INTERNATIONAL ABSTRACTS of BIOLOGICAL SCIENCES

Supported by The Physiological Society, The Biochemical Society, The Society for Endocrinology
The Pharmacological Society, The Nutrition Society, The Association for the Study of
Animal Behaviour, The International Association for Dental Research (British Division)
The Society for Experimental Biology, The Genetical Society, British Society for Immunology and
The Society for the Study of Human Biology

1963

VOLUME 31

Hon. Editor
C. C. N. VASS

Executive Editor and Indexer
V. BOLINGBROKE, B.A.

Hon. Published
and Business Manager
ROBERT MAXWELL

I. D. FARRELL, B.Sc.

Editorial and Indexing Assistants
D. M. S. PERKINS, B.Sc., A.R.C.S.

I. SQUIRES, B.Sc.

I. M. SMITH, B.Sc.

C. E. SMITH, B.A.

Administrative Secretary : Miss M. GLANFIELD,

Editorial Board

Chairman : C. C. N. VASS

- J. W. BRADBEER (Experimental Botany).
R. D. BUTLER (Genetics and Cytology).
P. N. CAMPBELL (Biochemistry).
A. F. COBBOLD (Physiology).
B. CRUICKSHANK (Immunology, Experimental Pathology).
J. W. S. HARRIS (Anatomy).
G. D. HUNTER (Biochemistry).
G. A. KERKUT (Experimental Zoology).
G. M. MITCHELL (Pharmacology).
L. M. ROITT (Biochemistry).
H. Y. SPENCER-BOOTH (Animal Behaviour).
C. G. A. THOMAS (Microbiology).
C. P. WALLIS (Odontology).

LIST OF ABBREVIATIONS	120
ERRATA	122

The sign f after abstract numbers signifies that the abstract consists of a title only.

INTERNATIONAL ABSTRACTS OF BIOLOGICAL SCIENCES

NOTES TO INDEX. VOLUME 31

Entries are grouped under keywords (i.e. names or concepts under which information is most likely to be sought). Keywords are printed in heavy type and referred to as "bold headings" in cross-references. Generally choice of keyword is based on titles only but, where titles do not adequately represent the scope of the work, further selections are made from the body of the abstract.

The index is mainly alphabetic but under headings dealing with complex subjects a general section (alphabetically arranged) is followed by bold type subsections which may have the main keyword repeated, e.g. :—

Muscle
general entries
Muscle apparatus & techniques
Muscle contraction
general entries
skeletal
smooth
Muscles, specific [where named muscles are listed].

CROSS-REFERENCES are as full as possible but are not given where the choice of heading is reasonably evident. Thus, names of individual bones, muscles, nerves etc. are listed under **Bones**, **Muscles**, **Nerves**, and not **Tibia**, **Soleus**, **Sciatic**. All enzyme studies are grouped under **Enzymes**: here sections dealing with concepts of general biochemical and physiological interest (e.g. **Enzyme biosynthesis**) are followed by a section listing specific enzymes, their classification and nomenclature being based on the "Report of the Commission on Enzymes of the International Union of Biochemistry" (e.g. aldolase will be found under **Enzymes, specific, lyases**).

CHEMICAL SUBSTANCES. *Organic compounds* are indexed either under the principal substituted group (e.g. 2-amino-6-mercaptopurine under **Purine analogues**) or alphabetically under the name of the first substituent group (e.g. **Sulphamethoxypyridazine**). Some prefixes have been alphabetically ignored in accordance with the conventions laid down by The Chemical Society, 1959, e.g. *cis*-, *trans*-, *o-t* *m-t* mono-, di-, DL-. *Drugs* are indexed under their G.M.C. approved names and cross-referred from chemical and alternative names. Group headings based on chemical composition or physiological action are used extensively (e.g. **Antibiotics**, **Barbiturates**, **Cholinergic agents**, **Tranquillisers**). *Inorganic compounds* are indexed under group headings (e.g. **Electrolytes**) and under individual elements/ions (e.g. **Carbon**, **Fluoride**, **Sodium**).

DISTURBANCES IN FUNCTION (both experimental and pathological) are grouped in special sections under organs and systems concerned (e.g. **Liver disorders**).

ORGANISMS have been indexed in two ways:—

(1) in the general Subject Index under the names of the major groups of organisms. Here there are references to the general biology of the group and also to specific organisms where these are mentioned by their common names in the abstracts, e.g. monkeys will be found under **Mammals**. The chief group headings used are :—

- | | |
|------------------------------|--|
| (a) for Micro-organisms .. . | Bacteria , Bacteriophages , Micro-organisms , Protozoa ,
Viruses , Yeasts . |
| (b) for Plants | Algae , Lichens , Fungi , Bryophytes , Pteridophytes ,
Gymnosperms . Angiosperms are covered by various
Plant headings which also contain references to the
biology of other green plants. |
| (c) for Animals | The phyletic names, or in the case of Arthropods and
Vertebrates, the class names. |

Occasionally it is necessary to use wider headings, e.g. **Aquatic organisms**; **Invertebrates**. Other headings relating to living organisms include **Species comparisons** and **Laboratory animals**.

(2) in the Taxonomic Index which follows the general subject index. Here organisms are indexed under their Latin names. This index is in three parts, Bacteria, Plants, and Animals. It is preceded by a systematic key to the included genera and also by further explanatory notes.

INDEX OF SUBJECTS

INTERNATIONAL ABSTRACTS OF BIOLOGICAL SCIENCES

1963

Volume 31

A.

Abdomen (see also **Peritoneal cavity**; named viscera, e.g. **Gastrointestinal tract**; & **Surgery**), abdominal aura, in epilepsy, 1967. ?xpt. ova implantation in, 2682.
Abra-abdominal pressure, cy. effects, 4431.
Abortion. Refer to **Pregnancy**, interruption; & **Brucella abortus** in Taxonomic index.
Absorption,
V organisms, tissues, organs & systems. See individual headings, e.g. **Bacteria**; **Gastrointestinal tract**; **Boots**.
o* sp. substances. See named substance or group, e.g. **Drug absorption**; **Electrolytes**; **Glucose**.
Absorption spectra. See **Spectra**; **Spectroscopy**.
K⁺-²⁺-cides. Refer to **Arachnids**, anti-agents,
Talasia. See **Heredity abnormalities**.
Acceleration g (see also **Centrifugation**; for geotropic studies refer to **Taxes & tropisms**); Jnimal motor activity during (title 43), 7155. tolerance to, hypothermia as related, 1775.
Tolimatinase. Refer to **Adaptation**.
Naphthalene. See **Hydrocarbons**, aromatic polycyclic.
Aldehyde (see also **Aldehydes**), action on carotid chemoreceptors, 6466. active (a-hydroxyethylthiamine), in plant tissue (title 12), 5038. Metabolism by brain in vivo, 3511.
Alamide,
I¹³¹-O-. See **Iodoacetamide**.
A¹⁰-O-. See **Thioacetamide**.
Acetate & **acetic acid** (see also **Acetyl CoA**; **Coenzyme A**; **Fatty acids**; **Lipids**), acetic anhydride, glycerol deriv. boiling in, 222 f. Aversion to: carotenoids & phytol, 3446; **Pyridine ring of nicotine**, 890. **deprivation & repletion**, *Euglena*, 869, 5629. formation» *Ustilago COCCUS* Sp., OO*. "Corporation (into cholesterol, fatty acids & jteroids, refer to **Cholesterol**; **Fatty acids**; **gryps**), into lipid & protein, muscle prep., 551. **abolism**: by isolated perfused udder, 5181; J³-Alligator, 147; in sheep, 5231; in *Tetrapoda*, 3925. stimm. of *Selenomonas* growth, 3852.
Acetazolamide (diamox). See **Carbonic anhydrase inhibitors**.
C₁ ad. See **Acetate** & **acetic acid**.
C₁ hydride, glycerol deriv. changes in, 222. C₁ i Acetoacetyl CoA. See **Ketone bodies**.
ketone: formation from pyruvate, uraemic patients, 999; metabolite of ethanol, 5775. ketone or metabolic aspects* see **Ketone bodies**, addition cpd. with frozen NAD, 2973. effects on serum lactic dehydrogenase, 5649. ketone, cigarette smoke constituent, 5646. **Acetylaminofluorene**. See **Amides**, aromatic, **Acetylation**. See **Acetyl groups**. S₁ **auridine** See **Purine** * **pyrimidine** **riboflavin**.

Acetylcholine (see also **Cholinergic** headings; **Neurohormonal mechanisms**), analogues, JV-alkyl-, rat brain AChase action on, 595. cardiovascular effects: atropine modification, 4046; A-V block, K inhibitor, 4361; in thiamine deficiency, 6235. conduction block, in cetrime-treated nerves, 6236. conformation, 6234. desensitisation of molluscan cholinergic receptors, 4981. effect on: axonal conduction, normal & venom-treated, 6530, 6532; brain phospholipids, 2832, 5248; phosphoproteins, seagull, salt gland, 3107t. end-plate action: drug effects, 4034; membrane conductance changes, 1928-9. in brain: during activity, 6560; extraction, 3106t, 3108t; synaptic vesicles, 4484. in sea urchin pedicellariae, 2576. in tunicates, 2577. induced catecholamine release, adrenal medulla, 4058. induced convulsions, & cond. responses, 1960. interaction with electric organ protein, 3974. medullary neurone sensitivity, 6545. release, brain, 1985. role in: non-myelinated nerve conduction, 4026; sympathetic ganglion transmission, 4446-7, 4449. spasmogenic effect: ATP enhancement, 6620; lysolecithin inhib., 4151; vit. B₁ action on, (title 4) 5044. sympathomimetic effect, cat spleen, 4451-2. **Acetyl CoA** (see also **Acetyl groups**, acetylation; **Acyl CoA**), liver content in ketosis, 543. **Acetyl digoxin**. Refer to **Glycosides**. **N-Acetyl dopamine**. See **Catecholamines**, dopamine. **Acetylene**; **poly Acetylenes**. See **Hydrocarbons**, aliphatic. **Acetyl galactosamine**; -glucosamine; -hexosamine. Refer to **Amino sugars**. **Acetyl groups** (see also **Acetate**; **Acetyl CoA**;
Acyl groups), acetylation: collagen & gelatin cross-linking during, 382 f.; of hexosamines, epiphyseal cartilage, 5216. **Acetyl hydroxamates**, paper chromatog., 3543. **Acetyl-/-methyl choline** (methacholine). Refer to **Cholinergic agents**. **A'-Acetylneurameric acid** (sialic acid). See **Neuraminic acids**, A'-acetyl. **Acetylphenylhydrazine**. See **Phenylhydrazine**. **Acetyl phosphate**, enzymic utilisation, 2859. **3-Acetyl pyridine**. See **Nicotinamide** & **nicotinic acid**, analogues. **Acetyltetraglycine ethyl ester**, solubility, denaturing agents effects, 5326. **Achlorhydria**. See **Gastrointestinal tract disorders**. **Acid-base balance** (see also **Blood gases** & **pH**; **Electrolytes**, balance; **Hydrogen ion concentration**, **Kidney function**; **Respiration**), relationship with serum Ca & tetanic symptoms in uraemia, 3342. **imbalance**, acidosis & alkaloisis, effects on hypo-oxia resistance, mice, 1871.

Acid base balance, imbalance, acidosis: in CO poisoning, 4213; in uraemia, 3342; metabolic, during operation, 1843; respiratory (a) expt., 108, 4398, 6517, (b) O₂ admin. during, 4349. alkaloisis, expt., effects on neuromuscular blocking agents action, 6229. expt. O₂ tension—satn. changes in, 6477. **Acidosis**. Refer to **Acid-base balance**. **Acids** (see also named individual & grouped org. & inorg. acids, e.g. **Carboxylic acids**; **Fatty acids**; **Succinic acid**; **Hydrochloric acid**; & **Hydrogen ion concentration**), qft* "2, *J* A aromatic, paper chromatog., detection, 5801. effects on poliovirus, 1445. in grasses, 6987. particulate, in town air, 8529. **Acinar cells**. Refer to **Pancreas**. **Aconitine**, -induced atrial fibrillation, 6284. -induced pulmonary oedema, 1328. **Acridine dyes**. Refer to **Dyes**. **Acridavine**, mutagenic action, 2338, 6016. **Acromegaly**. Refer to **Pituitary disorders**. **Aorylate** & **acrylic acid** & deriv. (see also **Cytology**, **histology**, techniques; **Synthetic materials** & individual cpd.), poly-a-amino-, synthesis, 293 f. **Actidione** (cycloheximide). Refer to **Antibiotics**. **Actin**. See **Muscle**, **contractile proteins**. **Actinic elastosis**. See **Skin disorders**. **Actinomycin**; **Actinospectacin**. See **Antibiotics**. **Actinophages**. See **Bacteriophages**. **Active transport** (see also specific substances; & -composition & metabolism subsections of tissues, organs etc.), theory of, 6458. transcellular, model for, 975 f. **Actomyosin**. See **Muscle**, **contractile proteins**. **Acyl CoA** (see also **Acetyl CoA** etc.), concn. in heart & liver, rat, (title 46) 7148. inhibn. of fatty acid biosynthesis, 2801. in lecithin synthesis, 216. **Acyl groups** (see also **Acetyl groups**): migration in glycerol deriv., 2221. **Adaptation** (see also **Behaviour**; **Environment**; **Evolution**), physiol.: to diving, in reviews, 5043; to lowered O₂, tissue mechanism, (title 42) 7155. to drugs. See **Drugs**. to environment. See **Altitude**; **Climatic factors**; **Environment**; **Salinity**; **Temperature**; **Water relations**. to exercise, muscular work. Sec **Exercise**; **Work**. to stimuli. See sense organs and systems (e.g. **Ear** & **hearing**); & **Nervous system**. **Addison's disease**. See **Adrenal cortex disorders**. **Adenine** (see also **Purines**), deriv., mitosis stimm., plum, 953. incorporation into nucleic acids. See **Nucleic acids**. independent fungal mutants, methionine effects, 4781. synthesis, prebiotic conditions, 3558. **Adenocarcinoma**; **Adenoma**. Sec **Tumours**, specific **Adenohypophysis**. See **Pituitary**, anterior. **Adenosine** (see also **Nucleosides**), 3'-amino-3'-deoxy-, isolation, 405.

INDEX OF SUBJECTS

- Adenosine,** analogues. See Purine & pyrimidine analogues, effect on neonate r.b.c. ATP content, 5665. inhibn. of ADP-induced platelet aggregation, 6428-9. JV^A-methyl-, in yeast RNA, 431. -succinic acid, *Penicillium* sp., 5369.
- Adenosine phosphates** (see also Nucleotides), adenyl 2,3-diphosphoglyceric acid, isolation & prop., 2990. electrophoretic determination, 5365. levels: brain, stimn. & ethanol effects, 6561 ; sea urchin sperm, 5366. N¹ & JV-méthyladenosine-5'-pyrophosphates, synthesis, 463. phosphorylation of, & as PO₄²⁻ donors. See Phosphorylation. promoting embryonic neurulation, amphibia, 4937. role in platelet aggregation, 1817, 6428.
- ADP,** action on blood platelets, 1816, 4299, 6428-9. as Hi carrier in respiratory chain, 5360. -1-iV-oxide, synthesis & polyAMP uptake, 3070. residue in NAD, 3118.
- AMP,** cyclic 3',5': biol. role, review, (title 3) 5043; biosynthesis, vasopressin effect, 679 f. deoxy-, dephosphorylation, liver & kidney, 5082. enzyme inhibn., bacteria, 442. hydrolysis, wheat leaf, 5489. in expt. myocarditis, (title 7) 7152. incorporation into RNA, 462. poly-: double helix with polyUMP, 2984, 3017 ; isolation, thymus, 430. reducing expt. porphyria, 3512.
- ATP,** -ACh interaction, 6320. 2-aza-deriv. & K transport, r.b.c., 3082, 3318. biosynthesis : Mg requirement, 515 ; rare earth effects, 513. -dependent amino acid activation. See Proteins, biosynthesis.
- hydrolysis (see also Enzymes) : by mouse oocyte prep., 4702 ; in vit. B¹² coenzyme biosynthesis, 3207 ; rare earth effects, 513. in angioxyl, pancreatic extract, 4404. increasing blood flow, isolated heart, 6518. inorganic phosphate exchange, thiophosphate inhibn., 3310. inotropic action, heart, 5359. interaction with muscle proteins. See Muscle contractile proteins, levels : amion, pressure effects, 411 ; brain, cold adaptation, 3507 ; muscle (a) cold adaptation, 3507, (b) mussel, 2980 ; r.b.c. neonate, 5664-5. metal chelation by, 512. of adrenal chromaffin granules, 412, 4081, 5387. phosphohistidine formation, mitochondria, 314-5. stimn. of insulin secretion by, 671, 2062. stoichiometric relation to NAD, 3029.
- Adenosis, sclerosing.** See Mammary gland disorders.
- Adenoviruses. See Viruses, animal, adeno group.
- Adenylic acid. Sec Adenosine phosphates, AMP.
- Adenyrin. See Glycosides & aglycones, cardiac.
- Adipose tissue (see also Body composition ; Lipids ; Obesity). adipokinetic effects of various hormones, 1784, 3255f. brown, pregnancy & cortisone effects, bats, 2092. carbohydrate metabolism : 174 ; Cr³⁺ effects on galactose entry, 528 ; glucose uptake, i.v. glucose effects, 1782 ; insulin & NADP effects, 5558. chlorinated insecticide content, man, 6359. E.M., 2649. enzymes : hexokinase, 174 ; lipase, a.n.s. control, 1783 ; phosphoglyceric acid kinase, 2804. lipid metabolism : amino acid conversion to fatty acids, 2041, 207 ; fatty acid mobilisation, 211, 3227 ; glycerol release, insulin effects, 1838 ; lipolysis & fatty acid esterification, hormone effects, 3226 ; triglyceride turnover, 622.
- Adipsia.** See Drinking.
- Adjuvants.** Refer to Immunisation.
- Adrenal cortex** (see also Adrenocorticotropic hormone ; Pituitary ; for corticosterol biosynthesis, metabolism, secretion, etc., refer to Steroids), histoL/histochem. : cell migration after CCl₄ stress, 2633 ; changes induced by (a) Aldosterone, 2632, (b) season, 5088, (c) X-rays, zona fasciculata, 3596. interrelations with other endocrine systems (see also Pituitary), with pituitary during surgery, man, 4577.
- composition & metabolism,** ascorbic acid : 3215 ; angiotensin II effects, 2056 ; concn., 4567 ; depleted by (a) ACTH, 2056, 3235, (b) stress, 2058. ascorbic acid & cholesterol, guinea-pig, 1003. CoA, 5598. enzymes : 19-hydroxylase, 3263. lipid: ACTH admin. effects, *Cricetomys*, 4565 ; in zona glomerulosa, man, 4086. vit., pantothenic acid, 5598.
- disorders,** Addison's disease, 4570. congenital hyperplasia, 2061, 6662. Cushing's syndrome, 2085 f, 4570, 6649. haemorrhage, pantothenic acid induced, 3197. hypofunction, 6684. primary aldosteronism, 4570. tumours, 815-7, 1291, 3716.
- function,** as affected by: ACTH, 5563 ; heat stress, 6651 ; splenectomy, in soc. proc. (title 18) 7152 ; triparanol, 1646. cold, season & altitude effects, 6655, 6657, (title 15) 7154. glucocorticoid, (title 4) 7161. hormone actions on, 4088, 4092, 5563. in sarcoma-treated mice, 3758. influence of kidney epithelium on, 2055. mineralocorticoid, dog, rabbit, 6457. regulation, 5602. role in : glucose oxidation, 5574 ; Na & K excretion, 4555. thymus as related, rat, 4566.
- inhibitors.** See Aldosterone antagonists.
- Adrenaline.** See Catecholamines.
- Adrenal medulla,** anti-pertussis vaccc. effects on, 6664. ascorbic acid & isoascorbic acid as affecting, 3261. calcium role in stim. secretion coupling, cat, 4058. catecholamine localisation, release, storage etc. See Catecholamines.
- lipid content, *Cricetomys*, 4565. removal effects on : cond. avoidance response, mouse, 4633 ; corticosterone levels, 2059 ; expt. oedema, 4564. reserpine effects, 3261, 4059, 4067. tumours : 3366, 5674, (title 3) 7162.
- Adrenals,** adrenalectomy effects : 1472, 2002, 2011, 2059, 3716, 4011, 6580, 6645, 7074 ; in expt. induced conditions, 1176, 1337, 2117, 4564 ; on heart & c.v.s., 6513 ; on kidney, 2037 ; on ovary, 2106 ; on Na metabolism, 4570-2, 5999, 6454, 6457. Ag, interspp. relations, 3674. ascorbic acid content. See Adrenal cortex.
- cannulation method, hamster, 4231. changes during renal hypertension, soc. proc. (title 40), 7152.
- composition & metabolism : amino acid incorporation, in vitro, 3234 ; lipid levels, 228, 5562. denervation effects, 4567. foetal, role in development, (title 17) 7152. histol./histochem., seasonal changes, *Rana*, 5012. hydroxylation activity, spp. comparisons, 3264. nerve connections, electrophysiolog., (title 19) 7152.
- regeneration hypertension, hydralazine effects, 1321. role in gastric secretory response to hypoglycaemia, 4513-4.
- sound stress, as affecting, 1472.
- wt. : ACTH & steroid effects, 2054, 2089 ; seasonal change, rat, 6655.
- Adrenergic agents** (see also Appetite depressants ; Catecholamines ; Tryptamine ; Tyramine), general entries are followed by named drugs. effect on : pupil size, 4050 ; tonic muscles, 4036.
- Adrenergic agents,** hyper- & hyposensitivity to, (title 2) 7160, indirect, enhancing tyramine catecholamine release, 4081. inducing myocardial lesions, 4084. potentiation by TM-70, 1631. structure-activity relations, reserpined ileum, 4066.
- named drugs,** amphetamine : & Ammonium scleriosis, 6256 ; -barbiturate mixtures, dose-response study, 1600 ; behavioural effects, 1610, 3979, 3994 ; -induced hyperthermia, temp. stress effects, 4013-14 ; toxicity, protection by methylodopa & methyl-m-tyrosine, 1601. amphetamine & deriv. : dex- & methamphetamine, group effects, fish, 4202 ; hydroxyamphetamine, metabolised by dopamine-0-oxidase, 4078. triluoromethylphenylisopropylamine (P-7 727), **retinotoxic**, 6337.
- isoprenaline: antagonising b.p. effects of sympathetic mediators, 4405 ; cardiostimulatory, 4155 ; cardiotoxic, 1888 ; effect on tracheal muscle, 1630 ; pressor response, cat, 6246 ; ^-receptor activation, cardia, 2010 ; salivary gland effects, 4169.
- isopropylnoradrianol (sic), effect on bovine iris muscle, 1629.
- mephenetermine, ineffective in cyclopropane-adrenalin arrhythmia, 1593.
- phenylephrine : action on biliary-duodenal function, 4077 ; effect on serum electrolytes, I 1694.
- Adrenergic blocking agents** (see also Ergot-* Rawolfia-type alkaloids, Hypotensfr6 agents), activity of cysteamine, 1632.
- bretylium & guanethidine : & phenoxybenzamine, effect on catecholamine metabolising enzymes, 4060 ; estimation, serum, 1625 ; initial adrenergic effects, 4068.
- dibenamine : & others, cardiovascular actions, 4073 ; salivary gland effects, 2638.
- guanethidine : action, & catecholamine stores, 4071 ; b.p. effects, 6251 ; catecholamine release, reserpine compared, 4069 ; effect 00 (a) cold resistance, 6252, (b) tyramine-induced catecholamine depletion, 1626 ; haemodynamic effects, 4072 ; -induced catecholamine hypersensitivity, 4070 ; potentiating noradrenaline pressor action, 6244.
- phenoxybenzamine : 4061, 4073 ; & CCl₄ liver damage, 4217 ; antagonising K⁺ effects, aortic strip, 4150.
- phenyltrimethylammonium, blocking sympathetic post-ganglionic transmission, 4057.
- 0-TM-/0, potentiating sympathomimetics, 1631-tolazoline, hypertensive action, 4065.
- various, effect on tyramine-induced catecholamine release, 4061.
- Adrenergic systems & transmission. Refer to Catecholamines ; Nervous system, autonomic J see also Neurohumoral mechanisms.
- Adrenochrome.** See Catecholamines, oxidation products.
- Adrenocorticotrophic hormone** (see also Pituitary), for studies on adrenocortical activation & effects on steroid urinary excretion, etc. refer to Adrenal cortex ; Steroids), activity comparisons, 676, 2054, 5563. admin. effects, 1868, 2047, 4555, 5562, 6644. assay, 2056.
- blood levels (see also -release below), stress-induced changes in, 2058, 2071.
- body composition & metabolism as affected b/w 1784, 1835, 2089, 3226, 3234, 3236, 4437, 4523, 4565, 6631.
- hormone & steroid excretion as affected b/w 6649, 6661.
- induced hyperlipaemia, 1835.
- inhibn. of ascorbic acid uptake, adrenal & bra^{hi} cortex, in vitro, 3215.
- kidney as affected by, 2037, 3662.
- pituitary content : 2071, 3977 ; extractaD¹⁷ with TCA, 3237.
- related synthetic peptides, corticotropinU* releasing activity, 6647.
- release (see also blood levels, above): decarbonylation effects, 6646 ; induced by (a) drugs, 3977, 6648, (b) stress, 2058, 2071, 4577 ; * [cont'd]

- Adrenocorticotrophic hormone.** (contd. from ..)
- inhibn. by (a) ethionine 2071, (b) hydrocortisone, 6645.
- Adsorption.** See Surface phenomena.
- Adynerin,** constitution, 3464.
- Aerosols,**
- ^as pharmacol., vaccine & pesticide prep, refer to Drugs ; Immunisation ; Pest control.
 - ^bgas-chromatog. trap for, 58081.
 - Aestivation (see also Diapause ; Dormancy), of Pjanorbid molluscs, 7130.
 - AET.** See Thiouronium compounds.
 - Atiocholanolone.** See Steroids.
 - Ajatoxin.** See Toxicology ; Toxins.
 - African horse-sickness.** Sec Viruses, animal, arbor ^{to} pp.
 - Agammaglobulinaemia.** See Blood proteins.
 - Agar** (see also Culture & physiol. media ; Electro-phoresis ; Immunological techniques), inhibn. of virus prop, by, 6081.
 - Age & ageing** (see also Development; Infants ; Neonates ; Plant growth & development; & sp. organisms; for studies on cells & biochem. & physiol. prep, refer to e.g. Brain ; Cells ; *Mitochondria*.)
 - arteriosclerosis in, plasma antithrombin as affected, man, 1825.
 - cnr. count changes in, man, 2306.
 - ^atermination, from eggs, kittiwake, 2573.
 - ^a-cg. effects, 6495.
 - f.^eg. & reaction time as affected, 1979.
 - "te-span": diet as affecting, *Chrysops* (fly), 7082 ; infantile handling effects, rat, 2172 ; man, (title 14) 7151 ; temp, effects, army cutworm, 7095.
 - ^{me}chanisms : errors in protein synthesis, 499 ; somatic mutations, 4777.
 - "lethalic effects : fibrinolytic activity, man, 112 ; kidney citric acid reabsorption, 4559 ; lipaemia clearance, dog, 229 ; pulmonary N, clearance, man, 1860 ; serum asparaginase, guinea-pig, 313 ; steroids, man, 2128.
 - offspring defects as affected, man & other mammals, 4752.
 - macromol. reactivity as affected, 500,2901.
 - ^aspiratory system effects, man, 1862.
 - ^aAt^y : 4^b response to influenza vaccine in, 0859 ; nipple epidermis in, man, 6386.
 - ^atissue & organ changes during : arterial intima, Pig, 5069 ; bone marrow Fe content, 4288 ; Done Sr & Ba uptake, rat, 553 ; connective tissue, man, 838 ; mucosal glands, man, (title 46) 7152 ; muscular dystrophy, fish, amphibia, reptiles, 23 ; phospholipid patterns, ^aat, 241 ; r.b.c. -SH groups, man, 3349 ; wound healing, rat, 117.
 - ^aStskins ; Agglutinogens. See Antibodies; pwigens.
 - ^aAr^{yo}nes. See Glycosides & aglycones.
 - ^aulocytosis. See Blood cells, white, anomalies.
 - Atmosphere (for moisture ; pressure ; respiratory aspects ; temperature, refer respectively to Relative humidity ; Atmospheric pressure ; At^os & respiration; Temperature ; see also ^aterial ; Climatic factors).
 - ^aprolonged exposure to, 4237.
 - Pollution & airborne particles (see also gerosols ; Flowers, pollen ; Lung disorders ; Radioactivity ; Spores ; Toxicology ; & microorganisms, e.g. Bacteria ; for related infection & infection studies, refer to Disease & Jg.jemid ogy ; Disinfectants ; Disinfection & fumigation).
 - dieldrin, toxicol., 6361.
 - disposal of inhaled particulate matter, 1329f.
 - dusts: Al₂O₃ inhalation, 6464 ; bagasse, 1330-1 ; quartz, 2676, 5224, (title 25) 7155.
 - D¹⁰C content near plasma jet, 2000.
 - ^aTl-¹³¹urate acid » determination, 35291.
 - ^aAlkaloids. See Rauwolfia-type alkaloids.
 - ^aAlkannamine. Refer to Alkaloids.
 - ^aAlanine. (see also Amino acids), carboxylic deriv. pyrimidine precursor, wheat, 3466.
 - 32V^aole-l-yl-alanine, biosynthesis, 3435.
 - ^aderiv. : liver damage, 6006 ; tissue U¹⁴C^bration, 3749.
 - D¹⁴U¹⁴C^bion, *Drosophila* strains, 6882.
 - ^aAntibodies » in cell walls, 5277.
 - ^ain Hopi Indians, 4829.
 - Albumin** (see also Blood proteins ; Proteins, structure-), alkylation by chlorambucil, BSA, 3323.
 - [^aAs]^barsonoazoalbumin, tissue uptake, mice, 5641.
 - as Ag. See Antigens, protein.
 - denaturation by urea, BSA, 391.
 - infusions, effects on kidney, rabbit, rat, 1340.
 - interaction with : GSH, human serum, 343, 2929 ; hyaluronic acid, BSA, 160.
 - Mayer's movement of water-sol. material in, 5178.
 - mercaptalbumin, buoyant behaviour in salt soln., BSA, 2922.
 - microheterogeneity, human serum, 5307.
 - of liver xmicrosomes, 3040.
 - ovalbumin. Refer to Glyco- & mucoproteins.
 - physical prop., BSA, 2924.
 - polypeptides release from, human serum, 344.
 - prep. & prop., rat serum, 5306.
 - soln. colloid osmotic pressure, BSA, 1834.
 - turbidity under high pressure, horse serum, 5338.
 - Albuminuria.** See Proteinuria.
 - Alcian Blue.** See Dyes.
 - Alcoholic beverages,**
 - cider, SO₂ content, 1030.
 - drinking behaviour, community study, (title 13) 7147.
 - wine, sugars in, 5187. - Alcoholism** (see also Alcohols, ethyl): cortico-steroid therapy, 5593 ; disulfiram-ethanol reaction, plasma K effects, 1844.
 - Alcohols** (see also Amino alcohols ; Glycerol ; & Cytology-), allyl, liver damage, 1750.
 - biosynthesis, micro-organisms, (title 1) 5045.
 - n-butyl, enzyme effects, housefly, 3136.
 - C₁₀ to C₄, of skin surface, man, 197.
 - cyclotols of Compositae, 3476.
 - ethyl, & benzquinamide, admin, effects, 1606.
 - & blood coagulation, 4301-2.
 - & e.r.g. man, 6592.
 - & neuromuscular transmission, 1932.
 - & splanchnic blood flow, 1923.
 - assay in body fluids, 1029 f.
 - brain composition as related, 1598, 5198, 6561.
 - cardiopulmonary effects, 1883.
 - c.n.s. effects, 3989.
 - 2-chloro-, seed treatment, spinach, 2455f.
 - cholesterol recryst. from, calcaemia as related, 3086.
 - circulatory reflex inhibn., 3967.
 - disulfiram reaction, 1844, 5775.
 - hypoglycaemia production after fasting, 4259.
 - liver as affected, 3311, 6624.
 - metabolism, 1007, 4861, 5484, 5593, 5775.
 - noise response as affected, 4477.
 - oxytocin release inhibn., 4605.
 - plasma FFA effects, 4314.
 - higher, liver metabolism as affected, 3311.
 - induced changes in chloroplast spectra, 965.
 - methyl effect on chloroplast phosphatase, 5762.
 - octacosanol & chick comb growth, 1012.
 - octan-3-ol & A¹⁰cen-S-ol, in bay oil, 3458.
 - Dhenylethyl, DNA synthesis inhibn., bacteria, 3317.
 - ^apolyvinyl. See Synthetic materials.
 - /o/yAlcohols. See Carbohydrates, sugars, alcohols.
 - Aldactone** (spironolactone). See Aldosterone antagonists.
 - Aldehydes** (see also Acetaldehyde, etc.), aromatic, condensation with 4-hydroxycoumarins, 6329.
 - Aldosterone.** See Steroids.
 - Aldosterone antagonists,**
 - metyrapone (metopirone, SV-4885) : & endotoxin, ACTH responses, 6648 ; inhib. 19-hydroxyase, 3263 ; response, in obesity, ^aspiro.
 - spiro lactone : & related cpd., effects, in hypophysectomy, 4572 ; inducing adrenal cytolimic bodies, 4086.
 - spiro lactone, effects : adrenals, pineal gland, diencephalon, 2632 ; in renal disease oedema, 6292 ; juxtaglomerular cells, 2632, 6650. - Aldrin.** See Insecticides.
 - Alexin** ; Alezination. See Complement.
 - Algae** (see also Aquatic organisms; Micro-organisms ; Plankton ; Protozoa ; & individual spp. in Taxonomic index), antarctic spp., 6161.
 - Algae,** anti-agents,
 - actinomycin D, *Acetabularia*, 4929.
 - amino acid analogue, *Chlorella*, 3440.
 - carcinogenic hydrocarbons, marine spp., 4906.
 - Cu, toxic to *Chlorella*, 4840.
 - SH-groups, *Acetabularia*, 4930.
 - triazines, *Chlorella*, 2419.
 - trimethyl-0-chloroethylammonium chloride, no effect on *Chlorella*, 4890.
 - tris, *Haematococcus*, 6162. - coccolith production, *Coccilithus huxleyi*, 2423.
 - composition/metabolism (see also Chlorophyll ; Photosynthesis ; Plant pigments), enzymes : arginosuccinate repressor, *Chlamydomonas*, 508 ; glycolate oxidase, *Chlorella*, (title 15) 2594 ; NADP reductase, blue green spp., 2977 ; of glyoxylate cycle, *Chlorella*, 4862 ; respiratory, *Chlorella*, 124.
 - extract toxic to echinoderm sperm, *Fucus*, 4936.
 - lipid content, unicellular spp., 7002.
 - methionine metabolism, adapted *Chlorella*, 3440.
 - N : cpd. assimilation, *Chlorella*, 959 ; fixation, *Nostoc commune*, 4872, 6161.
 - pterins, isolation, blue green spp., 5740.
 - respiration & photosynthesis as related, 3490.
 - cytol/cytochem.** studies,
 - cell morphogenesis, *Nitella*, 2274, 2444.
 - cell walls, in reviews, 7156.
 - fine structure of : cell boundary, *Anacystis*, 6789 ; chloroplasts, comparative, 2273 ; laminarin nucleus, 4740 f, zoospore, *Oedogonium*, 4917.
 - mitosis, *Sphaeroplea*, 6856.
 - nucleic acids, localisation, *Oscillatoria*, *Spirogyra*, 2279.
 - protoplasmic streamlining, *Acetabularia*, 6915.
 - distribution of : *Laminaria* spp., 4910 ; soil spp., rhizosphere effect, 4911.
 - growth & development,
 - affected by : automatabolites, *tfostoc*, *Chlorella*, 6967 ; carcinogenic hydrocarbons, marine spp., 4906 ; salinity *Scenedesmus*, 2435 ; -SH groups, *Acetabularia*, 4930.
 - cell morphogenesis, *Nitella*, *Bryopsis*, 2274, 2444. - growth rate, measurement, 2436.
 - inhibn. by: actinomycin D, *Acetabularia*, 4929 ; tris(hydroxymethyl)amino-methane, *Haematococcus*, 6162.
 - of *Macrocystis pyrifera*, 6949.
 - response to light : *Chlamydomonas*, 6974 ; *Plumaria elegans*, 4871.
 - ionising radiation effects ; *Synechococcus*, 1544 ; *Zygerna*, 2485.
 - marine phytoplankton, HCO₃⁻ utilisation, 4850.
 - nutrition,
 - assimilation of: Cu, *Chlorella*, 4840 ; "I marine spp., 4842 ; NO₃⁻, inhib. by NH₄⁺, *Chlorella*, 959.
 - ion transport, *Nitella*, 2409.
 - K, Ca, Mg effects on *Acetabularia*, 6915.
 - translocation, stipe tissue, *Macrocystis*, 6945. - reproduction: *Macrocystis pyrifera*, 6949 ; mating process, *Chlamydomonas* spp., 6995* ; used in bivalve feeding expt., *Phaedactylum*, 7060.
 - viability, effect of lyophilisation, *Chlorella*. *Nostoc*, 7003.
 - Alimentary tract, invertebrate** (for vertebrates, see Gastrointestinal tract; Oesophagus), annelids, earthworms, 1556.
 - echinoderms, pyloric caeca regeneration, *Hericia*, 7040.
 - insect: intestinal protease, *Calliphora*, 7066 ; toxic principle in digestive fluids, *Pieris brassicae*, 4951.
 - Alizarin Red.** See Dyes.
 - Alkaloids** (see also Ergot-, Rauwolfia-, Veratrum-, Vinca-type alkaloids; & the following),

Alkaloids, (contd. from **)

structure, 3451 ; drageamine, structure, 909 ; garryfoline, 904t; holarrhimine, deriv., 3449t; huneriamine, hypotensive, 899 f; isopilocereine, structure, 911 ; limaspermin, constitution, 902 f; lunarie, structure, 903 f; methylhalfordinium, structure, 910 ; ricinin, biosynthesis, 891 ; securinine, 894 f, 3448 ; tabernaemontanine, 909 f; tecomanine, structure, 897f; tomatid-5-en-30-ol, synthesis, 898f; virosecurinine, structure, 901 f, 3448 ; vobasine, 909 f.

general entries, biosynthesis, 891-2, 895, 3450.

bisbenzyltetrahydroisoquinoline, monodemethylated 1-curine, 5729.

diterpene, synthesis, 904-5 f.

extraction, continuous, & ultrasound treatment, 5731.

mass spectra, key points, 908f.

of sp. plants : *Aconitum heterophyllum*, 905f; *Amaryllidaceae*, 3450 ; *Areca catechu*, 3452 ; *Halfordia scleroxyla* 910 f; *Hunteria eburnea*, 899 ; *Kurchi*, transformation, 3449t; *Lophocereus schottii*, 911 ; *Lunaria* spp., 9031t; *Morning Glory*, 907 ; *Rivea corymbosa*, 906 ; *Securinaga suffruticosa*, 894; *Securinaga virosa*, 9011, 3448 ; *Senecio*, hepatotoxic, (title 4) 5038 ; *Solanaceae*, 5731 ; *Solanum dulcamara*, 898 ; *Tecoma stans*, 8971; *Xylopia discreta*, 3451.

opium, porphyroxine prep, from, 1674. separation, chroma tog., 912, 1619.

Alkalosis. See Acid-base balance.

Alkylating agents. See Cytostatic/cytotoxic agents ; Mutagens ; Radiomimetics.

Alkyl bromides. See Halogenohydrocarbons.

Alkyl groups (see also Ethyl-; Methyl groups etc.), alkylation : of Hb & BSA, 3323 ; of nucleoside analogues, 1019.

Alkynitrosamines. See Nitrosamines.

Allantois ; Allantoic fluid. See Embryos, extra embryonte.

Allergens ; Allergy. See Antigens, allergens ; & Hypersensitivity.

DL-Allo-5-hydroxylygine, inhibn. of glutamine synthetase, 311.

D-AUose, prep., 133.

AHosecurinine. See Alkaloids.

Allozan, -induced diabetes. See Diabetes mellitus.

AUylnoroxymorphone, anti-narcotic, 1618.

Alyloestrenol. See Steroids.

Aloes ; Aloe-emodin. See Laxatives.

Altitude (see also Oxygen),

adrenocortical activity at, man, 6657. circulatory responses to : cats, rabbits, 4397 ; pulmonary circulation & O₂ transport, lambs, 4412 ; pulmonary vasoconstriction, steers, 4411.

e.c.g. responses to, man, 4377. -induced brisket disease, calves, 1918, 6500.

physiol. effects, man, 4223. simulated : blood O₂ capacity in, 6475 ; effects on erythropoiesis, rats, 6413 ; effects on r.b.c. carbonic anhydrase, 4281.

Aluminium (see also Metallic ions),

-citrate-endotoxin complex, prep. & prop., 1417. silicate, bentonite : absorption on *Bacillus subtilis*, 3949 ; sensitised, as Ag, 3841 ; use in typhoid vaccine prep., 3839.

toxicity to *Carex* spp., 2413.

Aluminium oxide, microparticles, inhalation, 6464.

Amaurotic family idiocy. See Hereditary abnormalities.

Aamberlite resins. See Ion exchange resins.

Amethopterin (methotrexate). See Folic acid antagonists.

