content of the myocardium from 2907 mg./100 g. After 90 days the glycogen content fell to 853 mg./100 g. The glycogen content increased to 1775 mg./100 g. after 120 days.

(French) M. A. Price

7024. EFFECT OF HYPO-OXIA ON THE DISTRIBUTION OF PHOSPHATES IN THE BLOOD OF THE TENCH (TINCA TINCA L.). CBange: CR. Soc. Biol.,

Paris, 1962, 156, 1400-1403 (Lab. Physiol. ggn., Fac. Sci., Lyon, France) The org. phosphate content of the blood of tench showed a seasonal variation with an increase during winter and spring. During mild hypo-oxia there was a decrease in the blood content of mineral phosphate. The acid sol. org. phosphates decreased initially and returned to the normal level. The ATP content decreased rapidly after 2 hr. hypo-oxia. During severe hypo-oxia there was an increase in phosphate content of the blood with a decrease in acid sol. org. phosphates and ATP. 7026. PRELIMINARY OBSERVATIONS ON SCALES AND THEIR MODE OF ORIGIN IN CHRYSOCHROMULINA POLYLEPIS SP. NOV. LManton and M.Parke: J. Mar. biol. Ass. U.K., 1962, 42, 565-578 (Lab., Citadel Hill, Plymouth, England) *C polylepis* produces 4 different types of scale on the same cell. The scales develop in vesicles in the body and are later deposited on the surface of the cell. Rates of scale production vary with the time of day. P.J.Baron

7027. ENVIRONMENTAL FACTORS INFLUENCING THE GROWTH OF CORDYLOPHORA. CFultone J. exp. Zool., 1962, 151, 61-78 (Dept. Biol., Brandeis Univ., Waltham, Mass., U.S.A.) Using a defined culture method, the hydranth no. of cultures of the colonial hydroid *C lacustris* increased exponentially, with a doubling time of approx. 3 days. In a defined culture soln., *C lacustris* requires Na, K, Ca and Cl* for growth and in addition Mg²⁺ for growth at a max. rate. A max. growth rate is obtained by feeding once a day with larvae of *Artemia*. Light has little effect on growth, while within the pH range 6-9 and temp, range of 18-26°, the growth rate is similar. Expt. indicate a distinct but low O₂ tension requirement for growth. R.J. Walker

7028. THE EXTENSION OF FERTILISABILITY AND A HYPOTHESIS ON SPERM ENTRANCE IN SAND DOLLAR EGGS. O.Rulon: Biol. Bull. Woods Hole, 1962, 122, 391-395 (Dept. Biol. Sci., Northw. Oftern Univ., Evanston, Ill., U.S.A.) The eggs of *Dendraster excentricus*, which normally lose their capacity for fertilisation in 2 days, can retain it for as much as 8 days when treated with M/400-M/800 CoCl₂. Neither thioglycolic acid or cysteine hydrochloride had this effect on the eggs, but when combined with CoCl₂ preserved the fertilisability for 21-25 days. It is suggested that these substances have these effects by preventing destructive oxidations in the egg and further, that fertilisation is facilitated by reduction of disulphide to sulphhydryl at the egg surface. G.J.Peaikin

7029. ACID PRODUCTION AT FERTILISATION OF SEA URCHIN EGGS. K.Aketa: Exp. Cell Res., 1963, 30, 93-97 (Biol. Inst., Fac Sci., Nagoya Univ., Nagoya, Japan) Sea urchin eggs released sulphate into the sea water surrounding them upon fertilisation. It is suggested that the acid formed upon fertilisation of the sea urchin eggs corresponds to the inorg. sulphate spit off from mucopolysaccharide contained in the cortical granules. Paper chromatographic analysis showed no qual. difference between the sea water in which sea urchin eggs were fertilised and normal sea water. K.Jones

7030. FUNCTIONAL MORPHOLOGY OF LARVA, AND POST LARVAL DEVELOPMENT OF VENUS STRIATULA (DA COSTA). A.D.Ansell: J. Mar. biol. Ass. U.K., 1962, 42, 419-443 (Dept. Zool., Univ., Glasgow, Scotland) A description of the functional morphology of die veliger, pediveliger and early post larva is given. The phylogenetic significance of the mode of development of certain organs of the post-larval stage is discussed. P.J.Baron

7031. FINE STRUCTURE OF POLE CELLS AND POLAR GRANULES IN DROSOPHILA MELANOGLASTER. A.P.Mahowald: J. exp. Zool., 1962, 151, 201-215 (Woodstock Coll., Woodstock, Md., U.S.A.)

The pole cells from embryos of *D. melanogaster* are distinguished from cells of the blastoderm by a less dense cytoplasm, annulate lamellae, hollow spherical nucleoli and polar granules. Polar granules originate in stage 9 oocytes as small dense bodies 0*2 p in diam. They are not bounded by a membrane but contain RNA*. Their basic structure during oogenesis is composed of granules the size of ribosomes and also a smaller granular or fibrillar component.

R.J.Walker

7032. DEVELOPMENT OF PARTHENOGENETIC AND AMPHIGONIC EGGS IN BREVICORYNE BRASSICAE. A.M.Pagliai: Caryologia, 1962, 5, 537-544 (Inst. Zool., Univ., Modena, Italy) Parthenogenetic and amphigonic egg development of *B. brassicae* are compared. As an examination of Aphid amphigonic egg development shows peculiar chr. behaviour when compared with that of most insects, this has probably permitted endomeiosis establishment in parthenogenetic individuals and hence the genetic variability in single parthenogenetic lines of Aphids. (Italian) J.L.Batten

7033. FERTILISATION IN DROSOPHILA. I. EVIDENCE FOR THE REGULAR OCCURRENCE OF MONOSPERMY. P-E.Hildreth and J.CLucchesi: Develop. Biol., 1963, 6, 262-278 (Lawrence Radiation Lab., Univ. California, Berkeley, Calif., U.S.A.) Examination of 294 prep. of meiotic eggs of *D. melanogaster* and *p. virilis* and autoradiographs of 20 eggs fertilised by T³H-thymidine labelled sperm revealed on 11 eggs containing more than 1 sperm. It is suggested that in a large no. of insect spp. physiol. polyspermy does not occur, and that pathol. effects of polyspermy need not be manifested when accessory sperm enter the egg. J.W.S. Harris

7034. A MARINE FISH-REARING EXPERIMENT USING ANTIBIOTICS. J.E.Shelbourne: Nature, Lond., 1963, 198, 74-75 (Min. Agric, Fisheries and Food, Fisheries Lab., Lowestoft, Suffolk, England) Treatment of eggs of plaice, *Pleuronectes platessa*, with penicillin and streptomycin increased the no. of eggs hatched and the no. of larvae developing. The optimum temp, for egg incubation was 6-T, rising to 10-11° during larval development. G.M.Lewis

7035. EFFECT OF MESODERM ON AUDITORY VESICLE IN ACIPENSERIDAE, URODELA AND ANURA. E.V.Chulitskaia: Dokl. Akad. Nauk, 1962, 144, 245-247. Transplant expt. showed that in Acipenseridae, Urodela and Anura, in that order, the mesodermal layer becomes increasingly important in its inductive effect on the material of the auditory vesicle.

(Russian) B.J.Cooper

7036. PERMEABILITY CHANGES IN FERTILISED AND ACTIVATED AMPHIBIAN EGGS. S.Lovtrupc J. exp. Zool., 1962, 151, 79-84 (Dept. Histol., Univ. Goteborg, Sweden) The changes in permeability to water after fertilisation and in activated and unfertilised eggs of *Rana platyrrhina* in which symmetrical cortical contraction occurred were followed. A distinct rise in the permeability const. occurred during the early phase of contraction in fertilised eggs. As this reverbates, the value for the permeability const. decreases to reach at grey crescent formation, a level slightly higher than in the unfertilised egg. In activated and unfertilised eggs, there is a temporary increase in permeability associated with contraction but the max. value of the permeability const. was lower. J.Walker

7037. DIFFERENTIATION AND GROWTH OF THE EMBRYONIC NOSE, LENS AND CORNEAL ANLAGEN IMPLANTED INTO THE LARVAL EYE OR DORSAL FIN IN AMBLYSTOMA PUNCTATUM. R.W.Reyer: J. exp. Zool., 1962, 151, 123-153 (Dept. Microanat., Sch. Med., West Virginia Univ., Morgantown, W. Va., U.S.A.) The expt. were performed on embryos and larvae of A. punctatum. The prospective nose ectoderm at the neural stage can self-differentiate when transplanted to the ear region of the embryo or into the larval eye or dorsal fin. There is a gradual increase in the capacity for self-differentiation of the lens anlage from progressively older donors. The environment of the larval eye chamber did not stimulate lens development from the prospective lens ectoderm of the neurula and head and tail-bud donors. Following transplantation to the fin or eye, a lens grows better in close association with nasal tissue than when alone. Embryonic lens vesicles develop normally when transplanted into the host pupillary space of the larval eye following removal of the host lens, but are retarded in growth when transplanted to the larval dorsal fin. Prospective corneal epithelium does not form a lens when implanted into the ^{lentectomised} ~~lentectomised~~ ^{J.S.J.S.F.A.}

7038. TISSUE-SPECIFICITY OF FROG EGG-JELLY ANTIGENS. J.R.Shaver, S.H.Barch and O.A.Shivers: J. exp. Zool., 1962, 151, 95-103 (Dept. Zool., Michigan State Univ., East Lansing, Mich., U.S.A.) The double-diffusion technique employing antisera prep. in rabbits against egg-jelly of Rana pipiens and against various adult tissues of this sp. were used to analyse the antigenic components of the jelly coats of the frog egg. Apart from the ovary and oviduct, no tissue was found to contain components identical with those in W Jeuy. It is suggested that the cross-reaction between jelly and ovarian material may be due to the presence in the jelly of material secreted by the egg or the oviducal cells. The results of the antigenic analysis of frog egg-jelly are discussed in relation to the effect Ab against egg-jelly have on the fertilisation process in this sp. w. walker

REGENERATION

7040. ^{m^T}TOTAL STUDIES OF MECHANISMS IN V O ^ S U ^ GENERATION. D-B-Spangenberg and R.E.Eak: J. exp. Zool., 1962, 151, 85-94 (Path. Dem. Univ. Arkansas Med. Cent., Little Rock, Ark. SSfc) LiPoic acid affects the generation of the tentacles of Hydra oligactis and 4 strains of H. tenuiflora and H. tenuirostris by *d***TMgf regeneration. It is concluded that the inhibitory effect of LiSSic acid is not related(*) its vitamin function as both toe E active and inactive antipodes are inhibitory. Lipoic acid retarded the differentiation of interstitial cells into cnidoblasts. while the mesogloal kyer was restored at a normal rate. R.J.waiKer

7040. STUDIES ON VISCERAL REGENERATION IN SEA STARS. I. REGENERATION OF PYLORIC CAECA IN BTSt SKS?ffiKS⁰%₁₋₃₄₂ (Dept.

ⁿ Zool., Cornell Univ., Ithaca, N.Y.. U.S.A.) [^]generation was studied grossly and histol. at 1, 2, 3, 4, 6 and 8 weeks after removal of the pyloric caeca through

a median longitudinal aboral incision in one arm. After 2 weeks the incision and the cut ends of the caeca were found to be healed. Subsequently, the caeca grew out into the arm and showed progressive differentiation from the tip to the base. The tip comprised a solid mass of undifferentiated tissue but no signs of mitotic activity were revealed. G.J.Peaikin

7041. TISSUE AFFINITY IN AMAROECIUM. H. REAGGREGATION OF THREE PARTIAL ZOOIDS INTO FUNCTIONING SIAMESE TWINS. F.M.Scott: Biol. Bull. Woods Hole, 1962, 122, 396-416 (Seton Hill Coll., Greensburg, Pa., U.S.A.) Young adult zooids were divided into branchial and abdominal halves and then 2 branchial and one abdominal part were inserted into the tunic of a 2-week old zoid which had been previously emptied of its occupant. After mild maceration the reaggregation of the parts in various combinations took place within 5 days to produce functioning Siamese twins. G.J.Peaikin

7042. POLARISATION OF THE PIGMENT PATTERN IN THE REGENERATING IRIS OF ADULT NEWT EYES. L.S.Stone: J. exp. Zool., 1962, 151, 269-278 (Anat. Lab., Yale Univ. Sch. Med., Yale Univ., New Haven, Conn., U.S.A.) The observations indicate that the well marked nasal and temporal black pigment spots in the eyes of the adult of the newt Triturus v. viridescens, become permanently polarised at opposite poles in the horizontal plane, and that they can be replaced if temporarily lost. When the entire nasal or temporal half of the iris is excised, the regenerating iris is derived from peripheral wound edges of iris tissue and retina pigment epithelium. The iris with its chromatophores and pigment pattern can be regenerated from retina pigment cells which are not of neural crest origin. R.J.Walker

7043. REGENERATION OF HOMOPLECTICALLY DEPLANTED FORELIMBS FOLLOWING SPINAL CORD ABLATION IN AMBLYSTOMA OPACUM LARVAE. R.A.Liversage: J. exp. Zool., 1962, 151, 1-15 (Dept. Zool., Univ. Toronto, Canada) Expt. were carried out on 82 larvae of Ambystoma opacum of 25-56 mm., to test to what extent a forelimb can be isolated from the central and peripheral nervous systems and still retain its regenerative capacity. Using deplantation techniques it was found that the function of the nerves in larval urodele regeneration was solely at the local level and was possibly neurosecretory in nature. The conduction of impulses would appear not to be a prerequisite for limb regeneration in larval A. opacum. R.J.Walker

OSMOREGULATION AND EXCRETION

7044. IONIC REGULATION AND MODE OF ADJUSTMENT TO REDUCED SALINITY OF STARFISH ASTERIAS RUBENS L. J.Binyon: J. Mar. biol. Ass. U.K., 1962, 42, 49-64 (Dept. Zool., Royal Holloway Coll., London, England) The perivisceral and ambulacrinal fluids of A. rubens are isosmotic and isoionic with sea water, even if that medium is diluted by half. There is slight accumulation and regulation of Ca in the perivisceral fluid. To a much more marked extent K is accumulated and regulated in the water vascular system. It is

EXPERIMENTAL ZOOLOGY

suggested that there exists, for the K of the water vascular system, an active accumulator mechanism.

P.J. Baron

7045. FINE STRUCTURE OF THE SOLENOCYTE TREE IN PRIAPULUS CAUDATUS LAMARK. A.Nffcrevng; Nature, Lond., 1963, 198, 700-701 (Inst. Comparative Anat., Univ. Copenhagen, Universitetsparken 3, Copenhagen, Denmark). G.M.Lewis

7046. EXPERIMENTS ON OSMOTIC REGULATION AND IONIC REGULATION OF THE TERRESTRIAL CRAB, CARDISOMA ARMATUM HERKLOTS. M-de Leersnyder and H.Hoestlande Cah. Biol. mar., 1963, 4, 211-218 (Lab. Zool., Univ. Lille, France) The serum of *C. armatum* is hypotonic when the animal is kept in sea water ($A = -1^{\circ}70^{\circ}$) and hypertonic in fresh water ($A = -1^{\circ}391^{\circ}$). The urine of the animal is always isotonic with the serum, in all conditions. Temp, has no effect on osmo-regulation. Variation of the ionic composition occurs in response to environmental changes in the case of Cl, Na and Mg, but not K or Ca. Urine Ca is less than serum Ca. Excretion of Mg increases in sea water. (French) M. S.Laverack

7047. OSMOREGULATION IN LIGIA OCEANICA AND IDOTEA GRANULOSA. M.E.Todd: J. exp. Biol., 1963, 40, 381-392 (Dept. Zool., United Coll., Winnipeg, Man., Canada) The osmoregulatory response of *L. oceanica* and *I. granulosa* was tested expt. in various salinities at 5° and 15° in summer and winter animals. In 100% sea water the osmotic concn. of the blood of *L. oceanica* was markedly above that of the medium whereas in *I. granulosa* the blood was only marginally hyperosmotic. In both spp. the osmotic concn. of the blood was influenced by season, by temp, and by a tejn-p.-salinity interaction. A.J.Martin

7048. POTASSIUM METABOLISM AND ACCUMULATION OF 137CAESIUM BY DECAPOD CRUSTACEA. G.W.Bryan: J. Mar. biol. Ass. U.K., 1962, 42, 199-241 (Lab., Citadel Hill, Plymouth, England)

In unfed *Homarus vulgaris* and *Palaemon serratus* 137Cs is taken up and lost much more slowly than 42K. Higher whole animal factors are reached for 137Cs than for 42K*. The freshwater crayfish, *Austropotamobius pallipes*, in 0*-1% sea water does not concentrate 137Cs to the same extent as K. In all spp. muscle is the principle limiting factor in the uptake or loss of 137Cs, whereas with 42K the body surface is more limiting. P.J.Baron

7049. CHEMICAL COMPOSITION OF HAEMOLYMPH IN INSECTS AND SOME OTHER ARTHROPODS, IN RELATION TO THEIR PHYLOGENY. D.W.Sutcliffe Comp. Biochem. Physiol., 1963, 9, 121-135 (Dept. Zool., Univ. Durham, King's Coll., Newcastle-upon-Tyne, England) Details are given of analyses of the haemolymph of many insects representative of many orders of the Insecta. Three classificatory groups of haemolymph are suggested. Type 1, represented by *Aeschna grandis* larvae, have fluid in which Na and Cl account for the major part of the total osmolar concn. K, Ca, Mg and PO₄ are small in amount, and amino acids account for only about 10% of total concn. This type appears typical of Ephemeroptera, Odonata, Plecoptera, Dictyoptera, Hemiptera-heteroptera. Type 2 (*Locusta migratoria*). Na and Cl" provide less of the total concn. (about 50% combined) and there is a large amount of unknown material; found in some orthoptera, one dermopteran and one isopteran. In type 3 chloride is very low relative to Na which ranges from 21-48%. Amino

acids are present in considerable amounts (25<70- Exemplified by *Sialis* larvae, and found in trichoptera, diptera, megaloptera, neuroptera and mecoptera.

M.S.Laverack

7050. EXCRETION IN THE BLOOD-SUCKING BUG, RHODNIUS PROLKUS, STÅL. I. THE CONTROL OF DIURESIS. S.H.P.Maddrell: J. exp. Biol., 1963, 40, 247-256 (Dept. Biol., Dalhousie Univ., Halifax, Nova Scotia, Canada) The mechanism underlying the diuresis of fed larvae of *R. prolixus* was investigated. The rate of secretion of the Malpighian tubules isolated in a drop of haemolymph is at first high but soon falls to a low level. It can be restored by the addition of haemolymph taken from an insect during diuresis.