Amides,

aliphatic, as mosquito repellents, 1734.

aromatic : fluorenylacetamide (acetylaminofluorene), carcinogenicity, 1250 ; fluorenylene bistrifluoroacetamide, carcinogenicity, 5932.

Amidochin. See Analgesics & antipyretics.

Amidomycin. See Antibiotics.

Amines,

aliphatic : cyclic, deriv. as mosquito repellents, 1734 ; long-chain, assay, aq. soln., 1033 ; penetration, *Streptococcus faecalis*, 880 ; trimethylamine, A⁻oxide biosynthesis, comparative study, 555 ; virus inhibn., 1537.

Amines.

aromatic (see also Azo dyes) : o-aminophenol, glucuronidation (a) effect of female serum, 3341, (b) Gum rat intestine, 149 ; aniline, non-enzymic hydroxylation, 3510 ; carcinogenicity, 5924, 5934 ; dimethylaminonaphthalene, -protein conjugates, titration behaviour, 3801 ; naphthylamine (a) & naphthylhydroxylamine, carcinogenicity, 5642, (b) & others, radioprotective in vitro, 5843.

biogenic (see also Catecholamines ; Histamine ; 5-Hydroxytryptamine ; Tryptamine ; Tyramine) : identification, cattle faeces, 3552 ; in pericardial cell stimn., cockroach, 5537 ; neuroamines, effect on ant. pituitary glucose oxidation, 5579.

DNP-, chromatog., 5262.

naturally occurring, enzymic synthesis & degradation, 5497.

of nail tissue, pharmacol., 1010.

sympathomimetic. See Adrenergic agents ; Catecholamines.

^aAmines, interaction with nucleic acids, 436.

polyAmines.

interaction with virus RNA, 3010.

partitioning, in aq.-phenol system, 393.

Aminoacetonitriles. See Lathyrogens.

Amino acids (see also Peptides ; Proteins ; & named amino acids ; for studies of named tissues, organs & organisms, refer to composition & metabolism sections under relevant headings).

JV-acetyl deriv. stimn. of oxytetracycline synthesis, 3422.

analogues : inhibn. of indole formation, 734 ; 1,3-thienylalanine (a) liver damage, 6006, (b) tissue distribution, 3749.

as N source in synthetic media. See Nitrogen metabolism ; Culture & physiological media, basic, in snail tissues, 1010.

blood : in collagenosis, in soc. proc, (title 14) 7152 ; sex differences in r.b.c./plasma ratio, 1832.

composition of & sequence in peptides & proteins. See Peptides ; Proteins, structure & physicochemical properties ; & individually named peptides & proteins, in mussel shell, 285.

in suint, 349.

in whale muscle, 5466.

interaction with ion-exchange gels, 297.

iodine containing, 5683, 6685.

lipo-, bacterial, 5233.

of fungi, 286.

plant : conidine containing-, 891 ; non-protein effect, 3437 ; (titles 6, 7), 5038 ; role in chemotropic *Vicia* seeds, (title 11) 2594.

radiation effects : 3559, 3560.

sulphur-, in wool, 295.

urinary : 0-hydroxyasparagine, man, 2858 ; in collagenosis, (title 14) 7152 ; in neuroblastoma, (title 78) 7148 ; patterns in disease, 5671.

assays & separation,

automatic method, basic amino acids, 288 f. chromatography : S-amino acids, 2871, 5273 ; betaine & choline, 1037 ; decomposition

during, 291 ; DNP-deriv., 2849-50, 5262 ; elution behaviour, 5265 ; esters in ammonia, 2891 ; in coconut, 2488 ; isomer separations, 2851.

colorimetry, S-amino acids, 295.

diamino cpd., 5269 f.

quant." ninhydrin method, 5263.

spectrophotometric enzymic method, 5264.

synthesis, iV-methyl isomers, 2860.

balance & nutritional aspects (see also Proteins, dietary ; & individual amino acids), availability : lysine & methionine in fish flour, 3179 ; reduced by heating, 3178.

deficiency : arginine- or lysine-deficient, chicks, 4782 ; erythropoiesis reduced by, rats, 5525 ; lysine, affecting host resistance to anthrax, 1115 ; methionine, effects on Ab production, 1207 ; "unnecessary" N in, 3175.

essential : arginine, requirement affected by lysine & glycine, guinea-pigs, 619 ; D- & L- utilisation, chicks, 3184 ; deprivation

of, erythropoiesis reduced, rats, 5525 ; loss in Hartnup disease, 5700 ; requirements of *Staphylococcus*, 6021.

Amino acids,

imbalance: during ageing, rats, 3198. threonine-induced, rat, 3183.

leucine-isoleucine & -valine antagonism, 9ft methionine, ethionine & />fluorophenylalanine effects on blood cholesterol, 623168.

non-essential, 3175, 3177.

phenylalanine effects on brain 5HT, 694. reference patterns, FAO & oat patterns, fr to man, 3182.

S provision by, cystine & cysteine compare, 3180.

tyrosine toxicosis, rats, 653, 657.

utilisation by aphid, 3181 ; lysine, 3155.

biological effects,

control of RNA synthesis, bacteria, 464, 4# cytoactive. See Cytostatic & cytotoxic agent* escape phenomenon, heart, 1877.

growth inhibn.: 318, 2863, 4206.

hypersensitivity response to thiol cpd., 11' inducing fatty liver, 232.

inhibn. of : Ab response, 1207 ; 5HTP uptake, brain, 4492.

on enzymes, 730, 5342.

on Fe absorption, liver, 5448.

on PAH absorption, c.s.f.-blood barrier, 4491.

on serum lipids, 3168.

on yeast sporulation, 3901.

protection in NH₃ intoxication, (title 79) 7M^t

radiation protection by, 4718.

stimn. of crustacean chemoreceptors, 4973

metabolism, activation & incorporation into peptides

proteins. See Enzymes ; Nucleic acids

RNA ; Peptides ; Proteins, biosynthesis-biosynthesis : 3061 ; aspartic acid effect

brain, 990 ; from fatty acids, bacteria, 5229 ; from glucose, silkworm, 5420 ;

plants, 304, 320 ; in trauma, liver, 313

maleate admin. effects, kidney, 313

valine-isoleucine pathway, bacteria, 331

brain : chlorpromazine effects, 3997 ; 1/V

10) 2594 ; reserpine effects, 3993.

deamination ; decarboxylation. See Enzymes

specific, -aminohydrolases, -lyases, -oxidoreductases.

fatty acids from, adipose tissue, 204f, 24

GOT role, mitochondria, 5351.

in abnormal/pathol. conditions : phenylketonuria, 804f; viral hepatitis, 810 ; B, deficiency, 3192.

in review, (title 11) 2593.

increased in cold-exposure, 5527.

levels: during development, flax seed, 345 postnatal changes, 2848 ; salt/fresh vr% effects, crustacean, 4958-9, mollusc, 4*

"N excess as related, 5781.

S deriv. as penicillin precursors, 878.

utilisation, tumour cells, 309.

transport & uptake,

S-amino acids, yeast, 3900.

bacterial, in rhizosphere, 1554.

chloramphenicol inhibn. carrot, 4844.

growth hormone effects, 5561.

in brain, 2847, 2861.

in kidney: kinetic study, 6635; phlorrh

effects, 6636.

in mitochondria, thyroid effects, (title 7148).

intestinal: 6611 ; glucose/urea interact^ 2018.

protozoal, KCN stimn., 3925.

stoichiometry of carrier amino acids, 2*

D-Amino acids,

alanine in cell walls, 5277.

histidine, brain transport, 5270.

utilisation, chick, 3184.

Aminoaciduria. See Amino acids, urinary.

Amino alcohols, 205, 1612, (title 76) 7148.

Aminoazobenzene. Sec Dyes.

m-Aminobenzoic acid ethyl-ester. See Anaesthetics, general.

o-Aminobenzoic acid metabolism in *Neurospora* 5723.

o-Aminobiphenyl, for glucose assay, 3344.

y-Aminobutyrate,

crab muscle response, 6397.

crayfish receptor response, 4974.

hypotensive action, 6243.

- & myasthenia gravis, review, 6697.
- & renal homotransplantation, 1185.
- & reserpine therapy, 1590.
- admin. in pregnancy, effect on maternal &c
foetal blood, K, 6223.
- m-aminobenzoic acid ethyl ester, e.c.g. effect,
elasmobranchs, 4182.
- c.s.f. pressure increase effects during, 1921.
- cyclopropane : & halothane, effect on blood
vol., 1591 ; -adrenaline arrhythmias, mephe-
termine therapy ineffective, 1593 ; haemo-
dynamic & c.n.s. effects, 6207 ; use in
obstetrics, 6206.
- effect on : c.n.s. tryptamine receptors, 6211 ;
respiratory gas flow, 6204 ; jaw, reflexes,
4024.
- ether (diethyl ether) : effect on expt. oedema,
4564 ; inhib. lactate dehydrogenase, 5624 ;
Shein effect, (title 21) 7152.
- halothane : blood assays, chromatog., 6208 ;
cardiac effects, 1592 ; -catecholamine arrhyth-
mias, 6210 ; digitalised heart performance
during, 6209 ; induced hepatitis, 6348.
- hydroxydione-ethinamate-phenobarbitone, an-
aleptics antagonising, 4005.
- hypo tensive, cerebral circulation in, 4416.
- methoxyallylphenoxyacetic acid diethylamide,
short-acting, 4021.
- methoxyflurane, blood assay, chromatog., 1588.
- nitrous oxide, uptake & excretion, man, 1589.
- pneumothorax effects during, 1856.
- prolongation by Shein-Ashman mixture, (title
22) 7152.
- respiratory function, disturbances during, 6465.
- urethane, adrenaline depressor effects during
inhibn., 6245.
- Anaesthesia/anaesthetics, local** (see also individual
names),
action mechanism & drug-binding protein, 3974.
- assessment of conduction block, 1587.
- in dentistry : effect on dental pulp O₂ con-
sumption, 5150 ; penetration into dental
pulp, 115.
- oxethazaine, toxicity, 1595.
- sedative, anticonvulsant & analgesic actions,
review, 1609.
- *SKF 4^o ^oP^{idural} » **SKF-90054**, long-acting,
structure-activity, 6215.
- substituted phenoxyethylalkylamines, long-
lasting, 4022.
- various, toxicity, O₂ modification, 1596.
- Analeptics**. See **Stimulants**.
- Analgesics**,
activity of: anticoagulants & vit. K, 4009 ;
basic ketones related to haloperidol, 3981 ;
local anaesthetics, review, 1609.
- mefenamic acid : & flufenamic acid, antagonis-
ing, 4020.
- methoxin bronchoconstriction, 4053 ; efficacy,

Analgesics, strong (see also **Morphine antagonists**), action, reticular formation, 3995. laevorphanol, inhib. RNA biosynthesis, *E. coli*, 6328.

meperidine (pethidine) : & morphine, pre-operative medication, children, 1594 ; metabolism, excretion, 4038 ; urinary metabolite assay (pethidine acid), 806.

morphine : behavioural effects, 3979, 3983 ; central inhibn. of peristalsis, 1617 ; effect on (a) lipid mobilisation & transport, 4037, (b) nerve impulse propagation, 4027 ; fluorescence, concn. effects, 5730 ; inhib. restraint tilcers, 1616 ; uptake, damaged liver, 1750. morphine-like, thymol basic ethers compared, 1608.

1-phenethyl-4-phenyl-4-propionoxyppiperidine, propargyl-phenyl replacement in, effects, 4039.

Analgesics & antipyretics (see also **Anti-inflammatory agents** ; **Salicylates**) ; "amidochin", components, 6337.

aspirin : & gastrointestinal bleeding, 6304 ; & Na salicylate, effect on kallikrein systems, 4177 ; alimentary tract mucosal damage, 4178.

assay, using bacterial pyrogens in rats, 1709. phenacetin, renal toxicity, 4161.

Anaphylaxis. See **Hypersensitivity**, immediate.

Anatoxins. See **Antigens** ; & **Immunisation, active**.

Ancillin. Sec **Antibiotics**, penicillins.

etruscomycin, antifungal activity, 3963.

filipin, antifungal activity, 3963.

flavofungin, inhibiting yeasts, 1535.

fumagillin, inhibiting protozoa, 5019.

griseofulvin, biosynthesis, 5727.

griseoviridin, synergism with viridogrisein, &

hadacidin, reversal of *E. coli* inhibn. by azauracil, 759.

Antibiotics,
hamycin, digitalis-like effect, frog heart, 1585.
kanamycin,
chemotherapeutic for expt. tularaemia, 1570.
constituent of, chem. synthesis, 2758.
inhibiting germination, potato tubers, 4896.
lycomarasin,* & deriv. cpd., structure, 3481.
mezocin, effect on metabolism, *Proteus* sp., 3959.
mitoxycin,
C, effect on growth, chick fibroblasts, 2675.
reducing phage production, *E. coli*, 1485.
neomycin,
effect on cholic acid metabolism, man, 3960.
reducing gut flora, rats, 1364.
nystatin,
antifungal activity, 849, 1534, 3963.
lysing protozoa, 6190.
oleandomycin,
activity against *Mycobacterium* spp., 1568.
triacyetyl-(evramycin) : activity, 1568 ;
chemotherapeutic for lymphogranuloma
inguinal, 1532.
otigomycin,
affecting ATPase activity : mitochondria, 3497 ; rabbit brain, 5613f.
penicillins,
active against *Leptospira* spp., 3961.
ampicillin, inducing lysis, *E. coli*, 3930.
ancillin, activity in vivo, 6184.
as feed supplement: mice 1583 ; rice moth,
2537.
assay, i567f.
biosynthesis, 878.
chemotherapy in staphylococcal septicaemia,
mice, 1522.
depressing microflora of : bile duct, dogs,
4547 ; mouth, rats, 109.
effect on r.b.c. : sensitisation, 1563 ; thyroxine
binding capacity, 1564.
effect on T phage replication, 3886.
enhancing reproduction, fish, 7034.
G, carcinogenic to rats, 5643.
inactivation by penicillinase, 1565-7, 3928-9,
6165-6.
inactivation/excretion in vivo, 6187.
inducing spheroplasts, *Vibrio*, 1423.
inhibiting trachoma agent, 1562.
M, production & prop., 3956.
methicillin-resistance, *Staphylococcus* spp.,
3927, 6167.
oxacillin, activity in vitro & in vivo, 6183-4.
penicillamine, used as chelating agent, 6188.
resistance : assayed, 1521 ; in *Staph. aureus*,
3926.
toxic to guinea-pigs, 6186.
Phleomycin, inhibn. of DNA biosynthesis, 1581.
Prodigiosin, biosynthesis, 3421.
Puromycin,
analogues, potency trials, 748.
antiviral activity 749, 1531, 3390.
inhibit. of thyroid hormones, 1639.
spiramycin. See erythromycin above.
staphylococcin. See colicines above.
staphylocycin, action spectrum & cross resistance studies, 1523.
streptomycin,
action & aerobiosis, (title 34) 7148.
action on protozoa : *Amoeba*, 2347 ; *EugUna*,
237, 870.
active against *Leptospira* spp., 3961-2.
chemotherapy in : expt. tularaemia, 1570 ;
leptospirosis, 3962.
alpha-hydro-, chemotherapy in tuberculous
guinea-pigs, 1569.
dissimilation by bacteria, 3419.
effect on bile duct flora, 4547.
increasing reproduction, fish, 7034.
resistance : acquired, *Bac. megaterium*, 6016 ;
assay method, 1521 ; decreased by nitrofurazone, 6192 ; in *Brucella abortus*, 3931 ;
in *Haemophilus* spp., 3814.
"Vnergism with subtilin, in reviews, 5047.
tetracycline,
action spectrum, 6168.
active against *Leptospira* spp., 3961-2.
£? feed supplement, vit. A depleted rats, 629.
biosynthesis, 1580.
cnclating effect : 5847 ; on chick embryo,
2696.
chlor- : biosynthesis, 876 ; effect on metabolism, bacteria, 750, 3959.
"Chloro-6-demethyl-, biosynthesis, 870f.

Antibiotics,
tetracyclines,
epi-, chromatog. assay, in urine, 3959.
inhibiting trachoma agent, 1562.
interaction with bone : affecting "Sr retention, 1101 ; binding to bone powders, 5434 ; localisation, rats, 2707.
oxy- : as feed supplement, 2537, 5510f; effect on mitochondria, HeLa cells, 6825 ; production, 1529, 3422.
resistance to, assay method, 1521.
serum level & excretion as related, 6194.
trichothecin, destruction, 849.
valinomycin, structure, 873 f.
viridogrisein, synergism with griseoviridin, 3932.
Antibodies (see also Antigen-antibody reactions ; y-Globulins ; Immun- headings ; & sp., factors e.g. Rheumatoid-),
abstracts refer to normal lab. mammals unless otherwise stated.
against bacteria (see also "-anti-toxin" below) :
anti-R pneumococcal sera, 5388 ; *Clostridium* spp., spores, 6036 ; *C. perfringens*, agglutinins & homologous incomplete Ab, 3614 ; *Neisseria gonorrhoeae*, CF, women, 6019 ; *Pasteurella tularensis*, monkey, 1112 ; *Proteus*, localisation in treated pyleonephritic kidney, 5990 ; *Salmonella*, flagellar Ag agglutinin, 1205, O Ag, 3841 ; *S. typhimurium*, modifying chick egg infection, 3842 ; 5, *typhosa*, Vi antisera, 1111 ; *Staph. aureus*, identification, 8020 ; *Streptococcus* group A, long-chain phenomena effects, 3821 ; *Treponema pallidum*, immobilising, 1430-1, 1433, lipid & polysaccharide Ab, 1117.
against bacteriophages : *E. coli* T2, neutralising, neonates, 1204 ; OX-174, (a) foetal lamb, 5896, (b) non-mammalian vertebrates, 1130, 1201.
against fungi, *Cryptococcus neoformans*, 1132.
against helminths: *Schistosoma*, pptg., 1135 ; *Toxocara* & *Ascaris*, pptg., children, 5865.
against protozoa : *Histomonas meleagridis*, pptg., turkey & fowl, 3621 ; *Toxoplasma*, epidemiol., man, 1513, pptg., 1133, *T. gondii*, dye test, 1134.
against rickettsiae, *R. mooseri* & *R. prowazekii*, man, 1118.
against trachoma, CF, man, 1129.
against viruses : adenov., children (a) haemaggl.-inhibiting, 1444, (b) neutralising, 1128 ; blue tongue, neutralising, 1127 ; haemolytic (NDV), haemolysis-inhibiting, 1242 ; influenza (a) aged subjects, 5859, (b) haemaggl. inhibiting, 3617-8, & CF, 3616, (c) neutralising, 1443 ; Japanese encephalitis, neutralising, 1456, 6084 ; measles (a) in multiple sclerosis, man, 3615, (b) & polio, in commercial human y-globulin prep., 1450 ; myxovirus strains, 1124 ; polio- (a) inhibiting, common to other enteroviruses, 1447, (b) neutralising, children, 3620, mothers & neonates, 1126, (c) sp. Ab determination, 1101, U; types x, * u, uua, aoo^o, pscuuurabes, heterogeneity, 1125 ; rapid production method, 1120 ; respiratory syncytial, neutralising & CF, 1473 ; Rous sarcoma, birds, 12811, 5945 ; vaccinia, neutralising, 1121 ; Venezuelan equine encephalomyelitis, man, 1458 ; yellow fever, (a) Ab persistence, man, 6082, (b) CF, heterologous, 3619.
anti-blood cells (see also "-haem-" below, & Blood groups) : w.b.c. & anti-marrow, inj., localisation in bone marrow, 5874 ; agglutinin in chlorpromazine-induced agranulocytosis, 6306 ; anti-sera complex Ab, 1161.
anti-cell components : microsomes, kidney, 3660-1 ; cytoplasm & nuclei, thyroid, 5882 ; nuclei, in L.E., 3652.
anti-collagen, prep. & in arthritis, 3677.
anti-colon (foetal) cells, ulcerative colitis sera, children, 5109.
anti-C : sera prep. & prop., 1243, 5913 ; serum & c.s.f. activity, 3710 ; & anti-globulin, renal fixation in L.E., 3649.
anti-cow's milk & anti-gluten, man, 3650.
anti-DNA : in L.E. sera, 5875-6 ; pyrimidine sp., reactions, 3704.
anti-endocrine, hetero- & homo- prep., incidence & effects (for auto- see "auto-", below) : Konadotrophins, (a) FSH & HCG, 5885, (b) HCG, 3669, 5694, 6700-1, * (contd.)

Antibodies, (contd. from **)
& PMS, 6702, (c)
ICSH inj. Ab effects on oestrous cycle & organs, female rat, 2101, 6680 ; growth hormone (a) in pituitary infantilism, 4578, (b) inhibiting Sarcoma-J-0, 5958, (c) & thyroid, production, 1170 ; insulin (a) 3231, (b) binding Ab incidence, 1174, (c) inj. Ab effects, (title 4) 3231, (d) & glucagon, assays, 1173 ; parathyroid, hormone, 3673 ; thyroid, 3670-1 ; TSH, inj. Ab effects, 1171.
anti-enzyme (expt.) : citrate condensing, 574 ; kallikrein, 5880 ; pepsinogens, 1231 ; proteolytic-, 1160.
anti-fibrin & fibrinogen, 3647.
anti-haptens, 2944, 2960, 3701.
anti-potato glycoproteins, pptg., 3638.
anti-placenta (human) : in postpartum sera, 5883 ; in rat, 3668.
anti-spermatozoa : A & B, man, 1151 ; acrosomes, 1169 ; & anti-testis, 1280.
anti-sphingolipids, animals & men with c.n.s. lesions, 1180.
anti-synthetic polypeptides, 2961.
anti-toxins (bacterial) : *Clostridium*, *C. septicum* & *C. histolyticum*, interactions, 1411, *C. perfringens* (welchii) oc-toxin, 5858, 5907, *C. tetani*, vit. effects, (title 2) 5047, & *Coryne*, *diphtheriae*, 3796-7, 5916 ; *Coryne*, *diphtheriae*, strains, 6030, wheal-reactive, 793 ; *E. coli* oc-haemolysin, 6037 ; tuberculin fractions, 1109, 3611 ; of horse, specificities, 1233 ; (title 11) 7150 ; staphylocolysins (a) 3820, (b) *S. aureus* a, 6023-4 ; streptolysins (a) non-sp. titre, 1110, (b) O, detection, 5855 f.
anti-toxin /venoms, snake : *Agkistrodon halys*, 3705 ; Egyptian black snake, prep., 4110 ; *Viper a ammodytes*, auto-Ab, 1182.
anti-tumour. See Tumours, immunology.
as cytol. tools, review, (title 4) 7150.
auto- (see also Immunity, auto- ; & Immunopathology) : in drug-induced jaundice, to liver, 3657 ; in L.E., to nuclei, 3652 ; in pernicious anaemia (a) to intrinsic factor & parietal cells, & in Fe-deficiency anaemia, 3655-6, (b) to thyroid, 3675, (c) various! 5884 ; natural & expt. *Eimeria*-infected rabbits, 3658 ; review (titles 14-15) 7150 ; to thyroid & thyroglobin (a) detection, 5881-2, (b) in thyroïditis, 3672 ; to venom, viper, 1182.
autologous y-globulin in expt. glomerulonephritis after immunisation, 3665.
blood group. See Blood groups.
C-reactive protein : after surgery, 1230 ; assay, 5917.
cell-fixed (sessile), & tuberculin reaction 1109, (title 6) 7165.
chemistry, assays, detection, prep. & prop., assay methods : & detection, insulin & glucagon Ab, 1173-4 ; CF, Rous virus Ab birds, 12811 ; haemaggl. antitoxins, man) 3796-7 ; electrophoresis & gel diffusion-pptn., C-reactive protein, 1230, 5917.
binding activity/sites & specificity : peptide role (a) H & L chains, antitoxins, 1233-5916, (b) site structure, model, 5914-2044, 2960 histidyl residues & iodination characterisation ; & prop. of *Toxoplasma* Ab, diffusion-in-gel & dye tests, 1133-4 of atopic Ab, dog, man, 1149, 3635 ; of high & low mol. wt. poplin, chick, 5914 detection methods : for anti-infection Ab (ai bacterial, 58851, floccn, with bentonite particles, 3841, (b) trachoma, CF, 1129 (c) virus-diln, neutralisation & microcultures, 1456 ; for auto-Ab (a) gastric, CF & fluorescence, 3655-6, (b) thyroid freeze-dried blocks, 5882, (c) thyroglobulin, microspot test, 5881 ; for cell-fixed anti-tuberculin PPD, 1109 ; for overlapping Ab, & prop., anti-w.b.c. sera, 1161.
fractionation of syphilis-tested sera, 1432.
heterogeneity, pseudo-rabies Ab, 1125.
identification by gel pptn., 6020.
prep. methods : & antigen-globulin components, anti-C sera, 5913, & prop., microsome antisera, 3660 ; fentim-conjugated, 1166, 3644 ; for anti-sol, collagen Ab, 3677 ; isolation, by Ag-cellulose suspensions, 1238 ; purification, Ag conformation during, 3701.

Antibodies,

review, (titles 2-5) 7150.
sedimentation prop.: of neonatal J-phage & *Salmonella* Ab, 1204-5 ; of non-mammalian vertebrates phage Ab, 1130, 1201.

cytotoxicity/cy to toxic sera : Forssman, 1198-9 ;

humoral & homografting, 3678, 3683 ;

inhibiting viral plaque formation in culture, 1453 ; iso-, 1278, 1282-3 ; natural, man, 3812 ; review, (title 13) 7150.

fluorescent. See **Immunological techniques**.

haemagglutinins: anti-sheep, after allogenic spleen cell injn., mice, 3639 ; homograft studies, 3679-80, 3683 ; in heterologous chimaeras, 3680 ; to PPD, cell-fixed, 1109.

hetero-, Rh specificity, guinea-pig, 1153.

heterophile (see also **Lectins**). Forssman : in anti-w.b.c. sera, 1161 ; pathol. effects in animals, 1198-9.

homo- & heterologous (a) specific, (b) pathol. effects, see (a) "anti-" above, (b) **Immunopathology**.

in body fluids : c.s.f. & serum, measles Ab, man, 3615 ; venom & serum, auto-Ab, viper, 1182.

in cord & maternal blood, anti-food, man, 3650. in hypersensitivity reactions, 1109, 1144, 1146, 1149, 3625, 3635, 5866, (title 6) 7165.

incomplete, homologous, *C. perfringens*, 3614. inhibn./inhibitors : by chloroquine, denatured DNA L.E. Ab, 5816 ; by thiols, reagins, 1146 ; temporary, by substance injn., Le Ab, 3637 ; various, 1110.

iso-(non-blood group) : y-globulin allotypes (a) man, 1158, 4292, (b) mouse, 4778, (c) rabbit, 1229; H-2, cytotoxicity, 1278; tumour effects (a) 1282-3, (b) opsonisation of cells, 3737.

natural: in equines, anti-*C. welchii*, 5858 ; in man (a) cytotoxic, 3812, (b) dextran-reactive, 1234, (c) relation to ABO polymorphism, 4807 ; role in phagocytosis, 5996.

opsonins: effect on (a) bacterial intracell..

survival, 1108, (b) tumour cells by iso-Ab ;

origin, chick embryo, 3773 ; rickettsial, man, 1118.

organ specific. See "anti-' auto- & " homo- & hetero- " above,

reagins : dog, 1149; man, 1146, 3635; review, (title 12) 7150 ; wheal-reactive diphtheria antitoxin, prop., 793.

review, all aspects, 7150.

serol. surveys (for micro-organism serotyping see **Bacteria** ; **Viruses** etc.), man : adenovirus,

Sheffield children, 1128; antistaphylocysin over 10 yr., 3820 ; polio-, immunised population, 5862-3 ; *Toxoplasma* epidemic, 1513 ; Venezuelan equine encephalomyelitis, after Trinidad epizootic, 1458.

sessile. See "cell-fixed" above,

sp.-specific, anti-mouse sera, tumour/virus neutralising prop. 3729, 3739.

transfer (see also **Blood groups**, incompatibilities ; **Transplantation immunology**) : cellular/

adoptive, (a) in LCM virus carriers, 5908, (b)

in parabiosis, 1196 C; immunotherapy treatment, 1274 ; maternal-offspring (a) colostrum, pig, 3691, (b) placental, man, rabbit, 1126, 5998, (c) lacteal, mice, 1127.

Antibodies, formation (see also **y-Globulins** ; **Immun- headings**), for responses to (a) sp. infections, (b) grafts, see (a) **Antibodies, against**, 6-**Immunisation**, (6) **Transplantation immunology**.

anamnetic response : in myxovirus cross-infections, ferret, 1124 ; to phage OX-174, guinea-pig, 1201 ; to influenza strains, related Ag role, man, ferret, 3616-7.

by transferred cells : in cancer therapy, 1274 ;

in heterologous hosts, 3688 ; in LCM virus infection, 5908 ; in parabiosis, 1196 ; markers for source of, y-globulin allotypes as, 3689.

by w.b.c. significance, 3685.

cerebral role, 5902.

depression/suppression. See **Immunological unresponsiveness**.

development. See **Immunity**, development; &

"in foetus" etc. below.

effect on, of : Ag admin., method/route, 1112,

5899 ; dietary protein variation & methionine deficiency, 1207 ; vit. B₁, & C, (title 4) 5044, (title 2), 5047.

Antibodies, formation,

enhancement/stimn. (see also **Immunisation**) : anti-viral, rapid induction method, 1120 ; by pertussis cells or Freund's adjuvant, 1113 ; by endotoxin & X-rays, 1201-2 ; by X-ray, mechanism, 5903.

histophysiol. of (see also **Lymphoreticuloendothelial system**) : lymph nodes & spleen, 1112 ; plasma cells, 3686-7, 5898 ; spleen red & white pulp, 1202.

immunol. competent cells functional nomenclature & relationships, 5900-1 f.

in chick, macro- & 7S y-globulins, 5914.

in cold-adapted mice, anti-phage, 1206.

in foetal lamb, to various Ag, macro -> 7S y-globulins, 5896.

in monkey, to *Past. tularensis*, 1112.

in neonates, infant animals & children : man (a) to adenoviruses, 1128, (b) to polio, 1126, 3620 ; piglet, 3691 ; rabbit (a)y₁-macro- -*7S y-globulins, 1205, (b) to phage, 19S, 1204.

in non-mammalian vertebrates, 1130.

in vitro : & in vivo comparisons, spleen, 1202 ; by delayed phase corneal limbal foci, 1144 ; by small lymphocytes, 5897 ; initiation, macrophage RNA role, 3690.

of natural Ab, role of ABO polymorphism, man, 4807.

of 19S & 7S Ab to phage OX-174, factors affecting, guinea-pig, 1201.

primary & secondary responses : differences, 3687 ; primary (a) depression in lymphocyte depletion, 1221, (b) in spleen, 1202 ; secondary (a) adaptation for suppression, 3698, (b) small lymphocyte role, 5897.

review, (titles 7-10) 7150.

Anticholinergic drugs. See **Cholinergic blocking agents**.

Anticholinesterases. See **Cholinergic agents** ; **Cholinesterase inhibitors**.

Anticoagulants. See **Blood coagulation**; **anti-agents**.

Anticonvulsants (see also **Depressants** ; **Muscle relaxants** ; **Sedatives & hypnotics**),

activity of : anticoagulants & vit. K, 4009 ; local anaesthetics, review, 1609.

admin. with autonomic drugs, effects in electroshock, 4045.

amphenidone, e.e.g. & behavioural effects, 1611. diphenylhydantoin : effect of intracarotid & intravertebral admin., 3968 ; effect on liver regeneration, 1698 ; electroshock threshold increase, endocrine factors, 4010-11.

Antidepressants. See **Stimulants**.

Antidiabetic agents. See **Hypoglycaemic agents**.

Antidiuresis. See **Kidney function**.

Antidiuretic agents. See **Antidiuretic hormone** ; **Kidney function**.

Antidiuretic hormone, pitressin, vasopressin (see also **Kidney function** ; **Pituitary, posterior**),

8-arginine form : adipokinetic activity, mammals, 1784 ; effects on AMP production, 6791 ; synthetic & natural, comparison, 3243.

blood & urine levels, 2076-7, 4584.

distribution & activity, pituitary homogenates, 673, 5566-7.

effects of, on : adrenaline reversal, anaesthetised dog, 6245 ; Na transport & permeability, frog skin, 6387.

-like principle, elasmobranchs, 5013.

8-lysine form, synthesis & biol. activity, 677, 3242.

post, pituitary content, 2075.

release, as affected by : carotid occlusion & vagus nerve, 2076-7 ; starvation, reptiles, 5015 ; tranquillizers, frog, toad, 1607.

renal response to, hypothyroid rat, 4094.

uterine sensitivity to, 1795.

Anti-epileptics. See **Anticonvulsants**.

Antifungal agents. See **Fungal anti-agents**.

Antigens (sec also **Antigen- antibody reactions** ; **Imm- headings**),

antigenic prop./antigenicity (see also sp. types below) : & anaphylactogenic prop., pertussis cells & Freund's adjuvant, 1113 ; enzymic activity relationship, 1231, 1239 ; of cultured lymphoid cells, 3681 ; of FSH in HCG prep., 5885 ; of thyroid substances from cytol. aspiration, 3671f.

Antigens,

antigenic relationships (for (a) biochem., (b) taxonomic applications see (a) **Immunological techniques**, (b) **Taxonomy & species-specific** below) ; artificial Ag & TMV, 840 ; human placenta & kidney basement membrane, 3668 ; interspp. (a) & cross-immunity, bacteria, 1110, 1114, 1413, viruses, 1124, (b) mammals, (adrenal) 3674, (gastric) 3654, (kallikreins) 5880, (r.b.c.) 1152, 4291 ; normal & neoplastic liver, 1279, blood cells & platelets. See **tissue** below, blood group. See **Blood groups**.

blood (serum) proteins. See "-proteins" below J

y-Globulins.

catabolism sig., 3693, 3702.

chemistry/structure, prep. & prop, (see also -hapton below; **Immunological techniques**); characterisation : albumin microheterogeneity, 5307 ; *C. perfringens* e-Ag, 1410; trypanosome protective Ag, 3920 ; tuberculin parent substance, 884.

conformation during Ab purification, 3701.

detection methods : & differentiation, crossing paper electrophoresis, venom, 3705 ; haemagglutinin absorption, H-2 Ag, 1278 J

microspot technique, tissue Ag, 5881.

determinants/sites : & structural modifications, pepsinogen, 1231 ; demonstration by E.M., 1237f, of y-globulins (a) allotypes, 1229, (b) normal 7S, 1232, (c) fragments, 5912 ; of orosomucoid, sialic acid unimportant, 386 ; of polyoma variant, 6124 f.

differentiation / identification : allogenetic, by lymphocyte cytotoxicity, 3683 ; of myeloma proteins, 5650 ; of *Staph. aureus*, by Ig pptn., 6020.

prep. & prop. of TMV-related artificial Ag, 840 ; labelling (a) ["Cr]-dextran, 1234, (b) [¹⁴I]-tuberculin PPD, 1142 ; of measles, 3664 ; for haemaggl. inhibn. tests, 3867 ; of polyfunctional pyrimidine Ag, 3704 ; of rickettsial, for CFT, 1438 ; of pertussis (a) sol. protective, 1425, (b) submicroscopic antigenic particles, review, (title 11) 7163 j

of treponemal Ag for syphilis diagnosis, J spp., (title 8) 7165 ; purification of *C. perfringens* toxins & anatoxins, 3833.

vacuum/toxic prep. & evaluation. See **Immunisation, active**.

development, cattle r.b.c., 2377.

inhibiting cell migration in vitro, 1143.

endotoxin, Cohn fraction IV effects on, 601*

Bac. anthracis toxin, 3827.

Bord. pertussis: antigenic particles prep. (title 11) 7163 ; protective Ag (a) cell wall, 3613, (b) sol., 1425 ; vaccine, 5856.

Brucella: spp. (a) cross-immunisation, H_J:

(b) cytoplasmic & cell wall, 1426 ;

abortion, immunogenic extracts, 1427.

Clostridium: spp. spore & vegetative Ay

6036 ; *C. perfringens* (*welchii*) (a) e-Ag

1410, (b) toxins & anatoxins, 3833 ; "

tetanus toxoids (a) adsorbed & ¹⁴C-

adsorbed, 5857, (b) vaccine, (title 1) 7163

Corynebact. diphtheriae: -tetanus ALOP*

absorbed vaccine, 5853 ; • (contd.)

- antigens, (contd. from **)** toxoids (a) purified & cone, protein fractions, 6031, (b) vaccine, 6032.

Diphlococcus pneumoniae, "competent" cell sp. Ag, 13&c.

&⁺ *coli*: & other Enterobacteriaceae (a) common haptens, 3835, (b) OB groups, 1413; common ribosomal & sp. Ag, 423; a-haemolysins prep., 6037.

Haemophilus influenzae, type-sp. Ag, 3845.

Klebsiella: capsular & somatic Ag, 6040; PP⁺ sp. & common Ag, 1421; *K. pneumoniae*, type 2 polysaccharides, 1225.

Mycobacterium: spp. comparisons, 1398-9; *M. lepraeumurium*, sol. Ag in culture, 1400; *M. tuberculosis*, BCG, tuberculin & cell extracts, vascular effects, 3779, tuberculin & fractions (a) prep., 884, 1109, 3611, (b) & hypersensitivity, 1142, 3631, & tuberculolipids, 3632.

Pasteurella tularensis, vaccine, 1112.

Proteus mirabilis, persistence in treated pyelonephritic kidneys, 5990.

Salmonella: flagella, 1205; group G OI & 037 factors, 6017; *S. typhosa (typhi)*, vaccines (a) 1118, 38391, 4015, (b) & Vi Ag, 1111; variants, 1524; Vi Ag (a) production, 6043, (b) & O, in mouse protection tests, 1415.

Staphylococcus: toxins & anatoxins, (title 1) 5047, (title 2) 7165; *S. aureus* (a) group sp. & agglutinogens, (b) & *S. epidermidis*, chem., 3819.

Streptococcus: groups (a) A, membrane common Ag, 1394, (b) D, & teichoic acid identity, 3822; spp., cell wall Ag, peroxidase effects 1395.

Treponema: 3 spp., syphilis test Ag, (title 8) T 7165; *T. pallidum*, Reiter, vaccine, 1117.

Vibrio cholera vaccines : & El Tor, 6055; Protective Ag, 1424.

Jacteriophage, *E. coli* T, 1204.

***apto** : & protein carrier in hypersensitivity, 1145, H47; differentiation, 5915; endotoxin-associated, 3835, 6012; in passive Glomerulonephritis induction, 3629; induc-VS responsiveness, 1219; penicillin deriv., 563.

***tolm琳** : *Ascaris* & *Toxocara* extracts, 5865; *Lechinococcus granulosus* hydatid fluid, 3624; *fasciola hepatica*, 3622; *Schistosoma* skin Ag, 5864.

Jt⁺ **tephopehl**, cattle, horses & men, 1152; 4291.

***otozoal** : *Histomonas meleagridis*, 3621; *« ixoplasma*, immunochem., 1133-4; *Trypanosoma* spp. w rhodesiensis, protective Ag, 3920.

ettsial : *Coxiella burnetii*, prep., 1438; *Kickettsia prowazekii*, 1118.

-cies-specific (see also -bacterial etc. above; immunogenetics; Transplantation immunology), 4448 spp., 7113.

£'tite r.b.c. ontogenesis, 2377.

fog, 7038.

friconpatibility (see also "iso" below) : chicken, 5906; mouse (a) hybrid cells, 76, (b) irradiated inbred sublines, 2374; transplantation (a) microsome as, 5888, (b) release from graft, 5895.

homologous (allogenic), mouse strains, 3639, 3683.

syngeneic (for (a) blood groups, (b) hereditary y-globulins, see (a) **Blood Groups**, (b) **Blood proteins, hereditary**): man, sperm, ABO, 1151; mouse H-2 system (a) detection in cell lines, 1278, (b) immunogenet., 5893.

Tuscan spp., 7129.

snake venoms: *Agkistrodon halys*, 3705; *Bothrops newtoni*, 4210; Egyptian black, tigon, 1182.

ean-specific (see also -heterophile, & for 5? # specific above).

Pfhol. effects of foreign Ag (e.g. expt. allergic *encephalomyelitis*), see **Immunopathology**. **cenS?** PP⁺ distribution, 3674.

U⁺ fractions : kidney microsomes, 3660-1; U⁺ mitochondria, microsomes & sap, ell⁺ thyroid cytoplasm & nuclei, 5882.

Schistosoma spp., 1285.

U.V⁺ epithelial protein fractions, *10³ lens (title 3) 7161.

Antigens, tissue/organ-specific, gastrointestinal : colon, human foetal, 5109; gastric, 3654-5; loss in neoplasia, 3736. liver: 1163; changes during azo-carcinogenesis, 1279; in serum after toxic damage, 1164; of DAB-fed rat, (title 5) 5047. placenta, distribution, man, 3668. spleen, absorption by *Salm. typhosa*, 1414. testicular/sperm : acrosomal, 1169; loss in neoplasia, 1280; sperm & seminal plasma, 2141. thyroid, 3670-1 f, 5882.

trachoma, species-sp., 1129.

tumour. See **Tumours, immunology**.

viral (for haemagglutinins & -lyssins see **Viruses**), foot-&-mouth : CF, 6100; strain differences, 6099. Friend disease, 3719. herpes simplex, N, V & S Ag, 1442. influenza: Ag, 5869; B, 5069-70; vaccines, 3618, 3856, 5859. Japanese B encephalitis, CF & haemaggln, 6083-1. measles, vaccines, 1122-3. myxoviruses, interrelationships, 1124. NDV, vaccines, 3861-2.