Diuresis is promoted by some substance, presumably a neurohormone, which can be extracted from the post, cells of the fused ganglionic mass situated in the mesothorax. A.J.Martin

7051. ABSORPTION OF Ca AND Sr IN SOLUTION IN THE AMBIENT MEDIUM BY LYMNAEA STAGNALIS L. O.Van der Borght: Arch. int. Physiol., 1962, 70, 611-623 (Centre d'Etude de l'Energie Nuclaire, Mol, Belgium) The fresh water gastropod *L. stagnalis* L. can absorb Sr and Ca from the surrounding water, it is not necessary for these elements to be ingested in the food. Ca is absorbed against a cone gradient from external milieu/blood. Rate of absorption is const, wheft Ca concn. is > 10 p.p.m. Below this concn. absorption is less rapid, possibly due to decreased efficiency of the transport mechanism regulating difference in Ca concn. between blood and external milieu. The rate of absorption of Ca is x 5 that of Sr under die conditions investigated.

(French) M.E.Nutt

7052. IN- AND OUT-FLUXES OF Ca IONS IN FRESH WATER GASTROPODS. O.van der Borght Arch. int. Physiol., 1963, 71, 46-50 (Radiobiol. Dept., Centre d'Etude de l'Energie Nucl&dre, Mol, Belgium)

Influx and outflux of Ca in *Lymnaea stagnalis* L. was measured, using 45Ca, and showed that Ca can be actively transported against a concn. gradient and used for construction of the shell. Since Sr seems to be accumulated in a similar manner to Ca the Sr content of the shell of *L. stagnalis* could be a possible indicator of radioactive Sr contamination*

M.E.Nutt

7053. OSMOTIC BEHAVIOUR IN AN INTERTIDAL LIMPET ACMAEA LIMATULA. E.Segal and P.A. Dehneb Biol. Bull. Woods Hole, 1962, 122, 417-430 (Dept. Biol., Rice Univ., Houston, Tex., U.S.A.)

Three populations of *Acmaea limatula* were used for osmotic and air desiccation expt. No osmoregulation took place over the range 50 to 150% sea water. Isotonicity of the blood with the medium was reached within 3 hr. in hypertonic media but took longer in hypotonic media. Extra-visceral water appeared to act as both as osmotic and a temp. buffer. G.J.Peakin

7054. GLOMERULAR FILTRATION RATE OF RAINBOW TROUT SALMO GAIRDNERI. W.N.Holmes and R.L. McBean: J. exp. Biol., 1963, 40, 335-341 (Dept. Zool., Univ. British Columbia, Vancouver, B.C., Canada) Upon adaptation of rainbow trout to 80% sea water, the GFR is reduced. Return to fresh water after one month in sea water is followed by a rapid re-establishment of die high GFR. The effects of adrenocortical and mammalian neurohypophysial hormones on the GFR were studied. Vasopressin and oxytocin, when given separately or together, increased the rate.

EXPERIMENTAL ZOOLOGY

685

aldosterone had no effect, while corticosterone caused a reductidh.
AJ.Martin

7055. UREOTELISM OF ECHIDNA AND PLATYPUS.
D.A.Denton, M.Reich and F.J.R.Hird: Science, 1963, 139, 1225 (Dept. Physiol., Univ. Melbourne, Parkville, Australia) Adult platypus and echidna excrete most of their nitrogen in the form of urea; amounts of allantoin and uric acid are small*. The presence of arginase in the liver was demonstrated. G.M.Lewis

FEEDING AND DIGESTION

7056. ABSORPTION OF VANADIUM BY TUNICATES.
M.Kallc: Nature, Lond., 1963, 198, 1010-1011 (Dept. Zool., Univ. Witwatersrand, Johannesburg, South Africa) E.M. studies of cells of Ascidia pygmaea Michaelson indicate that vanadyl cations from sea water are linked with sulphate groups in the acid pharyngeal mucus, which after neutralisation, passes by pinocytosis into the blood plasma and is available to amoebocytes. here the vanadium is reduced and pptd. on the membranes of cytoplasmic vacuoles. G.M.Lewis

7057. LACK OF DEPENDENCE OF THE FEEDING REACTION IN HYDRA ON REDUCED GLUTATHIONE.
H.Forrest: Biol. Bull. Woods Hole, 1962, 122, 343-361 (Dept. Zool., Rutgers State Univ., New Brunswick, N.J., U.S.A.) Of 10 spp. of Hydra none were found to be restricted to a diet of living animals of the higher phyla or exclusively dependent on release of reduced glutathione for initiation of feeding. Prolonged mouth opening was induced under the influence of 5 x 10⁻⁶ M quinine hydrochloride. It was concluded that prolonged mouth opening was not a natural feeding response, indeed dil. reduced glutathione soln. (10⁻² to 10⁻⁵ M) retarded normal swallowing and induced abnormal contraction of the tentacles. G.J.Peachin

7058. ADAPTATIONS OF TWO INTERTEDAL ISOPODS.
I. RESPIRATION AND FEEDING IN NAESA BIDENTATA (ADAMS) (SPHAEROMATIDAE). W-Wiesen J. Mar. biol Ass. U.K., 1962, 42, 665-682 (Zool. Inst., Univ., Vienna, Austria) Respiratory rate depends on the tidal cycle, max. respiratory rate being at high tide. In ? the turnover rate of gut contents, during max. feeding activity, is 30 min. Dry wt. of the faecal pellets increases in linear proportion with the wt. of the animal. P.J.Baron

7059. FEEDING AND RESPIRATION IN COPEPOD TEMORA LONGICORNIS (MULLER). A.Bernen J. Mar. biol. As*. U.K., 1962^ .42. 625-640 (Inst. Mar. Biol. Adv. A., Oslo, Norway) Radiophosphorus was used as a tracer. Filtering rate was found to be variable and is probably related to size. 1961 Summer weekly water samples estimated for participate carbohydrate showed that there was always enough food present in Temora. Respiration, measured by a modified Winkler method showed that O₂ consumption was related to surface area. P.J.Baron

7060. PRELIMINARY EXPERIMENTS ON FEEDING AND EXCRETION OF BIVALVES USING PHAEODACTYLM LABELLED WITH 32p. J.A.Allen: J. Mar. biol. Ass., U.K., 1962', 42,-609-623 (Dove Mar. Lab., Culler-

coats, Northumb., England) Venus arenaria* Venus striatula, Ostrea edulis and Cuspidaria cuspidata were fed with suspensions of Phaeodactylum labelled with 32p. O. edulis was found to have a filtering rate of 6'6 ml./ hr./mg. dry body tissue, a figure more than 6 times that recorded for M. arenaria and V. striatula. Up to 94% of the 32p in the Phaeodactylum filtered out of suspension was assimilated. Some of the 32p assimilated is excreted with the faeces, but most is released in soln. The kidney is probably the main organ for P excretion. P.J. Baron

7061. LOPHOPHORE AND CILIARY FEEDING MECHANISMS OF BRACHIOPOD CRANIA ANOMALA (MULLER). D.Atkins and MJ.Rudwick: J. Mar. biol. Ass., U.K., 1962, 42, 469-480 (Lab. Citadel Hill, Plymouth, England) Confirmation is given of Orton's account of the ciliary feeding mechanisms on the lophophore of C. anomala, but observations on the natural orientation of the lophophore have caused some modification of his account of the filter feeding water currents. P.J. Baron

7062. BIONOMICS OF CHRYSOPS SILACEA AUSTEN, 1907. I. LONGEVITY AND FOOD REQUIREMENTS OF ADULT FLY. W.Crewe and W-N.Beesley: Ann. trop. Med. Parasit., 1963, 57, 1-6 (Helminth Res. Unit of W.African Coun. Med. Res., Kumba, W. Cameroon) In order to survive the fly must ingest considerable amounts of sugar. After an initial blood meal and unless additional blood or sugar meals are taken, development of the ovaries is associated with a lowering of the survival rate of the flies. Under natural conditions blood meals are taken at intervals of 5 days and normal adult life is probably 3-4 weeks. P. J. Baron

7063. PREDATOR-PREY SIZE RELATIONSHIP FOR PLAICE LARVAE FEEDING ON OKOPLEURA.

J.E.Shelbourne: J. Mar. biol. Ass. U.K., 1962, 42,

243-252 (Fisheries Lab., Lowestoft, England)

Pelagic plaice larvae in the southern North Sea normally feed exclusively on Oikopleura dioica, larger plaice larvae feeding on all sizes of the appendicularian.

P. J. Baron

ENDOCRINES

7064. RESPONSES OF SPECIFIC NEUROSECRETORY CELLS OF THE COCKROACH, BLABERUS GIGANTEUS TO DEHYDRATION. BJ.Wall and C.L.Ralph: Biol. Bull. Woods Hole, 1962, 122, 431-438 (Dept. Biol. Sci., Univ. Pittsburgh, Pa., U.S.A.) Changes in the no. and distribution of stainable granules in the type A cells of the pars intercerebralis and the thoracic ganglia under conditions of dehydration are described and it is suggested that regulation of water content is under hormonal control. G.J.Peachin

7065. EFFECT OF THE REMOVAL OF THE FRONTAL GANGLION ON THE DEVELOPMENT OF THE GONADS IN LOCUSTA MIGRATORIA L. K.U.Clarke and P.A. Langley: Nature, Lond., 1963, 198, 811-812 (Dept. Zool., Univ. Nottingham, England) Removal of the frontal ganglion from fledgling ♂ and ♀ L. migratoria prevented further sexual development. G.M.Lewis

EXPERIMENTAL ZOOLOGY

7066. INFLUENCE OF NEUROSECRETORY CELLS AND OF CORPUS ALLATUM ON INTESTINAL PROTEASE ACTIVITY IN THE ADULT CALLIPHORA ERYTHROCEPHALA MEIG. E.Thomsen and hUflier. *J. exp. Biol.* 1963, 40, 301-321 (Zool. Lab., Royal Vet. and Agric. Coll., Copenhagen, Denmark) Adult 5 of *C. erythrocephala* fed only on sugar and water show a much lower intestinal protease activity than ♀ fed also on meat. Medial neurosecretory cells [m.n.c] are needed for normal production of proteolytic enzymes. Implantation of corpora cardiaca-allata in ♀ deprived of their m.n.c significantly increased the protease activity. Meat-eating acts indirectly on protease activity by causing liberation of m.n.c. hormone. A.J.Martin
7067. SHORTENING OF A DIAPAUSE-CONTROLLED LIFE-CYCLE BY MEANS OF INCREASING PHOTOPERIOD. G.M.Blake: *Nature, Lond.* 1963, 198, 462-463 (Pest Infestation Lab. (A.R.C), Slough, Bucks*. England) The effect of const. and changing photoperiods at 2/f on the development of the larvae of *Anthrenus verbasci* indicates that the length of the 1st cycle of the rhythm was controlled in a different way from the 2nd cycle. In uni-voltine individuals, the mean length of larval period decreased compared with the control in const. darkness when larvae were exposed to increasing photoperiods during early larval life, up to 13 weeks. The larval period became progressively shorter as the photoperiod on the 1st day of larval life increased. The metamorphosis of semi-voltine individuals remained largely under the immediate control of environmental light conditions. * G.M.Lewis
7068. PRESENCE OF THYROID HORMONES IN A PELAGIC TUNICATE, SALPA MAXIMA FORSKAL. J.Roche, G.Rametta and S.Varrone: *C.R. Soc. Biol., Paris.* 1962, 156, 1964-1968 (Inst. Gen. Path., Univ. Naples, Italy) After 5 days in seawater containing NaI¹³¹, *Salpa maxima* fixed 131I in tissues. Chromatographic analysis of the tissues showed the presence of thyroxine [T₄], 3-monoiodotyrosine [MIT] and 3,5-di-iodotyrosine [DIT]. A fraction of the 131I was present in a protein containing T₄, MIT and DIT. (French) M.A.Price
7069. SEX HORMONES IN FISH. H. OESTROGENS OF SCYLIORHINUS CANICULUS. T.H.Simpson, R.S. Wright and S.V-Hunc. *J. Endocr.*, 1963, 26, 499-507 (D.S.I.R., Torry Res. Stat., Aberdeen, Scotland) Ovaries of this fish were found to contain oestradiol-17_β and oestrone, each at about 19 µg./kg. Most of this material was located within the eggs themselves. The same steroids were also identified in the plasma at concn. of 3-4 pg./ml. and 0.5-1.0 (ig./ml. respectively. G.F.Blane
7070. STEROIDS IN SEMEN OF DOGFISH [SQUALUS ACANTHIAS]. T.H.Simpson, R.S.Wright and H.Gottfried: *J. Endocr.*, 1963, 26, 489-498 (D.S.I.R., Torry Res. Stat., Aberdeen, Scotland) The semen was found to contain as much as 500 pg./100 g. 11-deoxy-corticosterone, mainly in the non-ultrafilterable fraction. Small amounts of progesterone, androstenedione, dehydroepiandrosterone, pregnenolone, androsterone and possibly aldosterone were also identified. G.F.Blane
7071. SEASONAL AND SEXUAL VARIATION IN PITUITARY GLAND OF TRITURUS VIRIDESCENS. J.N.Denc Anat. Rec., 1961, 141, 85-95 (Dept. Biol., Univ. Virginia, Charlottesville, Va., U.S.A.) Four types of cell (acidophils, chromophobes and globular and

and aglobular basophils) are described. Staining reactions indicate that the aglobular basophils may be th'Jrotrophs and the globular basophils gonadotrophs. There is an apparent correlation between the cyclic changes of the globular basophils and of the ovary in the ♀. F.Beck

7072. TOTAL EXTRIPATION OF THE PREOPTIC MAGNOCELLULAR NUCLEUS OF RANA TEMPORARIA. K.Dierickx: *Arch. int. Riarmacodyn.**. 1963, 143, 268-275 (Dept. Embryol. and HistoL, Univ. Ghent, Belgium) Total extirpation of the magnocellular neurosecretory preoptic nuclei was performed in frogs*. Histol. studies confirmed the completeness of ablation. Normal seasonal gonadal and secondary sexual development were not affected. S.E. Smith

7073. METAMORPHOSIS-ACTIVATING SYSTEM OF THE FROG. W.Etkiis: *Science*, 1963, 139, 810-814 (BioL Dept., City Coll., New York, U.S.A.) Evidence is reviewed which supports a hypothesis of the interaction of thyroid, pituitary and hypothalamus in regulating the development of the tadpole. Thyroid hormone feedback matures the neurosecretory mechanism and coordinates the phases of metamorphosis. G.M.Lewis

7074. THE NYCTHEMERAL RHYTHM OF EXCRETION OF FAECAL NITROGEN IN THE RABBIT (ORYCTOLAGUS CUNICULUS); INFLUENCE OF THE ADRENAL GLANDS. R.Bonnafous, P.Raynaud and J.Catala: *Comp. Biochem. Physiol.*, 1963, 8, 321-326 (Inst. Physiol., Univ. Toulouse, France) When considering the total nitrogen excretion it is shown that the rabbit excretes more at night than during the day (46 mg./g. dry wt. at night; 18 mg./g. dry wt. in the day). This constitutes a diurnal rhythm, and the 2 faecal masses show differences in structure. Extirpation of the adrenal glands leads to a change in the structure and N content of the daytime pellets; the N fraction increasing above normal values. The diurnal rhythm of nitrogenous excretion is also disturbed, the values of nighttime voiding being no longer markedly different from those of the day. In one case the diurnal rhythm returned spontaneously after operation, but in other cases could only be partially reintroduced by treatment with hydrocortisone. (French) M. S.Laverack

NERVOUS SYSTEM

7075. THE CONTROL AND SYNCHRONISATION OF FLAGELLAR MOVEMENT. K.E.Machire: *Proc roy. Soc. B*, 1963, 158, 88-104 (Dept. Zool., Univ. Cambridge, England) Mathematical arguments are presented which explain some of the observed phenomena of ciliary and flagellar motion. It is suggested that waves of bending will arise spontaneously if changes in length of the contractile elements cause changes in tension, after a delay. The prop. of the contractile elements must be non-linear if the amplitude of these waves is to remain finite. This results in control of freq. and direction of propagation of the waves being exercised from the proximal end, and in synchronisation of freq. and Xby adjacent flagella. G.M.Lewis

7076. CONDITIONING OF A FREE OPERANT RESPONSE IN PLANARIA. R.M.Lee: *Science*, 1963, 139, 1048-

EXPERIMENTAL ZOOLOGY

687

1049 (Dept. Psychol., Univ. Maryland, College Park, Md., U.S.A.) Using *Cura foremani* as expt. subject, the rate of response of breaking a photoelectric beam to terminate intense light exposure for 15 min was quite different from that of control subjects matched for equiv. changes in light intensity. Reinforced subjects produced steady, spaced behaviour. G.M.Lewis

7077. THE FINE STRUCTURE OF THE NERVOUS SYSTEM IN THE STARFISH [ASTERIAS RUBENS L.] CONCERNING THE STRUCTURE AND THE INNERVATION-OF THE AMPULLAE. W.Bargmann and B.Behrens Z. Zellforsch., 1963, 59, 746-770 (Anat. Inst., Univ. Kiel, Germany) Ampullae of the starfish *A. rubens* L. were studied to elucidate their innervation; the wallstructure of the ampulla consists of an internal endothelial layer, muscle layer and connective tissue; no nerve cells or any other nervous endorgan could be detected. (German) J.E.Under

7078. RAPID RESPONSE OF MTCICOLA INFUNDIBULUM (GRUBE). M.B.Roberts: J. Mar. biol. Ass. U.K., 1962, 42, 527-539 (Marlborough Coll., Wilts., England) The rapid muscular response evoked by direct stunn. of the nerve cord with a single shock obeys an all or nothing' relationship to the intensity of stunn. Magnitude of the summated contraction obtained by repetitive stunn. of the nerve cord depends on the no. and freq. of me shocks'. The results obtained are discussed in relation to the animafc* mode of life and the morphology of its giant fibre reflex. PJ.Baron

7079. PHASIC STIMULATION OF A THORACIC STRETCH RECEPTOR IN LOCUSTS. E.Gettrupi J. exp. Biol., 1963, 40, 323-333 (Zoophysiol. Lab. B. Univ. Copenhagen, Denmark) The response to phasic stunn. of stretchreceptors located at the wing hinges Mai locus* wu analysed. Results are discussed in relation to co-ordination of flight. AJ.Mann

7080. CO-ORDINATION OF SUCCESSIVE ACTmTES IN AN APHID. THE EFFECT OF FLIGHT ON SETTLING. J.S.Kennedy and CO.Booth: J. exp. Biol., 1963, 40, 351-369 (Dept. Zool., Univ. Cambridge, England) Previous evidence that newly winged adult aphids become increasingly ready to settle down on a leaf the longer they have been in flight, and that this effect is appreciable after less than one minutes flight, was confirmed with aphids allowed to fly and alight freely without interference: The settling responses initiated after flight were quickly again by in unsuitable leaf, with reversion to flight, but repeated flights had a cumulative effect. A.J.Martin

7081 METHOD FOR CHRONICALLY IMPLANTING OF ION. C.H.F.Rowell J. exp. Biol., 1963, 40, 571 to* (Dept. Zool. Makerere Univ. Coll. Kampala, Uganda) Methods are described for plating and localising permanent SSSP⁺ brains and stimulating. The effect of stimulation largely confirms previous work: the brain is determined to be rather than S⁺S⁻min⁺; the brain car to inhibit, but not elicit, by stimuli. A.J.Martin