Perugia cat virus, 6101.

polio- & enteroviruses common Ag, 1447; types, 1446; vaccines, 1448, 3620, 3863, 5861, 6078.

polyoma variant, 6124 f.

rinderpest, vaccine, 6109.

vaccinia: & hypersensitivity, 3694; vaccine, 1121. yellow fever, 17D vaccines, 3619, 6082.

Antigen-antibody reactions (see also **immunological techniques**), for (a) C.F, (b) allergic & (c) pathogenic (e.g. nephritis) in roles, see (a) **Complement**, (b) **Hypersensitivity**, (c) **Immunopathology**.

agglutination : adhesion measurement, 1245; haema. In, (a) inhibn by bacterial polysaccharide S 12²⁴ (C¹²) P²⁴ with incomplete Rh Ab, trypsin effect on, 2958. cell injury in, X-ray-induced damage compared, 1079.

D⁸ anti-DNA inhibn. by chloroquine, 5876. haemolysis (see also **Complement**, haemolytic) : enteritis-associated system, serum factors in, rabbit, 4293; mechanism & pH & ionic strength effects, 3707-9. nature of, (title 1) 7150.

ppn., dextran—natural human Ab, 1234.

toxin-antitoxin : *Clostridium* spp., 1411; diphtheria, 6030.

virus-Ab interactions, kinetics : influenza, 1443; Japanese encephalitis, 6084; NDV (haemolytic), 1242.

Antihaemophilic globulin (factor VIII). Refer to **Blood coagulation***

Antihelminthics. See **Helminth anti-agents**.

Antihistamines (see also **Histamine**; **Phenothiazine derivatives**), antazoline, anti-arrhythmic, 4154. assay, inhib. histamine cytotoxicity, tissue culture, cinnarizine pharmacol., 1700. identification, chromatog., 4190. meclozine & mepyramine, effects, pregnancy, 6277.

strain difference, 1197 in response, mice, 4194.

Antiprostaglandine, 1197.

Antiinflammatory agents (see also **Analgesics & aXyretics**; **Inflammation**; **Salicylates**; **Steroids**, pharmacol. active), activity of : c-aminoacrylic acid, 4167; citrus flavonoid complex, 939. a_n evaluation : carrageenm-induced oedema, 4156 • mesenteric permeability, 1719. phenylbutazone : & salicylate, cortico-pial calcification effects, 4079; -induced ulcers, 4179.

Qteroidal: acetates & phosphates, activity, 1652 • thymolitic activity, 6268.

Antimalarials. See **Protozoal anti-agents**.

ATSiSSBolites. See **Cytostatic/cytotoxic agents** ; **Metabolic inhibitors**.

inheritance of drug resistance, (title 5) 50 mutations : directed, 4759 ; episomic cont of, *Salmonella*, 4758 ; mutagenic action (a) radiation, 3815-6, 6015, (b) chemical 6016, 6018.
nature of colicinogenic factors, review, 23^ of **Streptomyces coelicolor**, (title 5) 2591.
recombination : analysis, *Streptomyces*, W 2335 ; incorporation of parental DN^{E. coli}, 4756 ; related to DNA synthesis, *coli*, 3393 ; sex factor transfer, during, 475 reversions, analysis, *E. coli*, 2332.
transduction : by phage, *Bac. subtilis*, 380 in *E. coli*, 299 ; of Ag factor, *Salmonella*, 6017 ; of lac region, *E. coli*, 3062 ; of se prop., *Salmonella*, 3843.
transformation : competence (a) *Haemophilus* spp., 3814, (b) *Streptococcus*, 3817 ; *Rhizobium*, (title 12) 5037 ; possif dependence on Ag structure, pneumocG 1365 ; reaction, 5388.
growth & nutrition,
avian & parafabicular bacilli, developing (title 3) 5047.
C sources utilised : n-octane, *Pseudotnod 3408* ; phenol, *Ps. resinovorans*, 98 pteridine, *Alcaligenes faecalis*, 872.
colony development : long-chain phenoj non, *Streptococcus*, 3821 ; swarmers Y deduced, *Bac. cereus*, 3828.
culture conditions affecting growth/morphb Bad. anitrat, 1429 ; Halobacterium sp 3849-50 ; *Pasteurella septica*, 6049t ; SM pyogenes, 5442.
growth cycle : ageing affecting metabolic E. coli, 848 ; mean generation time patig 3810 ; of penicillin resistant & sensit Staph. aureus, 3926 ; popln. den Spirillum serpens, 1363 ; related to to bolic activity, 844, 850, 2769.
growth inhibition. See **Bacterial anti-ag**'S N cpd. utilisation : nitrate, *Agrobacter* W 5446 ; peptides, (a) *E. coli*, 3413, & (b) *Lactobacillus casei*, 2875 ; tyrosine, I colii, 5353.

Bacteria.

nutritional requirements : amino acids (a) auxotrophic *E. coli*, 3057, (b) *Staph. aureus*, 6021 ; growth factors, 1402, 3852 ; salt, *Halobacterium antirubrum*, 3849.

selective media for : *Desulphovibrio desulfuricans*, 3848 ; heterotrophic saltmarsh spp., 3795.

substrate-accelerated death, 3057, 3935.

uptake of K & Rb, *Staph. pyogenes*, 5443.

naemolysins. See **Toxins, bacterial.**

heterotrophic salt-marsh spp., 3795.

in earthworm, 1556-7.

in food & water. Refer to **Foodstuffs ; Waters, natural.**

in gastrointestinal tract, mouth, respiratory & urinary tracts, soil, etc. Refer to relevant bold headings.

in insects, 1428, 3831-2, 5029.

nhibiting : tumours, streptococcal lysates, 1269 ; viral multiplication, *Corynebacterium*, 1460.

Jysing fungi, 3952, 6034.

ysis by (see also **Bacterial anti-agents ; Bacteriophages**) : explosive decompression, 3792 f.; lysozyme, 889 ; osmotic shock, 855, 3850 ; Penicillin, *E. coli*, 3930 ; u.v. & lytic factor, *Bac. cereus*, 3829.

marine spp., 1372, 1542.

niotility, hydrodynamic study, 5719.

new spp. : *Microellobosporia*, 3825-6 ; *Nocardia italica*, 1403.

phage-infected. Refer to **Bacteriophages.**

Phagocytosis. See **Phagocytosis.**

Photosynthetic. Refer to **Photosynthesis** ; & named organisms in Taxonomic index.

Pleuropneumonia-like (see also **Mycoplasma** in Taxonomic index), 1434-6, 5378.

Protoplasts & related forms.

L forms : *Proteus*, 887 ; *Salm. paratyphi B*, 1416 ; *streptococci*, 1394.

protoplasts : bursting factor, 3426 ; "flickering" in, *Bac. megaterium*, 60351 ; induction, 1423, 3938 ; metabolism of, *E. coli*, 3886, 5630.

radiation effects, ionising, on : DNA, *E. freundii*, 3570 ; genes, 3815-6 ; **growth**, *Brucella abortus*, *M. tuberculosis*, 3945 ; metabolism, *Bad. cadaveris*, 3565 ; spores, 3946 ; viability, *E. coli*, 5839.

radioprotection by medium, 3570, 3574, 3815. reactivated by RNase, *E. coli*, 3572.

used in food sterilisation, 3943.

u.v. : affecting permeability, *E. coli*, 5825 ; lytic, *Bac. cereus*, 3829 ; mutagenic, (a) *E. coli*, 6015, (b) *Streptomyces*, 3816 ; on

nucleic acid metabolism (a) *E. coli*, 1061, (b) *Vibrio cholerae*, 1067 ; on sedimentation pattern, *E. coli*, extracts, 1076 ; radiosensitivity, gene controlled, *E. coli*, 2331 ; recovery from, *Shig. sonnet*, 1549-50.

resistance & sensitivity to drugs. Refer to **Drug headings** ; **Antibiotics** : Sulphonamides.

ro nodule spp. See **Boots.**

Pores, composition & structure: 3807-9; *Microellobosporia* spp., 3825-6.

heat resistance: lowered by γ -radiation, 3946 ; related to ionic concn. of medium, 1409.

of *Bac. anthracis* in anthrax, 1407.

resistance to antisepsis, 6172.

serol. study, *Clostridium* spp., 6036.

sporogenesis : affected by medium, 3809 ; metabolism during, 3806.

x viability, frozen dried spores, 3800.

strain typing, biochemical characterisation : *Actinomyces* spp., 1404 ; *E. coli*, 5346 ; *Ha. mophilus vaginalis* renamed *Corynebacterium vaginalis*, 6053 ; *Micrococcus* & *Staphylococcus*, 1371 ; *Nocardia*, 1111 ; *Rhizobium*, 3950, 6180-1.

phage typing : *Bac. subtilis*, 3890 ; *Micrococcus*, 1371 ; *Proteus*, 3891 ; *Staph. aureus*, 1371, 1375, 6021-2, 6028.

serol. typing : *Clostridium sporogenes*, 6036 ; *E. coli*, 1412-3 ; *Haemophilus influenzae*, 3845 ; *Klebsiella* spp., 1421, 6040 ; *Lactobacillus casei*, 1390-2 ; *Leptospira* spp., 3961 ; *Mycobacterium* spp., 1398-9 ; *Salmonella*, 3843, 6043 ; *Shig. flexneri*, 1418 ; *Streptococcus equinus*, 1823 ; *Streptococcus* Group D, 3822.

Bacteria,

analytical, 37931.

N-acetyl-glutamate formation, resting cells, 504 ; C-terminal groups on bacterial surface, 5318 ; DNA prep., 3000-1 ; penicillinase activity, 6166 ; staphylococcal 9-lysin, 3418 ; staphylokinase, 3396.

culture media for : colicine production, *E. coli*, 6038 ; competent *Haemophilus* spp., 3814 ; *Desulphovibrio desulphuricans*, 3848 ; ferroverdin production, *Streptomyces*, 5725 ; spore production, 3809 ; swarmer production, *Bac. cereus*, 3828.

density measurements : *Azotobacter* in soil, 3948 ; membrane filter, 1359 ; salt-marsh spp., 3795 ; spot-plate method, 1358.

diagnostic for: anaerobic Enterobacteriaceae, tetrathionate-reductase activity, 3798 ; coagulase pos. staphylococci, 1378, 1386 ; differentiating *Streptomyces* & *Nocardia*, 6034 ; Eaton's pleuropneumonia-like organisms, 1434 ; non-haemolytic coryneform spp., 2806 ; staphylococci, 1379, 1393 ; *Vibrio cholerae*, 3844.

Gram stain, 1360, 3799.

isolation of: *Aerobacter* mutants, 3837 ; heterotrophic salt-marsh spp., 3795 ; Myxobacteria, 37941 ; soil spp., 3953 ; *Staph. aureus*, 1379-80.

polymer 2-phase system for cell fractionation, 1408.

thermal resistance, *E. coli*, 1552.

thymineless death, *E. coli*, 3057.

toxins. Refer to **Antigens** & **Toxins, bacterial.**

virulence. Refer to **Virulence.**

water relations of staphylococci & micrococci, 1373.

Bacteria, composition/metabolism (see also **Bacteria, enzymes** ; for antibiotic, antigenic, pyrogenic & toxic component/metabolites see sp. headings).

acetate: biosynthesis, *Diplococcus glycinophilus*, 864 * ; metabolism, *Azotobacter*, 858-9.

acid production, *Azotobacter*, 3400.

amino acids, biosynthesis : acetylglutamine, 504 ; arginine

inhibit by uracil, 510 ; cysteine, *Salm. typhimurium*, 847 ; from fatty acids, rumen spp., 5229 ; tryptophan, 299, 2870.

composition : D-alanine, *Streptococcus*, 5277 ; diaminopimelic acid, L form *Proteus*, 887 ; ornithine, *Mycobacterium*, 219.

metabolism : tryptophan oxidation, *Flavobacterium*, 2869 ; valine-isoleucine pathway, *Salm. typhimurium*, 3394.

ammonia: oxidation, (a) *Arthrobacter globiformis*, 1553, (b) nitrifying spp., 645 ; uptake, *Streptococcus faecalis*, 880.

carbohydrate content, cellulose microfibrils, *Acetobacter xylinum*, 6784.

hyaluronic acid, *Streptococcus*, 885.

sp. lipopolysaccharides (see also **Toxins, bacterial**), *E. coli*, 886, 3803.

sp. polysaccharides (see also **Antigens, bacterial**): *E. coli*, 136-7 ; *Klebsiella* spp., 1420-1 ; *Mycobacterium lepraeumurium*, 1400 ; *Salmonella*, 3843 ; *Staph. aureus*, 3819, 6020 ; *Staph. epidermidis*, 3819 ; various spp. (a) Enterobacteriaceae, 5210, (b) inducing infection in mice, 3805.

carbohydrate metabolism. Refer to **Carbohydrates, metabolism, bacteria.**

C & energy storage, (title 5) 5045.

CO₂ fixation, organotrophic spp., 3802.

cell wall composition (see also **Cell walls**), 886-8, 3061, 3425, (title 2) 5037, 5277.

coenzyme Q10 biosynthesis, *Ps. denitrificans*, 5553.

electron transport systems: cytochromes, 28931-4, 3034, 3128, 5292 ; *Cl. pasteurianum*, 587 ; *Mycobact. phlei*, 3225 ; *Nitrosomonas*, 3128.

fatty acid : biosynthesis, (a) *Bac. megaterium*, 5226, (b) *Cl. kluveri*, 2803, (c) octadecenoic acid, *Staph. aureus*, 3818 ; composition

(a) *Mycobacterium*, 199, 219, (b) *Serratia*, 198, 206 ; metabolism (a) ricinoleic acid, *E. coli*, 5227, (b) rumen spp., 5229.

folic acid biosynthesis, *Bac. subtilis*, 641.

glycerol, *Bac. subtilis*, 3407.

glycols, oxidation, acetic acid spp., 3402.

Bacteria, composition/metabolism,

hydrocarbons : biosynthesis, methane, *Methanoscincina barkeri*, 3409 ; metabolism (a) n-octane, *Pseudomonas* sp., 3408, (b) of *Ps. aeruginosa*, 3130, (c) phenol, *Ps. resinovorans*, 867.

poly-/9-hydroxybutyrate, granules, *Spirillum* spp., 3399.

hydroxylamine : oxidation, *Nitrosomonas*, 3128, (title 35) 7148 ; reduction, *Cl. pasteurianum*, 5728.

isoxanthopterin metabolism, *Acaligenes faecalis*, 872.

lactic acid content, *Lactobacillus casei*, 862.

lipid : biosynthesis (a) *Lactobacillus*, (title 44) 7148, (b) various spp., 234 ; constituents (a)

arabinose mycolate, *M. tuberculosis*, 5221, (b) lipoamino acids, *Bac. megaterium*, 5233,

(c) of *M. tuberculosis*, 2808f. (d) peptidolipid, fortuitine, *Myco. fortuitum*, 329 ; metabolism, coryneform sp., 2806.

metabolic inhibitors. See **Bacterial anti-agents.** methyl succinate metabolism, *Ps. fluorescens*, 572 If.

nitrate respiration, *Ps. denitrificans*, extracts, 866.

nucleic acids. See **Nucleic acids**,

nucleotides. See **Nucleotides**.

of phage infected cells. Refer to **Bacteriophages**. pep tide : composition, 889, 3137 ; metabolism, 848 ; uptake/transport, 2875, 3413, 5283.

phenazine-N-oxides reduction, *E. coli*, 868.

phospholipid : content, *Mycobacterium*, 219 ; *M. cereus*, (title 35) 2594 ; ornithine ester of phosphatidyl glycerol, 251 f.

photosynthesis. See **Photosynthesis**, bacterial, pigments (see also **Carotenoids** ; **Chlorophyll**) : blue protein, *Pseudomonas*, 3100 ; ferroverdin production, *Streptomyces*, 5725 ; of staphylococci, 1387, 6025 ; porphyrin biosynthesis, *Rhodopseudomonas sphaeroides*, 843, 5610, 5726.

proteins. Refer to **Proteins**. respiration (see also **Respiration, tissue/cellular**), **γ -irradiated Brucella & M. tuberculosis**, 3945.

steroid : dehydrogenation (a) *Bac. sphaeericus*, 2839, (b) *Ps. testosteroni*, 262 f, 714 ; hydroxylation, *Streptomyces fradiae*, 3824 ; oxidation, *Nocardia italica*, 1403 ; transformation, *Actinomyces* spp., 1404.

teichoic acid, serol. prop., *Streptococcus*, 3822.

thiosulphate oxidation, *Thiobacillus*, 722.

vitamins : B₁₂ purine metabolism as related, *Lactobacillus*, 3205 ; B₂, biosynthesis (a) cheese spp., (title 10) 7157, (b) pathway, *Nocardia*, 648 ; biotin biosynthesis, *Achromobacter*, 638 ; K₂(α), *Myco. phlei*, 3225 ; nicotinic acid biosynthesis, *M. tuberculosis*, 3410.

Bacteria, enzymes/enzyme systems, active systems, prep. & prop., acetate : biosynthesis, *Diplococcus*, 864 ; metabolism, *Azotobacter*, 859.

fatty acid biosynthesis, *Cl. kluveri*, 2803.

H₂ production, *Cl. pasteurianum*, 587.

hydroxylamine oxidation, *Nitrosomonas*, 3128.

nucleic acid methylation, *E. coli*, 2994.

activity of, aldose dehydrogenase, *Ps. fragi*, 178.

amino acid decarboxylase, *Klebsiella*, 6044.

catalase, *Salm. typhimurium*, 6044.

chitinase & laminarinase, *Bac. cereus*, 3952.

dehydrogenases, *Rhizobium*, 6181.

lipase, *Staphylococcus*, 6169.

oxidase, *Staphylococcus* sp., 1381.

pectolytic enzymes, *Bac. polymyxia*, 850.

penicillinase : *Aerobacter cloacae*, 877 ; *Staph. aureus*, 3929, 6166.

peptidase, *E. coli*, 5283.

phosphatase, *Rhizobium*, 6180.

phospholipase, coryneform sp., 2806.

polyphosphate hexokinase, *Mycobacterium* spp., 5199.

sp. specific RNA methylase, 472.

steroid dehydrogenase, *Ps. testosteroni*, 714

biosynthesis, feed back inhibn. acetylglutamine synthase, *E. coli*, 504.

0-D-galactosidase, *Shigella*, 5051.

gene regulated, 299, 847.

Bacteria, enzymes/enzyme systems, induced : deoxycytidylic acid kinase, pneumococci, 3392 ; heptanol dehydrogenase, *Ps. aeruginosa*, 3130 ; hydroxyproline-2-epimerase, *Ps. striata*, 636 ; ribitol dehydrogenase, *Aerobacter aerogenes*, 182 ; tetra-thiomine reductase, 585.
inhibn. by : light, 3561 ; X-ray, 3565.
isocitrate lyase, *Azotobacter*, 858.
repression, 510, 3394-5, 5353.
extracellular : amylase, *Bac. subtilis*, 193, 2786 ; collagenase, *Ct. histolyticum*, 2903 ; lipase, *Staph. aureus*, 3818 ; pectolytic enzymes (a) *Bac. polymyxa*, 850, (b) *Streptomyces*, 871 ; proteolytic, rumen spp., 3801.
inhibition/inactivation (see also Bacterial anti-
~~ts~~), antifisi!, 5617.
histidase, *Pseudomonas*, 3303 f.
hydrazidase, 603.
nitrate-reductase, 3838.
penicillinase, *Aerobacter*, 877.
succinoadenylate kinosynthetase, *E. coli*, 442.
participate systems,
arginine dihydrolase, *Streptococcus faecium*, 852.
malic dehydrogenase, *Micrococcus*, 3397.
methyltransferase, *Rhodops. sphaeroides*, 5726.
penicillinase, *Bac. cereus*, 6165.
polyglycerophosphate synthetase, *Bac. sub-respiratory enzymes*, *Azotobacter*, 855.
prep. & prop., acyl Co A synthetase, *Bac. megaterium*, 5226 f.
alcohol dehydrogenase, *Ps. aeruginosa*, 3130.
alk. phosphatase, 3137.
S-alkylcysteinase, *Ps. cruciviae*, 2866.
ascorbic acid oxidase, *Aerobacter*, 658.
L-aspartate 4-carboxylase, *Achromobacter* sp., 31?.
biotinidase, *Propionibacterium*, 639.
citrate oxaloacetate lyase, *Aerobacter*, 575.
cytidine monophospho-2-ke to-3-deoxy-octanoate synthetase, *E. coli*, 408.
cyt. oxidase, *Pseudomonas*, 576.
y, 6-dioxovalerate amino-transferase, *Rhodo-pseudomonas*, 857.
folic acid deaminase, *Alcaligenes*, 3200.
galactokinase, *E. coli*, 175.
l-galactosidase : *Bac. anthracis*, 5183 ; *E. coli*, 5207.
fi-l, 3-glucanase, *Bac. cereus*, 5219.
heptanol dehydrogenase, *Ps. aeruginosa*, 3130.
hydrazidase, *Mycobacterium*, 603.
oc-&-f-hydroxy steroid dehydrogenase, *Ps. testosteroni*, 262-f.
0-methylcrotonyl Co A carboxylase, *Achromobacter*, 5539.
nitrate reductase, *Achromobacter*, 586.
nucleoside hydrolase, *Thermobact. acidophilum*, 2982.
penicillinase, Gram-pos. & -neg. spp., 1565-6.
phosphoribosyltransferase, *Thermobact. acidophilum*, 2983.
polynucleotide phosphorylase, *Ct. perfrigens*, 3073.
protease, 5485, 5573.
ribitol 5-phosphate dehydrogenase, *Lacto-bacillus*, 180.
staphylokinase, 3396.
tetraphionate reductase, anaerobic sp., 585.
transgalactosylase, *Streptococcus lactis*, 2793.
Bacterial anti-agents (see also Antibiotics ; Micro-organisms, anti-agents ; Siphonamides), general entries are followed by named drugs.
activity of : ground tick suspension against *Leptospira canicola*, 6057 ; honey bee venom, 3428.
drug resistance, (title 5) 5037.
factors in sera. See Immunity, natural & non-specific.
in honey, identified as H_2O_2 , 3324.
in human saliva against *Lactobacillus acidophilus*, 1536.
in oxbrain against *Staph. aureus* in vivo, 5776.
radiation effects. See Bacteria, radiation effects, above.
sterilisation of air filters, 6177.
named agents.
amino acid analogues, *E. coli*, 2863.
aminohydroxybenzenes against *Serratia marcescens*, 3936.

Bacterial anti-agents, chalkones against *Staph. aureus* & *E. coli*, 1571.
cyanin & other pigments against *Staph. aureus*, 1543.
ethylene oxide steriliser, 3937.
glycidaldehyde vapour, against spores & vegetative cells, 1547.
glycine, against *E. coli*, 3938.
hexachlorophane & polyvidone in soap, 6173.
8-hydroxyquinoline, inhibiting pigment biosynthesis, *Rhodops. sphaeroides*, 5610.
isoniazid, against *M. tuberculosis*, 5636.
lactoperoxidase, against *Streptococcus*, 3939.
laurolinium acetate, against various spp., 1574.
9-mercaptoethanol & dithiodiglycol, against *E. coli*, 1545.
phenolic cpd., & others, against dried organisms, 6172.
purine & pyrimidine analogues, 759, 763, 1541, 3936.
quaternary ammonium cpd., against *Ps. aeruginosa*, 1673.
Roccal, 6174.
selenite & tellurite toxicity, *E. coli*, 5626.
Bacterial infections (see also Antigens, bacterial, & endo toxin effects -Disease & epidemiology; Immunity ; Virulence ; individual infective organisms in Taxonomic index), anthrax, 1406-7.
bacteraemia & peritonitis in mice, 5988.
carrier state of : *Haemophilus influenzae*, 6052 ; *Staph. aureus*, (title 3) 5037, 6028.
choleragenic prop. of El Tor vibrios, 6054-5.
diphtheria-like strains isolated in Poland, 6029 f., 6030.
gastrointestinal: guinea-pig, 6186 ; infants, 1413 ; man, 1374f, 1520, 6045-7, 6092 ; pigs, 3628, 3834 ; rabbit, 4293.
in chick embryo, 3840, 3842.
in plants. Refer to Plants, diseases, leptospirosis, 3847, 6057, 6058f.
mastitis in sheep, 1389.
mycobacterial granulomas of hamsters, 1401.

cocks, spermatocyte structure, 2285 ; comb growth, 1012.

contact filters for, 2590.

eggs (see also Shells), 2892, 5115, 5433, 5436-7.

encephalomalacia & muscular dystrophy, 3150.

enzyme activity, pancreas & small intestine, 265.

hens : laying birds, plasma phosvitin, 348 ; maternal behaviour, 6770-1.

parasites, *Eimeria acervulina*, 2554.

pituitary histol., ageing & castrate birds, 6.

reproduction, genetic aspects, 4781.

Kous sarcoma virus in, 5945.

thyroid function, 3244.

ducks (see also *Anas*, *Cairina*) : diving & stress effects, cardiovascular system, 6484 ; imprinting, auditory factors, nestlings, 4689 ; 'nonsense' orientation, mallard, 2246 ; serum proteins, choline deficient ducklings, 617 ; pituitary histol., annual cycle, 6^o, 7.

flamingo, skin & feather pigments, 552.

gulls, salt gland, 3107f.

kittiwake, laying hens, age & egg size as related, 2573.

migratory spp., fat deposition & range as related, 2149.

pigeons (see also *Columba*) : as expt. animal for concepts in general index above, 2164, 2166-8, 3029, 4640-3 ; discrimination ability, 2148 ; imipramine effects on behaviour, ***(contd.)

Birds, specific, (contd. from **)

3986 ; retinal absorption spectra, 559.

rooks, hyperlipaemia without atherosclerosis, 5250.

tropical songbirds, antiphonal singing & auditory reaction time, 2241.

turkeys : dimetridiazole absorption, excretion & metabolism in, 1670 ; Hb development, 2381 ; retinal absorption spectra, 559 ; Kous sarcoma virus in, 1281 f., 5944.

Bismuth, as electron-opaque stain, 5091.

Bismuthate, oxidation of steroids, 719.

Bladder. Refer to Biliary tract & gall bladder ; Urinogenital system ; for swim-bladder, see Fish.

Blastocyst. See Embryos.

Bleaches, optical, toxicity, 1737.

Blood, for levels of substances not given below see individual headings, e.g. Amino acids ; Catecholamines J Drugs ; Ketone bodies ; Steroids.

apparatus & general techniques. See -indices & tests below,

arterial, capillary, venous. Refer to -gases ft pH below ; & Cardiovascular system, chem. elements, (title 1) 5035.

Cu levels, pregnancy effects, sheep, 3099.

foetal/cord, maternal/placenta, neonatal. See Blood- sections below ; & e.g. Embryo* mammalian ; Pregnancy, -gas interface. See -gases below ; Gills ; Lungs.

haematol. lab. & clinical, (title 18) 5040.

haemodialysis. Refer to Cardiovascular system, apparatus & techniques ; & Kidney, artificial, haemolymph ; invertébrate. See -invertébrate below.

pH. See -gases & pH below,

hypo-oxia effects on phosphates, tench, 7024.

immunity aspects. See Immunity & related headings,

infections (septicaemia, viraemia etc.). See e.g. Bacterial infections ; Viruses, animal.

ionic composition. Refer to Electrolytes I Metallic ions ; Mineral metabolism ; & to individual ions,

picture, chem. & morphol. : after dextral administration, 5212 ; changes, birth to maturity, guinea-pig, rat, 4278.

radiation (ionising) effects (see also Bon* marrow) : 5831, (title 5) 7164 ; on haemopoiesis, 3583, 3585 ; on r.b.c., 3587 ; on serud proteins, 3584 ; on w.b.c. & platelets, 3576 ; on w.b.c., 1088, 3586.

sodium selenite effects, 1685.

steroid reduction, 5601.

storage (see also Preservation), 1801, 4290, 4319, 6430.

Blood-brain/c.n.s. & eye barriers (see also Dm* absorption), I & PAH transport, drug effects, 4494.

¹⁴Na turnover as affecting, 4493.

Blood cells (for radiation effects see Blood* radiation effects, above), counts, automatic disposable system, 6375.

nucleases & -inhibitors in, 3027.

nucleated, thyroid hormone fixation, various spp. 3249.

staphylococcal infections, effects, 6026.

Blood cells, red (see ²so Haemoglobin), Ab, Ag. Refer to Antibodies ; Antigens ; * Blood groups, as immunol. prep. See Immunological tec' & techniques.

³Cr-marked, in splenic studies, 3374.

cortisol-binding agent of, 1800.

fibrinolytic activity, 4311.

foetal, in maternal blood, 6407.

ghosts : -protein interactions, 5317 ; soft disruption affecting ATPase inhib., 3321.

haemagglutination (for aggl., adsorption * surface prop, as related to hetero-Ag & vir⁺ fixation, refer to Antigen-antibody reaction!) Immunological techniques; Viruses): 43¹ electronic quantitation, 4225 ; inhibitor ^ edible bird's nest, 746.

haemagglutinins & haemolysins. Refer ^{rl} Antibodies ; Blood groups ; Lectins ; To** headings ; Viruses.

haemolysis (see also -anomalies ; -phys⁺ standards below) : 248 ; haemolysate electrophoresis, 1013 ; immune, 3707-9 ; PPLCM⁺duced, 1434 ; vit. A induced, 5531.

- Blood cells, red,** **haemolytic C** See **Complement**, in acatalasias, (title 118) 7148.
membrane prop. (for metabolic & permeability/transport studies refer to **-composition & metabolism** below) : Hb as component, 4283 ; lyssolecithin effects, 254 ; surface structure, 1000; transferrin attachment, 1809.
nuclear Hb, sig., newt, 4699.
precursors. See **-formation** below, sensitisation, D-benzylpenicillenic acid, 1563.
slowing factor in cancer serum, 3335.
anomalies & disorders (see also **Anaemia**), aplasia, Co treatment, 4127.

biosynthesis, 497, 3173f, 5421-2.

Cohn fractions : angiotensin II degradation by, 1714 ; VI, isolation, in rheumatoid arthritis, 779.

contamination of perfused organs, 396, 1156.

DNase distribution in, 5388.

fraction ptd. by 80% sat. (NH₄)₂SO₄, streptokinase formation from, 3612.

in review, (title 4) 7156.

loss into g.i. tract, 3334.

mesentery permeability to, 1719.

metabolism, (title 9) 2599.

oestrogen distribution in, (title 8) 7163.

patterns, after polycyclic hydrocarbons, i.p. injn., 1290.

after (NH₄)₂SO₄ fractionation, man, 777.

developmental changes, rat, 2911.

of American Indians, Negroes & Caucasians, 780.

of grass snake, 5311.

of growing rats fed antibiotics, (title 16) 5044.

of hamster, 5309.

of pig, 334.

of various reptile spp., 4968.

separation/estimation/analysis, 3331, 389, 777, 781, 2907, 5289.

solubility, acid pptn. effects, 333 f.

temp., effects on, 5289.

total, in diabetic hamsters, 1833.

abnormal types, patterns & dysproteinæmia*

affecting calc. Ca content, man, 4321.

after benzo-5,6-flavone admin., rat, 5777.

after ³³Pu admin., expt., 3608.

agammaglobulinaemia, 1154, 5983.

associated with pathol. & deficiency states, 617, 1131, 1268, 1516, 6448.

Bence-Jones: myeloma globulins ; Waldegrave's Strom's macroglobulins. See **y-Globulin** ".

hypogammaglobulinaemia, 2382.

hypogammaglobulinaemia, in vaccinia f. infection, infant, 6175.

of post-operative sera containing C-reactive protein, 1230.

photosensitiser-induced, 1314.

albumin (see also **Albumin**; **Proteins**; for binding of cpd. by albumin, see **-cpd. e.g.** below),

biosynthesis in liver, 5421, (title 30) 7148.

decreased : in malnutrition, ducklings, 6448.

in myocardial infarction, 6448.

pre-albumin, 617, (title 17) 5038, 5683, 6643T.

ceruloplasmin, 2926f, (title 11) 7148.

Bone marrow, (contd. from **) mitotic indices, 6416; plasminogen localisation, 6442; promyelocytes in leukaemia, 6424. circulation, 4429. composition & metabolism: iron content, age effects, 4288; iron incorporation, 3153; nucleic acids, 473, 3326; reticulin in haematol. disorders, 3383. leukaemic, effect of RNA from normal marrow, 1267. preservation, 66, (title 8) 7164. radiation effects, 3588, 4719, 5831. regeneration, irradiated parabiont rat, 3772. role in bone formation, 65. sampling technique, mouse, 6376. suppression by chloramphenicol, 6417. transfusion/transplantation (see also **Immunological unresponsiveness**), after thio-TEPA, 5965. homologous: after irradiation & urethane or 6-mercaptopurine, dog, 5910; effect on secondary disease after Myleran, 5889. in medullary aplasia treatment, 4126. liver & spleen phosphatase as affected, 3684. "take" assessment, drumstick ch. appendage in, monkey, 5890.

Bone marrow disorders (see also **Blood disorders**; **Tumours, specific**), hypoplasia, 4127. metaplasia, 6423. myeloma: 1157, 5654-5; multiple, 5973.

Boron compounds, effects on plants, 4897, 4908. Na penta- & tetraborate, toxicity, 6370.

Botulism. See *Clostridium botulinum* in Taxonomic index.

Brachiopoda, feeding mechanisms, *Crania anoinala*, 7061.

Bradykinin. See **Kinins**.

Bradyodonti (rabbit-fishes, etc.). See **Fish**; & Taxonomic index.

Brain (see also **Mental activity**; **Nervous system**; for -fluid refer to **Cerebrospinal fluid**; for sp. animals refer to taxon headings), general entries are followed by (a) named areas, (b) circulation, (c) composition, (d) disorders, (e) electrical activity, (f) oococcal factor, 5775. cell culture. See **Tissue culture**. development. See **Nervous system**, development. drug effects. See **Nervous system**, pharmacology; & sp. drug headings. dura mater, pigmentation, desert rodent, 4986. ependymal cilia, 1982. injury prevention, impact-absorbing materials, 6379. invertebrate. See **Nervous system**, invertebrate. light penetration, mammals, 4476, 6575. mid-line structures position determination, man, 4233. mitochondria. See **Brain, composition & metabolism**; **Mitochondria**. overwriting avoidance, 4691. phylogeny, Macropodidae, spp. comparisons, 7097. sleep induced by stimn., 1973. stereotoxic diagrams, chicken, 4463, hamster, 5127. techniques of study. See **Nervous system**, apparatus & techniques; see also **Brain, electrical activity**. tetanus toxin fixation, frog, 3505. tissue swelling, 6563. Wallerian degeneration, 5059. wt. related to environmental complexity, rat, 6752.

Brain, named areas, **basal ganglia** (for disorders, e.g. Parkinsonism, see **Neuromuscular inco-ordination**), amygdaloid, 1955, 6553. caudate nucleus, 1948, 1954, 2029. corpus striatum: dihydroxyphenylalanine in, 6255; effect on liver potentials, 2029. **centres** (see also anatomical sites, e.g. **-hypothalamus**), analysers. See **Nervous system**, central, higher activity. feeding & drinking, 1621. of thirst drive, limbic & diencephalic, 2152.

Brain, named areas, cerebellum, cortico-nuclear pathways, cat, 5129. granule cell nuclei compared with oligodendrocyte nuclei, birds, mammals, 2608. lesions giving dyskinesia, 4456. reversible cooling, rat, 4454. spinal a-motoneurones control, cat, 1936. **cerebral cortex**, ablation & lesions effects, 1963-4, 1970, 2157, 2206, 4473, 4500, 4635, 5963. ACh-like activity, cat, 1985. Ab production as related, 5902. auditory, role in acoustic cond. refl., 1958. auditory, somatic sensory & visual, 4464-5. desynchronisation & recruiting responses, thalamus effects, 1950. electrical activity. See **Brain electrical activity/e.e.g.** evoked responses: optic, changes in conditioning, 6570; schizophrenics' urine extracts effects, 6566; to cerebellar stimn. in arousal, cat, 1969. memory trace, localisation & interhemisphere transfer, 4474. myeloarchitectonic, 2603, 2605. olfactory bulb, 2003-4, 4462, 5963, 6556-9. prefrontal, in timing behaviour, monkey, 1971. sensorimotor, 1970. sensory areas, in extra pyramidal motor responses, 1958. somatosensory, recovery function, 1959, 7092. spreading depression, 1951, 6217. sylvian gyrus in auditory conditioning, dog, 2157. temporal, activity during amygdaloid seizures, cat, 1955. visual, removal, visual discrimination after, cat, 4501. white matter, selective spread of pneumococcal polysaccharides, 1351.

choroid plexus. See **Brain, circulation, commissures**, between occipital lobes, 2606. corpus callosum, section, effect on bimanual skill, monkey, 4639.

diencephalon. See **-hypothalamus**; **-thalamus**.

hippocampus, ablation, behavioural effects, 1953. origin of tubocurarine-induced seizure discharge, 6555. recurrent inhibn., 6554. steroids as affected by stimn., 6553. stratum radiatum, E.M., 5050. synapse structure, 6554.

hypothalamus, anatomy, ferret, 2700. behaviour control, sham rage, cat, 1949. b.p. control, (title 6) 7152. lesions, effects on: body wt. & metabolism, rat, 4242; growth, rat, 4461. liver potentials as affected, cat, 2029. neurosecretion, 2632, 4582, 5006, 6675, 6779. nuclei gemini, rabbit, 5128. nucleus lateralis tuberis, fish, 5006. oestradiol, direct effect, 1945. oxytocin inactivation in pregnancy, (title 20) 5038. preoptic nucleus ablation, frog, 7072. subcommissural organ, striated intercellular material, 5049. temp., during feeding & sleep, cat, 1946. tonic activity, temp., effects, 1948. unit activity related to oestrous cycle, 4460. vasopressin, intracellular distribution, 5566-7.

hypothalamus, endocrine function, ACTH secretion control, 6645-6. electrical stimn., ascorbate in glands as affected, 1947. extracts effects on metamorphosis, tadpoles, 2553. 5HT injn., lactation induced by, 2121. pituitary system (for neurosecretion, see **-hypothalamus**, neurosecretion, above): cortisone & ACTH effects, 6644; lesions effects, 2067; LH release stimn., sheep, 4579; metamorphosis control, 7073; ovarian feedback, 2105; starvation effects, *Varanus*, 5015. reproduction & lactation, 6698. **eye barriers**, angiography in stroke patients, 6522. blood flow in hypertension, 4415-6. capillaries, morphol. & enzymic activity, rat. **choroid plexus**, 2623, 2690. clamping, b.p. effects, 4414. compensation for decreasing blood flow, 65 (title 1) 7152. cortico-pial: anaphylactic shock & **bradykinin** effects, 3627, 4079; haemorrhagic shock effects, 4417.

diencephalon arterial supply, rabbit, 2702. disorders. Refer to **Brain disorders**, dye distribn., dog, 4147. pressure changes, systemic b.p. as **affected**, 1899. regulation mechanisms (titles 121-7154).