7082. EFFECTS OF TEMPERATURE ON THE ORDINARY SONG OF THE COMMON MEADOW GRASSHOPPER ORCHELIMUM VULGARE (ORTHOPTERA: TETTIGONIIDAE). H.Frings and M.Frings J. exp. Zool., 1962, 151, 33-51 (Dept. Zool., Univ. Hawaii, Honolulu, Hawaii) Oscillographic analyses of the recorded ordinary call song of *O. vulgare* at different temp., were made to study the effects of temp. on singing. The song has at least 2 bands of freq. in the notes; a note about 14-16 kc/sec. which is relatively pure and a lower freq. note which is a rather broad band noise. The expt. indicate that the processes involved in stridulation are affected by temp. over all effective ranges and that there is a pos. relationship between the rate of stridulation and temp*. It is concluded that there is a need for the study of long periods of the recordings from many individuals, analysed with methods which permit analysis of extended continuous samples. R.J.Walker

7083. THE SWIMMING PLANE OF THE CRUSTACEAN MYSIDIUM GRACILE (DANA). RJanden Biol. Bull. Woods Hole, 1962, 122, 380-390 (Zool. Inst., Univ. Freiburg, W. Germany) Normally *M. gracile* swims in a plane orientated as nearly as possible perpendicular to the direction of light and gravity. Horizontal illumination induced swimming in a plane intermediate between the positions dictated by each of the stimuli*. The turning tendency due to the dorsal light reaction increased with increasing light intensity, while those due to the effects of light and gravity seemed to inhibit each other. G.J.Peakin

7084. SOME ESSENTIALS OF NEURAL MEMORY SYSTEMS. PAIRED CENTRES THAT REGULATE AND ADDRESS THE SIGNALS OF THE RESULT OF ACTION. J.Z.Young: Nature, Lond., 1963, 198, 626-630 (Dept. Anat., Univ. Coll., London, England) Investigation of the brains of *Octopus* and *Sepia* indicates that the tactile and visual centres have developed out of the simple taste-bite mechanism. Examination of the organisation by which they achieve their ends suggests hypothesis about learning systems. G.M.Lewis

7085. DELAYED RESPONSES IN OCTOPUS. P.N.Dilly: J. exp. Biol., 1963, 40, 393-401 (Dept. Anat., Univ. Coll., London, England) Octopuses were tested for their ability to perform delayed responses after varying delays and lesions. Normal animals delayed for 10 sec were capable of accurate performance without training. After delays of 20 or 30 sec. some learning is needed. Animals without vertical lobes or median superior frontal lobes, delayed for 30 sec. responded correctly. AJ.Martin

7086. EXCITATORY AND INHIBITORY PATHWAYS IN THE ARM OF OCTOPUS. C.H.F.Rowell: J. exp. Biol., 1963, 40, 257-270 (Dept. Zool., Makerere Univ. Coll., Kampala, Uganda) The nervous mechanisms of single sucker reflexes are contained in the ventral axial ganglion, and connect peripherally by mixed nerves. The medulla innervates the main arm musculature direct, not via the lat. nerve cords which control only the subdermal muscle layer. Normal chromatophore expansion requires a medullar supply. The final chromatophore nerves are controlled by excitatory and inhibitory fibres in the dorsal medulla. Their significance, and that of excitatory and inhibitory supplies to the sucker reflex mechanisms is discussed. A.J.Martin

7087. 5HT, THE PROBABLE MEDIATOR OF EXCITATION IN THE HEART OF MERCENARIA (VENUS) MERCENARIA.

EXPERIMENTAL ZOOLOGY

R.E.Loveland: Comp. Biochem. Physiol., 1963, 9, 95-104 (Biol. Lab., Harvard Univ., Cambridge, Mass., U.S.A.) When the cardio-regulatory nerves of M. mercenaria are electrically stim. the heart beat is normally inhib. but if stimn. is carried out after prior treatment with benzoquinonium, an ACh antagonist, excitation occurs. This excitation is mimicked by the addition of 5HT to the heart, and both actions are blocked by treatment with 1-methyl-d-lysergic acid butanolamide. No excitation occurs in prep* rendered tachyphylactic to 5HT. The alkaloid reserpine also effectively blocks the heart response to 5HT, treatment which also decreases the amount of 5HT in the cerebral ganglia of the animal. 5HT has never been isolated from the perfusate arising from the heart of M. mercenaria, after electrical stimn.

7088. ELECTROCARDIOGRAPHS AND OPERCULAR REACTIONS OF MARINE TELEOSTS PROVOKED BY LIGHT STIMULATION OR PRESENTATION OF AN OBJECT. R.Labat, C.Peyraud and A.Serfaty: J. Physiol., Paris, 1962, 54, 691-698 (Lab. Biol. animale, Fac. Sci., Toulouse, France) Shining a light at eye level is found to give a reflex inhibn. of cardio-respiratory rhythms, simult. decrease in heart rate and amplitude of opercular movement, mediated by the vagus nerve. This reflex is particularly marked in the pleuronectids, but less obvious in the non-homochromic fish, although the latter show an identical reflex to an object placed above the expt- tank.

(French) A-Angel

7089. DEVELOPMENT OF PHOTOTAXIS IN THE FROG RANA TEMPORARIA. W.R.A.Muntz: J. exp. Biol., 1963, 40, 371-379 (Univ. Oxford, Inst. Exp. Psychol., 1 South Parks Rd., Oxford, England) The development of phototaxis in the frog was studied by testing the behaviour of tadpoles at different stages of their development. The development of the retina at each stage was checked from histol. prep. Young tadpoles responded most strongly to green light. Gradually the no. of responses to green light decreased, while more responses were made to blue light, and also to darkness. The phototactic behaviour of frogs is probably mediated by a synergistic action of the green rods and the cones, which have an excitatory effect, and which are opposed by an inhibitory effect of the red rods.

A.J.Martin

7090. ABOUT A NUCLEUS SPECIFIC SYNAPTIC FORM IN THE NUCLEUS ROTUNDUS THALAMI OF THE LIP-FISHES. E.Horstmann: Z. Zellforsch., 1963, 59, 731-737 (Anat. Inst., Univ. Kiel, Germany) The glomera of the highly differentiated nucleus rotundus of the labridae contain at the end of nerve fibres, pre-synaptic star shaped formations whose further ramifications become lost in the neuropil of the glomera. This synaptic form is regarded as a nucleus as well as a family sp. characteristic

7094. DIFFERENCES IN REPRODUCTIVE POTENTIAL, FEEDING RATE AND LONGEVITY OF BOLL WEEVILS MATED IN FALL, AND IN FALL AND SPRING.

H.M.Taft, A.R.Hopkins and W.James: J. econ. Entomol., 1963, 56, 180-181 (Entomol. res. Div., Agric. Res. Serv., U.S.D.A., Florence, S.C., U.S.A.)

Weevils were collected during the spring, it being assumed that those laying viable eggs without spring mating, had mated during the previous fall. 8-20% ? weevils produced no eggs. Those not allowed to remate laid 50% fewer eggs but oviposition and pre-oviposition periods were similar. Feeding punctures were only 1*25 greater in paired than in separated ? groups. No significant longevity difference was noted.

H.W.Spencer

7095. EFFECTS OF FOOD, TEMPERATURE AND OVIPOSITION SITE ON LONGEVITY AND FECUNDITY OF ARMY CUTWORM [CHORIZAGROTIS AUXILIARIS].

K.P.Pruess: J. econ. Entomol., 1963, 56, 219-221 (Univ. Nebraska, N.Platte Expt. Stn., Lincoln, Neb., U.S.A.) The insect normally oviposits in the soil.

Longevity of test moths increased with decreased temp. Females survived best at 20° and 25° and died at 32°. Oviposition did not occur at 32° and was completed sooner at 20° than at 25°. Sand was preferred as an oviposition site. Food is not essential during the oviposition period in the fall except to prolong life during unfavourable laying conditions. After starvation under unfavourable oviposition conditions reproduction was completed more quickly than in the absence of these unfavourable conditions*

H.W.Spencer

7096. SOME ASPECTS OF MATING AND OVIPOSITION BEHAVIOUR OF CODLING MOTH, CARPOCAPSA POMONELLA. R.D.Gehring and H.F.Madsen: J. econ. Entomol., 1963, 56, 140-143 (Univ. California, Berkeley, Calif., U.S.A.) The moth can mate

within 12 hr. of emergence and mating occurs in laboratory tests independently of light conditions sitfit being probably unnecessary. The laboratory pre-oviposition period was 1 day and most eggs were laid on the 4th day

EXPERIMENTAL ZOOLOGY

689

and none after the 6th day. Black-light traps seem a more useful index of field populations than bait pans. In the field ♀ are less attractive to Rafter mating and only 15% mated more than once. Mated ♀ were distinguishable from virgins. Multiple matings were checked by counting the contained spermatophores per captured ♀.
H.W.Spencer

7097. FECUNDITY OF PLAICE FROM COASTS OF NORWAY. T.B-Bagenal: J. Mar. biol. Ass. U.K., 1962, 42, 105-112 (Marine Statn., Millport, Scotland) An analysis of plaice fecundity at 4 localities in Norway showed that, in general, these fish had more eggs than those in the North Sea or round the British Isles. Plaice fecundity was especially high in Trondheim Fjord.