INDEX OF SUBJECTS

- Calcium, biol. activator/co-factor/inhibitor role, in adrenal medulla function, 4058. in atria, pos. chronotropic effect, 6482. in blood platelet aggregation, 6429. in fibrin formation, 6436. in frog skin permeability, 4262, 6387. in muscle systems, 1659, 1795, 1876, 1901, 1929, 4434, 4529, 6395. in myelin sheath stabilisation, 4433. in parathyroid growth & secretion, in vitro, 2065. in protein extrusion from leucocidin-treated w.b.c., 882. in serum histamine binding, 1845. Calcium isotopes, ⁴⁰Ca, metabolism, dogs, 5591. Calcium salts, admin., utilisation, rats, 5431. aragonite, in mollusc shell, 285. carbonate (calcite), of avian egg & molluscan shells, 285, 5433, 5436. chloride & gluconate, i.v. injn., man, in review, (title 2), 7164. hydroxyapatite, 2725, 5439. Calculi. See Lithiasis & related headings. Calories. See Nutrition & diet. Calotropin; Calotoxin. See Glycosides. Campesterol. Sec Sterols. Cancer. See Tumours. See Blood sugar, & named carbohydrates, e.g. Glycogen. drug effects on, salicylate, 6303. hormonal regulation (see also Catecholamines ; Glucagon ; Insulin ; Pancreas ; Steroids ; Thyroid hormones), 4257, 5574, 5595. intestinal absorption, 4532, 6612-5. of alligator, 147. of insect, *Triatoma*, 747. of protozoa, 150, 176, 5190. sp. tissue studies : adipose tissue, 3369 ; ant. pituitary, 5579 ; brain, 2756, 2790, 3993 ; corpus luteum, 6711 ; liver, 122, 130, 196, 5363, 5367 ; lung, 1330 ; muscle, 986, 3369, 5177, 5198, 5555 ; myocardium, 3251 ; r.b.c., 5176, 6406 ; tissue culture cells, 121 ; tooth germ, 93 ; tumour tissues, 32, 146, 2751, 2755, 2791-2, 2798, 3509, 3881. Carbohydrates, metabolism, bacteria (see also Citric acid cycle ; Respiration, cellular & tissue), cellulose biosynthesis, *Acetobacter*, 211 A. colominic acid synthesis, *E. coli*, 195. fermentation, *Staph. aureus*, 6025. fructose 1, 6-diphosphate breakdown, *E. coli*, 2750 f. D-glucarate utilisation, *E. coli*, 3401. glucose, oxidation : 145 ; *Bad. cadaveris*, 3574 ; *Bac. cereus*, 151 ; *Ps. fragi*, 2753. phosphorylation, *Mycobacterium* spp., 5199. utilisation: *Bacteroides symbiosus*, 120 ; *Bac. cereus*, 151 ; *Neisseria*, 1368 ; *Streptomyces*, 1529. glycogen metabolism, *Agrobacterium*, 2769. glycolysis, *Streptococcus*, 880. lactose fermentation, *Bac. anthracis*, 5183. laminarin hydrolysis, *Bac. circularis*, 5219. oc-methylglucose uptake, competitive inhibn., *E. coli*, 3404. polysaccharides, biosynthesis: *Azlobacter*, 3400 ; *Streptococcus*, 2740. breakdown, *Bac. subtilis*, 193. sp. polysaccharides. Refer to Bacteria, composition & metabolism, polysaccharides. ribose oxidation, *Ps. fragi*, 2753. ribitol-5-phosphate : oxidation (a) *Aerobacter*, 182 ; (b) *Lactobacillus*, 180 ; polymer biosynthesis, *Lactobacillus*, 127. sucrose conversion, *Agrobacterium*, 2762-3. sugar oxidation, *Ps. fragi* enzyme, 178. transgalactosylation, *Streptococcus*, 2793. Carbohydrates, metabolism, plant (see also Photosynthesis ; Respiration, cellular & tissue), algae, glucose uptake, (title 15) 2594. glyoxylate cycle, 4862. fungi, carbohydrate utilisation : *Aspergillus*, 2342 ; *Calvatia*, 2417. cellulose : decomposition 6152 ; production, *Trichoderma*, 2428. D-galactose metabolism, *Aspergillus*, 3909. glucose metabolism : *Aspergillus*, 5199 ; *Ustilago* spores, 952. polysaccharide composition, 5209. higher plants, 2-deoxyhexoses, metabolism, tobacco, 2754. fructose polymers metabolism, tubers, 2473, 2775. galactose metabolism, *Plantago* seeds, 2781. glucose : catabolism (a) pea seed, 2427, (b) swede, 2425 ; transport, onion epidermis, 6916. glycolysis, peas, 981. metabolism during ripening, grapes, 6940. monosaccharide oxidation, buckwheat seedlings, 2747. photosynthate, translocation, 2431-2434. polysaccharide : analysis, corn stalk, 2776 ; metabolism, rye leaves, 2467. raffinose & stachyose metabolism, cotton seeds, 129. review, (title 7) 5042. sorbitol in *Malus*, 5188f. stachyose, 129, 5187.
- Carbohydrates, metabolism, plant, starch : metabolism, tobacco, 1419 ; synthesis, 2357, 2361. sugar metabolism, *Eucalyptus*, 3469. lichen, glucose utilisation, 6941. yeasts, glucose uptake, (title 6) 2594. glycerol formation, 861. maltose fermentation, 1503, 3032. sugars oxidation, protoplasts, 123. α-thioethylglucopyranoside transport, 845. trehalose synthesis & utilisation, 134. xylose transport, 3405. Carbohydrates, oligosaccharides (see also Raffinose ; Stachyose), conjugates with uridine nucleotides, in milk 2989. determination of degree of polymerisation, 2772 1,6-oligosaccharides, hydrolysis, 3377. pentasaccharide oc-limit dextrin *Bacillus*, (title 14) 5038. Carbohydrates, polysaccharides (see also Mucopolysaccharides, & individually named substances, e.g. Agar ; Carrageenin ; Cellulose ; Dextrans ; Dextrose ; Glycogen ; Pectin i Starch), biosynthesis, *Streptococcus*, 2740. in connective tissue, (titles 1 & 2), 7159. in serum, in L.E., 3787. in teeth, rats, 95. of bacteria (see also Antigens, bacterial; Toxins, bacterial), 1420-1, 2740, 3805, 5210. of plants : from hemicellulose B, corn stalk, 2776 ; role in floral induction, 2467. of *Schistosoma* skin test Ag, 5864. of yeasts, 3728, 5209. reaction with oligo-N-methylmorpholinium-propylene oxide, 1014. slime, of Enterobacteriaceae, 5210. structure, oc-l->3 linkages in starch-type cpd., (title 63) 7148. Carbohydrates, sugars (see also Glycosides), acid deriv. (see also Gluconic acid ; Glucuronic acid ; Saccharic acid), uronic acids, identification in mucopolysaccharides, 5218. alcohols. See Erythritol ; Inositol ; Mannitol ; Ribitol ; Sorbitol. amino deriv. See Amino sugars ; Mucopolysaccharides. disaccharides (see also Isomaltose ; Lactose ; Maltose ; Sucrose ; Trehalose) : hereditary intolerance, man, 3377 ; new prep, from 3-ketoglycosides, 133. in grapes during ripening, 6940. in vine & wine, 5187. inhibn. of a-methyl glucoside uptake, *E. coli*, 3404. Fe chelation by, 540. 3-ketoglycosides, conversion to disaccharides, 133. metabolism by yeast protoplasts, 123. monosaccharides, alkono-γ-lactones, chromatog., 132. aldono- & urono-lactones & acids, differential determination, 5179. heptoses. See Sedoheptulose. hexoses (see also AUose ; Canarose ; Fructose ; Fucose ; Galactose ; Glucose ; Man* nose ; Rhamnose) : 2-deoxy-, metabolism in higher plants, 2754 ; protein-bound, determination in human oral mucosa, 5149. ketose & aldose, chromatog. separation, 184. pentoses (see also Arabinoose ; Pentosuria I Ribose ; Xylose ; Xylulose), pentosuria, 4820-1. transport, r.b.c., 4276. trioses. See Glyceraldehyde phosphate 5 <2>iHydroxyacetone phosphate. of human vaginal tissue, 5083. partially acetylated, 2749. phosphates: effects on r.b.c. haemolysate electrophoresis, 1013 ; enzymic dephosphorylation, 5204 ; in cow's milk, 135. separation & estimation, 132, 184, 2767, 5149i 5179, 5218. transport in isolated ileum, 4532. Carbomethoxy group, in vobasine, configuration' 9091. Carbon, sources (see also Carbohydrates, metabolism ; Photosynthesis), for micro-organisms, 867, 3951, 4850, 5045, 6929.

INDEX OF SUBJECTS

- Carbon**, utilisation: by *Calvatia*, 2417; C/N ratio effects, fungi, 3912.
- isotopes**, ¹⁴C, translocation in soybean, 2433. ¹⁴C, assay, 1048, 3553, 5786. isotope effect in anisoyloxy radical decarboxylation, 10051.
- Carbonaceous meteorites**, 1361.
- varbonamide group**, in oxytocin, 3240.
- Carbonate & carbonic acid**, effects on hydroxylapatite solubility, 2725.
- Carbon dioxide** (see also Acid-base balance; Blood gases & pH; Respiration), alveolar transfer during breath holding, 4338-9. assimilation/fixation/incorporation (see also Photosynthesis): by plants & micro-organisms, 545, 722, 2429, 3802, 4863, 7016. effects on circulation. See Cardiovascular system, haemodynamics; Brain, cerebral circulation, etc. effects on jaw reflexes, 4024. end-tidal, 4328, 6535. expired: continuous measurement, ¹⁴C study, 4235; increased by ACTH, mice, 1868. in leaves, 2420. induced respiratory acidosis, 4398. inhalation effects, 1863-4, 1867, 6451, 6468. production (as energy metabolism index, refer to Metabolism) as measure of lung function, refer to Lungs & related headings), in enzyme reaction, ¹⁴CO₂ assay by liquid scintillation counting, 2856. solubility in serum, 1869. tensions, alveolar, 4338-40. ventilatory response to, Korean diving women, 4332.
- Carbonic anhydrase inhibitors**, acetazolamide (diamox), effects, blood-c.s.f. barrier, 4494. Physiol. responses to, 4163. triazines, inactive, 6289.
- Carbon monoxide**, -binding cyt., 357. blood content, 6347. combination with *Ascaris* Hb, 2919. inhalation effects on renal circulation, rabbits, 4425. inhibn. of Hb reduction by cysteine, 340. Poisoning, 4213, 6346-7. Preventing sickle cell formation, 4282. Pulmonary diffusing capacity & similar indices. Refer to Lungs & related headings.
- *rbo** tetrachloride. See Halogeno-hydrocarbons.
- *rbonyl compounds**, formed by addition reactions of NAD, 2973.
- *rbonyl groups**, carboxylation (see also Enzymes, specific, hgaes), of crotonyl-CoA, (title 106) 7148. aecarboxylation (see also Enzymes, specific, r. vases), of anisoyloxy radical, 1005f.
- carboxylic acids** (see also individually named ands, & Citric acid cycle; Fatty acids; Seto acids, etc.), action on separation of fertilisation membrane of sea urchin eggs, 5616. carbamino-, utilisation by marine phytoplankton, 4850. arboxylic, formation from n-octane, bacteria, 3408. cis-trans isomers, TLC, 5804 f.
- fj^city**, sub-acute, rabbits, 1725.
- ^rcinogenesis**; **Carcinogens**; **Carcinoma**; **Carcinosarcoma**. Refer to Tumours, induction; specific.
- ^f^c^o^des**. See Glycosides & aglycones, cardiac.
- cardiac system** (see also Heart; for regional studies refer to "circulation" under organ or tissue, e.g. Brain, cerebral; Lungs, pulmonary; Placenta), haemostasis. See Blood. vertebrate. See Heart, invertebrate; & named groups.
- CRSU** ^{adipose} effects, rat, 5999.
- vascular system, apparatus & techniques** ^{^P}t., clinical & surgical), ^aortic-venous homografts, thrombo-atherosclerosis in, 1323. ^Mrulatory dynamics, alteration to improve *Pri??"mro*genten studies, review, 1897. ^c fistula, 6001.
- Cardiovascular system, apparatus & techniques**, extracorporeal circulation for thrombus formation, 6378. for blood flow & distribution studies: cine-arteriography, coronary, 1911; flow meters (a) 63771, (b) electromagnetic, flow profile as affecting, 4388; indicator dln. curves, computer removing distortion, 1757; indicator methods, theory, 6502. for b.p. measurement: 4228-9; indirect recording, rat, 1896; photoelectric, for neonates, 4227. for heart studies (for b.c.g. & e.c.g. see under Heart): defibrillation, 1887; dye dln. curves (a) in aortic regurgitation measurement, 4370, 6501, (b) in cardiac output determination 4369, 4371, (c) pulmonary artery constriction effects, 4372; electronic micrometer, 4226; extra-corporeal maintenance, long-term, dog, 1872; intracellular electrodes, 1759; output estimation, 6491. for peripheral vascular responses, rat, 4389. haemodialysis: plasma K & e.c.g. effects, 1893; urea distribution after, 6459. heart-lung bypass, partial, 1920. heart-lung machine, in liver perfusion, 2028. pacemaker, artificial, long-term, 6487. portal vein ligation, & effects, mouse, 1924. pulse rate monitor, 1756. surgery: a-v. fistula, 4344; open intracardiac anaesthesia in, 6205; vessel repair by grafts, (title 17) 7155. vascular occlusion or narrowing, 4232.

of crustacean muscle cells, 4972.
of higher plants, permeability, 2484.
of insect salivary gland cells, 4696.
of mammalian cells (see also named organs &
tissues e.g. **Blood corpuscles**) : amion cell
lines, 2267 ; ATPase localisation, 5079 ;
kidney, 6642 ; muscle cells, 1087 ; nerve cells,
5054, 5058 ; steroid binding, 2673 ; virus
attachment to, 1471.
of protozoa *Leishmania donovani*, isolation &
structure, 7017.
of vaccinia virus, 6063.
of yeasts, 2262, 2275, 3903.
radiation effects, of X-rays, 1087, 2484, 3592.
structure & function, review, 6790.
symposium, 5048.
vesiculation, 5058.

Cell walls (see also **Cellulose** ; **Lignin** ; **Mucopeptides** ; **Mucopolysaccharides** ; **Pectin**),
of algae, growth, structure & extension, *Nitella*,
2444.

of bacteria (see also **Antigens, bacterial**),
composition : & biosynthesis, (title 2) 5037 ;
D-alanine, 5277 ; C-terminal groups, de-
tection, 5318 ; diaminopimelic acid, *Bac.*
cereus spores, 3806 ; in *Propionibacterium*
spp., 888 ; in stable L forms, *Proteus*, 887 ;
lipopolysaccharides, 886 ; mucopeptide,
345.

physical prop., 885.
protective activity, *Bord. pertussis*, 3613.
residual wall, *Vibrio comma* spheroplasts,
1423.
role in Gram-staining, 1360.
structure : *E. coli*, 6010 ; Reiter's *Treponema*,
6056.

of higher plants : Ca in, root hairs, 4839 ;
cohesion, pea root tips, 2445 ; O-fixation into
hydroxyproline, 3431 ; permeability, in-
duced changes, 4835 ; pigment, *Sphagnum magellanicum*, 957 ; proline incorpora-
tion, 2430 ; review, (title 5) 2594 ; structure,
gibberellin as affecting, 6962 ; ultrastructure,
(title 15) 5048 ; water content (a) as affecting
stomatal control, 2403, (b) measurement,
2408.
of yeasts, lysis by actinomycetes, 6034 f.
review, plants, (title 5) 7156.

Cells (see also **Cytology** ; **Cytoplasm** ; under pre-
fixing names, e.g. **Mast cells** ; under unicellu-
lar organisms, e.g. **Protozoa**),
aggregation. See "surface phenomena" below.
Ag. See **Antigens, tissue**,
chem. communication systems in, 3038.
control mechanisms : in algae, 2274 ; lecture,
(title 1) 5043 ; model system, 1057.
culture, behaviour & growth requirements in
vitro. See **Tissue culture**.

cytoplasmic inclusions (see also individual
structures, e.g. **Lysosomes** ; & "subcellular
components" below) : Councilman bodies
2268 ; granularity of juxtaglomerular cells'
rat, 6650 ; granules, protein biosynthesis in'
rat liver, 3041 ; in intestinal goblet cells, rat'
6796 ; in living eggs, mouse, 4702 ; in myo-
cardial cells, human, 4694 ; in uterine
epithelium, spayed mouse, 6776 ; of *Rhodo-
torula glutinis*, 2262 ; of *Spirillum* spp., 3399.
differentiated, DNA renewal in, 2293.
differentiation (see also "transformation*" below):
dedifferentiation, muscle cells, 5072 ; genet'
control, *Drosophila*, 4788.
dimensions : dimorphism in triploid salamanders,
2309 ; vol. relationship with nuclear
vol. & DNA content, xylem, 6957.

drug effects. See **Drugs**.
giant cell formation, radiation-induced, 2296.
growth/expansion (see also **Cell division** *
Growth) : inhibn. by light & u.v., plants,
2478-90 ; reversible arrest, technique, 5110 ;
spiral growth, *Nitella*, 2444.
hydrostatic pressure as affecting ATP levels,
411.

INDEX OF SUBJECTS

- Cells,** ingestion of liquids & solids, See Pinocytosis ; Phagocytosis.
injury/death (see also Antibodies ; Radiation & Virus headings), photodynamic cytotoxicity, 1314.
interconnections : desmosomes, chick embryo, 73 ; in beating heart cells, 1873.
intracellular localisation (for enzymes see Enzymes, assays & detection) : of Ca, carrot, 2411 ; of cellular functions, "functional topography" proposed term, 6612.
migration: embryo cells, 76 ; in adrenals, mice, 2633.
nucleocytoplasmic relations : in *Amoeba* spp., response to streptomycin, 2347 ; in ciliate, 2281 ; intercellular nuclear transfer in vitro, 2282 ; RNA biosynthesis &c transfer, 3065-6 ; transfer of nucleolar material, 4709, 6800.
of named tissues. Refer to relevant headings, e.g., Liver; Nervous system, structural elements.
of tumours (including comparative studies with normal cells). See Tumour headings, organelles (see also named organelles), carotenoid-body (new), in *Mimosa pulvini*, 6994.
permeability. See Permeability.
plant (see also Cell division ; Plants, cytology/ histology : Vacuoles) : E.M. study, 6785 ; hydration, determination, 2408 ; morphogenesis, mechanisms, algae, 2274 ; plasmolysis & deplasmolysis, 2257, 6839 ; structure & development, (titles 1 & 3) 5042 ; protoplasts, isolation, (title 16) 2594 ; nuclear translocation in intercellular spaces & cell walls, 2432.
radiation effects. See other Cell headings ; Radiation headings ; Algae ; Bacteria ; Protozoa.
response to viruses. See Virus headings.
single cell studies : heart cells, 1873 ; radiation damage, effect of cooling, 3593 ; temp. adaptation, mammalian cells, 7138.
somatic cells, sex differences. See Sex differences, nuclear.
subcellular components/fractions (see also "cytoplasmic inclusions" above ; & named structures e.g., Mitochondria) : exchange between cell cultures, 2588 ; polyosomes, (titles 22,27-8) 7148 ; subprotoplast isolation, plants, (title 16) 2594.
surface phenomena (see also Antigen-antibody reactions ; Cell membranes ; Surface phenomena) : adhesion of blastomeres, chem-induced diminution, 6823 ; aggregation, 2517, 4701, 4935 ; cell contact, hep a torn a strains, 60 ; cohesion, plant root tip, 2445 ; in dividing ovum, rat, 4715 ; interaction with chlorambucil, 724.
surface structures, hemi-desmosome, rat enamel organ, 2716.
transformation (see also "differentiation" above ; Genetics, transformation; Tumour headings): fibroblasts in vitro, (title 41) 7155 ; virus-induced morphol. conversion, 6119.
transport mechanisms. See relevant substances & tissues, e.g., Carbohydrates ; Electrolytes ; Blood corpuscles.
vol. See "dimensions" above.
Cellulose (see also Hemicellulose), as chromatog. medium, 2773.
biosynthesis, bacteria, 2774.
CM-, interaction with cellulose fibres, 2774.
CM- & DEAE-, action on lactate dehydrogenase, (title 89) 7148.
cotton, degradation by *Myrothecium*, 5208.
DEAE-, binding folic acid-active cpd., 3199.
ECTEOLA-, prep., 5795.
E.M. & electron diffraction analysis of, (title 16) 5048.
in diet, mice, 614.
medium prep, for fungi, 6152.
methyl- : injn., c.v. response, rats, 1879 ; use in virus plaque assay, 6081.
micelles of wheat internode, 6962.
microfibril, size of, 6784.
polyphosphate, new cation exchanger, 5806.
production, fungi, 2428.
reducing end groups, assay, 158.
thermodynamically bound water of, 3522 f.
- Centrifugation & ultracentrifugation** (see also Acceleration g), density gradient : isolation of thymus nuclei, 5789 ; photometric scanning of columns, 3537 ; separation of organic & inorganic particles, 5790.
depression of germination, cereal, 4894.
isopyknotic cushioning of cells during, 7145.
of germ cells, no genetic changes, 4789.
promoting viral adsorption on cell monolayers, 1480.
swinging bucket rotor, 3541.
ultra- : Archibald method, polymers, 1020 ; hydration & mol. wt., bovine serum mercaptalbumin, 2922 ; Johnston-Ogsten effect, denatured collagen, 395 ; layering technique, viruses, 3873 ; magnetically supported, 3540 ; patterns of proliferating yeast cells, 5720 ; radioactive marker proteins, 2941 ; sampling technique, 3536 ; steady-state as homogeneity test, (title 85) 7148 ; zonal, new instrument, 3538.
- Cephalin. See Phospholipids.
Cephalosporin. See Antibiotics.
Ceramide. See Sphingolipids.
Cereals. See Foodstuffs ; Plant crops.
Cerebral circulation. See Brain, circulation.
Cerebral palsy. Sec Brain, disorders.
Cerebrin. Sec Sphingolipids.
Cerebronic acid. See Fatty acids, unsat., C_a.
Cerebrosides. Refer to Sphingolipids.
Cerebrospinal fluid (see also Bloöd-brain barriers), electrolytes, 1848, 4493.
electrophoresis in brain tumour diagnosis, 3358.
lipids of, 235.
phospholipid composition, demyelination diseases, (title 1) 2598.
pressure : haemodynamic changes effects, 6451 ; increase, pressor effects, 1921.
proteins, lipo- & glucoproteins in hydrocephalus, 3359.
proteins of, 5299, 5669.
- Cerium isotopes, ¹⁴⁴Ce: as indicator for g.i. absorption, 2021 ; inducing lung cancer, 5928 ; soln., storage, 1026.
Ceruloplasmin. Refer to Blood proteins.
Cervical fluid ; Cervix. Refer to Uterus.
Cetyltrimethyl ammonium Br (cetrimide). See Surface active agents.
D-Challose, synthesis, 2764.
Chalkones. See Bacterial anti-agents.
Chanoclavin. Sec Ergot-type alkaloids.
Charoninsulphuric acid, ATP dependent formation, 148.
Cheese. Refer to Foodstuffs.
Chelating agents (see also Metallic ions ; & individually named ions).
EDTA : & intestinal absorption of heparinoid, 4538 ; Cu assay, serum, 5438 ; Ca removal & intestinal contractions, 4529 ; Ca salt, LD₅₀, 1726 ; enzyme solubilisation, 188 ; Hb oxid. by, 1807 ; induction of flowering by, 2464 ; mutagenic action, bacteria, 6016.
diethylenetriamine penta-acetic acid, metabolism, 831.
hydroxyquinoline (8-quinolinol) : inhibn. of chlorophyll biosynthesis. *Rhodopseudomonas*, 5610 ; metal complexes, fluorescence, 3094.
lmtmercapto propanol (BAL), effect on Cu-protein bond, 3097.
penicillamine : effect on Cu-protein bond, 3097 ; vit. B₆ antagonism, 6188.
tetracycline : & alk. earths, 5847 ; toxicity, chick embryo, 2696.
Chelation : of dihydrofolate acid, (title 122) 7148 ; of iron, 1808, (title 123) 7148.
Chemodectoma. See Tumours, specific.
Chemoreceptors. See Nervous system, afferent & sensory.
Cheratomucoprotein. See Glyco- & mucoproteins.
Chikungunya virus. See Viruses, animal, arbor group.
Children. See Infants.
Chimaeras. See Immunological unresponsiveness ; Transplantation.
Chitin (see also Cuticle), 2890, 4925, 5211.
Chlorambucil. See Cytostatic & cytotoxic agents.
Chloramphenicol. See Antibiotics.
Chlorazanil. See Diuretics.
Chlordane. See Insecticides.
Chlordiazepoxide (librium). See Tranquillisers.
- Chloride** (see also Electrolytes), assay, 5785-5.
effects on plasma kininase, 5577.
tissue/fluid content: assay, 5784-5 ; saliva 1451†.
transport : intestinal mucosa, 2017 ; skin, 6387.
Chlorides (see also relevant cations, e.g. Potassium salts), of Na & K, enteric-coated, alimentar absorption, 1715.
Chlorinated hydrocarbons. See Halogeno-hydro* carbons ; Insecticides.
Chlorine compounds, role in chlortetracyclin* biosynthesis, 876.
Chlorisondamine. See Ganglion blocking agents.
Chloromerodrine. See Diuretics, mercurial.
ChloTO. See also Halogeno-t.
Chloroacetic acid, gametocidal prop., 2502.
frChloroacetic acid : action on anthocyanfr synthesis, 4887 ; effects on pituitary histoli 3237.
2-*£*-Chloroanalino-5-*£*-chlorophenyl-3, 5-dihydroO* 3-isopropylimophenazine. See Riminophenft* zinc.
Chloro-2 - cyclohexyl-1 - o xo - 6 - sulphamoylisoin * doline (M & B 8430), new diuretic, 1690.
*/-i-Chloro-di(/>-chlorophenyl) ethane. Refer to Insecticides.
2-Chloro-4,4'-i-2-imidazolin-2-yl-terephthalai' lide, anti-lennaemic prop., 6314.
Chlorodiphosphonates. Refer to Phosphorfl compounds, organic.
2-Chloroethanol, seed treatment, spinach, 2455f.
6/s(Chloroethyl) amines. See Cytostatic & cytotoxic agents.
/3-Chlorothiaylammonium chloride, trimethyl deriv. action on plants, 4890.
Chlorogenic acid. See Phenolic compounds.
2,3-tfChloroisobutyric acid, action on anthocyanfr synthesis, 4887.
titChloroisoprenaline (dichloroisoproterenol). See Adrenergic blocking agents.
Chlorolabate. See Eye, visual pigments.
£-Chloromercuribenzoate. See Sulphydryl groups inhibitors.
diChloromethotrexate (dichloroamethopterin)' See Folic acid antagonists.
Chloro-2-methyl-3-sulphamoylbenzalnilide, diuretic, synthesis, 1689.
Chloromycetin. Sec Antibiotics, chloramphenicol* ^aChlorophenone. See Disinfectants.
/nChlorophenol piperazine, hookworm therapy* 6199.
2,4-^aChlorophenoxyacetic acid (2,4-D). S* Growth substances for plants.
Chlorophenylidimethylurea (monuron). See Her*^{**} cides.
2,4-^aChloro-6-phenylphenoxyethylamine, inhibit of drug metabolising enzymes, 4119.
Chlorophyll (see also Chloroplasts ; Photosy* thesis) : Plant pigments), a : electron transfer reactions, 5756 ; fluorescence inhibn., 966f.
absorption spectra, 961-2, 965; affected by Ov 4855.
bacteri.-, 3851 ; biosynthesis, 5610, 5726.
biosynthesis : 3446, 5451 ; 6, 6932 ; genet, control of, 4735 ; in dark grown beans, 6932 ; inhibn. of, 760 ; phytol, *Chlorella*, 4865.
-complex, ESR, 3489.
content : abj trid, dark grown plants, 6933 affected by N nutrition, 4846 ; genet, contro *Arabidopsis*, 2357 ; increased by GA, 2457.
deficient mutants, 2350, 2357.
function in photosynthesis, 3491.
liquid scintillation counting, 1025.
photoinduced EPR, 968.
proto- conversion to chlorophyll, 2424, 3488, 4857.
Chloroplasts (see also Chlorophyll ; Chrmatt^f phores ; Photochemical reactions ; Phot^f synthesis ; Plastids), absorption spectra, 961-2, 965, 4855.
composition : 6931 ; ascorbic acid, 5545 ; en^fzyme distribution, 6938 ; ferredoxin, *parsley* (title 12) 2594 ; soluble proteins, 6930.
development, 2358, 6934-5.
Emerson effect in, 963.
fine structure : 2273, 6786, 6934-5 ; csm^f microhili globules, (title 9) 2594.
in rust-infected leaves, 2495.
metabolism, fatty acid synthesis, 201.

- G**Uoplasmats, oxidation-reduction, 726; (title 37) 7148; enzyme systems, 3482, 3485, 3487; ferricyanide, 5628; flavin, 5760; nitrate, 5761; nitrite, 960, 3483. phosphatase activity, 5762. photophosphorylation, 2418, 5759. photosynthetic accumulated, 973. permeability, *Nitella*, 2409. Purification, 3486. radiation effects, 967. shrinkage, effect of light, 5758. α -L-rifChloropropionic acid, action on anthocyanin synthesis, 4887. Chloropurines & -pyrimidines. See Purine & Pyrimidine analogues. Chloroquine, inhib. DNA immune systems, 5876. Poisoning by, 6338. **C**olothiazide. See Diuretics, thiazide. (a) CMoro-vinylK-cysteine, toxicity & metabolism, 1733, 6324-5. β - γ -Chlorovinyl dimethyl phosphate, assay, 615f. J.IJorpromazine. See Phenothiazine derivatives. J.IJlortetraacycline. See Antibiotics. J.IJlorthalidone (hygroton). See Diuretics. Violate; Cholic acid. Refer to Bile acids; Surface active agents. γ -Iithiasis. See Biliary tract & gall bladder disease. Solera. See *Vibrio comma* in Taxonomic Index; also Antibodies; Antigens; Immunity. 4V-<Cholestanedioi. See Sterols. α -olestan-3/9-ol. See Sterols. β - γ - δ - ϵ - ζ -deriv., metabolism by liver microsomes, 844. γ -olesteranol. See Sterols. Cholesterol (sec also Atherosclerosis; Blood lipids; Lipids; Sterols), assay, 275, 796, 3346, 5653. biosynthesis (see also Squalene etc.), 268, 409, 687-8, 729, 1696, 2843, 3312, 3315-6, 4121, 4133, 6713. γ -position, 277, 5606. Δ -crv.: dihydrocholesterol (a) assay, 2845, (b) deposition, rabbit, 5606; paper chromatog., 278. effect on tissue respiration in vitro, 2846. ϵ -sterification, 2842. esters: assay, 275; cholesterol oleate, i.v.; effects on RE system, 1349; hydrolysis & utilisation for steroid biosynthesis, 270; of milk, 268; paper chromatog., 271. feeding effects, 620-1, 625, 2670, 2785, 3068, 3160, 3162, 3171, 3779, 5238, 5517-8, 5520, 5695, in review, (title 1) 7167. γ -fistochem. demonstration, 36. animal tissues & fluids, adrenal, 1003. arteries, 3160, 5697. bile, 260. Wood plasma. See Blood lipids. hyle, 5259. corpus luteum, 2111, 6713. egg yolk, 277. liver, 3163, 3171, 3213. γ -ngs, after quartz dusting, 5224. milk, 268. ovarian tumours, 3367.* γ -kin, 3315-6. γ -anthomata, 5695. γ -higher plants, 6986. reduced liver steatosis, 5518. γ -testinal absorption, 4132, 5258f-9. γ -pcitin sols, 245. Metabolism, 716, 2115, 2842, 3213, 3229, 3269t, 3272, 5120, 5258f. γ -nt. isolation, 2841. γ -cyst. in ethanol & hexane, 3086. γ -our induction, by, 1254. γ -choline. See Hypocholesterolaemic agents. γ -choline, ion exchange separation, 1037f. γ -aigous: alkyl-substituted, brain choline esterase specificity for, 607; neuromuscular action, 4029. γ -dent *Neurospora*, use in determining γ -ase inhibn., 5622. γ -toadstool spp., 5741. γ -methyl-, phospholipids containing, derived from carriuine, blowfly, 2831.
- C**holine, nutritional deficiency: & fatty liver, histoch., 29; & liver or serum triglyceride biosynthesis, 626; plasma proteins in, duckling, 617. Choline salicylate, & other deriv., effect on b.p. & smooth muscle, 4043-4. Choline-O-sulphate, hydrolysis, *Penicillium* extracts, 865 f. Choline 2,6-xylyl ether bromide (I-TM-10). See Adrenergic blocking agents. Cholinergic agents (see also Acetylcholine; Cholinesterase inhibitors; Nicotine), arecoline & muscarine, cn.s. effects compared, 4006. bethaneol, pre-operative prophylaxis with, 1720. edrophonium, neostigmine & ambenonium, effect on motor nerve & skeletal muscle repetitive discharges, 4035. effect on pupil size, 4050. physostigmine: 4045; e.e.g. effects, 6217; interaction with electric organ protein, 3974. pilocarpine, effect on liver & salivary gland PO_4 cpd., 1698-9. pilocarpine, neostigmine, physostigmine & methacholine, effect on electroshock, 4045. Cholinergic blocking agents (see also Ganglion- & Neuromuscular blocking agents; Spasmodicals; Tranquillisers), general entries are followed by named drugs. activity estimation, Magnus method, limitations, 4042. central activity of phenothiazines, & anti-Parkinson efficacy, 3999. effect on tonic muscles, spp. comparison, 4036. **t**iamed drugs, atropine: effect on (a) cardiovascular responses to neurohormones, 4046, (b) cond. aversive behaviour, 4637, (c) electroshock seizures, 4045, (d) pancreatic enzyme production, 6237; like action of benzoloxethyldimethyl-octylammonium Br, 1622; mydriatic effect, 4051. atropine & scopolamine, inhib. eating & drinking, 1621. methylscopolamine, cardiovascular effects, 6480. Cholinergic systems & transmission. Sec Acetylcholine; Nervous system & Neuromuscular headings; Neurohumoral mechanisms. Cholinesterase inhibitors (see also Cholinergic agents; Phosphorus compounds, organic; alkylphosphates, antagonised by laevulinic acid, 4048). assay, using choline-less *Neurospora*, 5622. -esterase interaction, bimol. rate const., 3297. local anaesthetics as, 6215. neuromuscular effects, 5HT role, 6249. Chondrites. See Meteorites. Chondroitin sulphate. See Mucopolysaccharides. Chondromucoprotein. See Glyco- & mucoproteins. Chorioallantoic membrane; Chorion. See Embryos, extra-embryonic membranes; Eggs. Chorionic gonadotrophins. See Gonadotrophins. Chorismic acid, structure, 3412. Choroid plexus. See Brain, circulation. Christmas disease (haemophilia B)-factor. See Blood coagulation, disorders & -clotting factors, IX. Chromaffin granules, 412, 3261. Chromatin. Refer to Nuclei. Chromatography (see also Gel filtration; Ion exchange resins; & assay & separation sections under e.g. Drugs; Enzymes), separation of: 17-KS, 5256t; RNA of high mol. wt. from virus-infected FL cells, 53751. types & application: cellulose, virus isolation, 6145; fatice, non-polar lipids, 223; ion exchange, (a) betaine, choline, 1037f, (b) psittacosis virus, purification, 6060, (c) sRNA, 454, (d) sulphur amino acids, 5273; silicic acid-Super-Cel, unesterified sterols, 2S40. Chromatography, column, detection of: glycerol in presence of sugars, 35451; phospholipids, 226. fractionation of: alkaloids, 912; DNP-amino acids, -peptides & -amines, 5262; glycerophosphatides, 2823; phospholipids, 2813; sterols from lipid extracts, 5254. fraction collection, 3542.
- C**hromatography, column, gradient elution systems & techniques, 253, 1039-j*, 2813, 5262. in situ detection of alkaloids, 912. types & application: celite, DNP-osazones, 1038; cellulose phosphate, polysaccharide hydrolases, fungi, 2773; DEAE-cellulose (a) plasminogen, 5324, (b) Taka-amylase A, 566; DEAE-sephadex (a) hyaluronate lyase, testis, 161, (b) plasminogen/plasmin, 347; ion-exchange (a) 2-amino-4-hydroxypiperines, 560, (b) Hb, man, 5668, (c) Hb peptides, 5284, (d) ninhydrin-pos. cpd., 5265, (e) quaternary N cpd., 5792; polyethylene powder, thiamine & pyritthiamine, 3189; silicic acid (a) phosphatides, 253, (b) steroids, 5254. Chromatography, gas, analysis of: fatty acids, 2795, 5235; dithydroxy-aromatic acids, 3549; purine & pyrimidine pyrolytic products, 5807; sugars & polyhydroxy cpd., 2767; urinary pregnanediol, 718, 3292; urinary steroid metabolites, 3550. apparatus & techniques: collection devices, 1051-3t, 5808; electron capture detector, 6461; large samples, 5794; preparative, 1050 f; review, (title 20) 2593. halogenated hydrocarbons, expired air, detection, 6461. racemisation during peptide synthesis, determination of, 2874. Chromatography, gas-liquid, analysis of: bile acid esters, 5809; fatty acids, 5239; lipids, (title 43) 7148; L-sorbitol, apparatus' & techniques: silicone polymers, 5809; stream-splitting device, 1049. liquia phase changes during, 1054. Chromatography, paper, analysis of: amino acid stereoisomers, 2851*; aromatic a-keto-acids, 5798; L-ascorbate & D-araboascorbate, 5191; diazo dyes, 5802; DNP-hydrazones, 5799; drugs, 6335; faecal amines, cow, 3552; flavonoid cpd., Rf values, 5736; glycerol in presence of sugars, 3545+; hydroxamates, 3543; insulin, glucagon, 3233; phenolic steroids, in review, 7166; sRNA, 452. apparatus & techniques: acetylated paper, 5799; automatic sample application, 3544; centrifugal (a) 5791, (b) distributor for, 1043; circular, wick systems, 10421; DEAE-cellulose, 452; ion exchange, 3233; reverse phase, 6335; solvent systems, 1044. detection of: aromatic acids, 5801; caprolactam cyclic oligomeric peptides, 1045; chlorinated hydrocarbon pesticides, 5803 f; isonicotinic acid hydrazide & products, 1041; purines, 5797; sulphur cpd., 5796f. detection techniques: fluorescence & phosphorescence, low temp., 5800+; radioautography, 1046, 1047. histol. sections application, 47. Chromatography, thin layer, analysis of: amino acids, 3547; bile acids, 1055-cv-*ras-carboxylic acid isomers, 5804*; lipids, (title 43) 7148; phospholipids, 2822; purine/pyrimidine bases & nucleosides, 5806; pyridine nucleotides, 2966; radionuclides, 3548; urinary homovanillic acid, disease effects, 5675. apparatus & techniques: cellulose, polyphosphate, 5806; satn. chamber, 5805f; scanning, 5547. Chromatophores, animal. See Pigment cells. bacterial. See Chlorophyll, bacterio. Chromium (see also Metals), trivalent: effects on galactose metabolism, 538; interaction with insulin & mitochondria, 538. Chromium isotopes, ^{54}Cr , as r.b.c. label, 3374. binding by Hb, 500. in liver, X-ray effects, 5823. -labelled endotoxin, 3803, 6011. use in study of bone marrow circulation, 4429. Chromomycin. See Antibiotics. Chromoproteins. See Flavoproteins; Haem proteins, etc.

- mollusc**, amoeboid movement, *Spisula solidissima*, 2514. composition : lactic dehydrogenases, *Argobuccinum oregonense*, 582 ; proteins, *Australorbis glabratus*, 5291. cortex structure, E.M., *Barnea Candida*, 2265. hatching, inhibn., *Oncometelia formosana*, 1727.
- Egg-white** (see also **Avidin** ; **Enzymes**, glycoside hydrolases, lysozyme ; **Olyco- & mucoproteins**, ovalbumin; & **Foodstuffs**; **Proteins, dietary**), albumin, carbohydrate moiety, 2765 f. conalbumin, denaturation, 377.
- Egg-yolk** (for phospholipid components, see under **Phospholipids**), intake, effects on blood cholesterol, 5517. livetin fraction, prep., 2892. size, relation to cholesterol concn., 277.
- Ekapterin**. See **Pteridines & pterins**.
- Elasmobranchs**. See **Fish** ; & *Selachii* in Taxonomic key & index.
- Elastic fibres/tissue**. See **Connective tissue**.
- Elastin**. See **Scleroproteins**.
- Electric organ**, drug-binding protein from, use in neurotropic agents study, 3974. enzymes : AChase from, prep, method, 597 ; localisation, 5469. isolated post, plate, *Electrophorus*, 2507.
- Electrocardiogram**. See **Heart electrical activity**.
- Electrochemistry**, method for enzyme kinetics, 3117.
- Electroencephalogram**. See **Brain electrical activity/e.e.g.**
- Electrolytes** (see also individual named ions & their salts ; **Metallic ions** ; for electrophysiolog. aspects, see **Electrophysiological**- cross references), alkali metal ions : binding by heparin, 164 ; effects on *Staph. pyogenes* growth, 5442 ; inhibn. of mitochondrial ATPase, 5441. cation : bivalent, exchange with actin-bound Ca, 3084 f ; effects on w.b.c. electrophoresis, 6422 ; exchange, bacterial spores, 1409 ; requirements for ATP formation, 515 ; role in stabilisation of myelin sheath, 4433 ; stmn. of PO₄²⁻ incorporation into brain phospholipids, 5248.
- media composition (see also **Culture & physiol. media** ; **Environment**; **Osmotic phenomena** ; **Salinity** ; & under named organs, tissues & organisms), effects on sympathetic ganglion, 4448.
- poly- (see also **Macromolecules**), polybasic, 1834. raising thermal resistance, bacteria, 1552. requirements of fungi, 6929. role in catecholamine secretion, 4058. salts : effects on penicillinase formation *Staphylococcus*, 3929 ; interaction with phospholipids, 2821 ; requirements of *Halobacterium* sp., 3849.
- soln. of, (title 8) 5036.
- solute activity determination, 2852.
- steriod cardiopathy, 4385.
- tissue/fluid content, blood, hyper- & normotensives, man, 1694. blood vessel walls, 1321, 6504, 6514. brain, 4185f. c.s.f. diurnal rhythm, (title 23) 7152. haemolymph, arthropods, 7049. heart, frog, 1585. in protracted nephrogenic hypertension, dog, muscle, 4270, 6396.
- balance** (see also individual ions; **Acid-base balance** ; **Kidney function** ; **Mineral metabolism** ; **Water, physiological aspects** ; for endocrine glands/secretions & vitamins involved refer to relevant headings), hypophysis role in, 4093. imbalance, 6452-3, 6455, 6457. in hot conditions, (titles 6, 46) 7154. of Crustacea, 7047. of earthworms, 4956. of intertidal crabs, 4957. of planarians, 4955. of starfish, 7044. of terrestrial crab, 7046. of various arthropods, 7049.
- renal excretion, 4165, 4570, 6288, 6514, 6629.
- biol. activator/co-factor/inhibitor role**, in actin -SH group reactivity, 3076. in ATPase, inhibn., 5441. in glutamic dehydrogenase reaction, 352. in PO₄²⁻ incorporation into phospholipids, stmn., 5248.
- transport**, active, 3083, 6458. amphibian ovulated eggs, 4967.
- Electrolytes, transport**, anion pump, plant cells, 4834. brain, 514, 6562. diffusion through lipoprotein interface, 3078 f. during nervous activity, 3077 f. eye lens, 3081. H⁺ effects, 1850. in model systems, 5814. kidney cortex slices, 3075, 6634. phosphoproteins role in, 514, 537. plants, 2409, 4834, 6916. Na-K-activated ATPase role, 3081, 3083.
- Electromyogram**. See **Muscle electrical property activity**.
- Electro- & molecular structure** (see also **Crystal structure** ; **Energy levels** ; **Free radical*** & relevant sections under **Carbohydrate***). **Hydrocarbons** ; **Nucleic acids** ; **Proteins, etc.** for structure-activity relations of biol. actif compounds, drugs & enzymes, & immunology reactions, refer to relevant headings. **Steroids** ; **Drugs** ; **Enzymes** ; **Antigen-antibody etc.** association in dil. acetic acid, insulin, 667. configuration: absolute, cadinanes, 916 f. hyaluronate, 162. insect virus inclusion bodies, 6130. helix : formation, kinetics, 3069 ; poly-C, 301⁵. polypeptide, hydrophobic stabilisation 2921†. H-bonding: DNA, (title 13) 7148 ; embryonic membranes, 5616 ; keto-imine 2923. lipid-water systems, (title 17) 5048. molecular vibrations, insect sex attractantsTM 5456. monolayer studies, BSA, 2924. nucleophilic reactivity, (title 13) 5036. stereospecific metabolism, 1008-9.
- Electron transport**. See **Oxidation-reduction**.
- Electrophoresis** (see also **-assays**, **detection** separation sections under e.g. **Nucleic acid Proteins**), effect of stabilising media, mathematical formulation, 3551.
- immuno-. See **Immunological techniques**, protein patterns as affected by: diphtheria intoxication, heart, 3502 ; ionic strongTM 5480 ; neurological disease, c.s.f., 5669. supports : acrylamide gel, 3427 ; agar \$, 579-80, 3333, 5481, 5810 ; cellulose acetate, 5310-11 ; polyacrylamide gels, 2880 ; starch, 5310, 5480, 5811 ; starch block, (title 17) 7155 ; starch-urea gel, 824. techniques : auto-radiography, 1046 ; voltage, 5365 ; detection, dehydrogen* isoenzymes, 579-80, 5481 ; dialysing tubes, application, 1040 ; 2-dimensional, 5205, 5310, (b) with chromatography, 1°, 3552 ; micro, 4918, 5811 ; pre-staining, applied material, 5296 ; sample applicat*, 5810 ; staining, xanthine dehydrogen* 5133.
- Electrophoretic homogenisation**, serum protein 5289.
- Electrophysiological apparatus & techniques** (see also relevant organs & systems: **Eye** ; **Heart** ; **Muscle** ; **Nervous System** ; **etc.** amplifier, const. gain, for micro-electro** 1764t. electrodes : micro-, mounting for intracellular heart recordings, 1759 ; silver-silver type, 1758.
- Electrophysiological phenomena** (see also **organ**; & sub-headings under **Heart** ; **Nerve** ; **Nervous system** ; **etc.**), activity in ovo, chick, 2114. **Amoeba** locomotion, bioelectric potential* related, 5030. electrostatics, aphid vector affected by, 8147 nuclear membranes, conductance & potential 4696.
- Electropax**. See **Electric organ**.
- Electroretinogram**. See **Eye**.
- Electroshock**. See **Shock**.
- Eledoisin**. See **Kinins**.
- Embedding**. See **Cytology**.
- Embolii**; **Embolisms**. See **Cardiovascular disorders** i **Lung disorders**.