MISCELLANEOUS

7110. A CODED WIRE IDENTIFICATION SYSTEM FOR MACRO-ORGANISMS. K.BJefferts, P.K.Bergman and H.F.Fiscus *Nature*, Lond., 1963, 198, 460-462 (Washington St. Dept. Fisheries, Seattle, U.S.A.) Pacific salmon (Oncorhynchus sp.) have been successfully tagged by implantation of a magnetically coded wire into the fish. It is estimated that fish tagged by this method can be detected in a channel as wide as 12 ft. providing instrumentation is present on both sides. J.R.Sargent

7111. MECHANICS OF THE LIGAMENT IN THE BI-VALVE SPISULA SOLIDISSIMA IN RELATION TO MODE OF LIFE. W.R. Hunter and D.C.Grant *Biol. Bull. Woods Hole*, 1962, 122, 369-379 (Dept. Zool., Univ. Glasgow, Glasgow, Scotland) The mechanical characteristics of the ligament of S. solidissima were investigated and compared with those of Mya arenaria. The differences found indicate that the ligament is the most important antagonist of the adductor muscles in S. solidissima and can be related to the modes of life of these 2 clams. The powerful ligament of Lutraria lutraria, a deep burrowing form like Mya, indicates its derivation from a mactrid like Spisula. G.J.Peakin

7112. EFFECT OF STANDARD COLD STORAGE AND CONTROLLED ATMOSPHERE STORAGE ON SURVIVAL OF LARVAE OF ORIENTAL FRUIT MOTH, GRAPHO-

LITHA MOLESTA. CG. Dust an: *J. econ. Entomol.*, 1963, 56, 167-169 (Canada Dept. Agric, Vineland Stn., Ont., Canada) Apples infested with eggs were kept in either a standard atmosphere [SA] at $32 \pm 1^\circ\text{F}$ and 95% RH or controlled atmosphere [CA] containing 3-5% CO₂ and at 38°F for 90 days. In SA young larvae did not survive 56 days, 22-5% survived 28 days while in CA a few survived 140 days and 2-6% survived 112 days. Using double wooden blocks to simulate apple boxes, 25+% larval cocoons (mostly non-diapause type) in SA and 27-3% in CA survived the conditions for 112 days, while 4-5% survived 140 days in CA. CA did not measurably affect larval mortality. H.W. Spencer

7113. MOSQUITOES: COMPARATIVE SEROLOGY OF FOUR SPP. OF AEDES (OCHLEROTATUS). A.E.R.Downe: *Science*, 1963, 139, 1286-1287 (Dept. Entomol., Kansas St. Univ., Manhattan, Kans., U.S.A.) Ag of ? adult A. communis (*DeG.*) A. punctor (*Kby.*), A. trichurus (*Dyart*) and A. excrucians (*Walk.*) compared by precipitin tests show a wider divergence than is indicated by external comparative morphology. G.M.Lewis

7114. EVOLUTION OF SOME FACTORS AFFECTING EFFICIENCY OF LIGHT TRAPS IN COLLECTING MOSQUITOES. A.R.Barr, T.A.Smith, M.M.Boreham and K.E.White: *J. econ. Entomol.*, 1963, 56, 123-127 (Bureau Venter Control, California Dept. Publ.Hlth., Fresno, Calif., U.S.A.) The following effects on mosquito attraction to traps were considered:- trap colour, screening, air movement in the trap, heat of the lamp and moonlight compared with light intensity. Aedes melanimon! Anopheles freeborni and Culex tarsalis mosquitoes were used. Trap colour had little effect. Horizontal screening reduced the no. of ? A. melanimon and vertical screening reduced the no. of all but cf of this sp. Trap air movement had no significant effect. Warm and cold lamps had no different effect on the trap catch. During full moon only ? of all 3 spp. showed differences with ref. to different bulb wattage (25 to 100 W) and always less than at new moon. H.W.Spencer

7115. THE PERMEABILITY OF THE CUTICLE OF PERIPLANETA AMERICANA (L) TO MALATHION. F.Matsumura: *J. insect Physiol.*, 1963, 9, 207-221 (Dept. Zool., Univ. Western Ontario, London, Ont., Canada) Three millicuries of 32p in terms of phosphoric acid was used to obtain radioactive malathion. The radioactive malathion in acetone was topically applied to the pronotum of P. americana. The rate of entry of malathion through the cuticle was found to deviate from the theoretical rate, especially at the beaming of penetration. This deviation was found to be mainly due to accumulation of malathion in the cuticle. If the absorbed malathion was removed by treating with hot water, the penetration of malathion could be explained by the diffusion theory. The Isolated protein from the cuticle can absorb malathion, which can become extractable to chloroform upon denaturation of the protein by trichloroacetic acid. It is suggested that absorption takes place mainly at the hot water-sol. portion of the cuticle which consists of protein. ttJ.WalJcer

7116. $^6\text{M}^1 \wedge I \wedge L ? ? 9$ W T H LAYERS TM LOCUST RUBBER-LIKE CUTICLE INFLUENCED BY AN EXTERNAL RHYTHM. A.C.Neville: *J. insect Physiol.*, 1963, 9, 177-186 (Zoophysiol Lab. B, Juliane Maries Vej, 36, Univ. Copenhagen, Denmark) Expt. verified daily growth layers have been found in both rubber-like

EXPERIMENTAL ZOOLOGY

691

and solid cuticle of *Schistocerca gregaria*. During night conditions, a wide brightly fluorescent zone is laid down; during day conditions, a thin faintly fluorescent zone is deposited. Three days* deposits are formed in the pharate adult prior to emergence. Then one pair of layers is added daily until the rubber-like cuticle is fully grown. Daily growth layers are of no mechanical significance in resilin, which is a mechanically isotropic material. Expt. prolonged days and nights produced correspondingly wide faintly or brightly fluorescent zones in which the characteristic daily zonation of control conditions had been suppressed. Daily growth layers appear to be a general characteristic of the exopterygote skeleton.

R.J. Walker

7117. STUDIES ON THE TOTAL HAELOCYTE COUNT AND HAELOLYMPH VOLUME IN PERIPLANETA AMERICANA (L.) WITH SPECIAL REFERENCE TO THE LAST MOULTING CYCLE. R.E.Wheeler: *J. insect Physiol.*, 1963, 9, 223-235 (Dept. Entom., Univ. Maryland, College Park, Md., U.S.A.)

The haemolymph of *P. americana* during the last moulting cycle was studied quant. in relation to haemolymph coagulability, haemolymph vol., total haemocyte counts, and differential haemocyte counts. The haemolymph coagulates about 13 times faster in last-stage moulting larvae and in newly ecdyed adults than in intermoult larvae and in adults over 1 hr. old. The relative no. of circulating haemocytes [THC] varies 8[#]-6-fold during the last moulting cycle. The THC increases prior to ecdysis, abruptly falls at ecdysis, and remains about die same for 24 hr. These changes are related to haemolymph vol. Injections of *Bacillus subtilis* into last-stage moulting larvae did not affect their normal THC or haematocrit for 24 hr. The mean abs. no. of circulating haemocytes during the last moulting cycle ranges from 9 to 13 million cells. This value remains approx. the same in intermoult, moulting larvae and in newly ecdyed adults. 24 hr. after ecdysis the absolute count decreases, while the THC remains about the same as at ecdysis. It is suggested that the changes in the THC during moulting can be accounted for by cyclic changes in haemolymph vol. and/or selective adhesion of cystocytes to tissue and/or destruction of these cells.

R.J.Walker

7118. THE EFFECT OF COLD ON PRE- AND POST-DIAPAUSE EGGS OF GRYLLUS PENNSYLVANICUS BURMEISTER (ORTHOPTERA: GRYLLIDAE).

fcRakshpal: *Proc. roy. ent. Soc. Lond. A*, 1962, 37, 117-120 (Dept. Zool., Univ. Lucknow, India)

Pbst-diapause eggs can withstand chilling to 6-7° with only slight detrimental effects. Pre-diapause eggs chilled on the first day after hatching, die, but if chilling is postponed, they withstand cold to a greater degree and continue developing at 6-f until they reach diapause. The Physiol. effects of chilling is to make the yolk more assimilable. . D.M.S. Perkins

7119. THE MESOSTERNAL BODIES [MB] ON ACRIDOIDAE. J.G.Thomas: *Proc. roy. ent. Soc. Lond. A*, 1962, 37, 107-113 (Roy. Holloway Coll., Englefield Green, Surrey, England)

Adult, nymph and embryonic stages were studied in 7 spp. of grasshoppers and locusts. MB are*small paired structures inside the mesothorax ventrally, attached by their epithelium to the 2nd spina (an internal projection of the integument) and sometimes to certain thoracic muscles. They are oval flattened bodies, mainly cuticular, formed of concentric lamellae^b Jd surrounded by an epithelium. Probably a new layer^c of cuticle is added at each ecdysis. MB were formerly

thought to be glandular in function but the present histol. studies makes this improbable. Alternative functions are discussed, whether they are proprioceptors, gravity receptors or merely vestigial apodemes. None have been found in non-Aridoid Orthoptera. D.M.S.Perkins

7120. ARTIFICIAL SELECTION FOR WEIGHT AND ITS CONSEQUENCES IN TENEBRIOS MOLITOR L.

J.LeClercq: *Nature*, Lond., 1963, 198, 106-107 (Lab. Zool. G\$., Inst. Agronomique de l'Etat, Gembloux, Belgium) A population of *T. molitor* was selected for small and large pupal wt., thereby producing 2 strains, which were found to differ significantly also in growth rate, size, resistance and fecundity. The results are discussed in relation to theories of natural selection.