INDEX OF SUBJECTS

Embryos ft other developmental forms (see also **Development; Eggs**), abnormalities. See **Development, abnormal**, & related headings.
 composition : proteins, (title 6) 2592 ; vit. A, (title 11) 5044.
 differentiation, E.M., (title 20) 5048.
 extraembryonic fluids : allantoic, oestrogen concn., pig, 4617 ; amniotic, secretion, man, 6721.
 extraembryonic membranes (see also **Placenta** : for use as culture substrate, see **Immunological techniques**; **Tissue culture**; **Transplantation**; **Viruses**): 2681, 3668, 3922; amniotic, 411, 6792 ; chorioallantoic, 5116, 5946.
 immunol. studies, 1203, 2377, 3653, 3668, 5896.
^oi plants. See **Plant growth ft development**.
 ooplasmic reaction systems, invertebrates, (tit) 4722, 5834-5.
Ambystoma, embryos : auditory vesicle, Urodela & Anura, 7035 ; catecholamine appearance, frog, 4938 ; DNA synthesis, batrachians, 5395 ; ferritin concn., *Rana*, 3044 ; Hb, toad, 5301 ; heart formation, *Triturus*, 2522 ; limb development after exogastrulation, urodele spp., 2523 ; metabolism inhibn. in CO₂ culture medium, *Rana* hybrids, 545 ; neurulation, frog, 4937 ; phosphatase in frog, 2954 ; ribosome & protein synthesis, *Rana*, 3044.
 embryos & larvae, growth effects of chlorpro-mazine, axolotl, 1614.
 larvae (tadpoles) : growth & differenUation of embryonic tissues in *Ambystoma*, 7037 ; mortality, drug effects on, * * * ? ; phototaxis development, frog, 7089 ; pigmentation, *Triturus*, *Hynobius*, 4927.
 morphogenetic effects: of actinomycin, *Pleurodeles*, *Xenopus*, 4929 ; of mercapto-ethanol, 4930.
 transplantation: in *Ambystoma*, 2527-8, 4922, 7037 ; in Anura, 7035 ; in various urodele spp., 2523, 7035 ; nuclear (a) between *Rana* spp., 6801, (b) intrasp. man, frog, 4710.

Embryos refer to domestic fowl unless otherwise stated, bioelectrical activities, recording method, 2114.
 blastoderm segments, development potential, duck, 2683.
 Wood: Hb synthesis, chick, turkey, blackbird, 2381 ; hypoglycaemia in *S. typhi* infection, 3840 ; serum protein synthesis, 497.
 cardiovascular system : aortic arches & heart loop, morphol., (title 9) 2592 ; heart, glucose uptake inhibn., 5611 ; myocardial cell differentiation, in vitro, 2687 ; precardiac mesoderm, migration, 76.
^otUsage, SO₄ metabolism, 706.
^ozyme repression in, 506.
 lens (a) mitotic activity 5118, (b) regeneration capacity, 2688 ; papillae & placodes histogenesis, 3685 ; hormone effects, 69, 78.
 kidney : enzyme activity, 77 ; mesonephros, cartilage formation as related, 5122.
 limb radiosensitivity & development as related 5834.
 glycoprotein content & metabolism, 1317.
 metabolism & tissue composition (see also ^os "headings") : arginine biosynthesis, 347 ; coenzyme Q, 5551 ; DNA biosynthesis, 5395 ; glycogen, 2771 ; intercellular E.C.R. & 3833 ; microsphaerulites, identification, 1011, 2779.
 mitochondrial activity, 5768.
 multi-sty. virus I**TM**. 1441.
 neurula %C.g. technique, chick, duck, 4376.
 cellular form & response changes, 74 ; inter-nervous differentiation, E.M., 73.
 nervous system: brain, induced choroid plexus differentiation, 2690 ; central, mitotic activity difference, 2691 ; neural tube (a) cell differentiation, 75, 18 ; matrix < **, 5117.
 pituitary, early V Uction, 2686.
 radiation effects of X-rays, 5834.

Embryos,

Hormones: RE system, functional development, 3773. skin : 2524, 5064 ; thymidine incorporation, in vitro, 5121.
 thyroid : acid phosphatase in precursor cells, 80 ; stimn. by 5HT, 79 ; thyroxine effects, 78.
 tissue culture : cardiac myoblasts, 2687 ; protein synthesis & metabolism in, 54^ab.
 transplantation studies: 5122 ; of gonad primordia, duck, 81.
 vestibulo-cochlear organ, mitotic activity, virus-induced haemorrhagic disease, 1287.
Crustacea, megalops, eyestalk removal as affecting, blue crab, 4998.
Ecology: hydrolases in, *Arbacia*, *Asterias*, 5474.
 differentiation patterns, vegetalised & animalised sea urchin, 2517.
 morphogenesis, cellular activities in, *Psammechinus tuUiaris*, 2516.
fish, sensu lato,
 auditory vesicle, mesoderm role, *Acipenseridae*, 7035 ; development & habits, 7034, 7063, 7134.
 spinal cord regeneration, *Petromyzon*, 2526.
 thyroid, thiourea-induced changes, *Lebistes*, 501.
Insects (for metamorphosis, see **Development**), embryo : fluorescent cpd. in, silkworm, 4934 ; mortality, *Drosophila wUiston*, 6059 ; p. **Sumption**, *oEopeltus fasciatus*, 2518 ; photosensitivity, aphid, 5001 ; pole cells & polar granules, *Drosophila*, 7031.
 embryo & larvae, nucleic acid & protein metabolism, *Tribolium*, 459.
 in tissue culture prep., 5032.
Larvae, carbohydrate chemo-receptors, Bombyx, 2543 ; digestive fluid toxic factor, *Pieris brassicae*, 4951 ; excretory-system, *Ckaoborus crystallinus*, 4960 ; nutrition (a) *Aedes*, 4949, (b) *Drosophila*, (c) *Tribolium* & development as related, *Drosophila*, 4548 ; para-SMC On induc., *uirjw*, * * y, ——, 256^a * photoperiod effects (a) on diapause, *Ostrinia*, 7001, 5003, (b) on larval period & atm. effects, fruit moth, 7067, 7112 ; survival, cold, 4594.
Larvae & pupae, sub-threshold temp. effects, *Tribolium castaneum*, 2519 ; nymphs (of exopterygotes) : dispersal rate, Sashopper, 2570 ; stages, duration, bug, 1565 ; survival, locusts, 2146.
 prepupae, g.i.t. flora, blow-fly spp., 5029.
 SuTa^a corpora allata activity, silkworm, *lili*, emergence, blowfly, 2238.
 radiation effects, of y-rays, fruit fly spp., 562.
maternal embryo ft foetus (see also **Neonates**; **WwntaTPregnancy** & related headings), **Anoxia**, 4611^a.
 wastocysts, drug-induced changes, rabbit, 417.
 blood (see also **Blood disorders**; **Blood groups**; **Haemoglobin**; **Placenta**) : *<* Snino N concn., man, 5660 ; a-glycoproteins, bovine, 342 ; leucocyte counts, man, 4202^a ; plasma protein pattern, rat, 2911 ; protein biosynthesis, rat, 5422^a ; rrbc. Ua & containing, study methods, 5300, (b) in maternal circulation, man, 6407 ; K levels, ra, 6223.
 eariv stages*: oestriol metabolism, man, 6734 ; protein, virus & bacteria uptake, rabbit, 598.
 endocrine glands, hypoplasia after maternal hypophysectomy, 6682.
 «Su2af» external, morphogenesis, man, 1-^{(p) IXS}.
 i>Aarf changes caused by noxious factors, Cdtle14) 7155 ; immunisation effects, rat, 3853.
 immunol. studies, 1203, 2377, 3653, 5896.
 Infection by *Toxoplasma*, sheep, 3922.
 Sidney differentiation & growth, rat, 2691 ; glomerulus permeability, E.M., man, 5119 ; faecal reabsorption, sheep, 4553.
 Liver • dehydrogenases, man, 3267 ; haem-Sietic function, mouse, 3583 ; urea synthesis, man, 5465.

Embryos,

mammalian embryo ft foetus, malformations. See **Development, abnormal**.
Genes, embryol. & developmental effects ; **Hereditary abnormalities**, metabolism & tissue composition (see also other subheadings) : "caesium, 3607 ; cholesterol, 5120 ; coenzyme Q, 5552 ; methionine & ethionine, 5272 ; steroids, 4617-8, 5603, 6734 ; water, 4610.
 mortality, mouse mutants, 4776.
 nervous system: brain (a) histogenesis, cerebral cortex, rat, 1983, (b) electrocortical activity, rat, 1961 ; nucleus differentiation, trigeminal spinal tract, man, 2684.
 radiation effects, of X-rays, lethal dosage, mouse, 5835 ; on brain, 1961, 1983 ; on liver, 3583.
 radiosensitivity, mouse, 5835.
 resorption, induced by glutethimide, rabbit, 6345.
 survival: & size, endometrial stage as related, rabbit, 6724 ; time, after asphyxia, sheep, 6473.
 teeth, enamel organ, E.M., rat, 2716.
 thymus, histol., man, 2629.
 thyroid : hormones, (title 2) 7158 ; removal effects, rabbit, 2115 ; role, rabbit, 5120.
 transplacental transfer. See **Placenta**.
 transplantation studies, 1184, 6724.
Mollusca, larvae: response to hydrostatic pressure, *Mitilis*, 5033 ; survival & growth at low salinity, oyster, 4963 ; veliger, pediveliger, functional morphol., *Venus striatula*, 7030.
 reptiles, urudaeum epithelium, histol. & histo-chem., blindworm, 7012.
urochdates, V uptake, *Phallusia mamillata*, 2532.
Emotional states ft responses (see also **Behaviour** : **Drive** ; **Mental disorders** ; **Pain** ; **Stress**), age and stim. effects, 2204.
 anxiety anti-agents, 3988.
 disturbances, married men, 2209.
 DL-dopa effects, mouse, 6254.
 emotionality : handling effects, rat, 2184.
 4594 ; strain-differences, rat, 2155.
 fear, sound produced in, dolphin, 2215.
 neuropharmacol., rabbit, 3979.
 prenatal maternal stress as affecting, rat, 2187.
 related to maternal states, 6756.
 sham rage, midbrain control, cat, 1949.
 timidity, shock stress effects, rat, 4475.
 Emulsions, use in autoradiography, 44.
Enavid (norethynodrel). See **Steroids**.
Encephalitis : **Encephalomyocarditis** ; **Encephalomyelitis**. See **Nervous system disorders** ; for allergic encephalomyelitis see **Hypersensitivity** ; for causative agent refer to **Viruses**, **animal**, **arbor group**, **picornavirus**.
Encephalomalacia. See **Brain disorders**.
Endocrine systems (see also named secretory & target organs ; named secretions, e.g. **Qonadotrophins** ; **Insulin** ; **Steroids** ; & **Neurohumoral mechanisms**, (c.n.s.), (title 7) 2599.
 blood flow following ether stress, 2071.
 immunomorphol., (title 37) 7152.
Hormones, adipokinetic action, review, 3255.
 as affected by : hypothalamic stimn., 1947 ; low temp., 4248, (title 23) 7154 ; triiodo-thyronine, 20851.
 blood levels, during fracture healing, rat, 3275.
 clearance from plasma, salmon, 3273.
 control of: B particle formation, 67 ; cholesterol oxidation, 3272 ; interpubic ligament formation, 4595 ; Fe absorption, 6677 ; salt & water metabolism, (title 6) 7154 ; skeletal growth, 4267 ; uterine sensitivity, 2118.
 effects on : body & organ wt., 2089 ; composition & metabolism, 169, 3226, 3757, 4260, 4571-2 ; DOCA response, 6681 ; electro-shock threshold, 4011 ; g.i.t. mucosal bleeding, mice, 4523.
 inducing lesions, heart, liver & kidney, 2057.
 interactions, man, 2086, 6656, 6658 ; rat, 2072-3, 2117, 4566, 6670, 6678, 6687.
 role in carcinogenesis, 3712.
 transport, levels in lymph, 6668.

- Endocrine systems, invertebrate** (see also Moulting),
insect, corpora allata : mating behaviour control, cockroach, 2550; wax moth, 5000; effects on protease activity, *Calliphora*, 7066.
ecdysone : biogenesis, *Calliphora*, 3229; gene activating effect, *Chironomus tentans*, 4711; •H labelling of, 5257.
hormone chem. & biochem., review, 3228f.
juvenile hormone, role in development, silk-worm, 5002.
- Endometrium.** Refer to Uterus.
- Endoplasmic reticulum.** See Cell membranes.
- Endotoxin ; -shock.** See Toxins, bacterial.
- Energy** (for calorie values of foodstuffs & diet, refer to Foodstuffs ; Nutrition & diet; for physiol. conservation / expenditure, refer to Body temperature ; Exercise ; Metabolism ; Muscle ; Respiration ; Work; for solar energy, refer to Light ; Radiation, electromagnetic), -absorbing materials, impact protection, 6379.
Energy levels (see also Electronic & molecular structure ; Fluorescence ; Photochemical reactions ; Reaction kinetics ; Spectra ; Spectroscopy ; Thermodynamics), electronic excitation & energy transfer of chlorophylls. Refer to Chlorophyll ; Photosynthesis, excited state ionisation, pyridoxine, (title 16) 5038.
triplet state in photosynthesis, 969.
- Enniatin.** See Antibiotics.
- Enoic acids.** See Fatty acids, unsat.
- Enteric disorders.** See Gastrointestinal tract disorders ; for causative organisms refer to Viruses & Taxonomic Index.
- Enterogastrone.** 4524
- Enterotoxins.** See Toxins, bacterial.
- Environment** (see also Adaptation ; Altitude ; Climatic factors ; Light ; Population studies ; Soil), aquatic (see also Aquatic organisms) : differentiation as affected, marine hydrozoa, soc. proc, 7146; growth of *Cordylophora* as affected, 7027.
behaviour effects: locust hoppers, 2239 ; maternal, rabbit, 2170 ; test area on bar-pressing, rat, 4644.
black & white backgrounds, pituitary as affected, fish, 5014.
captivity (see also Laboratory animals) : paralysis induced by, quokka, 7109 ; restriction effects on responsiveness to objects, chimpanzee, 4688.
complexity, effect on brain Chase activity, rat, 6752.
concept of, definition, 4751.
crowding, drug toxicity, group effects, *Gambusia* (fish), 4202-3.
ecology of animals (see also Hibernation ; Parasitism ; Predation): *Ixodes* (tick), 7103 ; locust phases, 2146.
ecology of plants : ground water & soil aeration, wet-heath communities, 2438 ; *Laminaria*, 4910 ; lupin & root nodules, 6179 ; soil fungi, moisture effects, 7149.
flowering as affected, *Dactylis*, 2463.
intertidal, adaptations in isopod, 7058.
morphogenetic effects, slime moulds, review (title 7) 5043.
polar physiol, man, review, 4222.
preferences, early experience effects, rat, 6754.
sex ratio as affected, arrhenotokic insect, 4994.
temperature. See Body temperature ; Temperature.
unrestricted. See Behaviour, exploratory ; open field behaviour.
- Enzymes** (for specific types & systems, see -specific & -systems below. See also Co-enzymes), developmental studies, 21, 92-3, 177, 265, 2662, 3132, 3267, 3271, 5194, 5488, 5502.
pH 5 fraction. Refer to Protein biosynthesis, immunochem. studies, 574, 583, 1231.
isoenzymes & multiple forms, 578-83, 827-8, 2659, 3131-2, 3370, (titles 7-9) 5037, 5474-5, 5480-1, 5499, 5500, 5649, in review 7141, (title 95) 7148.
location in Azotobacter agilis. 855.
radiation effects, 3565.
reconstitution & reactivation, 3125-6.
- Enzymes,** role in chem. communication systems in cell, 3038.
stability in stored tissue sections, 37.
- Enzymes, assays & detection**, automatic potentiometric titration, AChase, brain, 5492.
chromatog., polysaccharide hydrolases, 2773.
colorimetric : D-amino acid oxidase, 2953; y-glutamyl transpeptidase, 787, 3336 ; phosphoglucose isomerase, 5658.
electrophoretic : amylases, 5205 ; lactic dehydrogenase isoenzymes, 5480.
pH effects, plasma kininase, 5577.
histochem./cytochem : aldehyde fixation, 5094; ATPase, in *Strychnchia*, 3030 ; Chase, 3 ; dehydrogenases (a) in mitochondria, 2664-5, (b) in oral squamous epithelium, 14, (c) isoenzymes, nitro-Blue Tetrazolium staining, 579-80 ; in hypertrophic gingivitis, 5164 ; in symposium (title 10) 5048 ; phosphatases (a) in embryos, 80, (b) in exocrine gland capillaries, 26 ; phosphodiesterase, azo dye simult. coupling method, 3138 ; quānt, potentialities, 5468 ; succinate dehydrogenase, 2665.
immuno-electrophoretic characterisation, proteolytic enzymes, 1160.
isolation/purification methods, 161, 181, 262, 439-41, 443, 566, 586, 588, 593, 597, 602, 2787, 2830, 2903, 3022-3, 3396, 5214, 5219, 5253, 5280, 5319.
of alk. phosphatase, serum, 786.
of histaminase, 3142.
of glucose 6-phosphatase, new method, 52021.
of lipase, in pancreatic & duodenal juice, 3375.
of penicillinase, 6166.
of redox enzymes in chloroplasts, 3487.
of steroid dehydrogenase, *Pseudomonas* mutant, 714.
of tryptophan pyrrolase, liver, 301 f.
pptn. methods, RNase, 3024.
qual. test for DNase production by Staphylococci, 1393.
radiol.: histidine decarboxylase, 2856 ; trans-aminases, 5349.
spectrophotometric : ascorbic acid oxidase, 660; cathepsin C, 2947 ; histidine ammonia-lyase, 3379.
- Enzymes, biosynthesis** (see also Protein biosynthesis), adaptation, 3110, 3561, 5274.
by fungus spores, 952.
genetic control, 2283f, 4760, 4762, 4764.
induction, 191, 299, 479, 849, 1263, 1565-6, 2153, 3026, 3032, 3270-1, 3389-90, 3392, 3395, 3416, 3565, 5341, 5347, 5428, 5711.
neg. feedback regulation, 5347.
of /D-galactosidase, 505 f.
of pectolytic enzyme, *Bacillus*, 850.
of penicillinase, pH effects, *Staph. aureus*, 3929.
of thymidine kinase, 3055.
regulation, 505 f.
repres. : 506-8, 509, 599, 3394-5, 5271, 5353 ; in symposium (title 10) 5037.
X-irradiation effects, *Bad. cadaveris*, 3565.
- Enzymes, clinical & physiological significance** (see also Tumours, composition & metabolism ; -physiol. effects), anti-enzyme therapy in odontostomatologia, 5174-j.
aorta : dehydrogenases, cholesterol-fed rabbits, 625 ; 0-glucuronidase in atherosclerosis, 2785.
blood cells, red : acetyl esterase inheritance, man, 4817 ; acid phosphatase, 800 ; carbonic anhydrase (a) 802, (b) altitude effects, rat, 4281 ; catalase deficiency, man, in soc. proc. (title 119), 7148 ; glucose 6-PO₄ dehydrogenase deficiency, 800, 4806, 4818-9, 5201, 5663, 6890-2 ; malate dehydrogenase, 3124 ; various enzymes (a) after storage, 4290, (b) age effects, 5502.
blood cells, white : glucose 6-PO₄ deficiency, man, 4818 ; hexokinase & NADP-dependent dehydrogenases, in leukaemia, man, 3350 ; monocytes, non-sp. esterase, 6425.
blood plasma/serum : acid phosphatase, raised in myocardial infarction, 783 ; adenosine deaminase, fibrosarcoma-bearing rats, 3019 ; alk. phosphatase, in various states, 2035, 3770, 4547, 7166 ; L-asparaginase, age effects, guinea-pig, 313 ; ** (contd.)
- Enzymes, (contd. from *)** fructose 1-PO₄, absent Tay Sach's disease, 3372 ; glutamic dehydrogenase, in CCl₄ poisoning, 4217 ; y-glutamyl transpeptidase, liver disorders, 787 ; his. aminase (a) in anaphylactic shock, 1140 (b) pathogenesis, 3382 ; lactate dehydrogenase, in various states, 788, 3743, 3781, 5396, 5649, 5971 ; lipase, post-heparin, in hypothyroidism, mice, 3648 ; pepsinogen, in live cirrhosis, in soc. proc. (title 53) 7155 ; RNAs thyroid hormone effects, man, 4313 ; trypsinogen, in various states, 319, 784, 3605, 5532 ; various enzymes (a) after burns, 351 (b) in hydrocephalus, newborn calf, 3111, tumour-bearing mice, 577.
brain & nervous tissue : carbonic anhydride distribution, man, 3144 ; cholinesterases, (3, (b) localisation, 4482-4 ; cerebral capillaries, enzymes, 4 ; during increased functn. & hypoxia, 2622 ; enzyme induction related to memory, 2153 ; phosphorylases after meprobamate admin., dog, 4003 ; respiratory enzymes, in anoxia, 1353.
cartilage, various enzymes, vit. D, effect on rachitic chicks, 5549.
cell cultures, starch gel zymograms, 63-4.
eggs : mitotic apparatus, ATPase, sea urchin, 2287 ; nucleotide phosphatases, mice, 470.
eye : lens, peptidase, man, 2949 ; optic tectu Chase after unilat. eye removal, 1941 ; retin (a) dehydrogenases alloxan-diabetic rats, 5556, (b) various enzymes, cattle, 3113.
g.i. tract : disaccharidases, in hered. disaccharidase intolerance, man, 3377 ; 0-galactosidase intercellular location, 72 ; sucrase, age, sex, diet effects, rat, 2788 ; various enzymes, 3113.
gastric juice, proteolytic enzymes in *decreased*, 3376f.
gingiva, various enzymes in hypertrophic gingivitis, 5164.
insects, alimentary tract, protease, *Calliphora*, 7066.
kidney : acid phosphatase, intracellular location, 27 ; alk. phosphatase, in disease, 2659 ; /9-glucuronidase-rich particles in androgen stimn., 3278.
liver : alcohol dehydrogenase, steroid effector, 5593 ; fructose 1,6-diphosphatase, in hepatitis & alloxan diabetes, 2791 ; glucose 6-phosphatase, diabetic & hepatoma, I, D-glucuronolactone dehydrogenase, & 179 ; glycogen metabolising enzymes in *decreased* tuberculous, 5193 ; hexokinase, inhibited diabetes, 5200 ; 3/9-hydroxy steroid dehydrogenase, sex differences, rat, 3266 ; leakage from slices, in soc. proc. (title 10) 7148.
nuclei, enzyme activity, in soc. proc. (title 7148) : phosphatases in bone marrow transplantation, 3684 ; RNA polymerase, oestriol effects, 2031 ; respiratory enzymes, I corticosteroid-treated rats, 1654, (b) virus-infected mice, 1478 ; sorbitol dehydrogenase after CCl₄ admin., 5702 ; succinate dehydrogenase, during 4-dimethylaminoazobenzene feeding, 5640 ; tryptophan pyrrolase, 4926 ; urea cycle enzymes, (a) 608, (b) effects, 1747 ; various enzymes (a) after cold admin. to cold-exposed rats, 5560, (b) diabetes, 5557 ; xanthine oxidase, chaw with N requirements, 3174.
lysosomes : acid hydrolase, cortisone & effects, 5592 ; distribution of enzymes, various spp., 989 ; during liver regeneration, 600 ; various enzymes, in hypervitamin A, 3771.
mammary gland : carbonic anhydrase, lipase, at parturition, guinea-pig, 224 ; protein lipase, at parturition, guinea-pig, 258 ; various enzymes, in diabetes, 5558.
myocardium : ATPase, in heart failure, dehydrogenases thyroxine effects, frog, 4207 ; GOT, in infarction, 5350 ; a-glucan phosphorylase, after blood flow arrest, 1861.
ovary : GOT in hypothyroid & vit. B₁₂ rat, 3194 ; GOT & dehydrogenases, goitre effects, 6707 ; A₂-3-hydroxystearoyl dehydrogenase, rats, 5589.
pancreas : amylase, hypophysectomised 6670 ; islets (a) horse, 2635, (b) *peptides* obese-hyperglycaemic mice, 6669.

INDEX OF SUBJECTS

Parathyroid, alk. phosphatase, after bilat. nephrectomy, 6674.
 Pericardium, amino acid decarboxylase, cockroach, 5537.
 Pituitary : ant., acid phosphatase, after thyroidectomy, 2668 ; various enzymes, horse, 581.
 Plants, 304, 2441, 2472, 2494.
 "leumatoïd synovial tissue, acid phosphatase raised, 837.
 » acid phosphatase, no correlation with vanes, 5154.
 paravertebral glands, choline acetylase, denervation effects, 2006.
 skeletal muscle : 3112 ; ATPase & α-glycerophosphate dehydrogenase, age effects, house, 1157 ; maturation, 21 ; glucose O₂ dehydrogenase & 6-phosphogluconate dehydrogenase, increased in atrophy, 5177 ; numerous enzymes, in dystrophy, 23, 3114.
 "Qf" in Arthus-type inflammation, 1305 ; stratum corneum, histidine ammonia-lyase absent in histidinaemia, 3379.
 present phosphatases, in bone marrow trans-plantation, 3684.
 Plant glands, polyphenol oxidase, during moulting, crustacean, 4923.
 IF*, various hormones, LH effects, bird, 4627.
 myomas, ATPase in avian myeloblastosis, 5948.
 "m" dehydrogenases, after thiocyanate & Methyl thiouracil admin., 5619 ; proteolytic activity in non-toxic goitre, in review (title 7164).
 tumour tissues^{man} 3365 dehydrogenases in astrocytes, glutamate decarboxylase depressed, brain, 813 ; guanase, man, 3741 ; inhibin of dehydrogenases by chemotherapeutic agents, 1878 ; "marker" enzymes, minimal deviation between them, 3742 ; NAD⁺ phosphorylase, nuclei, 2254 ; nucleotidyltransferases, virus-infected, 5398 ; oxidising enzymes, malignant fibroblasts, in soc. proc. (title 41) 4455 ; RNase, age & treatment effects, 2992 ; W^U enzymes (a) hepatoma, 3744, (b) SSJ^{Bation} human squamous cell cancer, specified tissue, various enzymes, after radiated diet, rats, 5817.
 "m" elevated enzymes in urinary tract infections, 807 ; uropepsin, in chronic asthma, in soc. proc. (title 23) 7155.
 "merit" : 5'-nucleotidase, pseudodregnancy effects, "phosphorylase", mastamine & 5HT effects, 6719.
 "m" body fluids, γ-glutamyl transpeptidase, disease, man, 3336.
 "m" issues: ATPase localisation, 5079 ; enzyme, sarcoma-bearing rats, 3759 ; transaminase effects, 618 ; transaminases, muscular dystrophy, expt. & hered., 5550.
 "m" inhibition/inactivation (see also "inhibition") : α-amino acid decarboxylase, Carbonic anhydrase, Catechol-O-methyl transferase, Cholinesterase, Monoamine oxidase inhibitor, by H³ inhibitor-resistant enzymes, 5617.
 by metal ions, mitochondrial ATPase, 5441.
 by L-6-hydroxylysine, glutamine synthetase, 511.
 by α,γ-dihydroxy acids : aspartate kinase, 5271 ; tryptophan, 5342.
 by αS¹ trypsin, various enzymes, 739.
 by α¹-antitrypsin dihydrofolic reductase, 757.
 by S¹¹¹A¹⁰⁵, AChas., 6215.
 by S¹¹¹¹⁰⁵ factor, nucleases, man, 3027.
 by S¹¹¹¹⁰⁵ omoacid & ovoinhibitor, protein, 2896-7.
 by S¹¹¹O¹⁰⁵ P¹¹¹ omazine-, alcohol dehydrogenase, 5614.
 by ethyl dehydrogenase, 5624.
 W carbamate, proteolytic activity, 740.

Enzymes
 by F¹⁴ hydrazidase, 603.
 by INH & cycloserine, GOT, 5631.
 by glucose, phlorizin & phloretin, stromal ATPase, 3321.
 by groundnut skin, protease, 3306.
 by heat, AChase, 596.
 by histamine, xanthine oxidase, 3302.
 by H₂O, 1001.
 by γ-hydroxy-a-oxoglutarate, citric acid cycle enzymes, 3298.
 by γ-irradiation, RNase, 10691.
 by nucleotides, succinoadenylate kinase, 442.
 by oligomycin, ATPase, 5613f.
 by oxidation of bound Fe, 3-hydroxyanthranilate oxidase, 539.
 by oxalamate, isocitric enzyme, in soc. proc. (title 94) 7148.
 by O₂ : Azotobacter enzymes, 859 ; nitrate reductase, Aerobacter, 3838.
 by L-phenylalanine, alk. phosphatase, 5275.
 by pyrimidines, aspartate carbamoyl transferase, 741.
 by salicylate : glutamate dehydrogenase & -decarboxylase, 5609 ; malic dehydrogenase, 1661.
 by Na dodecyl SO₄, dehydrogenases, 5473.
 by soyabean : *Tribolium* protease, 727 ; trypsin, 2885, steroid 19-hydroxylase, 3263.
 by synthetic detergents, α-camylases, 3300.
 by thymidine triPO₄, thymidine kinase, 2978.
 by tumour-inhibiting agents, dehydrogenases, 1578.
 by u.v. irradiation, ATPase, 1075.
 by urinary factor, trypsin, man, 1653, 2047.
 by various drugs, microsomal drug-metabolising enzymes, 4119, 4121.
 enzyme-inhibitor complexes, 757.
 feedback mechanisms, 504, 843, 2978.
 nomenclature & theory, 561.
 of hydrogen dehydrogenase, 589.
 of lactic dehydrogenase isoenzymes, 3131.
 of lipase in fixed liver, 28.
 product inhibin, 5472 ; in review, 7141.
 substrate inhibin, myofibrillar ATPase, 5389.
Enzymes, physicochemical, structure-activity relations & substrate interaction studies (see also *etc.*)
 active site, 3122, 5486.
 allosteric site, 2-deoxyribosyl-4-aminopyrimid-2-one-5'-PO₄ aminohydrolase, 5361.
 amino acid composition, 294, 889, 2787, 2957, 3113, 3164, 452.
 denaturation, 385, 604 ; thermal, 3025, 5485.
 difference spectra, α-chymotrypsin, 394.
 elementary steps in enzyme reactions, in review (title 1) 7141.
 T₂4R : flavo-enzymes, 5471 ; succinic dehydrogenase, in soc. proc. (title 98) 7148.
 enzyme-substrate complexes & interactions : *ZM 634-5, 2784 ; binary & ternary complexes, 584, 2955 ; Michaelis complex, 282, 361.
 exoenzymes catalysis of consecutive reactions, pH changes during enzyme reactions, 511, 3120-1.
 isoelectric point, Chase, 564.
 Sanisimov's action, 570, 3118, in review (title 18) 2593.
 mol. wt. as related to activity, 356, 2787.
 on alcoho dehydrogenase, in soc. proc. (title 1) 7148.
 on α-amino acid oxidase, 5344.
 on arylsulphatase, brain, 3140.
 on S¹ on c anhydride, 511, 3115.
 on carboxypeptidase A, 2927.
BS¹ roxaSetate, ya₁e₂575.
 on hydrogen dehydrogenase, 589.
 on D₃(-)-hydroxybutyrate apodehydrogenase, on Invertase, *Neurospora*, 185.
 on *Pseudomonas* protease, 2948.
R₁ a₁B₁ 3022.
BS¹ teSatinate reductase, 585.
 on urease, sulphite-modified, 5495.
 prosthetic groups, 569, 576.
 quaternary structure, nomenclature, 3120-1.

Enzymes
 reaction kinetics, 561-2, 583, 2788, 2969, 3115-7, 3119, 3120-1, 3915, 4725, 5320, 5467-8, 5470.
 structure-function relations, 0-galactosidase, 5207.
 structural modification effects, 1231, 3031.
 -SH groups, 662, 877.
 S-S bonds, lysozyme, 2933.
 temp. effects, succinic dehydrogenase, frog & rat liver, 3123.
Enzymes, specific,
*nomenclature & classification is based on the Report of the Commission on Enzymes of the International Union of Biochemistry, 1961," using the broad systematic headings followed by accepted trivial names ; older terminology is indicated in brackets. Unclassified enzymes are included in Enzymes, systems, amidohydrolases, amidase, 3801.
 L-asparaginase, 313, 5959.
 biotinidase, 639.
 glutaminase, 5560.
 penicillinase, 877, 1565-6, 3929, 6165-6.
 urease, 4922, 5495.
 aminohydrolases, adenosine deaminase, 3019.
 AMP deaminase, 3114.
 2'-deoxyribosyl-4-aminopyrimid-2-one-5'-P₀ aminohydrolase, 5361.
 glucosamine 6-phosphate deaminase, 191.
 guanase, 3741.
esterases (see also hydrolases ; phosphatases ; sulphohydrolases), acetyl esterase, 4817.
 cholinesterases (for inhibitors/inhibitors, see Cholinergic agents, -blocking agents). Cholinesterase inhibitors : 3, 564, 1941, 2577, 2660, 3117, 3136, 3141, 4446, 4482, 4924, 4966, 5493, 5622, 6752, 6900, in soc. proc. (title 16) 7152 ; AChase, 595-7, 3297, 4048, 4482-4, 5175, 5491-3, 62*5, in soc. proc. (title 21) 5038 ; butyrylcholinesterase, 3135, 4482 ; pseudocholinesterase, 3370.
 chlorophyllase, 5763.
 in sol. Ag in kidney microsomes, 3661.
 lipases : 28, 224, 265, 785, 1783, 2805, 3375, 6271 ; lipoprotein lipase, 258.
 2-naphthyl octanoate esterase, 5817.
 non-sp. 37, 63, 265, 2513, 2719, 5087, 5164, 5488, 5970, 6425.
 of household, 3136.
 pectinesterase, 850.
 phospholipase A, 244.
glycoside hydrolases, amylases : 193, 613, 4891, 5205, 6237, 6670-1, α-amylase, 2784, 2786, 3300, 4892, in soc. proc. (title 14) 5038 ; β-amylase, 4892 ; phenylazobenzoyl-Taka-amylase A, 192, Taka-amylase A, 385, 566.
am₁ f₁ gluc₁ set₁ 155; in soc. proc.
 carbohydrate, 5513.
 cellulase, 2787, 3915, 5206, 5208.
 disaccharidases, 3377.
 0-2,6-fructan-6-levanbiohydrolase, 2783.
g₁7¹5iy₁5?ov₁, 7.
 0-1,3-glucanase, 5219.
 glucosidases : α, 4760 ; β, 5486.
α₁β₁γ₁57₁SAT₁ 285 A 3 771, 4581.
 invertase, 185, 3377, 4534.
 isomaltase, 3377.
 maltase, 1503, 4892.
 mechanism of action, 2786.
 muramidase (lysozyme), 294, 3801, 604, 6851, 889, 1430, 1433, 2933, 3134, 3759, 5160, 5317, 5319, 5486.
 neuraminidase/sialidase, 183, 564, 3370, 5214.
 NAD nucleosidase, 1414, 2985.
 polysaccharide hydrolases, 2773.
 quercitinase, 3416.
 sucrase, 2788.
hydrolases (see also amidohydrolases ; amino-hydrolases ; esterases ; glycoside hydrolases ; nucleases ; peptidases ; phosphatases ; sulphohydrolases ; ureohydrolases), acid, 5592.
 pyrimidine nucleoside hydrolase, 2982.*