G.M.Lewis

7121. SCENT-GLANDS OF LAND-BUGS [HEMIPTERA] THEIR PHYSIOLOGY AND BIOLOGICAL FUNCTION.

H.Remold: *Nature*, Lond., 1963, 198, 764-768 (Inst. Zool., Univ. Munich, Germany). G.M.Lewis

7122. CYANOGENIC GLANDULAR APPARATUS OF A MILLIPEDE. T.Eisner, H.E.Eisner, J.J.Hurst, F.C.

Kafatos and J.Meinwald: *Science*, 1963, 139, 1218-1220 (Dept. Entomol., Cornell Univ., Ithaca, N.Y., U.S.A.) The cyanogenic secretion of *Apheloria corrugata* is discharged from paired, serially arranged glands consisting of 2 compartments, one storing an undissociated cyanogenic compound, possibly mandelonitrile, and in the other, a chem. factor which triggers cyanogenesis. The contents of the 2 compartments are mixed at the time of discharge. G.M.Lewis

7123. ON BEHAVIOUR OF BARNACLES. IV. INFLUENCE OF TEMPERATURE ON CIRRAL ACTIVITY AND SURVIVAL OF SOME WARM-WATER SPECIES.

A.J.Southward: *J. Mar. biol. Ass. U.K.*, 1962, 42, 163-177 (Lab., Citadel Hill, Plymouth, England) Temp. ranges over which the cirri were active, and the freq. of beating at different temp., were measured in *Cthamalus depressus*, *C. stellatus*, *Balanus eburneus* and *B. amphitrite* var. *denticulata*. Irritability or survival at nigh temp. was assessed in these spp. and in others from Trinidad.

P.J. Baron

7124. ABSORPTION AND EXCRETION OF COPPER ION DURING SETTLEMENT AND METAMORPHOSIS OF THE BARNACLE, BALANUS AMPHITRITE NIVEUS.

F.J.Bernard and CE.Lane: *Biol. Bull. Woods Hole*, 1961, 121, 438-448 (Inst. Marine Sci., Univ. Miami, Fla., U.S.A.) The sites of Cu storage were identified in the barnacle cyprids and it was concluded that it is absorbed through the permeable surfaces of the body coincidentally with other ions, particularly Ca. The excess was excreted by the epithelia of the hind gut. Cu deposits were absent from decorticated settlers and young adults. Exposure to media of high Cu concn. resulted in an increased rate of elimination from the gut epithelium. G.J.Peakin

7125. OBSERVATIONS ON ORMER [HALIOTIS TUBER-CULATA L] POPULATION OF GUERNSEY. G.R.Forsten J. Mar. biol. Ass. U.K., 1962, 42, 493-498 (Lab., Citadel Hill, Plymouth, England)

It is suggested that the short larval life of 2 days prevents *Haliotis* from extending its range naturally. The average no. of ormers found by diving between 0-5 fathoms below low tide mark was 2[#] 4/m.². P.J.Baron

EXPERIMENTAL ZOOLOGY

7126. EFFECTS OF WATER OF REDUCED SALINITY ON VERTICAL MIGRATION OF ZOOPLANKTON. J. Lance: J. Mar. biol. Ass. U.K., 1962, 42, 131-154 (Dept. Zool., Univ., Hull, England) In an investigation of 6 copepod spp. and one larval decapod sp. it was shown that salinity discontinuity layers had a marked effect on vertical migration. A single discontinuity layer formed by placing less dense diluted sea water over full strength sea water acted as a barrier to animals attempting to swim toward the surface of an expt. water column. Homogeneous columns of reduced salinity depressed the swimming activity of copepods. P.J. Baron

7127. COMPARATIVE STUDIES OF LUMINESCENCE IN COPEPODS AND OTHER PELAGIC MARINE ANIMALS. G.L.Clarke, R.J.Conover, C.N.David and J. A.Nicol: J. Mar. biol. Ass. U.K., 1962, 42, 541-564 (Lab., Citadel Hill, Plymouth, England) Comparisons were made between several spp. of luminous copepods*. Photoelectric recordings were made of flashes produced by electrical and mechanical stimm. The flashes lasted from 2-37 sec. Latency and intensity of the flashes were also studied. An investigation of the luminous glands and areas was made. Some measurements of luminescence in other pelagic animals are given and the present state of knowledge regarding luminescence in copepods is reviewed. P. J. Baron

7128. DISTRIBUTION OF SOME PLANKTON ANIMALS IN ENGLISH CHANNEL AND APPROACHES. II. SURVEYS WITH GULF m HIGH SPEED SAMPLER, 1958-60. A.J.Southward: J. Mar. biol. Ass. I*K., 1962, 42, 275-375 (Lab., Citadel Hill, Plymouth, England) Fifteen cruises were made between latitude 2T and S° W and longitude 48* and 52° N. Results for larger or commoner macroplankton animals are in the form of sets of contoured maps for each cruise and accompanying maps show salinity and temp. data. The indicator concept has been revised to take more account of north-south differences and oceanic-neritic effects. P.J.Baron

7129. CAN IMMUNOELECTROPHORESIS OF MOLLUSC ANTIGENS SOLVE CERTAIN PROBLEMS IN THEIR TAXONOMY? P.Tranvany, F.Rose and F.Laudé: OR. Acad. Sci., Paris, 1962, 255, 366-367 (Lab. de Parasitol., Fac. de Med. et de Pharm., Lille, France) Ag soln. were prep. from the lyophilised whole bodies of the molluscs Australorbis glabratus (Say, 1818) (Brazilian strain), Planorbis corneus a., 77S\$, Limnea palustris (Muller, 1774), L. stagnalis (L. 1758), L. limosa (L. 1759). Antisera were obtained from A. glabratus, P. corneus, L. palustris and L. stagnalis by weekly s.c. injn. for 16 weeks. Immunoelectrophoretograms were made for die standard Ag against each antiserum*. A correlation between similar immunol. prop. and closeness of classification was observed. (French) S.A.Thistlewood

7130. APERTURAL LAMELLAE, EPIPHRAGMS AND AESTIVATION OF PLANORBID MOLLUSKS. C.S. C.S.Richards: Amer. J. trop. Med. Hyg., 1963, 12, 254-263 (Puerto Rico Field Stat., U.S.Dept. Hlth., San Juan, Puerto Rico) The occurrence of six apertural lamellae in Australorbis glabratus and 3 spp. of Tropicorbis was studied. In laboratory cultures both lamellate and non-lame llate offspring without intermediate forms, were derived in a single clutch from either a lamellate or non-lamellate parent. A.A.Zimmerman

7131. COLOURS OF OPHIOCOPINA NIGRA (ABILD-GAARD). I. COLOUR VARIATION AND ITS RELATION TO DISTRIBUTION. II. OCCURRENCE OF MELANIN AND FLUORESCENT PIGMENTS, in. CAROTENOID PIGMENTS. A.R.Fontaine: J. Mar. biol. Ass. U.K., 1962, 42, 1-8, 9-31, 33-47 (Dept. Biol., Victoria Coll., Victoria, B.C., Canada) I. Observations on 2 geographically distinct populations of O. nigra showed that body colour ranges in a continuously graded series from black to orange-yellow*. There is a distinct difference in the range and tone of colouration which each population displays and this may be correlated in some degree with differences in the colour tone of the substratum. As depth increases, so does the incidence of light coloured phases in each population.

II. The solubility, oxidation-reduction, fluorescence and other chemical prop. of the pigment, of O. nigra, indicate that it is a true melanin. Visible colour produced by the melanin depend on its state of oxidation in the integument, fully oxidised pigment being dark brown and partially reduced pigment fawn coloured. The anatomy of the melanin-containing cells is described.

III. Red to orange-yellow colours of O. nigra are due to carotenoid pigments contained in specialised lipocytes. The major pigments detected were:- 8-carotene, an acid carotenoid similar to mytiloxanthin, and four xanthophylls of uncertain identity. New organs (vertebral pigment spots) were found on the aboral surfaces of the vertebral ossicles. P.J. Baron

7132. BACTERIAL INFECTION AND REACTION TO INJURY IN SOME ECHINODERMS. F.B.Bang and A.Lemma: J. insect Path., 1962, 4, 401-414 (Dept. Pathobiol., Sch. Hyg. and Public Health, Johns Hopkins Univ., Baltimore, Md., U.S.A.) The coelomic fluid of healthy Asterias forbesi when removed aseptically was sterile; while that removed aseptically from animals undergoing autotomy, from animals that had been traumatised dermally, from animals collected from stagnant water, or from animals showing muscular weakness and sluggish movement, contained bacteria. Healthy A. forbesi when kept in stagnant water developed bacterial infection, while expt. induced bacterial infection could be eliminated within 12 hr. of return to running water. Temporary aggltn. of amoebocytes was induced by bacterial infection, by surface trauma, and by the injn. of foreign substances into the coelom. Injn. of extracts of amoebocytes produced the strongest reaction and resulted in oedema. R.J. Walker

7133. THE BIOLOGY OF ASCIDIA NIGRA (SAVIGNY). I. SURVIVAL AND MORTALITY IN AN ADULT POPULATION. I.Goodbody: Biol. Bull. Woods Hole, 1962, 122, 40-51 (Dept. Zool., Univ. Coll. West Indies, Jamaica) A population of A. nigra was studied throughout its life. A. nigra is a primary coloniser and when colonising a new surface the* earliest settlers survive longest and after three months very few animals are able to settle. Mortality was not high for 18 months after initial colonisation but all the population was dead after 22 months. G.J.Peakin

7134. SWIMMING SPEEDS OF PLAICE LARVAE. J.S.Ryknd: J. exp. Biol., 1963, 40, 285-299 (Fisheries Lab., Lowestoft, England) Swimming speeds attained by hatchery reared larvae of the plaice, Pleuronectes platessa L. were demonstrated using two methods; timing swims over a measured distance in a tank, and allowing larvae to swim a current flowing through a long glass tube*

The design of collecting gear for use at sea is discussed. Only a highspeed townet, with a towing speed about 10 times that attainable by the largest larvae (about 20 cm./sec.) and giving almost no warning of its approach, can be considered to collect a quant, balanced sample.