- Enzymes, isomerases,** aldose mutarotase, 3304. hydroxyproline-2-epimerase, 636. **of *Neurospora*, 2340.** phosphoglucose isomerase, 5496, 5658. UDP-D-glucuronic acid 5-epimerase & UDP-IV-acetylglucosamine 4-epimerase, 2757.
- ligases/synthetases,** acetylglutamine synthetase, 504. acyl-CoA synthetase, 5226 f. 6-aminolaevulinate synthetase, 843. carbamyl PO₄ synthetase, 1747. glutamine synthetase, 311, 730, 5279. α-glutamyl-RNA synthetase, 5417. glutaminyl-RNA synthetase, 5417. glutathione synthetase, 327. glycogen synthetase, 3270. glycyl-RNA synthetase, 5414. 0-pyrazol-1-ylalanine synthetase, 3435. succinoadenylate kinosynthetase, 442. tryptophan synthetase, 299-300, 509, 5428.
- luciferase. See Luminescence, lyases.** aconitate hydratase (aconitase), 3298, 3430. aldolase, 194, 3111, 3372, 3518, 4290, 5203. amino acid decarboxylases, 5318, 5346, 5537, 6041. 6-aminolaevulinate dehydratase, 843. argininosuccinate lyase (argininosuccinase), 508. L-aspartate-4-carboxy-lyase, 312, (title 54) 2594. carbonic anhydrase, 511, 609, 802, 2662, 3115, 3144, 4163, 4281, 5499, 6289. citrate synthase (citrate condensing enzyme), 573-5, 3101. cystathione synthase, 5340. cysteine desulphhydrase, 5340. cysteine sulphoxide lyase, 307. decarboxylases, brain, 3991, 4060. dehydroquinate dehydratase, 4866. dihydروxycid dehydratase, 304. glutamate decarboxylase, 813, 5267, 5609, 7000, in soc. proc. (title 105) 7148. histidine ammonia-lyase (histidine a-deaminase), 3303t, 3379. histidine decarboxylase, 2856, 5687. hyaluronate lyase, 161. hydroxytryptophan decarboxylase, 3192. isocitrate lyase, 858. lysine decarboxylase, 3565. 0-methylcrotonyl-CoA carboxylase, 5539. methylcysteine synthase (S-alkylcysteinase), 2866. propionyl apocarboxylase, 637. pyruvate decarboxylase (a-carboxylase), 5535. ribulose-1,5-diPO₄ carboxylase, 2429. serine dehydratase, 3744. tartrate dehydratase, 3395. threonine dehydratase, 3744. tryptophan synthase, 2870.
- nucleases,** DNase, 424, 433, 1393f, 3023, 3027, 4725, 5384, 5388, 5402. in cephalopods, in soc. proc. (title 18) 7148. RNase : 380f, 439-41, 989, 1001, 1069f, 2345, 2988, 2992, 3015, 3022, 3024-5, 3027, 3572, 4313, 4873, 5385, 5427 ; polyalanyl RNase, 3031.
- oxidoreductases,** alcohol dehydrogenase, 584, 2969, 3130, 3402, 5452, 5593, 5614, in soc. proc. (title 97) 7148. aldose dehydrogenase, 178. D-amino acid oxidase, 282, 284, 361 f, 2953, 5344, 5471, in soc. proc. (title 100) 7148. L-amino acid oxidase, 5264, 5344. ascorbate oxidase, 658, 660, 2472. azobenzene reductase, 3320. catalase : 610, 807, 978, 2472, 3587, 5634, 6044, in soc. proc. (title 119) 7148 ; hepatocatalase (caperase), 729. dehydrogenases : cytochrome, in mitochondria, 2664 ; from *Micrococcus* cell membranes, 3397 ; in aorta, cholesterol feeding effects, 625 ; in human astrocytes, 3365 ; in inner ear, in soc. proc. (title 2) 7155 ; in oral squamous epithelium, 14 ; in tumour cells, 1578 ; isoenzyme visualisation, 580 ; mechanism of action, 3118 ; of *Rhizobium*, 6181 ; role in cabbage plant defence against fungal infection, 5753.
- Enzymes, oxidoreductases,** dehydroshikimic reductase, 4866. diamine oxidase (histaminase), 602, 1140, 3141-2, 3382, 4487. dihydrofolate reductase, 757, 3202-3, 5711. f-diphenol oxidase (laccase) 936, 5500, 6938. dopamine-0-oxidase, 4078. glucosidase, 562, 3324, in soc. proc. (title 70) 7148. glucose 6-PO₄ dehydrogenase, 181, 661, 800, 24941, 2789, 3114, 3350, 3744, 4283, 4806, 4818-9, 5177, 5195, 5201, 5556-7, 5602, 5663, 5970, 6890-3. D-glucuronolactone dehydrogenase, 179. glutamate dehydrogenase, 352, 356, 3121, 4217, 5278, 5560, 5609, 7000, in soc. proc. (title 93) 7148. GSH-insulin transdehydrogenase, 666. GSH reductase, 5280, 5746. glyceraldehyde 3-PO₄ dehydrogenase, 3122, 5473, 5502, in soc. proc. (titles 92, 112) 7148. glycerol diPO₄ dehydrogenase, 3112. ot-glycerophosphate dehydrogenase, 7021. glycolic acid oxidase, 7001, in soc. proc. (title 99) 7148. hydrogenase, *Clostridium*, 587. hydrogen dehydrogenase, 588-9. 3-hydroxyanthranilate oxidase, 539. /9-hydroxybutyrate dehydrogenase, 983, 5481. hydroxysteroid dehydrogenases, 262, 264, 714, 3263, 3266-7, 4627, 5253, 5589. hypoxanthine oxidase, 5483 f. IAA-oxidase, 2450, 4880, 5754. isocitrate dehydrogenase, 3298, 3350, 5481, 5557, 5970, 6708, in soc. proc. (title 94) 7148. kynurenine 3-hydroxylase, 3192. kynurenine oxidase, 810. lactate dehydrogenase, 63, 527, 577-9, 581-3, 788, 807, 827-8, 3080, 3111, 3131-2, 3518, 3743, 3781, 5078, 5480-1, 5488, 5496, 5624, 5649, 5708, 5970-1, in soc. proc. (titles 90, 91) 7148. D(-)-lactic cyt. c reductase, 527. lactoperoxidase, 3939. lipoamide dehydrogenase (diaphorase), 263, 5721, 2662, 5488. lipoyl dehydrogenase, in soc. proc. (title 89) 7148. malate dehydrogenase, 827, 1661, 3111, 3124, 3299, 3397, 3430, 4356, 5474-5, 5481, 5557, 5970, 6708. L-malate : NADP oxidoreductase (decarboxylating), 567. mandionide reductase, 2975. MAO, 593, 978, 3141, 3648, 4001, 5817, in soc. proc. (title 15) 7152. monophenol oxidase, 6938. NAD transhydrogenase, 3a-hydroxysteroid-dependent, 3071. NADH, dehydrogenase, 364, 2970, 3397. NADH-tetrazolium reductase, 263. NADP reductase, 2977, 3485. NADP transhydrogenase, 3020. NADPH, oxidase, 401. nitrate reductase, 586, 3838, 4124, 4764. oxalic acid oxidase, 5747. oxidase, 5581, 1381. oc-oxoglutarate dehydrogenase, 3298. peroxidases, 546, 590-2, 598f, 705, 2472, 3129f, 5484, 5569, 5572. phenylalanine 4-hydroxylase, 2871. 6-phosphogluconate dehydrogenase, 661, 1350; 5177, 5556-7. polyphenol oxidase, 605, 2472, 3914, 4923, 5745. ribitol dehydrogenase, 182. ribitol 5-phosphate dehydrogenase, 180. sorbitol dehydrogenase, 5702. succinate-cyt. c reductase, 3146. succinate dehydrogenase, 562, 569-70, 1654, 2635, 2665, 2719, 3123, 3125-7, 3430, 3515, 5078, 5488, 5640, 5970, in soc. proc. (title 98) 7148. succinate-tetrazolium reductase, 571, 5477. tetrathionate reductase, 585, 3798. L-threonine dehydrogenase, 5341. triosephosphate dehydrogenase, 858. tryptophan 5-hydroxylase, 2871. tryptophan pyrolase, 3011, 3271, 4926, 5274, 5341.
- Enzymes, oxidoreductases,** tyrosinase, 302. xanthine oxidase, 594, 3133, 3174, 3302, 547 5482, in soc. proc. (title 88) 7148.
- peptidases,** alanyl-0-aminopeptidase, 5817. aminopeptidase, 2951, 5970. carboxypeptidase A, 2927. dipeptidase, 6669. endopeptidases, 4516. exopeptidase, 3801. glycylglycine dipeptidase, 5283. in human lens, 2949. in mucosa sub-cellular fractions, 295p. kininase, 5577. leucine aminopeptidase, 5087, 5164, 6669.
- peptidases, proteolytic.** cathepsins : 837, 989, 2952, 3114, 3771, 548? cathepsin C, 1075, 2947. chymopapain, 3301. chymotrypsin : 2896, 5342 ; a-chymotrypsin 2012 ; diisopropylphosphoryl-a-chymotrypsin, 394 ; 6-chymotrypsin, 5343. chymotrypsinogen A, 5343, in soc. proc. (title 111) 7148. coagulase, 1378, 1391. clostridiopeptidase A (collagenase), 3» 1357, 2903. elastase : 350 ; proelastase, 350. fibrinolytic. Refer to **Blood coagulation**. immuno-electrophoretic characterisation, 1W kallikrein, 328, 2876, 4177, 4404, 5880. papa in, 310, 5410. pepsin (for gastric secretion, refer to **Gastintestinal tract, stomach**) : pepsin, 353, 37< 2014, 4525. pepsinogen, 1231, in soc. proc. (title 33) 715* (title 6) 7163. proteinases & proteases, 693, 1136, 13P 2948, 5485, 5573, 7066. rennin, 360, 5320. secretion in gastric juice in disease, 33761*. trypsin : 55, 355, 390, 721, 1653, 2047, 28* 2938, 2946, 2958, 3120, 5335, 5342, 623* diisopropylphosphoryl trypsin, 5335. uropepsin, in soc. proc. (title 23) 7155.
- phosphatasess,** acid, 23, 27, 37, 63, 80, 5981, 601, 783, 837, 8541, 989, 2068, 2441, 2635, 27J 2979, 3114, 3139, 3278, 3684, 3771, 508*, 5154, 5164, 5488, 5762, 5970, 6180, alk., 23, 37, 64, 80, 599, 786, 853, 2035, 26g 2659, 2719, 3137, 3278, 3684, 3770, 452 5164, 5275, 5488, 5490, 5817, 5970, 61P 6674, in soc. proc. (title 95) 7148, (title 7166). fructose 1,6-diphosphatase, 2791, 5203, in soc. proc. (title 71) 7148. glucose 6-phosphatase, 190, 2635, 2791, 519, 5202 f. oc-glycerophosphatase, 853. 0-glycerophosphatase, 2441, 5489. in cephalopods, in soc. proc. (title 18) 71* in exocrine gland capillaries, 26. in sol. Ag in kidney microsomes, 3661. inorg. pyrophosphatase 2979. localisation in yeast, 853-4 f. non-sp., 853, 2486. phosphatidate phosphatase, 267, 5242. phosphodiesterase, 3009, 3021, 3138, in 9* proc. (title 17) 7148. phospholipase D, 2806. phosphomonoesterases, I & II, 3162, 450* phosphoprotein phosphatase, 2954. phosphorylase phosphatase, in soc. proc. (title 74) 7148.
- phosphatasess, nucleotide-,** ATPase : 80, 365-6, 410, 535-6, 701, 833, 837, 1075, 2287, 2979, 3028-9, 3030, 3079, 3, 3120, 3321, 3497, 4283, 5079, 53hgj, 5441, 5460, 5488, 5613f, 5713-4, g] 5948, 7021, in soc. proc. (title 22) & (title 69) 7148. adenyl pyrophosphatase, 3162. deoxyCTPase, 3389. nucléosidephosphatase, in symposium 9)5048. 5'-nucleotidase, 2979, 3162, 3283, 3740* 5639.
- sulphohydrolases,** arylsulphatase, 664 f, 989, 3140.

INDEX OF SUBJECTS

Enzymes

transferases, involved in fibrinolysis. Refer to **Blood coagulation, fibrinolytic system**,
transfases, acyl-, choline acetyltransferase (choline acetylase), 607, 2006, 4484, 5491.
monoglyceride transacylase, 261.
palmityl CoA-carnitine-palmityl transferase, in soc. proc. (title 50) 7148.
transfases, alkyl,
thiaminase I, 630.
transfases, amidino-, glycine amidinotransferase, 5498.
transaminase, 618.
transfases, amino-, alanine transaminase (GPT), 319, 3111, 3113, 3518, 5278, 5496, 5532, 5550, 5560, in soc. Proc. (title 122) 7148.
4-aminobutyrate-2-oxoglutarate aminotransferase, in soc. proc. (title 105) 7148.
arginine-glycine transaminase, 506.
α^γ-partate transaminase (GOT), 319, 398t, 634, 807, 2955, 3111, 3113, 3193-4, 3299, 3518, 5278, 5350-1, 5496, 5532, 5550, 5627, 5631, 6707, 7000, in soc. proc. (title 10) ^ 2594, (title 121-2) 7148.
determination, 5349.
Y> 6-dioxovalerate aminotransferase, 857.
J-glutamyltransferase, 507 f.
Kynureine aminotransferase, 3192.
L^α-nithine-ketoacid aminotransferase, 5352.
synthesising serine, plant, 320.
transaminase A, 5353.
Transglutaminase, 2956.
tyrosine-oc-oxoglutarate transaminase, 3271, 5274.
various, 736 f, 784.
transfases, carboxyl- & carbamoyl,
aspartate carbamoyl transferase, 741, 2859, 4762.
carboxyltransferase, in soc. proc. (title 93) 7148.
ornithine transcarbamylase, 1747, 2853.
transfructosidase, 2782.
fructosylsucrose—sucrose transfructosylase, 2775.
α¹-glucan phosphorylase (phosphorylase), 32, 186t, 992, 1419, 2957, 4003, 5193-4, 6719, in soc. proc. (title 73) 7148.
teyansucrase, 2782.
ofigo-M-j-M-glucantransferase, 155.
Puine ribonucleoside & deoxyribonucleoside Phosphorylase, 444.
Kipsgalactosylase, 2793.
N⁶-glucos-a-glucan glucosyl transferase, 164.
UDP-glucose-glycogen transglucosylase, 5193, 5185, in soc. proc. (title 67) 7148.
UDP-glucuronyltransferase, 188, 3341.
UMP Pyrophosphorylase, 2983.
transfases, hydroxymethyl-
hydroxymethyltransferase, 635.
transfases, methyl-
α¹-adenosylmethionine transmethylase, 606.
“J¹-osylmethionine - Mg - protoporphyrin c₅-Chloro-meth-yl transCrase, 5726.
S²-ro²-yindole-O-methyl transferase, 5459.
^methyl transferase, 605.
transfases, nucleotidyl-
DNA nucleotidyltransferase, 5396-8, in soc. Proc. (title 21) 7148.
NAD pyrophosphorylase, 2254.
polynucleotide phosphotransferase, 463, 3073, 3406.
RNA nucleotidyltransferase, 5398.
UDPG Pyrophosphorylase, 5194-5.
transfases
acet-o-C adenylate kinase, 2979, 3114.
ATP-creatine phosphotransferase* 443.
aspartate kinase, 5271.
carbamate kinase, 3282.
creatinine kinase, 3124-3518, 5502- deoxycytidylate kinase, 3392.
diglyceride kinase, 266.
fructokinase, 177.
galactokinase, 175.
glucokinase, 196.

Enzymes, transfers, phospho-

hexokinase, 174, 176, 196, 738, 2792, 3120-1, 3350, 5195, 5199, in soc. proc. (title 69) 7148.
in plants, 2968.
nucleosidediphosphate kinase, 2983.
nucleosidemonophosphate kinase, 2983.
phosphoglucomutase, 5193-5.
phosphoglycerate kinase, 2804, 5502.
pyruvate kinase, 5502.
role in deoxyribo- & ribonucleoside 5'-PO₄ synthesis, 5370.
thymidine kinase, 2978, 3026, 3055, 3390.
transfases, sulpho-,
thiosulphate sulphurtransferase (rhodanese), ure **bilirubin**, 2711, 1263, 5347, 5560, 5634, in soc. proc. (title 96) 7148.

Enzymes, systems,

including unclassified enzymes; for general studies, refer to **Carbohydrates, metabolic pathways**; **Digestion**, etc.
acetylamino acid deacylase, 298.
amino acid activating, 5417, 5419.
arginine dihydrolase system, 852.
catalysing: folic acid deamination & amide cleavage, 3200; NAD breakdown, 2976.
cellulolytic & pectinolytic, 950, 1367.
cleaving cerebroside sulphate ester, 2830.
cyclisation of L-glutamine & L-glutamyl peptides, 310.
degrading nucleoprotein, 424.
denitrifying enzyme, prep. & prop., 5501.
dephosphorylating phosphoric esters, 5204.
desulphurisation of thiourea, saliva, 612.
fermentation enzymes, development, 565.
gangliosidase, 187.
glucosylating polyglycerophosphate, *Bac. sub-tillis*, 3407.
γ-glutamyl transpeptidase, 787, 3336.
hydration of fatty acid, flax rust uredospores, 886.
hydrolase 603.
hydrofoship: AMP & phenolphthalein diPO₄, 5489; FMN, plants, 2968; niacinogen, rice, 5540.
hydroxyamine reductase, 5728.
in glycogen debranching, 155.
ε-lysine acylase, 2855.
maltose system, 3032.
maltose permease system, 3032.
metapyrocatechase, *Pseudomonas*, 3143.
methylating RNA & DNA, *E. coli*, 2994.
microsomal drug metabolising enzymes, 4119-21.
oestrogen sulphokinase, 706.
of scorpion & snake venoms, 2898.
oxidising: cysteamine to hypotaurine, 556; glucose to 5-glucuronolactone, 145; hydroxylamine, 3128.
peptinolytic activity, 850, 871-950.
polyneucleotide polymerases, 466, 471, 485, 2831, 3051, 3067, 3074.
protein disulphide reductase, wheat flour, 5746.
pyrimidine reductases, 3744.
respiratory: in brain, in anoxia, 1353; of *Chlorella*, 124.

starch
RN

streptokinase, 1688, 1828, 3793.
succinoxidase, 3125-6, 4356, 5476, 5478, 5722, (title 123) 7148.
synthesising: acetate, *Diplococcus*, 864; colominic acid, 195; cysteine from phosphoserine & sulphide, 306 f; cytidine monophosphate-2-keto-3-deoxy-octonate, 408; fatty acids, 2803; fatty acid amides, 205; glyceride & phospholipids aortic prep., 256; hyaluronic acta, 159; leaf cutins, 3475; methionine methyl group, 642; monoiodotyrosine, 692; Sialic acid, plants, 5749; ribitol 5-PO₄; Dölymer, 127; RNA & polynucleotides, 462; sialyl-lactose, 189.

transaminatng, 5497.
transferring formamide groups, 5498.
tricothecinase, 849.
urea cycle, 608, 1747.

Eosin. See **Dyes**

S S ^ c A W also Blood cells, white,
of parathyroid, salivary & thyroid glands, 9.
of tissues, 2648.

Ependymoma. See **Tumours, specific.**

Epidemiology. See **Disease & epidemiology.**

Epidermis. For mammalian & plant, see **Skin**; & Plants, tissues; for tumours derived from, see **Tumours**; see also named animal groups.

Epididymis. See **Reproductive tract, male**; for metabolic studies on epididymal fat pad see **Adipose tissue**.

Epilepsy. See **Convulsions**.

Epinephrine (adrenaline). See **Catecholamines**.

Epiphyseal dysplasia. See **Bone disorders**.

Epiphytism, on trees, Canada, (title 4) 7163.

Epithelioma. See **Tumours, specific**.

Epithelium (see also **Mucous membranes**; **Skin**; **Wound healing** for corneal, gingival, intestinal, etc., refer to **Eye**; **Periodontium**; **Gastro-intestinal tract**), basement membrane; glomerular, heterologous, injn., 1168, 3659; histogenesis, 1312; oestrogen effects on, uterus, 5084.
mitosis in, (title 43) 7152.

radiation effects on, axolotl skin, 1084.

Equilibration. See **Posture & equilibration**.

Equine abortion virus. See **Viruses, animal, herpes group**.

Ergine; isoergine. See **Ergot-type alkaloids**.

Ergonomics. See **Exercise; Metabolism; Work**.

Ergosomes. See **Ribosomes, poly-**.

Ergosterol. See **Sterols**.

Ergot-type alkaloids & derivatives (see also **Claviceps** in Taxonomic index), chanoclavin, biosynthesis, 8951.
clavine & lysergic acid, in Morning Glory var., 907.
dihydroergotamine, smooth muscle effects, 6398.
ergine & isoergine, in *Rivea corymbosa*, 906.
lysergic acid, abs. configuration, 1702.
lysergic acid diethylamide; effects (a) allergic encephalomyelitis, 1704, (b) amino acid incorporation into liver proteins, 3036, (c) carp, 2147, (d) elephant, 1703, (e) reticular nerve cell Achase, 4483; hyperthermic action, 4016; metabolism, steroid effects, 1656.
methysergide, thyroid stimn., 6261.

Eriostemoic acid, in plant, 934.

Erythema. See **Inflammation**.

Erythraemia (polycythemia vera). See **Blood cells, red, abnormalities; & Blood disorders**.

Erythritol (see also **Carbohydrates**), in foetal tissues, cattle, 1427.

Erythroblastosis foetalis (haemolytic disease of newborn). See **Blood disorders**.

Erythroblasts; Erythrocytes; Erythroid cells. See **Blood cells, red; Bone marrow**.

Erythropoiesis. See **Blood cells, red, formation**.

Erythropoietin (see also **Blood cells, red, formation**), interrelation with hypo-oxia & renal juxtapaglomerular cell, 2039.

Erythropterin. See **Pteridines & pterins**.

errone agents.

Ethanolamine,

-containing phospholipids. See **Phospholipids** denv., anaesthetic activity, 1612.

fatty acid amide formation, microsomes, 205.

Ethers,

diethylether (see also **Anaesthesia & anaesthetics**).

a-S_nethyl R₂S_n*. See **Lipids**.

trifluoroethyl-**A**-brain electrolytes & water as artecea, 4105.

Ethidium bromide. See **Protozoal anti-affents**.

Ethinamate. See **Sedatives & hypnotics**.

Ethionime (see also **Amino acids**),

biochem. study of activity, in review, 7141.

ethyl deriv., distribution, maternal & foetal

tissue, 5272.

induced fatty liver, glucose inhibn., 232

inhibn. of ACTH stress response, 2071.

cholesterolaemia, 621; metabolism, liver, 731.

regeneration, liver, 993.

serum lipid effects, 3168.

Ethopropazine. See **Phenothiazine derivative!**

di-Ethylaminoethanol, *Mannine* «wauves».

as S_nate & nicotinic esters, cardiac activity*

6286.

«C_nS_nC_mplex», Phospholipid biosynthesis, 2833.

tamEthylammonium. See **Ganglion blocking agents**.

- Ethyl carbamate.** See **Urethane**.
Ethylene. Sec **Hydrocarbons, aliphatic**.
Ethylenediaminetetra-acetate (KDTA); rfiEthylenetriaminopenta-acetate. Sec **Chelating agents**.
Ethylene glycol. See **Glycols**.
Ethyleneimines; γ -**ethylenimino**benzoquinone. Sec **Cytostatic & cytotoxic agents**.
tnEthyleneimelamine (triamine). See **Cytostatic ft cytotoxic agents**.
rfiEthylenetriamine penta-acetic acid. See **Chelating agents**.
diEthyl ether. Refer to **Ethers**.
Ethylglycerol trinitrate, pharmacol. 1678.
Ethylhydroxyacetate. See **Cytostatic-A-Ethylmaleimide.** See **Sulphydryl groups, inhibitors**.
Ethyl methanesulphonate. See **Mutagens**.
2-Ethyl-3-methyl **valaramide**, behavioural & muscle-relaxant prop., 3985.
<ftEthylstilboestrol. See **Oestrogen-active compounds**.
tetraEthylthiuram disulphide. See **Disulfiram**.
Ethylnylcyclohexylcarbamate (ethinamate). See **Sedatives & hypnotics**.
Ethyloestradiol. See **Steroids**.
Eryptamine (monase). See **Tryptamine, deriv.**
Eugenics, in review, (title 18) 7151.
Evolution (see also **Adaptation; Variation**), biochem. innovation, 5765.
competition, interspp., aggressive neglect as factor, birds, 2245.
genetics, linkage & recombination in, in review, 2591.
in invertebrates: anthropon haemolymph as related, 7049; New World saturniid moth, 2561.
in micro-organisms: myxoma virus, Great Britain, 6098; origins of *Staphylococcus*, a review/1370t.
in plants: *Citrus*, 6853; *Trillium*, 2363; wheat, 4771.
in vertebrates: anurans, review, 7149; calls and facial expressions, primates, 2252; future of man, symposium, 7151; mammalian brain, 2698, 7091.
regressive, tumour cells, soc. proc. (title 37) 7155.
selection: artificial, for wt., *Tenebrio*, 7120; at molecular level, 4748; migrational, 4749; natural, *Merychippus*, 2385f.
Evravycin. See **Antibiotics, oleandemycin**.
Excretion (for renal studies, refer to **Kidney function**; see also **Bile; Biotransformations; Drugs, metabolism; Faeces; Urinary indices & tests**), biliary: bilirubin, rats, 6617; triterpenes, rabbit, 2034.
faecal: N, nycthemeral rhythm, rabbit, 7074; thiamine, reduced in hyperthyroidism, 5575; "Zn, interference by Cd, 4541.
faecal & urinary: » I-labelled proteins, 3334; "Sr, man, 3091.
of rare earth cpd., mice, 5455.
urinary: 0-aminoisobutyric acid, in mongolism, 2393; ureotelism, echidna & platypus, 7055.
Excretion, invertebrate (including mechanisms, excreta), crustacean, Cu, barnacle, 7124.
insects: *Chaoborus* larva, 4960; *Rhadnius*, 7050; xanthine excretion, greater wax moth, 4961.
molluscs: bivalves, M_P study, 7060; nitrogenous, *Helix pomatia*, 4964.
nematode, excretion products, 3517.
Exercise (see also **Work**), blood coagulation as affected, 1820, 1830.
cardiovascular effects, 1884, 6486, 6492, 6495.
effects, smokers & non-smokers compared, 1855.
lactates, pH & FFA as affected, man, 4316-7.
metabolic responses: Eskimos, 4245; warm- & cold-acclimatised rats, 4246.
O₂ consumption in, 1778.
plasma FFA metabolism in, 780.
respiratory effects, man, 1866, 4342.
running, energy cost, 1777.
serum Ca as affected, 4320.
urinary excretion of tryptophan-rich pre-albumin, 6643.
venous pCO₂ in, 4347.
- Exocrine glands/secretions** (see also named secretions, organs & tissues), capillaries of, staining, 26.
Exophthalmos (see also **Thyroid, disorders ft functional states**), -producing substances, assay, 2381.
Exotoxin. Refer to **Toxins, bacterial**.
Extracellular fluid. Refer to **Body fluids**.
Extremities. See **Limbs, extremities**.
Eye ft vision (for species studies refer to animal group headings & Taxonomic index; for visual pigments sec **Eye, visual pigments**), after effects of seen motion, 1993.
binocular fusion, 4496.
brightness depression, inductive, 6600.
central connections (see also **Brain, cerebral cortex -stem & -tracts ft projection fields**), electrical responses, neonates, 6569; eye removal, effects, 1941, 2689; photosensitive waves, cat, 6568; primary optic centres, 2699; spatial summation, 4499; visual analyser, (title 1) 7155.
colour vision: (title 1) 7155; -blindness, linkage with haemophilia, 4798; Israeli families, 6892; conjunctival bulbar arteries, responses in hypertension, 6515-6.
contact filters for birds, 2590.
cornea: mitosis, (title 43) 7152; proteins, 2887, 5703.
corneal reflex, frog, 1939.
corneal stroma: transplantation, prior labelling, 1188; water imbibition & swelling, 6576-8.
embryonic, transplantation, *Ambystoma*, 7037.
enucleated, responses, 4504.
extrinsic muscles innervation, birds, 2657.
fusion freq., nocturnal & diurnal mammals, 6593.
humours: aqueous, adrenal cortex effects, 6580; vitreous, post mortem K changes, 4495.
information & control, visual, 6601 f.
intraocular pressure, extra-ocular muscles effects, 6581.
imaging prop., 4505.
iris: angle, nerve fibres of, man, monkey, 5060; muscle, catecholamines effects, 1629; regeneration, pigment pattern, newt, 7042.
lens: crystallin prop., 388, 5362; elastic prop., 6579; enzymes, 2949, 2951, 3081, 5499; oc-glycerophosphate metabolism, (title 43), 2594; glycogen, 2770; lipids, 5238; mitotic activity, chick embryo, 5118; organ specificity (title 3) 7161; regeneration, chick embryo, 2688; X-irradiation, (title 33), 7152.
light & dark adaptation, 1995, 4503.
luminance gradients, subjective difference, 4502.
mast cells in, 5061.
movement & fixation, 1940, 1988, 6602.
nictitating membrane: feather epithelium, bird, 2509; X-rays effects, 5833.
nystagmus: head position effects, rabbit, 1989; optokinetic & central interaction, 6598.
pecten oculi, chicken, 6780.
photic habituation, ocular muscles as related, 1978.
pupil size: atropine effects, mouse, 4051; recording, 4050.
R membrane, frog, 4506.
refraction, premature infants, 6582.
regeneration, amphibia, (title 8) 2600.
retina: amplifier effect, 4507; bipolar layer, neurone-glia relationship, fish, 5062; circulation, 4418; direction-sensitivity, ganglion cells, 1992; enzymes, 3113, 5556; glucose & O₂ deprivation effects, 6589; NADPH, metabolism, 628; oil globules absorption spectra, 559; phase shifts, 1991; pos. after-image formation, 4508.
retinal electrical activity/e.r.g.: 1994; contact suction electrode for, 6588; dual nature, *Octopus*, 4510; ethyl alcohol effects, 6592; of enucleated eye, 6594; of squirrel monkey, 6591; on and off responses, 6584-5; oscillatory potentials, 6586, 6590; quantal absorption related, 6583; response to X-rays, 3595, 4509, 6587.
skeletal structures, chick, 2685.
tape turn cellulosum, fine structure, cat, 6552.
yeal blood flow, 6509.
visual discrimination, -perception. See **Discrimination; Learning; Perception**.
visual self-stimn. after deprivation, monkey, 1990.
- Eye & vision disorders** (see also **Exophthalmic cataracts**, 1738.
hemianopia: binasal, & binocular colour rivalry, 1996; homonymous, 4497.
kerato-conjunctivitis, infectious bovine, 1476.
river blindness, (title 5) 2599.
toxic retinopathy, 6357.
trachoma, 1129, 1562, 6062.
Eye ft vision, invertebrate, Crustacea, electrical responses, decapods, 254*.
insect: eccentric retinula cell, *Bombyx*, 2545 glow, sensitivity & pigment migration, nocturnal Lepidoptera, 2589.
mollusc, light & dark adaptation, cephalopo* 2542.
Eye, visual pigments (see also **Vitamin A**), cone pigment, chlorolabe, in protanopes, 6595-7 of cockroach, 5461.
of coelenterate, 3520.
pre-lumirhodopsin, 557.
retinal pigment hormone, Crustacea, 5005.
rhodopsin, 5460, 5462.
Eye stalk. See **Crustacea**.
- F.**
- Face.** See **Maxillofacial region**.
Faeces (see also **Excretion, faecal; Meconium**), biogenic amines of, cattle, 3552.
coprophagy, 631, 3188.
from early Antarctic expeditions, man, 3813.
hepatitis virus in, mice, 1479.
microflora, antibacterial drug effects, 1584.
of pigs, *A scar* is eggs in, 7102.
structure of, rabbits, 7074.
- Fallopian tubes.** See **Reproductive tract**.
Fallot's tetralogy. See **Heart disorders**.
Fall-out. Sec **Radioactivity**.
Farmer's lung. Sec **Fungal infections**.
Farnesy pyrophosphate conversion to squalene 2837-8.
Fasting. Refer to **Nutrition ft diet, food deprivation**.
Fat. Refer to **Adipose tissue; Body composite Lipids**.
Fatigue. Sec **Muscle; Stress; Work**.
Fatty acids (sec also **Acetate; Butyrate; Form*** etc.: **Lipids**), action on c.s.f.-blood barrier, 4494.
amide, of ethanolamine, enzymic formats 205.
branched chain, conversion to branched chain amino acids, bacteria, 5229.
composition of various lipid cpd., 197, 3159, 3169, (title 15) 5044, 5234, 5250, (title 43), 7148.
dietary aspects: 794, 2035; essential fatty acids (a) 623, 3167, (b) deficiency, 3496, 5521.
effects on: glucose metabolism in vitro, (title 7148; isolated carrot mitochondria, 979.
hydroxy acids: C₁₈-o-OH, biosynthesis, cerebronic, 203; 2-hydroxy (a) analysis, 27, (b) occurrence in animal tissues, 2800.
bacteria, 206; metabolism, 5227; ricino (a) metabolism by bacteria, 5227, (b) 4199.
in bacteria, 198, 199, 206.
in blood. See **Blood Lipids**.
in cryst. lens, GLC, 5238.
in human skin surface lipids, 197.
in liver, 3167, 5816.
in plants, 200, 979.
in unicellular algae, 7002.
in various tissues, diet effects, (title 40) 7149.
long chain: from Orgueil meteorite, 5232; virulent strains of tubercle bacillus, micro-assay, 2796.
peroxidised, damage to proteins by, 2814.
release/mobilisation, 211, 3227, 3368-9, 587*.
transport, noradrenaline effects, liver, 3281*.
volatile, in rumen of camel, 2007.
- analytical methods**, assay of plasma FFA, 2797.
chromatog., TLC & GLC, 2795, 5235, 5250, 7148.
colorimetric micro-assay of long-chain acids, 2796.
micro-assay, isolation & GLC of 2-hydroxy fatty acids, 2795.
- biosynthesis**, condensation reaction of, bacteria, 2803.
from amino acids, in adipose tissue, 204 f.

INDEX OF SUBJECTS

Fatty acids.

Mosythesia,
in bacteria, 198, 2803.
in liver prep., 202, 210, (title 49) 7148.
in mammary gland prep., 208, (title 55) 7148.
in plants, 200-1.
in testicular tissue, 5230.
inhibn. studies, 2801, (title 45) 7148.
* odd: & even-numbered cerebroside fatty acids, 203.

role of malonate deriv. in, **5744**.

metabolism.

absorption, 4536, 5228.
alterations in endocrine disorders, 5679.
conversion to amino acids, rumen bacteria, 5229.
* sterilization, hormone effects on, 3226.
?n bacteria, 198, 206.
?n brain, mice, (title 45) 2594.
In cockerel, corticosterone effects, 4261.
In plants, (title 41) 7148.
"Corporation into lipids, phospholipids etc., 215-4, 255, 626.
interrelations with glucose metabolism, 3369.
oxidation: by yeast cell prep., 1495; carbohydrate sparing action, (title 47) 7148;
W-oxidation in vitro, 209.

starated.

in human skin surface lipids, 197.
long chain, biosynthesis in plants, 200-1.
Mo, decanoic dériv., ethyl heptyloxyacetate, anti-tumour activity, 4107.
<?> 9,10-methylene-hexadecanoic, 206;
Palmitic, 202, 206, 213, 215, 626, 2817,
3169, 4261, 5230.
<u> cw9,10-epoxyoctadecanoic, 856, 5494;
stearic, 202, 3169, 3921, 5230; (+)-threo-
9,10-dihydroxyoctadecanoic acids, enzymatic production in plant rust spores, 5494.
<4, lignoceric, 203, 5228.

Saturated.

anti-toxin effects, 3774.
autoxidation by u.v. irradiation, 2798.
long human skin surface lipids, 197.
long chain, biosynthesis in plants, 200-1.
Jefabolism by plants, (title 41) 7148.
Mo, 9-oxodec-tows-2-enoic (queen substance) effect on ovary development, housefly, 2579.
Mo: AV¹⁰ -hexadecatetraenoic, conversion to C₁₈ & C₁₉ polyenoic acids, 212; palmitoleic (9,10-hexadecenoic), 206.
M.: linoleic, 214, 794, 2817, 3167, 3774; Hnolenic (a) 3167, (b) peroxidised, 2814; (c) y-linolenic, conversion to homo-y-linolenic, (title 52) 7148; octadecenoic, Production in plasma by *Staph. aureus*, 3818; frans-octadec-16-enoic, occurrence, 2377; oleic, 201, 2035, 2817, 3774, 4546, 5230, 5236; ricinoleic, 4199, 5227; vaccenic (U, 12-octadecenoic) 206.
?> arachidonic, 3167; polyenoic, 212.
?> polyenoic, 212.
?> cereDonic » 203*

Fatty acid e **Cholesterol.**

cholesterol; See Cholesterol.
in fatty liver, 3163.
methylestolate, prep. for gas chroma tog., 5235.
of *S. vulgaris* ! methyl elaidate, ozonides, 2799.
?> alkenyl & alkyl ethers of glycerol, 5225.
?> mono-unsat. acids, ozomisation, stereoisomer Nation, 2799.

fauvism. See Anaemia, haemolytic & *Vicia faba* in Taxonomic index.

cystol horny cells, E.M., pheasant, 6777.
development, 3770, 5064.

keratin: development, embryo chick, 2524.

pigments, flamingo, 552.

replacement, 2585.

?>.

as reinforcement, reward etc., refer to Learning behaviour: in cage population of mosquitoes, 2536; of gudgeon, seasonal variations, 4853; of *Rattus assimilis*, hair-ball formation, 4954; of woodpecker-finchi, 4686.

central control. See Brain, hypothalamus.
ciliary feeding. mechanism, brachiopod, 7061.
coprophagy. 31, 3188.
food preferences: gibbon, 4687; *Trogoderma* ect., 2566.

Feeding,

habits: of teal, 2538f; ophiophagus habits, *Pseudoboacloelia*, **4125**.
of bivalve molluscs, 7060.
of earthworm, 1556.
of insects, 4950, 7062.
of *Naesa* (isopod), 7058.
of pelagic plaice larvae, 7063.
of *Tenora* (copepod), 7059.
periodic, behaviour study, rats, 4666.
rate, boll weevil, 7094.
reaction, hydra, 7057.
skin temp, after, man 1770.
stimulus for behaviour study, rat, 4662.

Feet. See Limbs, extremities.

Fermentation. See Micro-organisms; Carbohydrates, metabolism; Nitrogen metabolism; Respiration.

Ferns. See Pteridophytes & named spp. in Taxonomic index.

Ferredoxin,

hydrogenase system component, *Clostridium*, **587**.
in chloroplast: nitrite & hydroxylamine reduction, *Cucurbita*, (title 37) 7148; of parsley, (title 12) 2594; photosynthesis role, 2418.
requirement for hydroxylamine reduction, *Clostridium*, **5728**.

Ferric tannate. See Dyes.

Ferricyanide. As electron carrier, refer to Oxidation-reduction.

Ferritin. See Iron, protein-bound.

Ferrous sulphate, in phosphate ester detection, 1034.

Ferroverdin. See Bacteria, composition.

Fertilisation (see also Eggs; Plant reproduction; Spermatozoa)

acid formation by egg during, sea urchin, 7029.
capacity, extension by CoCl₂, sand dollar, 7028.
cytol. changes during, rabbit sperm, 6773.
delayed mating effects, rabbit, 6715.
in *Drosophila* spp., 7033.
inhibn. by *Fucus* extract, *Arbacia*, 4936.
membrane separation, *Urechis*, sea urchin, 5616.
of *Barna Candida* egg, E.M., 2265.
permeability changes during, *Rana*, 7036.
self-fertilisation, *Eisenia foetida*, 2583.
time & location of sperm insemination as affecting rabbit, 6714.

Fertilisers. See Soil.

Fertility & Sterility (see also Contraceptives & contraception; Eggs; Pregnancy; Reproduction; Spermatozoa; for plants, see Plant reproduction), fertility,

assortative mating as affecting, man, 2400.
food, temperature & location effects: cutworm, 7095; plaice, 7097.
reduced by enzyme-digested DNA, mouse, 3007.

semen fructose levels as related, man, 6744.

genetic aspects, chickens, 4781.

sterility,

in cattle, 6725.

iii man, 2135; induced by oestradiol benzoate, neonate rat, 6742.

sterilisation as an insect control method. See Insect control.

Fertilizin, aggl. inhibn. by *Fucus* extract, *Arbacia*, **4936**.

Feulgen. See Dyes.

Fever. Sec Body temperature, hyperthermia; Pyrogens.

Fibrin; Fibrinogen; Fibrinolysis (plasmin); Fibrinolysin precursor (plasminogen). See Blood coagulation, clotting factors; -fibrinolytic system.

Fibroblasts; Fibrogenesis; Fibrotic response; Fibrous tissue. See Connective tissue; Tissue culture; Tissue response; Wound healing.

Fibroin. See Sideroproteins.

Fibrosarcomas. See Tumours.

Fibroma virus. See Viruses, animal, pox group.

Fingers. See Limbs, extremities.

Fish, *sensu lato* (see also Aquatic organisms; Migration; Vertebrates),

ageing, effects on steroid hormone metabolism, salmon, 3273.

auditory vesicle, Acipenseridae, 7035.

behaviour: drug effects on, carp, Siamese fighting fish, 2147; schooling, symp., (titles 6 & 7) 7142; surface contour influence on, *Salmo trutta*, (title 16) 7142.

Fish,

blood: 337f, 2912, 4783; phosphate concn., tench, 7024.

brain: habenula & thalamus, 4983f; thalamic nucleus, synaptic nucleus sp., lip-fishes, 7090. cardiovascular system: bradycardia, *MS*, 222 induced, elasmobranchs, 4182; light stimn. effects on, marine teleosts, 7088.

cartilage, polysaccharide composition, elasmobranchs, 171.

coloration, nervous system control, tench, 4984.

cytol./histol./histochem.: dystrophic muscle, 23; electroplate, *Electrophorus*, 2507; pituitary, 3523, 5014; retinal horizontal layer, 5062.

development. See Development; Eggs; Embryos; Growth.

electric organ: enzyme activity sites, *Electrophorus*, 5469; structure, *Electrophorus* 2507; various spp., 6529.

endocrines: oestrogens, *Scyliorhinus*, 7069;

steroid hormones, semen, dogfish, 7070.

endostyle & glandular tracts, goitrogen & thyroxine as affecting, lamprey, 5009.

eye & vision, retina, cell types, 5062.

feeding habits & diet: food intake & utilization, goldfish, 5509; inducing ciguatera toxicity, *Acanthurus xanthopterus*, 1723; of plaice larvae, North Sea, 7063; seasonal variation, gudgeon, 4953.

freezing resistance, *Myoxocephalus scorpius* & *Gadus ogac*, **7135**.

genetics: 4783; karyotypes, *Labeo* spp., 6842; of dorsal spines, stickleback, 2384; species differences, *Salmo*, 4732.

kidney: & head kidney, vascularisation, perch, 2584; GFR, *Salmo gairdneri*, **7054**.

liver, ketone prep, from, tuna, 3220 f.

melanophores, expansion, *Lebistes*, 4140.

metabolism & tissue composition (see also named organs & systems above & below):

Ca & Sr, *Salmo trutta*, 4965; chemical composition, mackerel, 551 If; enzymes, electric organ, *Electrophorus*, 5469; glycogen, myocardium, tench, 7023; iodine, *Salmo irideus*, 323; liver vit, D, tuna, 3220f; inermyosin carp, 5298; polysaccharides, cartilage, elasmobranchs, 171; steroid hormone metabolism, salmon spp., 3273, Na-DNA, sperm, salmon 3006; Na metabolism, gill, *Fundulus*, 4966; threonine ethanolamine phosphodiester, nervous tissue, (title 80) 7148.

muscle: dystrophic, 23; inermyosin in, carp, 5298; myocardial, glycogen levels, tench, 7023; slow & fast fibres, *Myxine*, 7108.

nervous system: reflex responses, marine teleosts, 7088; spinal cord & sympathetic nerves, coloration control by, tench, 4984; tissue composition, (title 80) 7148.

neurosecretion, from nucleus lateralis tuberis, *Salvelinus*, **5006**.

olfaction, role in schooling, (title 7) 7142.

pancreas, islets, protein biosynthesis in, *Lophius*, **3043**.

parasites: helminth, *Trachurus trachurus*, 7100; of elasmobranchs, 4922.

pharmacol.: antibiotics, improving egg hatchability, plaice, 7034; DDT, resistance.