A.J.Martin

7135. FREEZING RESISTANCE IN SOME NORTHERN FISHES. M.S.Gordon, B.H.Amdur and P.F.Scholander. Biol. Bull. Woods Hole. 1962, 122, 52-62. (Dept. Zool., Univ. California, Los Angeles. Calif., U.S.A.)

Super cooling and org. antifreeze compounds in the blood were found in specimens of Myrophis cephalorus, the scolpin and Gadus oseac, die fjord cod Trom Labrador. These fish were resistant to freezing, even though seeded with ice. Non-arctic populations of the scolpin and the tomcod, Mirimp-ariik tomcod, a close relative of me fjord cod, lacked this resistance to freezing when supercooled and also the antifreeze substances. The tomcods, when exposed to low temp., showed an increase in plasma non-protein nitrogen content like the fjord cod and it seems that a compound of *ibis* type acts as the anti-freeze. The nature of this substance in the scolpin is unknown.

G.J.Peakin

7136. A MAJOR ABNORMALITY OF THE VENOUS SYSTEM OF THE FROG- MJ.Parn. Nature, Lond..

A specimen of Rana temporaria with no left ant. vena cava is reported. G.M.Lewis

7137. A COMPARATIVE ANALYSIS OF NEST STRUCTURE IN THE WEAVER BIJK-OCEINAE. J.H.Crook. Ibis. 1963, 105, 238-262 (Def Psychology. Bristol. England) An analyse of nest struc

and correlations with environmental factors such as wind and predation. An evolutionary trend towards more

elaborate nests that enable spp. to exploit marginal environments is suggested. The nest-building behaviour of Malimbus rupicola, which 'prepares' nest material before bringing it to the nest, is described.

S.J.Davies

7138. TEMPERATURE ADAPTATION OF ISOLATED MAMMALIAN CELLS. E.D.Skholl^f: Tsitologii, 1962, 4, 562-565. The effect of O₂ within a certain temp. range, corresponding to the temp. of warm-blooded animals, on isolated rat muscle, was to promote temp. adaptation, resulting in increased duration of retention of excitability. At the same time there was intensification of synthesis of protoplasmic proteins. (Russian) B.J. Cooper

7139. OBSERVATIONS ON THE RANGE AND MOVEMENTS OF A WOODLAND POPULATION OF THE COMMON SHREW SOREX ARANEUS L. J.F.Shillito. Proc. zool. Soc Lond., 1963, 140, 533-546 (Dept. Zool., Univ. Exeter, England) Marking, release and recapture technique has been used to study the range of movements of common shrews. The ranges of the juvenile and subadult shrews was very limited but some dispersed up to 119 metres. The range of breeding 2 was slightly greater than that of juveniles. Males were found to move over the greatest range especially in the spring when ranges of up to 144 metres were recorded. These ranges are on the average somewhat less than the ranges of the short tailed shrew Blarina brevicauda*.

D.N.Wheatley

7140. AGE OF WEANING IN TWO SUBSPECIES OF DEER MICE. J.A.Kingi-J.CDeshaines and R. Webster: Science, 1963, 139, 483-484 (Dept. Zool., Michigan St. Univ., East Lansing, Mich., U.S.A.) The weaning age for Peromyscus maniculatus bairdii was 18 days, and for P. maniculatus gracilis, 24 days. Age and food consumption were better predictors of the weaning condition, as defined in terms of wt. change with isolation, than body wt.

G.M.Lewis

- Tissue mechanism of adaptation of animals to lowered oxygen content of environment. N.A.Verzhbinskaya, 582;
- Motor-activity of intact animals under conditions of artificial gravity. E.M.Yuganov, P.K.fckakov, LI. Kas yan, D.V.Afanase'ev and G.I.Pavlov, 589.

REVIEW ARTICLES

7156. INTERNATIONAL REVIEW OF CYTOLOGY, 1963, 1*.

- Inhibition of cell division: a critical and experimental analysis. S.Gelfant, 1-39; Electron microscopy of plant protoplasm. R.Buvat, 41-155; Cytophysiology and cytochemistry of the organ of Corti: a cytochemical theory of hearing. J.A.Vinnikov and L.K.Titova, 157-191; Connective tissue and serum proteins. ftE.Mancini, 193-222; The biology and chemistry of the cell walls of higher plants, algae and fungi. D.H.Northcote, 223-265; Development of drug resistance by staphylococci *in vitro* and *in vivo*. M.Barber, 267-279; Cytological and cytochemical effects of agents implicated in various pathological conditions: the effect of viruses and of cigarette smoke on the cell and its nucleic acids. C-Leuchtenberger and R.Leuchtenberger, 281-326; The tissue mast cell. D.E.Smith, 328-386.

7157. INTERNATIONAL JOURNAL OF VITAMIN RESEARCH, 1963, 33, 3.

- The influence of radioactive strontium on the course of *halalifl* of experimental rickets in rats treated with vitamin D₂. T.Giza, M.Hanicka, N.Hormik, A.Jelonek and H.Rembiesa, 227; Studies on the absorption of different forms of vitamin A in young chicks. O.R.Braekkan, 234; Studies on the metabolism of α, 3. V^α and 6-tocopherol in the rat. H-Schmandke, L.Kaludin and H.-A.Ketz, 254; The effect of fluorescent light on the vitamin A and carotene content of milk. S.P.Sinha, 262; Determination of pyridoxine and pyridoxal in blood and serum. J.Jaroslav, 268; The effect of cooking on α-tocopherol in vegetables. V.H.Booth and M.P.Bradford, 276; The isomerisation of vitamin A in chicks. O.R.Braekkan, 279*; The mode of absorption of vitamin A in chicks. O.R.Braekkan, 293; The effect of liquid paraffin on the utilisation of carotene and vitamin A. R>Tarjan and M.Kramer, 304; The biosynthesis of vitamin B₁₂ and other vitamins of the B group in a chromogenic bacterium isolated from cheese. R.Karlin, 311; The effect of antimetabolites of selected B vitamins on experimental dental caries in the rat. S.Dreizen, CN.Spirakis and R.E.Stone, 321.

7158. JOURNAL OF ENDOCRINOLOGY, 1963, 27, No.3. Proceedings of the Society for Endocrinology-

Protein binding of hormones.

- Thyroxine-binding by serum proteins. J.R.Tata, 1J Supply of thyroid hormone to the foetus. N.B.Myant, 1-3; Insulin binding. K.W.Taylor, 3-5; Binding of endogenously secreted insulin in experimental animals by injected insulin antibodies. P.H.Wright, 5; Protein-binding of cortisol. I.H.Mills, 5-6; Determination of the binding capacity of corticosteroid binding protein. D.L.Schatz and C-Osorio, 6-7;

Physiological significance of the adsorption of corticosteroids to protein. D.Bellamy, 7-8.

7159. JOURNAL OF HISTOCHEMISTRY AND CHEMISTRY, 1963, 11.

Symposium at the 13th Annual Meeting of the Histological Society.

- Polysaccharides of connective tissue. A.Dorfman, 2-13; Morphological aspects of extracellular polysaccharides. H.S.Bennett, 14-23; Quantitative approaches in the histochemistry of mucopolysaccharides. J.A.Szirmai, 24-34; Mucopolysaccharides of the arterial wall. F.T.Zugibe, 35-39.

7160. PHARMACOLOGICAL REVIEWS, 1963, 15, 2.

- Antituberculosis drugs. J-M.Robson and F.M.Sullivan, 169; Supersensitivity and subsensitivity to sympathomimetic amines. U.Trendelenburg, 225; Generation and conduction of impulses in the heart as affected by drugs. W.Trautwein, 277; The pharmacology of central and peripheral inhibition. D.R.Curtis, 333; Chemical suppression of the immune response. G.H.Hitchings and G.B.Eliot, 365; Chemotherapy of viral diseases. P.W.Sadler, 407*

7161. PROGRESS IN ALLERGY, 1963, 7.

- The hereditary human Y^gglobulin (Gm) groups: interpretations and extensions. H.Fudenberg, 1; Y-Globulin and molecular mechanisms in hypersensitivity reactions. K.Ishizaka, 32; Organ specificity with special reference to the lens. S.P.Halbert and W-Manski, 107; Induced synthesis of histamine, microcirculatory regulations and the mechanisms of action of the adrenal glucocorticoid hormones. R>W.Schayer, 187; Immunologic aspects of the mycoses. S.B.Salvin, 213.

7162. THE QUARTERLY JOURNAL OF MEDICINE, 1963, 32, 127.

Mononeuritis multiplex in polyarteritis nodosa.

- S.S.Bleehen, R.E.Lovelace and R.E.Cotton, 193; Primary peri-reticular ('Typical') amyloidosis in Israel, its relation to familial mediterranean fever. E.Sohar, J.Gafni, A.Blum, M.Pras and H.Heller, 211; Catecholamine excretion in normal persons and in cases of phaeochromocytoma. R.B.Hunter, P.B.Marshall and F.J.Oram, 225; Megaloblastic anaemia due to nutritional deficiency of folic acid. K.R.Gough, A.E.Read, C.F.McCarthy and A.H.Waters, 243; Farmer's lung; studies of pulmonary function and aetiology. J.M.Bishop, S.C.Melnick and J.Raine, 257*

7163. REVIEW OF CANADIAN BIOLOGY, 1963, 22, 1.

- The kidney-parathyroid axis and expt. cutaneous calcinosis. M-Cantin, 1;