Gambusia affinis, **1745**; drug & chem. toxicity, group effects, *Gambusia*, 4202-3; LSD, effects, carp, Siamese fighting fish, 2147; *MS*, 222, effects on heart, elasmobranchs, 4182; reserpine & tetrabenazine effects on melanophores, *Lebistes*, 4140.

pituitary: 5006; as affected by dark/light backgrounds, 5014; neurointeninate lobe, hormonal prop., elasmobranchs, 5013; of *Carassius auratus*, **3523**.

predation, carp fry, 2572.

regeneration, in spinal cord, lamprey, 2526.

reproductive system, gonads, thiourea effects on, *Lebistes*, **500**.

sensory organs/ mechanisms : in skin, *Gymnarchus*, 4985 ; lat. line nerve fibres, electro-reception, electric fish spp., 6529 ; role in schooling, (title 5) 7142.

swimming speed, larvae, plaice, 7134.

techniques of study, tagging, *Oncorhynchus* spp., 7110.

thyroid : renal follicles, *Barbus stigma*, 5010 ; thiourea effects on, *Lebistes*, 5011.

toxicity of *Acanthurus*, diet induced, 1723.

- Fish.** toxins & venoms : of puffer fish, effect on paraventriculus, cat, 6371 ; of *Trachinus viphera*, 6373.
- Fish, specific** (see also Taxonomic index for individual spp.). bonito, insulin structure, 668. carp (see also *Cyprinus*) : behaviour, influence of LSD on, 2147 ; fry, rotifer predation by, 2572 ; meromyosin heterogeneity in, 5298. elasmobranchs (see also *Scyllorhinus*, *Squalus*) : bradycardia induced by MS 222, 4182 ; cartilage polysaccharides, 171. lamprey, response to goitrogens & thyroxine, 5009. lip-fishes, thalamic nucleus, sp. synaptic form, 7090. plaice (see also *Pleuronectes*), feeding habits, larvae, 7063. Siamese fighting fish, behaviour, LSD effects on, 2147. tench (see also *Tinea*), coloration, 4984. tuna, ketone prep, from liver, 3220 f.
- Fish products.** See **Foodstuffs**; **Oils**.
- Fixation.** See **Cytology/Histology/Histochemistry**.
- Flagella** (see also *Cilia*), algal: fine structure, *Oedogonium*, 4917 ; role in mating, *Chlamydomonas*, 6995. bacterial, motility, hydrodynamic study, 5719. fungal, movement, *Blastocladiella*, 3916. in human skin, E.M. study, 2650. movement, mathematical study, 7075. protozoal, E.M. study *Trichomonas*, 2276.
- Flame photometry/spectrophotometry.** See **Photometry**; **spectroscopy**.
- Flavans.** See **Flavonoids**.
- Flavins,** photoreduction by illuminated chloroplasts, fluorimetric measurement, 5760. stimn., of mammalian nitroreductase by, 4124.
- Flavin nucleotides** (see also **Flavoproteins**; **Riboflavin**), as prosthetic group of succinic dehydrogenase, fluorescence, 569.
- FAD: charge on, in D-amino acid oxidase enzyme-substrate model, 284; in D-(+)-lactic-cyt-c reductase, 527.
- FMN : enzymic hydrolysis in plants, 2968; semiquinone, absorption spectrum, 413.
- Flavonoids** (see also **Coumarins**; **Plant pigments**; **Tannins**), anti-tumour action, 6321. benzoflavone, serum protein effects, 5777. bronchodilator action, 6322. chromatog. & structure, 5736. citronin, glycoside of *Citrus*, 940. complexes in citrus fruit, 939, 940, 3471. conversion to anthocyanidins & glycosides, 947. effects, plant metabolism, 2450. flavan polymerisation, 5735. glycosides : neohesperidose in, 3471 ; quercitrin, microbial degradation, 3416. in butterfly, 5531. munetone, isoflavone of *Mundulea*, 937. pratensein, isoflavone of *Trifolium*, 938]. theaflavin, in tea, 5734f.
- Flavoproteins** (see also **Flavin nucleotides**; **Riboflavin**), enzymes (see also **Enzymes**), 40, 527. in chloroplasts, spectrophotometric assay, 3487. muscle content, 6393.
- Flavouring; agents; Flavours.** See **Drugs**; **Foodstuffs** ; see also **Taste**.
- Flight.** See **Insects**; **Locomotion**.
- Flowers** (see also **Fruits**; **Photoperiodism**;
- Plants**, subheadings : **Scents**; **Seeds**), characters, genet, variation, *Sparaxis*, 2353. colour : affected by herbicides, *Salvia*, 4887 ; radiation effects on, *Chrysanthemum*, 4902. flowering, environmental control; *Dactylis*, 2463; light & temp., *Brunfelsia*, 2465. gibberellins as affecting : *Arabidopsis*, 4769 ; pea & tomato, 6966 ; *Petasites*, 6952. in vitro, EDTA induced, *Wolffia*, 2464. induced by polysaccharides, rye, 2467. inhib. by radiation, *Pharbitis*, 6980. moisture stress as affecting, pineapple, 931. photoperiodic induction : *Dactylis*, 2463 ; *Kalanchoe*, 2462 ; tomato, 2466. grandiflora character, genet, study, *Petunia*, 2356.
- Flowers.** nectaries phosphatase activity, 2486. pollen (see also **Plants, reproduction**), abortion, genet, study, wheat, 4770. acid-fastness, pine, 6997. cohesion within tetrads, *Typha*, 6998. gametocidal action of dichloroacetic acid, *Antirrhinum*, 2502. germination : affected by Boron cpd. (a) *Amaryllis*, 4897, (b) wheat, 4908 ; cytol. study, *Tradescantia*, 6977. immunol. study, ragweed, 1149, 3635. mother cell meiosis, *Cocos*, 2318. radiation effects on : *Ginkgo* tissue culture, 2480 ; oak, 4900. tissue culture, cytochem. study, 2480, 4714. tube growth : chemotropic response, *Oenothera*, 3437 ; *Crotalaria*, 2315 ; *Trifolium*, 2355. stamens, cytol. study, 2286, 2297.
- Flufenamic acids**, antagonism to kinin bronchoconstriction, 4053.
- Fluorenyleacetamide**, -bisacetamide, etc. See **Amides**, aromatic.
- Fluorenyle-bis**, 2, 2, 2- trifluoroacetamide, carcinogenicity, 5932.
- Fluorescein**; **Fluorescin**. See **Dyes** : for antisera labelling, see **Immunological techniques**.
- Fluorescence** (see also **Energy levels**; **Luminescence**; **Spectra**), algal, stimn. by photosynthesis inhibitors, 2419. low temp, assay of cpd. by, 5800f. of acridine dyes, metachromasia, 38. of chlorophyll, light intensity effect, 966f. of chloroplast fragments, at low temp., 961. of mercurochrome, in tumour tissue, 5979. of morphine, concn. quenching, 5730. of pigments of *Ophiocoma*, 7131. of 8-quinolinol-metal complexes, 3094. of succinic dehydrogenase prosthetic group, 569. of tyrosine in alk. soln., 5276. production in tumours, 5980. u.v. of proteins, pH & temp, effects, 5339.
- Fluorescence microscopy**; -spectroscopy. See **Microscopy**; **Spectroscopy**.
- Fluorescent labelling** ft staining. See **Cytology**; **Dyes** ft staining reagents; **Immunological techniques**.

y-Globulins & immunoglobulins.

macroglobulins/macroglobulinaemia : distinction from myeloma proteins, 5654 ; immunohistol. localisation in tumour cells, 5655 ; intranuclear inclusions in, 5973 ; physicochem. & immunol. study, 5652 ; Waldenstrom's, screening test for, 781. monoclonal & polyclonal gammopathies, (title 4) 2597. myeloma: a.-, classification, 1157; distinction from macroglobulins, 5654 ; immunochem. analysis, 5650 ; intranuclear inclusions in, 5973 ; A & G, immunofeistol. localisation in tumour cells, 5655 ; G, antigenic specificity, 5879.

sub-units,

fragments : amino acid composition, human, rabbit, 5312 ; antigenic determinants in, rabbit, 5912 ; from chymotryptic digest, immunoelectrophoresis, human, 5314 ; from papain digest (a) electrophoresis, 2959, (b) glycopeptides, periodate oxidation, 2879 ; from trypsin digest, immunol. active fragments, human, 5315 ; Porter's fractions I & III, inducing passive ana-phylaxis, 5866 ; purification by gel filtration, 341.

polypeptide chains, physicochem., 5312-3.

Glomeruli, renal; Olemornonephritis. See **Kidney**; -disorders.

Glucagon (see also **Blood sugar**; **Pancreas**),

Ab, assay method, 1173.

blood adrenaline, glucose & fatty acid levels as affected, 2053, 4318.

isolation from serum, chromatog., 3233.

metabolic effects, 3226, 4255.

terminal tetrapeptide, synthesis, 331.

Glucaric acid. See **Saccharic acid**.

Glucocorticoids. See **Steroids**.

Gluconate & gluconic acid, catabolism, rat, 144.

Glucanolactone, y- & S-, formation from glucose, 145.

Glycosamine. See **Amino sugars**.

D-Glucosaminic acid, non-enzymic degradation, 140.

Glucose (see also **Blood sugar**; **Carbohydrates**),

a-D-glucose, radiation decomposition of, 3573. /9-D-glucose, substrate of yeast glucose 6-phosphate dehydrogenase, 2789. absorption, intestinal, 2017-8, 4533, 6613-5.

admin. effects, oral & i.v., 1782, 1893, 4195, 6300, 6455, 6672.

animal tissues uptake & metabolism : adipose tissue, 174, 1782 ; ant. pituitary, 5579 ; bladder, isolated, 4561 ; blood cells, 5195, 6406 ; brain, 2756 ; chick embryo heart, 5611 ; liver, 3311, 4543 ; lungs, in expt., bagassose, 1330 ; mucous gland, *Charonia*, 148 ; muscle, 1782, 2746, 6294, in soc. proc. (titles 57, 59), 7148 ; retina, 628 ; tissue culture cells, 5101, 5182 ; tumours, 146, 2751 ; udder, 5181 ; uterus, 32.

as carbon source for micro-organisms etc. Refer to **Carbon**, sources, assays, 3344, 5185.

bacterial uptake & metabolism, 151, 1368, 1529, 2753, 2769, 3574.

deprivation effects on isolated retina, 6589.

deriv. : 2-deoxy-D-, 5611, 5679, 6406, teratogenic action, 5123 ; 6-deoxy-methyl-oc-D-glucoside-6-sulphonic acid, 27591 ; a-methyl glucoside, uptake, *E. coli*, 3404 ; 3-O-methyl-, inhibn. of glucose uptake by embryonic chick heart, 5611 ; polymer, biosynthesis, *Streptococcus*, 21A0 ; a-thioethyl-glucopyranoside, 8451 ; UDP-, 32, 2769, 5190, 5195.

duodenal infusion effects, dog, 2026, 2032.

effects on : intestinal fluid transfer, 6612 ; r.b.c. -SH groups, 3349 ; RNA & nucleotide spectra, 5371.

-fatty acid cycle, 3369.

gluconeogenesis, 3995, 4259.

in culture/physiol. media (see also **Culture & physiological media**; **Tissue culture**), 851, 900.

incorporation into charoninsulphuric acids, 148.

inhibn. of : ATPase, r.b.c., 3321 ; ethionine fatty liver, 232 ; 3-ketosucrose formation, 2762 ; mutarotate, kidney, 3304.

L-isomer, oxidation by higher plants, 2747.

Glucose,

metabolism : catabolism, rat, 144 ; cortisol & corticosterone effects on, 3270, 4261, 5595 ; glucose infusion effects on, dog, 2032, 4258, 6300 ; in alligator, 147 ; in hypothyroid diabetic rat, 5574 ; in insect, DDT effects, 747 ; in protozoa, 150, 3925, 5190 ; in scorbutic guinea-pigs, 661 ; in sheep, 4553, 5184, 5595 ; in silkworm, 5420 ; in tumour-bearing mice, 3509.

micro-organism metabolism, 145, 5199.

plant metabolism & uptake, 2427, 2747, 3469, 6916, 6941 ; in colloquium & soc. proc. (titles 6 & 16), 2594.

promoting muscle degeneration, pigs, 6258.

renal tubular reabsorption, 4553, 6642.

serum & parotid fluid levels, as related to dental caries, man, 2738.

tolerance : in tuberculous guinea-pig, 1569, 5192 ; tests, 3368.

Glucose cycloacetocetate, hydrolysed, thiamine-sparing action, 631.

Glucose phosphates,

1-PO₄²⁻ : conversion to glycogen, uterus, 32 ; in human urine, 3363.

6-PO₄²⁻ (as glycolytic intermediate, see **Carbohydrates, metabolic pathways** ; for enzymic dehydrogenation see **Enzymes, specific, oxidoreductases**) : in human urine, 3363 ; stimm. of ³⁵SO₄²⁻ incorporation into chondroitin sulphate by, 5217.

Glucosiduronate, analysis, 142.

Glucuronic acid & glucuronate,

analysis, 142.

prophylactic admin. in liver damage, 6352.

Glucuronides. See **Conjugation**.

Glutamate & glutamic acid (see also **Amino acids**), causing escape phenomenon, heart, 1877.

chemoreceptor stimm., crustacean sp., 4973.

enzymic synthesis, 5417.

hypertensive action, 6250.

metabolism : & biosynthesis, in symposium, 5045 ; cerebral, in soc. proc. (title 10), 2594 ; mitochondrial, in soc. proc. (titles 81, 100, 7148 ; rust-infected sunflower, 7000 ; slime mould, 308.

muscle depolarisation, crayfish, 6394.

role in muscular dystrophy, vit. E deficiency, 5550.

uptake : chloramphenicol inhibn., carrot, 4844 ; insectivorous gland stimm., *Dionaea* sp., 4843.

Glutamine (see also **Amino acids**),

anaerobic metabolism, 309.

cyclisation, enzyme study, 310.

inhibn. of ethanol incorporation, 1007.

stimm. of chondroitin SO₄²⁻ synthesis, 5217.

synthesis, enzyme study, 5417.

y-Glutamyl- a-aminobutyryl glycine, 327.

Glutaric acid, deriv., detection in cadavers, 6226.

Glutarimide, antibiotics, 1572.

Glutathione (see also **Sulphydryl groups**),

& feeding reaction, *Hydra* sp., 7057.

growth effects, triiodobenzoic acid antagonism, 4880.

homologue, in bean seedling, 5281.

in liver during stress, 326, 4544.

interaction with blood proteins, 343, 2929.

reactivation of Arthus response by, 1136, 1306.

r.b.c. content, ageing effects, 3349.

r.b.c. synthesis, in soc. proc. (title 116), 7148.

Gluten (see also **Proteins, dietary**),

Ab to, in newborn, 365.

dietary (lysine-deficient diet), reducing host resistance to anthrax, 1115.

GSH reaction with, 2929.

homologues, 5281.

in liver during stress, 326, 4544.

interaction with blood proteins, 343, 2929.

reactivation of Arthus response by, 1136, 1306.

r.b.c. content, ageing effects, 3349.

r.b.c. synthesis, in soc. proc. (title 116), 7148.

Glyceraldehyde,

D- & L-, metabolism, rat liver, 130.

effects on collagen, 2884, 2902.

D-Glyceric acid, formation from D-glucarate, *E. coli*, 3401.

Glyceric acid phosphates,

effects on blood electrophoretic patterns, 1013.

2,3-diphospho-, in r.b.c., dog, man, 5176, 5664-5.

2-phospho, prep., in soc. proc. (title 74), 7148.

3-phospho, phosphatase action on, chloroplasts, 5762.

Glycerides. See **Lipids**.

Glycerol,

deriv., acyl group migration in, 222.

effects on nucleotide spectra, 5371.

Glycerol,

formation in baker's yeast, 861.

in plasma, 1837-8.

in tobacco, chromatog., 3545f.

intracellular protection by, during freezing, 2137.

toxic effects, guinea-pig, rabbit, 4137.

Glycerophosphates,

a-, metabolism in lens, (title 44) 2594.

poly-, enzymic glucosylation, 3407.

Glycerophosphatides. See **Phospholipids**.

Glyceryl ethers. See **Lipids**.

Glyceryl trinitrate. See **Vasoactive substances**.

Glycidaldehyde. See **Disinfectants**.

Glycine (see also **Amino acids**),

antibacterial action, 3938.

assay, 5263.

conjugation with isoniazid, (title 75) 7148.

growth inhibn., guinea-pig, 619.

incorporation into: collagens in lathyrism, 4#

dental enamel, 5139 ; fatty acids, 207

Hb, duck, 491; hepatic glycogen, tuber

lossis, 5192 ; nucleic acids, 3205, 54151".

intestinal absorption, 2018.

nitroguanidino-deriv., prep., 291.

Glycocholate, effects on auxin transport, 2449.

Glycoccil. See **Glycine**.

Glycogen. See also **Carbohydrates**,

biosynthesis : 32, 196, 2746, 4272, 5192^f

5555 ; in soc. proc. (title 57), 7148.

enzymic debranching, 155.

in birds' eye lens, 2770.

in chick embryo, 1317, 2771.

in chitons, 7022.

in insect fat body, 5027, 5554.

in liver, 196, 1291, 1317, 2768, 4130, 4259, 51^H

3, 5543.

in lung, in expt. bagassosis, 1330.

in muscle : 2655, 2746, 4272-3, 5196, 55^{*}

5555, 6294 ; in soc. proc. (titles 57, 73) 71*

in myocardium, tench, 7023.

in uterus, 32.

in w.b.c., man, 5195.

in wound healing of oral mucosa, rat, 3515.

metabolism, 2769, 4260, 5194.

staining, 5090.

structure, various spp., 156-7.

Glycogen body, avian, 4260.

Glycolipids. See **Sphingolipids**.

Glycollate/Glycolic acid,

metabolism, *Oxalis*, 5748-9.

phospho-, phosphatase action on, spinif

chloroplasts, 5762.

Glycomethacrylate, use in histol., 2666 f.

Glycols,

demonstration on paper chromatograms, 28

DNA stability in, 417.

ethylene-, plasminogen activation in, 2888.

oxidation by acetic acid bacteria, 3402.

polyethylene- : as marker, gastric emp

5344 ; systems for protein separations,

polyoxethylenes, in detergents, 1032.

polypropylene-, ethylene oxide polymer*,

¹⁴P excretion, 5841.

Glycolysis. See **Carbohydrates, metabolic V** ways**.

Glyco- & mucopeptides,

bacterial: in cell wall, *E. coli*, 3425 ; lysos

hydrolysis, 88\$; release from spores, 380*

components of bovine milk whey, soc. W

(titles 10 & 11) 5038.

isolation from: diphtheria toxoid, W*

oyomucoid, 154.

periodate oxidation, y-globulin, 2879.

in cinchopen ulcer formation, 4525.

in pathol. liver, 830.

inhibn. of urine gonadotrophins, 4560.

keratomucoprotein, costal cartilage, (title

7148.

levels: c.s.f. in hydrocephalus, 3359

mucosa, 5149 ; salivary gland virus dis

6113.

mucin : biosynthesis, intestine, 6796 ; b^olr

submaxillary, 3591 ; salivary, 5146-7 ;

ing. of, 18.

mucoids : synthesis, colon, 138.

INDEX OF SUBJECTS

- Glyco- & mucoproteins,** orosomucoid : & M-2 glycoprotein, structure, 2748; PA-Schiff-fuchsin reaction, 2930; structure & antigenicity, 386.
- ovalbumin (for immunol. & inflammatory studies, see **Antigens** ; **Immune response** ; **Inflammation**) : carbohydrate-aspartic acid complex from, soc. proc. (title 25) 2594; carbohydrate of, 2765 f ; denaturation of, 391, 2940, 5338.
- ovipucoid : carbohydrate of, 154 ; enzyme inhib., 2896 ; reducing power & protein teolysis, 2897.
- structure of ribonuclease B, 3022.
- Wlyco-sides & aglycones** (see also **Flavonoids** ; Phenolic compounds ; **Plant pigments**, anthocyanins; **Saponins** ; for simple saccharides, see **Carbohydrates, sugars**).
- antiarigenin & antioside, constitution, 926.
- [^]JJcyanate-producing, in Capparidaceae, of *Anjiaria*, sap, 3455.
- ³*digitalis* leaves, 3456.
- ⁴ hydroxycinnamic acids, in tonka bean, 942.
- ⁵*J* pruce sap, 3453.
- ⁶ sterols, in tobacco smoke, 274.
- ⁷ of *Xysmalobium* sp., 3457.
- ⁸ *an* ⁹sides, & **aglycones**, **cardiac**, ¹⁰ *cor* constitution, 3464.

- therapy, in pituitary infantilism, man, 4578.
- Growth substances for animals** (see also **Nutrition**; **Vitamins, etc**), stearic acid, essential for *Trypanosoma cruzi*, 3921.
- Growth substances for plants** (see also **Herbicides**; **Plant growth & development**, inhibitors), active cpd. extracted from: *Aegle marmelos* peel, 2461; *Chlorella*, 6967; *Skimmia* leaf, 2460.
- action on fungi, affecting O, uptake, soil spp., 1555.
- action on protozoa, *Oxytrichiden*, 2574 f, 5034.
- benzothiazole deriv., 6970.
- inhibitors from wheat caryopses, 6968.
- interrelationships, (title 2) 2594.
- synergism/antagonism, 2456, 2459, 4884.
- auxins** (see also named auxins below), production affected by light, *A vena* coleoptile, translocation, aspen, 2452.
- benzofuran** deriv., stimulating germination, seeds, 2475.
- betaine**, isolated from *Beta*, 4886.
- 2,4-D**, inhibin. of protozoa, 5034.
- transport, stem, 6947.
- uptake, leaf discs, 4888.
- gibberellic acid** (gibberellin A,), & phenyl-boric acid interaction on growth, roots, 4884.
- affecting germination, seeds, 4892-3, 6975.
- effect on fungal metabolism, 1555.
- modifying morphol., *Proserpinaca*, 6972.
- stimn. of growth, potato leaf, 2457.
- gibberellins**, activity: in seeds, 6964; of steviol (terpenoid), affecting cell wall structure, 6962.
- effect on: diffusible auxin in fruit, 6961; *Oxytrichiden*, 2574 f.
- gibberellin-like cpd.: biosynthesis affected by temp., *Matthiola* sp., 4881; in excised tomato roots, 4882; levels, *Pharbitis* varieties, 6963.
- inducing germination, lettuce, 2456.
- synergistic effects, 2456.
- IAA** (see **3-Indolylacetic acid** for references other than auxin activity), biosynthesis, fungi, 958.
- destruction by nitrite, root nodules, 4845.
- extracted, balsam fir, 6960, 2451; protozoa, 5034.
- metabolism: excised roots, 4878; pineapple stem, 931.
- oxidase activity: 2450, inhibin. of, 4880, synergism with 2,4-D, 2451.
- transport, stems, 2448-9, 4877, 6947.
- linetin**, counteracting toxic effects of *Ps. tabaci* on tobacco, 5752.
- effect on growth & flowering, 6966.
- inducing gametophyte development, 2458.
- inhibiting growth, pea, 2459.
- modifying organogenesis, *Hydrocharis*, T 6965.
- kinin**, induced bud break, *Vitis*, 4885.
- phenyl-boric acid**, & GA interaction on root development, 4884.
- trimethyl-l-chloroethylammonium chloride** effect on growth, roots, 4890.
- DL-tryptophan**, activated by autoclaving, 4879.

Guanethidine. See **Adrenergic blocking agents.**
Guanidine, competition with Mg for mitochondrial binding sites, 3093.
 -dependent poliovirus strain, 6076; inhlbn. of kidney mutarotase, 3304; toxicity, 5618.

Guanidine derivatives, radiomimetic effects, 4724.

Guanine (see also **Purines**), analogues. See **Purine & pyrimidine analogues**, deriv., assay in presence of guanine, 3530; metabolism to hypoxanthine, r.b.c., 5355.

Guanosine (see also **Nucleosides**), deoxy-, actinomycin complex, 751; methylation of, 5621.

Guanosine phosphates (see also **Nucleotides**), interaction with poly-C, 3018.

GDP, -mannose, isolation from r.b.c., 797.
GMP, enzyme inhibn. by *E. coli*, 442; neoguanlyc acid, new, in RNA, 404; of nucleic acids. See **Nucleic acids**, poly-, fractionation & prop., 2988.

Guanylic acid. See **Guanosine phosphates, GMP.**
Gums (gingiva). See **Periodontium.**

Gymnosperms (see also **Trees & shrubs**; Taxonomic key & index), composition/metabolism, auxin content, balsam fir bark, 6960; longicycline, *Pinus*, 919; resin metabolism, pine sap wood, 6942; rhodoxanthin, *Agathis* leaves, 2489; sciadin, *Sciadopitys*, 917; shikimic acid biosynthesis, *Pinus*, 3439; toxic cpd. isolated, *Cycas* nuts, 5739; cuticle structure & water relations, pine needles, 6912. « cytology, acid fastness, pine pollen, 6997; male gametophyte, structure, (title 2) 7149 staining, pine leaf vacuoles, 2504; fungal infections: bluestain, balsam fir, 2498; fungus-inhibitory prop., balsam fir, 2500. I uptake, pine roots, 4841. radiation effects, γ -radiation on *Pinus*: acute, 4901; chronic, 1090, 4898. inhibiting growth, pollen tissue, *Ginkgo*, 2480; rooting system characteristics, Douglas fir, 6953. water absorption, pine leaves, 2406.

Gypoxide. See **Saponins & saponins.**

H.

Hadacidin. See **Antibiotics.**

Haem (see also **Porphyrins**), a, in myocardium, reduced in Cu deficiency, 541.

a, prosthetic group of *Pseudomonas* cyt. oxidase, 576. biosynthesis in leukaemic w.b.c., 798.

various, globin reaction with, 2945.
Haem proteins (see also **Cytochromes**; catalase & peroxidase under **Enzymes**, specific, **oxidoreductases**; **Haemoglobin**; **Myoglobin**; etc.), purification, wheat germ, 362; separation, microsomes, 357.

Haemagglutination: **Haemagglutinins.** Refer to **Antibodies**; **Antigen-antibody reactions**; **Blood groups**; **Immunological techniques**; **Lectins**; **Toxins**; **Viruses**, haemadsorption & agglutination.

Haematin, accumulation by polychaetes, 550. cpd.: absorption spectra, 547; cyanamide reactions with, 5302. prosthetic groups of enzymes, 546, 576.

Haematoxylin. See **Dyes.**

Haemerythrin. See **Blood, invertebrate.**

Haemin, & deriv., action on NMR of water protons, 5464.

admin. to chicks, causing osteodystrophy, 3789. chem. constitution, 5449.

chloride: absorption spectra, 547; diazomethane action on, 548.

effects on alk. phosphatase, feathering & **bone ash**, chicks, 3770.

Haemocyanin. See **Blood, invertebrate.**
Haemodialysis. Sec **Cardiovascular system, apparatus & techniques**; & **Kidney, artificial.**
Haemodynamics. See **Cardiovascular system.**
Haemoglobin (see also **Blood cells, red**; **Blood proteins**; **Globins**; **Haem proteins**), acetylated, 339; age effects, 500, 2901; alkali-resistant, in congenital heart disease, 4284; alkylation, by chlorambucil, 3323. β -binding, seromucoid serum fraction, 776. biosynthesis, 483, 489-90, 3053. Bohr shift, rate, 1806. chemistry: N-bromosuccinimide, action, 375; chroma tog., 5668; ferri-Hb A, reduction, 340; glycine incorporation, 491; pep tide separation, 5284; peroxidase activity, 590; redox titration, dialysis & ferricyanide effects, 5337; "slow" proteins isolation, 801. concentration with Sephadex, 1802. differentiation from myoglobin, 5304. dissociation curve registration, 1805. droplets, as standards for quantitation of cytochem. reactions, 6860. foetal, 5300, 6886. hybrid mol. formation, 2913. inheritance in mouse strains, 2375. in r.b.c. nuclei, newt, 4699. metHb: congenital met haemoglobin aemia, 3371, 5663; formation, 1729; light absorption & magnetic susceptibility, 336 f; radiation-induced, 3587; reaction with cyanamide, 5302; reduction, pentose PO₄ pathway as related, 3352. mol. changes during metamorphosis, frog, 7025. oxidation by EDTA & leucocytes, 1807. O₂ uptake, 5321, (titles 112-114) 7148. r.b.c. membrane component, 4283. review, (title 9) 2593. u.v. absorption spectra, a, /8 & y chains, 2920.

Haemoglobin types, American buffalo, 1804. *Ascaris*, 2918-9. chicken, molecular genetics, 2381. fish: multiple, *Salmonidae*, 337; plaice, flounder & hybrids, 4783; six scombrid spp., 2912. flatworm, 2578. Galago, 1803. horse, a-chain structure, 2916. human, anomalies: foetal Hb persistence, 6886; Hb Bart's & thalassaemia, 4801; HbC disease, 6410; HbL Ferrara, 2914; HbM Radom, new variant, 338; Hb Shimonoseki, 2917; in Norfolk, 6888; sickle-cell Hb, Saudi Arabia, 6887. genetic/racial studies: Brazilian negroes, 4809; Greece, 6889; HbF, A, S & C. Ghana, 4803; Taiwan aborigines, 799; West Indies, 3384. normal, a & p chain analysis, 335. toad, embryonic, 5301.

Haemolymph. See **Blood, invertebrate.**

Haemolysins; **Haemolysis.** See **Antibodies**; **Antigen-antibody reactions**; **Immunological techniques**; **Lectins**; **Toxins**; **Viruses**.

Haemolytic bacteria; -viruses. See **Bacteria**; **Viruses**.

Haemolytic disease of newborn (erythroblastosis foetalis). See **Blood disorders**.

effects on r.b.c.-SH groups, 3349.

Inosine phosphates (see also **Nucleotides**),
of nucleic acids & polynucleotides. See **Nucleic
acids & Nucleotides, poly-**.
IMP,

biosynthesis, folic acid coenzyme analogue
effects, 5541.

Inosinic acid. See **Inosine phosphates, IMP**.

Insitol (see also **Carbohydrates**),
& 2-O,C-methylene-myoinositol, antagonism in
mice, 1693.

as component of phospholipids. Refer to
Phospholipids.

biosynthesis, rat, 126.
deriv., in Compositae, 3476.

from plum fruitlet, promoting cell division, 953.
growth stimm. of yeast by, 6148.

hexanicotinic ester, effects on hepatic NAD,
5518.

in human urine, 3363.
meso: metabolism in plant leaves, (title 56)
7148; renal tubular reabsorption, sheep,
4553.

metabolism in mammalian liver, (title 27) 2594.
role in: kidney cell metabolism, 1693; nucleo-

protein structure, 5383.

Insect control (see also **Insecticides**; **Insects**,
diseases & pathogens; **Parasitism**; **Pest
control & pesticides**; **Viruses, insect**; for
control of named insects, refer to Taxonomic
index).

biol. control by bacterial prep., 3831-2.
fumigation, O₂ as affecting toxicity, 4207.

repellents for mosquitoes, 1734.

Insecticides,
antimetabolite, imidazole, 1740.
application techniques, DDT soaps against lice,
6884.

Insecticides,

chlorinated hydrocarbons: aldrin, 4218 j.chloro-
dieldrin (a) 4218, 6361-2, (b) resistance to,
1741,6883; DDE, 747; DDT (a) 1746-f, 6884,
7104, (b) metabolic effects, bug, 747, (c)
resistance of fish, 1745; heptachlor, 4218,
6360; in human fat, England, 6359; lindane,
1746†

Dri-Die *67 & Dibrom-Drie-Die 67, 6367-8.
dusts, against: human lice, 6367; triatomid
bug, 6368.

organophosphorus cpd. (for further studies
including toxic effects in vertebrates, see
Pest control & pesticides; **Phosphorus com-
pounds, organic**) : animal systemics against
Gasterophilus, horses, 4219; butonate, 4219;
DDVP, 4219; malathion (a) 6360, (b) pene-
tration of cuticle, 7115; parathion, 1735,
1746f; Phosdrin, 1735; phosphorothiate,
4219; tri-o-cresolphosphate, 6365.

resistance (see also named cpd.), genet, study,
Anopheles albimanus, 6883.

techniques of study: chromatog. isolation from
biol. fatty materials, 1746f; dieldrin extrac-
tion from human tissue, 6362.
toxic hazards. See under **Pest control &
pesticides**.

various cpd., sprays on citrus, susceptibility of
honeybees, 1742f.

Insects (see also **Arthropods**; **Insect control**;
Insecticides; **Invertebrates**),

abdomen, post, torsion, § Diptera, 2520 f.
age: as affecting flight muscle enzymes, 7021;

life span, *Chrysops silacea* adult, 7062.
alimentary tract. See **Alimentary tract**.

as test subjects for vit. B, *Tribolium*, (title 3)
7167.

as vectors of: leishmaniasis, 6155; malaria,
7105; mammalian viruses, 1449; plant
viruses, 1494% 6141, 6147; trypanosomiasis,
6156.

bacterial flora of gut, blowflies, 5029.

behaviour. See **Behaviour, invertebrate**; **Loco-
motion**; **Migration**; **Nests**; **Predation**; **Taxes**.

body size/wt.: larval duration as related,
Drosophila, 2366; selection for wt., effects,
Tenebrio, 7120.

centrifugation as affecting, 4789.
cuticle. See **Cuticle**; **Chitin**.

cytol./histol. studies: eye, *Bombyx*, 2545;
interpseudotracheal papillae, blowfly, 2506
meiosis, 6* *Periplaneta americana*, 2284;
salivary glands, 6781-2.

development. See **Development**; **Eggs**; **Em-
bryos**; **Growth**; **Moulting**; **Regeneration**.

diapause. See **Diapause**.

digestion: digestive fluid, toxic constituents,
Pieris brassicae, 4951; of starch, *Oxycarenus
hyalinipennis*, 25351; protease production,
Calliphora, 7066.

diseases & pathogens (see also **Viruses, insect**):
bacteria, 1428, 3831-2, 6059; fungus, 1507;

helminth, 2557-8, 5025; protozoa, 5019-20.

dispersal (see also **Locomotion**): aphids, 7080;

Cannula pellucida nymphs, 2570.

ecological studies. See **Environment**; **Popula-
tion studies**; & "life history" below.

electrostatic effects, 6147-1.

evolution. See **Evolution**.

excretion/excretory system: diuresis, control in
Rhodnius nymphs, 7050; in *Chaoborus
crystallinus*, 4960; xanthine in excreta,
Galleria mellonella, 4961.

eyes/vision: eccentric retinula cell, *Bombyx*,
2545; glow, sensitivity changes & pigment
migration, nocturnal moths, 2589; pigments,
Blatta orientalis, 5461; reaction of walking
aphids, (title 13) 7142.

fat body: glycogen mobilisation, 5554; virus-
induced changes, 5027.

feeding/nutrition: antibiotic supplements, ef-
fects, rice moth, 2537; antimetabolite sup-
plements, *Aedes aegypti*, 3145, 4949; as
affecting intestinal protease activity, *Calliphora*,
7066; effects on longevity & fecundity,
Chorizagrotis auxiliaris, 7095; food prefer-
ence, *Trogoderma inclusum*, 2566; growth

factors in brewers' yeast, *Tribolium*, 4948;
protein ingestion, *Phormia*, 4950; require-
ments, *Chrysops silacea*, 7062; sugar-feeding
cycle, *Aedes aegypti*, 2536.

Insects,

flight. See **Locomotion**; "wings" below.
genetic studies (see also **Chromosomes**,
of insects; **Hybrids**; **Mutations**; *Drosophila* to
Taxonomic index): dieldrin resistance, *Ano-
pheles*, 6883.

haemolymph. See **Blood, invertebrate**.
hormones. See **Endocrine systems, inverte-
brates**; **Nenrohumoral mechanisms**; **Phero-
mones**.

larvae & pupae. See **Embryos & other immatu-
ture forms**.

life history studies: *Adelphocoris Hneolatus* St
2559; *Murgantia histrionica*, 2565.

luminous organ, *Photuris*, 4980.
mandibular glands of queen honeybees, exptf
study, 2145.

mesosternal bodies, 7119.

metamorphosis. See **Development**.

mouthparts: interpseudotracheal papillaer
E.M., blowfly, 2506; maxilla, chemorecep-
tors, silkworm, 2543; TMV on, aphid, 6136;
muscle: contraction, 6395; enzymes, 7021;
Na & K content in relation to membran*
potential, 7107.

nervous system: brain, electrode implantation
methods, effects, 7081; brain, neurones &
their inclusions, cytochem., cockroach, 4977;
corpora allata, 5002, 7066; corpora cardiac*,
7066; dieldrin absorption by, cockroach*
1741; frontal ganglion, locust, 7065; pal*
intercerebralis & thoracic ganglia, cockroach'
7064.

neuromuscular system, resting potential change*
after denervation, 4978.

palaeontology, Coleoptera, (title 2) 5039.

parasitic: effectiveness, *Bracon cephi* on *Sciaridae*
5024; *Nasonia vitripennis* on housefly, 5022;

on Acridoidea, 5021; on *Bufo terrestris*, 2560.

pericardial cells, metabolism, 5537.

phases in locusts, 2146.

photoperiod as affecting, 5001, 5003, 7067.

phytopathogens (see also "as vectors, of plant
viruses" above): host resistance to aphid*
temp. & R. H. effects, 2563; oviposition

Cardiaspina, 4995.

pigments (see also "eyes" above), flavonoid*
Melanargia galathea, 553 f.

radiation effects: of y-rays, 2562; of X-ray*
4790.

reproduction (see also **Behaviour, invertebrate**),
bisexual cycle restoration in parthenogenet*
aphid, 4989; fertilisation, *Drosophila*, 7039;

hypersexual activity induced in ? cockroach
2550; in *Chorizagrotis auxiliaris*, 70#;

maternal age as affecting progeny, *Dro-
phila*, 4752; mating, endocrines as affecting
Galleria, 5000; mating, oviposition, *Car-
iopsis pomonella*, 7096; mating times, effect*
boll weevil, 7094; oviposition on toma-
toes factors affecting, *Cardiaspina*, 4995;

thenogenesis, 47911, 4989, 6803,
spermatogenesis, 4712.

reproductive system: development, 2521;
ganglion removal as affecting, locust, 701g;

gonad differentiation in vitro, *Galleria*, 2521;
of *Spilopeltis cuniculi*, 4990; oocyte res-
orption, *Schistocerca*, 2551; ootheca, pheno-

cpd. in, cockroach, 70201; ovaries (a) info-
by queen substance, housefly, 2549;

nucleic acid biosynthesis in, 7019, (c)
Agraptocerixa gestroi, 4996; ovipositor
spermatheca, *Nasonia vitripennis*, 499 W.

respiration/respiratory system: air sacs, addi-
tional function, 4952; anaerobia as affect-
ing trehalose, 7018; physical gill, *Nasonia*

4943.

reviews, 3228, 5039.

salivary glands. See **Saliva**; **Salivary** gland

scent/scent glands: glands of Hemip*
physiol. & function, 7121; sex attract*,
(a) chem. structure, mol. vibration, 5456^

of cockroach, 551, (c) of *Diprion similis*, 1^ ?

(d) of *Prodenia litura*, 5457 f. JL

sensory mechanisms: abdominal stretch
tors, cockroach, 4975; chemoreceptors, 2547;

gravity receptors, *Hymenoptera*, 4976;

photoinhibition, *Locusta*, 4979; thoracic stret-

serol. receptors, locust, 7079.

serol. studies, *Aedes* spp., 7113.

INDEX OF SUBJECTS

- Insects, sex differences : in heterosis, *Drosophila*, 4786 ; in inversion polymorphism, *Drosophila*, 4787¹. sexual development : sex-determination, *Calliphora*, 4733 ; sex-ratio (a) bacteria-induced disturbance, *Drosophila*, 6059, (b) environmental effects, *Dahlbominus*, 4994. silk/silk glands, amino acid biosynthesis, silkworm, 5420. social, queen rearing & supersEDURE, 2144-5, 4683, 5020. songs, *Orechelimum vulgare*, 7082. spp., "airs, Psychodidae, 4993. symbionts, storage of fungus spores, *Corihylus Punctatissimus*, 5026. techniques of study : collecting mosquitoes by «light-traps, factors affecting, 7114; controlled environment room for observing honeybees, 4684 ; haemocyte monolayers, prep., 5032 ; implanting electrodes in brain, 7081 ; rearing wireworms, 2587 ; recording circadian rhythms, cockroach, 2544 ; trapping vectors of monkey malaria, 7105. temp, effects: cold as affecting pre- & post-diapause eggs, cricket, 7118 ; on aphid reproduction, 5001 ; on development, 2518-9 ; on grasshopper song, 7082 ; on longevity & fecundity, *Chorizagrion auxiliaris*, 7095²; on yeiosis, 4713 ; on trehalose content, *Bombyx*, '018 ; survival of *Grapholita molesta* in cold-stored apples, 7112. venom : bioassay & standardisation, honeybee, 3428 ; extraction from Hymenoptera, 2575. water content/relations, hormonal control, cockroach, 7064. wings, tracheal capture during development, 4932. metabolism & tissue composition (see also sub-headings in main section above), amino acid utilisation, 3181, 6882. carbohydrates : glycogen, 5554 ; metabolism, *Triatoma infestans*, 747 ; trehalose, 7018. chitin biosynthesis in cell-free extracts, 5211. cholesterol as ecdysone precursor, 3229. enzymes : amino acid oxidases, 2953, 5344 ; amino decarboxylase, 5537 ; Chase, 4924 ; esterase, 3136 ; in glutamate metabolism, 5278; of flight muscles, 7021 ; protease, 7066; tryptophan pyrolase, 5341; xanthine dehydrogenase, 3133. "broin biosynthesis, silkworm, 5420. fluorescent cpd., 3104, 4934. in fat body, genet, study, 4788. insecticide metabolism, cyclodiene cpd., 6336. jalasic acid from lac insect resin, 3478. "Pids, weevil, 6360. nucleic acids : at different stages, *Tribolium*, J59 ; biosynthesis in cricket ovary, 7019 ; PNA, 6795f; RNA, 5373-4. oxidative phosphorylation, *Schistocerca*, 3252. Phenolic cpd., 7020f. Phosphates in haemolymph, 3519. Phosphopd. *Phormia*, 2831. proteins : biosynthesis, *Tribolium*, 459 ; brain hormone» *Bombyx*, 3230. *aphids*, Pacific (see also Taxonomic key & index), *Aphis*, *Brevicoryne*, *Macrostaphylinus*, *Megoura*, *Myzus*, *Sappaphis*, *Therioaphis** transmission of plant viruses, 1494 f. beetle (see also Coleoptera in Taxonomic key & index) » palaeontology, review, 5039. key to acn (see also *Dicyoptera* in Taxonomic key & index), ootheca, phenolic cpd. in, cricket (see also *Gryllus*), ovary, nucleic acid dragonflies (see also *Aeshna*), 2 types of dev & Opment, 4933<. *flies* (see also *Spilopspillus*), on *Raitus* spp., 7106. *flies*, *sko* Diptera in Taxonomic key & index, arbovirus vectors, 1449. C. flies (see also *Bufo*, *Calliphora*, *Lucilia*, *Phormia*), imaginal fruit flies, 2238. 2562 (see also *Drosophila*)* Y-ray effects, houseflies (see also *Musca*), flight muscle enzymes, 7021. torsion of 6th post, abdomen, 2520 f.
- Insects, specific, grain beetles (see also *Tenebrio*, *Trogoderma*), group formation, (title 14) 7142. hymenoptera, gravity receptors, 4976. land-bugs, scent glands, physiol. & function, 7121t. lice (see also *Pediculus*, *Phthirus*) : on *Rattus* spp., 7106 ; use of DDT soaps against, 6884. locusts (see also *Acridoidea*, *Locusta*, *Notonotus*, *Schistocerca*) : brain, electrode implantation in, effects, 7081 ; gregarious behaviour (titles 9-12) 7142 ; thoracic stretch receptors, response to phasic stimn., 7079. mosquitoes (see also *Aedes*, *Anopheles*, *Chao-borus*, *Culex*, *Mansonia*), factors affecting efficiency of light traps, 7114. moths (see also *Lepidoptera* in Taxonomic key & index) : eye, functional prop. in nocturnal spp., 2589 ; predators on, lecture, 2569. silkworms (see also *Antherea*, *Bombyx*, *Hyalo-phora*), fluorescent cpd., 4934. wireworms, fearing techniques, 2587. Insomnia. See Sleep. Insulin (see also Blood sugar ; Diabetes ; Hypoglycaemic agents ; Pancreas), amino acid incorporation by, 3042. antagonism, man, 6673. Ab : (title 4) 7158 ; assay method, serum, 1173. binding : by Ab, 1174, (title 4) 7158 ; by proteins, (title 3) 7158. blood levels, 1782, 3368, 6300. degradation, 2063. effects on : carbohydrate metabolism, 2032, 2746, 4195, 4273, 4561, 5555, 5558, 6294, (title 57) 7148 ; g.i.t. mucosal bleeding, 4523 ; glycerol concn., 1838 ; lipid metabolism, 6691 ; oestrogen uterotrophic action, 2117 ; plasma K concn. & e.c.g., dog, 1893; pro act in secretion, 2072 ; protein biosynthesis, 6691, 670. free & bound, separation, 672. immuno assay, 3231. isolation from serum, chromatog., 3233. -like activity : after glucose admin., man, 6672 ; assay, 2064 ; Na salicylate, 6303 ; serum, hypophysectomised monkey, 665. molecular wt., 667. physicochem., 3522f, 5770. secretion, 671, 1712, 2062. sensitivity, 3369. structure, 668. teratogenic effects, chick, 2692, 5123. therapy in cerebral apoplexy, diabetics, 4100. Insulinoma. See Tumours, specific. Interferometry. See Optical properties. Interferon, & polyoma virus, role in herpes simplex infection in vitro, 6067. action mechanism, 1538. assay methods: cytochem., duck hepatitis virus-induced, 1539 ; use of bovine enterovirus M6, 1106 viral plaque inhibn., 6096. effect on viral plaque formation : & RNA, 3934 ; vaccinia, 6096. endogenous & cellular resistance to virus, review (title 4), 5037. mol. wt., spp. comparisons, 5632. production : & behaviour in 2 HeLa cell lines, 9094 ; & virus multiplication, temporal relationships, equine encephalitis- & influenza-infected cells, 6095 ; by polyoma viruses of differing oncogenicity, 3880 ; virus stimn. of a sensitivity to, (a) simian viruses, 1470, (b) temp, effects, 9093. purification & characterisation, chick embryonic, 3933. Interstitial cell stimulating hormone. See Gonadotrophins. Intestine ; -disorders. See Gastrointestinal tract. Interstitial pressures, neg., measurement, dog, 4396. Intrinsic factor (see also Anaemia, pernicious) Cobalamins, cyanocobalamin, activity of complexes from human gastric juice, 3211. assay in serum, 1035, 3212. auto-Ab to in anaemia, 3655-6. binding of vit. B₁₂, 2023, 3212. immunol. identification & assay, 3212. purification from human gastric juice, 650. role in vit. B₁₂ absorption, 2022-3.
- Invertebrates. See named groups, e.g., Annelids, Insects; see also Aquatic animals ; Sp. comparisons. Iodide & Iodine, admin.: & endogenous, equilibration, 3244 ; "I uptake, 5570. binding : bryozoan, 5007; facilitated by cortisone, 6687 ; mammals, 3247 ; marine algae, 4842 ; protochordates, 5008. -containing contrast media. Refer to Contrast media. in drinking water, 3380. metabolism: dietary effects, 4589; in I-induced goitre, 6690; intrathyroidal, 680. non-hormonal, goitrous thyroid, 5681. organically bound, cleavage, 3531 f. PBI (see also Thyroid, composition & metabolism), 2084, 5680, 6692. repletion after deficiency treatment, man, 5680. serum levels, 2081. test in cardiac differential diagnosis, (title 9) 7152. therapy, effects in atherosclerosis, (title 10) 7152. thyroidal uptake. See under Thyroid, composition & metabolism. Iodinated compounds, of thyroid, distribution, 3246. PBI. See Iodide & Iodine; Thyroid, composition & metabolism. proteins: formation, 684; in thyroid lymph, baboons, 3245; release, in thyrotoxicosis, 5677. Iodine isotopes, ¹³¹I, conversion ratio method, 6695. in milk, 3606; from fallout, 1103. recirculation from young to mother, rat, 6720. storage, 1026. thyroid content, dairy cow, 3606. thyroidal uptake. Refer to Thyroid, composition & metabolism. transport, 4494. uptake: by c.s.f., 6450; stim. by methyl bromide, pine trees, 4841. "I, thyroid uptake, 5570. Iodo-. See also Halogeno-. Iodoacetate (see also Sulphydryl groups, inhibitors), effects on oxyntic cell structure, 5077. Iodomethane deriv., CHI, 3S_a, radioprotection by, 1094. Iodopurines, -pyrimidines (including nucleoside & nucleotide deriv.). See Purine & pyrimidine analogues. Iodothyronines; Iodotyrosines. See Thyroid hormones. Ion exchange resins (see also Chromatography), ECTEOLA-celluloses, prep., 5795. filtration efficiency, columns, 3546. folic acid binding, DEAE-cellulose, 3199f. lactate dehydrogenase as affected, (title 89) 7148. new, polyphosphate-cellulose, 5806. particle grading, 5793. phage concentration, 5717. plasma protein excretion measured, "Amberlite", 3334. TMV binding, 61341. Ions. See Electrolytes; & named ions, organs & tissues. Iproniazid (marsiolid). See Monoamine oxidase inhibitors. Iridine. See Proteins, basic. Irin. & hydroxy acid, bram, 4149, 4157. Iron (see also Anaemia; Ferro- cpd., Haem-; Metals-), & porphyrin & chlorophyll formation, *Euglena*, 5451. blood level: assay, 1847; decreased, 3354, 5586. bone marrow content, man, 4288. -carbohydrate complexes: ferric dextran, in siderocalciphylactic sensitisation, 4129; sarcoma induction by, 3715; -sorbitol complex (a) metabolism, man, 4287, (b) new i.m. Fe medication, 4128. chelation, 540, 1808, (title 125) 7148. deficiency: animal, 1880, 3656, 4128, 6684; plant, 2415f. enzyme-bound, 539. -fortified bread, clinical trial, 5701. incorporation into r.b.c, in expt. protein deficiency, 3153, 6414.

- Iron,** inhibn. of mitosis, broad bean roots, 6820; metabolism: in avian erythroblastosis, 538; in sickle cell-Hb C disease, 6410; intestinal absorption, 4540, 5448, 6616, 6677; non-haem compartments in vivo, man, 1810; oestrogen control, 1846; plant content, 4848, 6976; -protein binding, gel filtration study, 5450; protein-bound (see also **Blood proteins, transferring**): ferritin, 809, 1145, 1166, 3044, 5288, 5331; haemosiderin, 809; siderotic granules, 4289; storage, in disease, man, 809.
- Iron isotopes**, ⁵⁷Fe, metabolism, snail, 517.
- Irritants** (see also **Tissue response; Toxicology**), activation of slow contracting substances, 1141; gases, thyroid effects on toxicity, 4103.
- Ischaemia.** See **Cardiovascular system**; & named organs & tissues.
- Islets of Langerhans.** See **Pancreas**.
- Isobutyramide**, -enzyme complexes, 584.
- Isocitrate & isocitric acid** (see also **Citric acid cycle**), in hydrogen transfer, liver, 5766, (title 101) 7148; oxalic acid biosynthesis, *Oxalis*, 5748-9.
- Isoleucine**, synthesis, bacteria, 3394.
- Isomaltose**, hydrolysis, 3377.
- Isoniazid**, & metabolites: conjugation with glycine, (title 75) 7148; isolation, identification, 1041; effects: brain metabolism, 3992; CO incorporation, *Chlorella*, 4853; liver GOT, 5631; thiamine-deficient rats, 4184; hepatotoxicity, 3657. inhib. nucleic acid biosynthesis, *M. tuberculosis*, 5636. -serum protein detfv., immunol. prop., 3703.
- Isonicotinic acid hydrazide.** See **Isoniazid**.
- Isopilocerine.** See **Alkaloids**.
- Isoprenaline** (isopropylnoradrenaline). See **Adrenergic agents**.
- Isopropanolamine**, identification in urine, (title 76) 7148.
- Isopropylnicotinic acid hydrazide** (iproniazid). See **Monoamine oxidase inhibitors**.
- Isopropylnoradrenaline.** See **Adrenergic agents**, **riflpropylphosphorofluoridate (DFP)**. See **Phosphorus compounds, organic**.
- Isoproterenol** (isoprenaline). See **Adrenergic agents**.
- Isothiocyanate**, glucosides producing, Capparidaceae, 941.
- Isotopes** (see also **Radioactivity; Radiological techniques**; and named elements), blood transport, radiation effects, 1080; comparative metabolism, mammals, 3247. dilution method, *Or* estimation, 5784; double labelling techniques, 2941, 6807. effect, in decarboxylation reaction, 1005f. ¹⁴N excess, metabolic sig., 5781. radio-naturally occurring in man, separation of, 3548 storage of radioactive soln., 1026. tracer kinetic study of biochem. processes, 3116. transcapillary movement of, 6502. uptake, ecological study of snails as parasite hosts, 517.
- Isozanthopterin.** See **Pteridines & pterins**.
- Iaconate**, metabolism, *Pseudomonas*, 3403, 5721.
- 7.**
- Jalaric acid**, constitution, 3478.
- Jaundice** (see also **Anaemia; Biliary tract ft gall bladder disorders; Haemoglobinuria; Liver disorders**), complicating diabetes, 6299. diagnosis, 3332. drug-induced, liver auto Ab in, 3657. neonatal, in glucose-6-PO₄ dehydrogenase deficiency, 4819.
- Jaws.** See **Bones, specific**, mandible or maxilla. **Jejunum.** See **Gastrointestinal tract, intestine**.
- Joints** (see also **Bone; Cartilage; Skeleton**), arthropod. Refer to named classes, development, temporomandibular condyles, man, 90. reflexes. Refer to **Reflexes**, synovial fluid hyaluronic acid in rheumatoid arthritis, 1648.
- Joints,** synovial tissue enzyme activity in rheumatoid patients, 837.
- temporomandibular**, 90, 2744, 5173.
- disorders** (see also **Gout; Inflammation**), carrageenan-induced proliferation, 2965. chlorothiazide-induced gout, 6293. degenerative disease, genet., mice, 2371 f. osteoarthritis, pathogenesis, sex hormone role, 3791. polyarthritides, adjuvant-induced, pathogenesis, 3790. polyarticular inflammatory lesions after lymph injn., review (title 9), 7163.
- rheumatoid**. See **Rheumatic-/Rheumatoid headings**, temporomandibular histopathol. after bilat. molar extraction, 2744.
- Juxtaglomerular cells.** See **Kidney**.
- K**
- Eallidin.** See **Kinins**.
- Eanamycin.** See **Antibiotics**.
- Kartagener's syndrome.** See **Respiration ft respiratory system disorders**.
- Keratin.** See **Scleroproteins**.
- Keratitis.** See **Skin disorders**.
- Keratoconjunctivitis.** See **Eye & vision, disorders**.
- Keratosulphate.** See **Mucopolysaccharides**.
- a-Keto acids** (see also **a-Ozoglutamate; Pyruvate** etc.), paper chroma tog., 5798.
- l-Keto acids**, in milk fat, 227, 240.
- Ketone bodies**, acetoacetate, reduction, (title 101) 7148. ketones, 543.
- Ketone 250**, vit. D deriv., prep., 3220 j.
- Ketones**, basic, related to haloperidol, pharmacol., 3981. methyl, in milk fat, 227, 240.
- Ketonuria; Ketosis.** See **Ketone bodies**.
- 17-Ketosteroids.** See **Steroids**.
- Kidney** (for cell culture & prep, techniques refer to **Tissue culture**), compensatory hyperplasia, control, 1344, 2037-8; development: changes at weaning, diet & age effects, rat, 6627; enzymes in, 77, 571; foetal glomerulus permeability, 5119; maternal nephrectomy effects, rat, 2691. lymph production after ureteral obstruction, 6625. mitochondria. Refer to **Mitochondria**; see also **-metabolism**, below. nephrectomy effects on parathyroid, 6674. -parathyroid axis, cutaneous calcinosis as related (title 1) 7163. temp., cardiac activity as affected, hypothermic rat, 4249. toxic effects on of various substances. See **Kidney disorders**, damage, transplantation: 994, 1185, 5894, 6629; tolerance increased by 6-methyl mercaptourine, 6630. wt., steroids effects, mouse, 6628.
- Kidney circulation**, blood flow: denervation effects, rabbit, 4426; measurement, dye diln., 4424; shunted, measurement, 6523. head kidney & kidney, *Perca* (fish), 2584. portal vein distension role, 6524. vasoconstriction, portal vein occlusion-induced, 1925.
- Kidney disorders**, damage by Hg, 1341, 1731. glomerulonephritis: after heterologous basement membrane injn., (a) sheep, 1168, (b) monkey, 3659; passive acute, 3629. glomerulosclerosis, radiation-induced, mouse, 3598, 3600. immunol. studies, 3663-5. insufficiency, chronic, skin homograft survival in, 1183. lesions: in lupus erythematosus, 3649; scintillation scanning, (title 2) 5046; steroid-induced, 2057. necrosis: cortical, immunol. factors, 1342; papillary, phenacetin in, 4161. nephritis: immunol. production, 1165; nephrotoxic serum localisation, 1166-7. nephrosclerosis, from salt-loading adrenalectomised rat, 5999.
- Kidney disorders,** nephrosis: amino-nucleoside excretion in, rat, 2044; amino-nucleoside induced, 1343, 1346; auto-immune transfer, 3667; expt., rice diet effects, rat, 3666; heparin, nicotinic acid & ACTH effects, 3662; insulin degradation in, 2063; poly vinyl alcohol induced, 1347. oedema associated, spironolactone effects, 6292. pathol., alk. phosphatase in, (title 1) 7166. pyelonephritis: endotoxin tolerance induction by, 5992; increased susceptibility in hypertension, 1348; *Proteus*, immunol., rat, 5990. renal hypertension (see also **Cardiovascular system, blood pressure**), 1345, 1602, 1909, 2052, 6452-3, (title 40) 7152. tubular malfunction in Cd pigment workers (title 5) 2598.
- Kidney function/renal excretion** (see also **Add-base-; Bio transformation; Urinary constituents**; & endocrine systems/secretions involved, e.g. **Antidiuretic hormone**), bicarbonate effects, in massive infusion, 6637. drug effects, 6288. endotoxin effects, dog, 6013. erythropoietic control, juxtaglomerular cells*, 4286.
- hypophsectomy effects, man, 6632. in acute ischaemia of limbs, 6632. juxtaglomerular cells effect on adrenal cortex, 2055.
- salt intake effects, partially nephrectomised dog, 6511.
- strophanthin effects, 4159.
- diuresis, urine production ft output** (see also **Diuretics**), antidiuretic action: of dopa decarboxylase inhibitors, 3296; seminal vesicle massag. & coitus, ram, 2043.
- diuresis: heart disease associated, 4552; hypophysis 8c aldosterone roles, 4093-4; renin effects, buffer-nerve-sectioned do# 2041; total non-dialysable solids effects*, 2042.
- excretion ft reabsorption patterns**, amirononucleoside, 2044.
- bilirubin, common duct-ligated dog, 4558.
- carbohydrates: foetal & neonate sheep, 45&J glucose, phlorizin analogues effects, 664.
- electrolytes: Ca, 4557; P, dog, 4556; Na (x) conservation, hypertensives, 6639, (W, during osmotic polyuria, hypothyroid rat, 4554; Na & K, adrenal cortex as related, 4555).
- electrolytes & steroids, angiotensin effect*, 4570.
- inulin clearance depressed by creatine, 2040.
- P & deoxyribose, after irradiation or methionine sulphoximine, 3564.
- urea, rabbit, 2045.
- water clearance in shock, dog, 4551.
- glomerular function**, denervation effects, rabbit, 4426.
- filtration rate, rainbow trout, 7054.
- tubular function** (see also **-excretion ft reabsorption patterns**, above), aldosterone effects, stop-flow analysis, 66W citric acid reabsorption, age & sex effect*, 4559.
- Hydroxyl action, 4160.
- proximal, ox-oxoglutaric acid transport, 66*⁷, thiosulphate secretion, drug effects, 1692.
- Kidney, histology ft histochemistry** (see *-metabolism below), Aldactone effects, 2632.
- changes with Meralluride, 4162.
- cortical cells, inorg. ions & PAH transp^, 3075.
- endoplasmic reticulum fraction, metabolic 2794, 3079.
- enzyme localisation, 27, 5079, (title 119) 7148.
- glomerular: epithelium, proteinuria effects, 1340; variation, quant. estimation, 2036, ^/5-glucuronidase-rich particles, androgen-stimulated, 3278.
- juxtaglomerular apparatus, 4548.
- juxtaglomerular cells: granularity (a) adrenalin enucleation & spironolactone effects, 6654; (b) mineralocorticoid & ACTH effects, 6631, hypo-oxia & erythropoietin as related, nerves, micromorphol., reptiles, 4987.
- thyroid follicles in, fish, 5010.

INDEX OF SUBJECTS

- Kidney metabolism.** AMP production, ADH effects, 679. amino acids, 5268, 6635-6. dephosphorylating activity, 5082. electrolytes: K retention at 0°, 4549; Se concn., dystrophic pig, 5444. enzymes, 298, 602, 2659, 2830, 3146; inhibn., 3304. formamidine group transfer, 5498. iteic acid effects, 3322. Mitochondria, Ca & Sr uptake, 532. nucleic acids, 3195, 5407. ^oJ diabetic rat, (title 6) 7148. ^o* transplants, dog, 994. ^o consumption : cold-acclimatised rat, 4247; ... ion movements as related, 6634. ^oTSH catabolism, 4550.
- *Uetics. Refer to Diffusion ; Energy ; Reaction Kinetics > Thermodynamics.
- Kinetic.** See Growth substances, for plants.
- Kinins** (see also Angiotensin ; Antidiuretic hormone; Oxytocin; Peptides, poly-, biologically active; Smooth muscle stimulating substances). assay, biol. fluids & tissues, 5578. bradykinin : 5577-8; & anaphylactic shock, 3627, 4079. ^a endonuclease in inflammation, 6426; & kallidin, enzymic inactivation, inhibitors, 3307; antagonised by (a) normal Urine extracts, 6278; (b) orally admin. Proteases, 693; (c) Na salicylate, 4079, 4090, 6301 f; antagonists, effect on anaphylactic responses, 4079; haemodynamic effects, 4407; pain response, visceral receptors, 4041; Precursor, isolation, 4158; release in haemorrhage, 4417; spasmogenic effect, inhib. ^olysoleithin, 4151; uterine relaxant prop., 1863.
- kronchoconstrictor effect, antagonised by mefenamic & flufenamic acids, 4053. ^aedoism, isolation & amino acid sequence, 2931. ^ozymic degradation, plasma, 5577. formation, effect of salicylates, 4177. ^antestinal obstruction, 5576. ^ajin, 3307, 5578. ^aallukrein, 328, 2876, 4177, 4404, 5880. ^alease, in inflammation, 1141. ^aubaric P : 6606; -like activity of UDP, 1697. ^ainary, distinguished from bradykinin, 1662. ^ainstalter's syndrome. See Testes, disorders, Krebs cycle. See Citric acid cycle. Krebs-Henseleit cycle. See Ornithine cycle, ^ayste. ^aeuus. See ^ampno-reticuloendothelial system. ^auromimetic. See Tryptophan, -nicotinic acid metabolism.
- L**
- Lab** oratory animals (see also Culture methods ; ^animal models in mals ; Species comparison). DS ^aessment, 5504. SUV, ^acute care & • 7152.
- ^aquity: of Macaco, speciosa for neuro-tissues, 1753; of rat strains (a) for dental caries studies, 105, (b) for metabolic expt., 149, 1709, 3238.
- techniques for study; foetal thyroid removal, 1, 200, 2115; i. v. anaesthetic for rabbits, Labyrinth. See Ear.
- Lachrymatory factor**, onion, 5742.
- Lactam**, caprolactam, peptides of, 1045.
- Lactate** < lactic acid, 43. ^a levels : adrenaline & glucagon effects, after exercise, man, 4316-7; ethanol effects, man, 4314. conversion to blood glucose, man, 4195. free & bound fractions, bacteria, 862. glucose metabolic interrelations, sheep, 5184. increased production : adrenaline-induced, 4422, 6399; ^aglucose absorption, gut, 6613. lactate : ^aglucose absorption, gut, 6613. liver: Pyruvate redox quotient, in perfused ^aliver, 387.
- Lactation** (see also Mammary glands ; Milk; Prolactin). ^a changes during, 6621. ^aduced, 2121, 4613. ^ay hypothalamic lesions, 6698.
- Lactation**, lipid & protein metabolism during, 258, (title 7) 5044, (title 55) 7148. maintenance, rabbit, 4612.
- Laotogenetic hormone.** See Prolactin.
- Lactones** (see also Carbohydrates), carcinogenicity & growth inhibn. by, 5643. sesquiterpene, plant, 921. wedelolactone, leaf blackening, 5745.
- Lactose** (see also Carbohydrates), Ca chelation by, 5435. fermentation by cell-free extracts, *Bac. anthracis*, 5183. -lysine browning systems, (title 11) 5038. preventive & curative effects in Ca deficiency, rats, 4435. sialyl, enzymic synthesis, 189. utilisation, *Aspergillus*, 2342.
- Leavo.** See Levo-.
- Leavoporphanol.** See Analgesics (strong).
- Laevulinic acid**, AChase reactivation, 4048.
- Laminarin**, SO₄, anti-tumour activity, 5967.
- Language.** See Communication ; Speech.
- Lanosterol.** See Sterols.
- Lanthionine**, decomposition in aq. soln., 305.
- Laparotomy.** See Surgery.
- Largactil** (chlorpromazine). See Phenothiazine derivatives.
- Larvae.** See Embryos.
- Larynx** (see also Respiration & respiratory system), movements in thought compared with those in speech, 4323.
- Lasiocarpine**, chr. breakage by, *Vicia*, 6819.
- Lateral line organ.** See Fish ; & Nervous system, afferent & sensory.
- Latex**, histamine action, *Calotropis*, 6275.
- Lathyrism.** aortic histol., 25, 5070. as model of mesenchymal disease, 3769. collagen glycine incorporation, 492. collagen intermol. defect, 368.
- Lathyrogens**, aminoacetoneitrile, effects on collagen, 494, 2727. aminopropionitrile, 3769, 5070. effects, liver glycogen, embryo, 1317. protection by hormones & vitamins, 1316.
- Laurodin.** See Micro-organisms, anti-agents.
- Laurolinium acetate.** See Bacterial anti-agents.
- Laxatives**, aloes, evaluation, barbaloin conversion, 4191. castor oil, absorption, excretion, 1716. liquid paraffin, effects, vit. A & carotene utilisation, review (title 9) 7157.
- Lead**, detoxication by isolated liver, 1750. poisoning, 4289.
- isotopes**, ¹⁰Pb, in human bone, 3095, 5850.
- salts**, acetate, inducing osteitis fibrosa & soft tissue calcification, 3788. citrate, as electron-opaque stain in E.M., 5090. hydroxide, staining, 34, 42.
- Learning** (see also Behaviour & related headings ; Memory ; Reflexes, conditioned), acquisition, retention & extinction, 4655, 4668, 6759.
- brain areas as affecting (see also Brain) : cingulum lesions, 4635; cortical & collicular lesions, cat, 4500; orbitofrontal cortex, cat, 4473.
- brain monoamines as affecting, mouse, 4634. depression effect, 6751.
- discrimination reversal effects, 2182, 6764.
- drug effects, 1721.
- environmental factors, locust hoppers, 2239.
- extinction: 2185, 4668, 6759; & recovery, 2178; partial reinforcement & overtraining effects, rat, 2194.
- fixation of experience in spinal cord, rat, 6542.
- genetic variation, pig, 6761.
- glial RNA changes in, rat, 4480.
- habit reversal, pigeon, 2166.
- imprinting : birds, review, 6772; forced, chick, 2169; in nature, 4689; of immobility reactions, chicken, 4685; painful stim. in, chick, 6750.
- in flatworms & annelids, 2234, 4680.
- instrumental responses (including bar pressing & self-stimn.) : partial reinforcement in, rat, 2191; punishment & preshock in, mouse, 2188; • {contd.}
- Learning, (contd. from **)** reinforcement in, mouse, 2189; successive acquisitions & extinctions, 2177; test environment area as affecting, 4644; theory of self-stimn., 2211.
- Kamin effect, rat, 4657.
- overlearning & reversal, 46761.
- overtraining effects, rat, 2181, 2194.
- placebo effects, 2151.
- problem-solving : handling in infancy effects, rat, 4659; new problem, effect on response to old, rat, 2190; previous training effects, monkey, 2201; sex & radiation effects, monkey, 2203.
- reinforcement : 2179, 2189; deprivation & goal-box cues effects, 4648; differential, rat, 4667; electrical stimn., 2175; gentling as, rat, 4655; illumination change, rat, 4664; low intensity auditory & visual stim., mouse, 2173; partial (a) extinction effects, rat, 2193; (b) pigeon, 4642; satiation, mouse, 2174; secondary, 2176, 6763; transition from non-reinforcement, effects, 46751.
- reward : forced, & forced non-reward, effects, rat, 2192; magnitude effects, 2186, 4645, 4650-2, 6759; rate, as affecting response strength, rat, 2171.
- set formation : monkey, 2206, 4670, 6762-4; rat, 4669; young gorilla, 2208.
- stim. generalisation : approach-avoidance, rat, 4646; infant monkey, 2198; pigeon, 2168, 4640-1, 4643.
- stim.-response isolation effects, monkey, 2205.
- temporal factors, monkey, 2207.
- Leaves** (see also Plants; Shoots), ageing, affecting auxin translocation, 2452. comparison with heat engine, 6990.
- composition and metabolism. See Chlorophyll, Chloroplasts ; Photosynthesis ; Plants, composition & metabolism ; Plant pigments ; & related headings.
- Cytology** (see also Plants, cytology) : cuticle structure, pine, 6912; vacuoles, staining, pine, 2504.
- defoliation, effect on plant growth, 4868, 4870.
- development & growth (see also Plants, growth & development), growth rate : tomato, 4870; wheat, 4869.
- leaf size : light effects, 2437; temp. effects, *Phalaris*, 2439.
- stim. by GA, potato, 2457.
- foliar penetration of 2, 4-D, *Phaseolus*, 4888.
- infections. Refer to Plants, diseases.
- injury, affecting cutin biosynthesis, *Gasteria*, 3475.
- insects feeding on. Refer to Insects, phyto-intercellular CO₂ concn., 2420.
- physiol. role, wheat, 4868-9.
- shape & orientation, *Proserpinaca*, 6972.
- spont. electrical activity, *Dionaea muscipula*, 2492.
- stomata, abnormal, bracken, 6993.
- affecting transpiration, 2405, 6913 f.
- movement: light & temp., effects, *Crassulaceae*, 4864; rhythmic phenomena, *Xanthium*, 4920.
- width, hydroactive control, 2403.
- "Sr deposit & leaching, potato, 6919.
- translocation of : assimilates, *Phaseolus*, 2431; auxin, aspen, 2452.
- transpiration, wilting, osmotic studies. Refer to Plants, water relations.
- virus-infected. Refer to Viruses, plant.
- water absorption : pine, 6912; rate, 2406.
- Lecithin.** See Phospholipids.
- Lectins** (phytohaemagglutinins), effect in vivo, rat, 5286.
- effect on w.b.c. in vitro: mitogenic prop., proportional to haemagggl., 4296; normal & leukaemic cells, 5108.
- from various species : *Lupinus luteus* seeds 5285; potato glycoprotein, sp. antigenicity, of, 3638; *Vicia graminea*, anti-N₁ reactions with r.b.c. stroma mucoids, 4291, 5873.
- Legs. See Limbs.**
- Leishmaniasis.** See Protozoal infections ; & Leishmania in Taxonomic index.
- Lepidopterin.** See Pteridines & pterins.
- Leprosy.** See *Mycobacterium leprae* in Taxonomic index.

INDEX OF SUBJECTS

- Leptogenin**, reactions, 3459.
- Leptospirosis**. See **Bacterial infections**; & *Leptospira* in Taxonomic index.
- Leucanthemitol**, new cyclitol from ox-eye daisy, 3476.
- Leucine** (see also **Amino aoidi**; **Isoleucine**), biosynthesis, plants, 2864. effect on tryptophan metabolism, 834. incorporation into : Hb, 490; liver ribosomes, 487; nuclear pH5 fraction, 5416; protein (a) azodye effects, 3330; (b) heart sarcosome, 5429; (c) inhibn. by antibiotics, 750; (d) thyroid prep., 2079; silkgland RNA, 5415f. -induced hypoglycaemia, 6671. -isoleucine & valine antagonism, liver regeneration, 993.
- Lencocidin**. See **Toxins, bacterial**.
- Leucocytes** : **Leucocytosis** ; **Leucopenia** ; **Leucopoiesis**. See **Blood cells, white**.
- Leukemia** (see also **Tumours** ; **Viruses, animal, tumour-associated**), aetiology/transmission : adults, & diagnostic X-rays, 3717; by cell-free extracts, PS mice, 5950; by tumour nucleic acids, (title 40) 7155; children, & agammaglobulinaemia, 5983; man, 2395; prenatal virus transmission, C3H mice, 3718. avian erythroblastosis, 538. cells/tissues : bone marrow, (a) cytogenet. study, 4812; (b) effect of normal marrow RNA, 1267; brain, extracts, effects, amnion culture, 5947; chr. studies (a) & endoreduplication, 5974. (b) Philadelphia pos. mitoses, 5975; haemat. effects of leucaphaeresis, man, 6423; w.b.c. (a) cultured, lectin effects, 5108; (b) haem synthesis, 798; (c) hexokinase & NADP-dependent dehydrogenase, 3350. human, immunol. studies, 5911. research, methodología, (title 8) 7147.
- clinical types** : acute & chronic, difference, 798; acute myeloblastic, 5974; acute promyelocytic, 6424; chronic granulocytic, 5975; chronic myeloid, 4812.
- inhibition/inhibitors/therapy**: amethopterin, toxicity reduction, 4112; 5-azaorotic acid & deriv., 5638; BCG infection effect, rodents, 3730; 2-chloro-4-, 4"-di-2-imidazolin-2-ylterephthalanilide & methotrexate, combined, 6314; cytostatics, Moloney viral, 1582; equine immunoglobulin, admin., man, 5966; rodent serum, high asparaginase activity, 5957, 5959; vincristine, 6316.
- marine** : A-K, effect of BCG infection, 3730; AK-4, transplants, hamster, 1275; AKR, predisposition, & polyoma virus sensitivity, 5941; C3H, foster nursing expt., 3718; Friend's viral (a) & transplantable tumour, BALB/c strain, 3720. (b) expt., virus recovery (title 19) 5048. (c) liver metabolism in, 5774; high-leukaemic strains, thymus development, 11; inhibn. by guinea-pig serum, 5957, 5959; LI210, chemotherapy, 4112, 6314; "LJ210" ascites, thioguanine effect, 1707; L577SY, pyrimidine nucleotide biosynthesis, inhibn., 5638; lymphocytic, ploidy, & radiosensitivity, 4721; Moloney viral, 1582; myeloid, plasma LDH in, 3743; P-1534, metabolism in, 3509; viral studies, 6114-7; virus-infected cells, E.M. study, 4744.
- side effects/concomitant states** : agammaglobulinaemia, 5983; hepatic energy metabolism, 5774; hypofibrinogenhaemia, 6424; Fe metabolism, chick, 538; phagocytosis impaired, 5984; plasma lactic dehydrogenase changes, 3743.
- Levallorphan**. See **Morphine antagonists**.
- Librium** (chlorodiazepoxide). See **Tranquillisers**.
- Lichen planus**. See **Mouth, disorders**.
- Lichens**, glucose utilisation, *Peltigera polydactyla*, 6941.
- Life-span**. See **Age & ageing**.
- Life**, origins, (title 6) 5035.
- Ligaments**, interpubic, formation, hormonal requirements, 4595.
- of bivalve mollusc, *Spisula*, 7111.
- Light** (see also **Energy levels**; **Microscopy**; **Optical properties**; **Photochemical reactions**; **Photoperiodism**; **Photosynthesis**; **Radiation**), & darkness : kinetin stimm. of gametophyte development, 2458; nuclear division, bryophyte, 2288.
- Light**, artificial, pituitary effects, 4580. behavioural effects : mice, 2174; planaria, 7076; rat, 4663-4. chloroplast shrinkage, 5758. continuous exposure, genital tract response to, pineal as related, 4596. contraction response to, *Hydra*, 4679. deprivation effects, animals, 1980, 1990, 6571. emission, (title 3) 7141. flashing : chlorophyll biosynthesis, 4857; plant growth, 4852. fluorescent : in biol. research, 1004; on algae, 4871; on fungi, 6971; on milk, (title 4) 7157. growth effects : 2436-7, 2481, 3490, 4852, 4857, 4870, 4877, 4888, 6958-9. -induced catalepsy, (title 20) 7152. initiation of coremia formation, *Penicillium*, 3908. intensity : & inhibn. of chlorophyll fluorescence, 9661; inhibn. of phototaxis, locust, 4979; plant growth effects, 2436-7, 3490, 4870, 6974; on plant growth substance action & uptake, 2458, 4877, 4888. on vit. content, milk, (title 17) 5044, (title 4) 7157. penetration, brain, 4476, 6575. polarised, on cell growth, *Equisetum*, 2481. quantum requirements for photophosphorylation, 5759. reproduction as affected, fungus, 1508. requirement for sulpholipid synthesis, *Euglena*, 237. respiration as affected, plant, 1500, 3490. -sensitive substances. See **Pigments, etc.** skin sensitivity to, (title 3) 7149. sp. wavelength effects : development, plant, 2462, 4893; enzyme synthesis, 3561; growth inhibn., 2479, 6959; habitat change, fern, 6951; photosynthesis, 4851; phototropism, 6978; reversal of u.v. effects, plants, 2480. sunlight. See **Radiation**, solar, traps, efficiency of, 7114. visual aspects. Refer to **Eye & vision**; & related subsections of **Brain**.
- Lignin** (see also **Phenolic compounds**; **Wood**), biosynthesis, 3474.
- Lignoceric acid**. See **Fatty Acids, sat., C₁₈**.
- Limaspermin**. See **Alkaloids**.
- Limbs** (see also **Bone**; **Joints**; **Muscles**; **Reflexes**; **Regeneration**; **for invertebrate limbs**, see relevant groups), circulation, as affected by : adrenaline, forearm, 4420-2; brain stimm., 4392; rest & surgery, leg, 4427-8. digits : nail growth, 6389; polydactylism, 2710, 4615. disorders/deformities : prevention, rat, 1092; thalidomide induced, man, 4171-2; tumours, chemotherapy, (title 36) 7152. embryonic development : radiosensitivity during, 5834; urodele, 2523. foot, shoe pressure on, 4234. ischaemia effects on, 1303, 6632.
- Lindane**. See **Insecticides**.
- Linolenic acid**. See **Fatty acids, unsat., C₁₈**.
- Lipids** (see also **Blood lipids**; **Body composition**; **Cholesterol**; **Fatty acids**; **Lipoproteins**; **Oils**; **Phospholipids**; **Sphingolipids**; **Sterols**; **Waxes**), activation of lipoamide dehydrogenase, 263. aliphatic diether analogues (glycerol ethers), 2807. bimolecular lipid leaflets, prop., 5220. complex lipids, (title 6) 2593, (title 8) 5043. components of respiratory chain, 233. composition of egg yolk lipoproteins, 2810. depot fat (see also **Adipose tissue**), 2797, (title 15) 5044, 6359. diglycerides, in runner bean leaves, 231. fatty acid composition, 197, 2817, 3159t, (title 15) 5044, 5236-8, (titles 40, 43) 7148. glycerol lipids, metabolism, 213, 216. granules in uterine epithelium, spayed mice, 6776. hydroperoxides, assay, 2815.
- in adrenal**: *Cricetomys gambianus*, 4565; man, 228.
- in alfalfa weevil, 6360. in artery walls, 3159-60, 5236, (title 51) 7148. in asporogenic yeast-like fungioids, 2812. in bacteria, 219, 2808f, 5221. in bile, 260, 624.
- Lipids**, in blood cells, r.b.c., 230, (title 29) 2594, 5520. in blood thromboplastin, 2809. in c. s. f., man, 235. in cryst. lens, fatty acids of, 5238. in hepatopancreas & muscle, fish, 3166. in liver, 29, 217, 232, 1695, 1748, 2033, 2704, 3163, 3575, 3782, 4134, 4545-6, 5081, 5236, 6002-3. in mitochondria, 3503, 5828. in oocytes of desert locust, 2551. in organs of chitons, 7022. in ovarian fluid tumours, 3367. in plants, 231 f, 1490, (title 13) 2594, 3432-3. in quartz-dusted guinea-pig lungs, 5224. in skin, man, mice, 197, 2817. in teeth, histochem., 95. in xanthomata, origin, 5695. i. v. admin. of fat emulsion, 3165, 4546, 6003. peroxides : damage to proteins by, 2814; *for* action inhib. by aspergillolamarin B, 5223! in liver (a) in CCl₄ poisoning, 1748, (C) irradiated rats, 3575. physiol. active, analysis, 2816. role in cyt. ft, oxidation-reduction potential 397; protein biosynthesis, 5413. smooth muscle stimulants in menstrual fluid* 4597. stability to irradiation, mitochondria, 5828. SO₄ in, quant. assay, 239. triglycerides : abnormal metabolism, 811; biosynthesis (a) in choline-deficient rat*, 626; (b) phenethylbiguanide effects, 2820; cycle in acute liver injury, 1695; fatty acids composition, mouse epidermis, 2817; in liver increased by ethionine, 232; transport isolated liver, 3258 f; turnover in adipose tissue, 622. uptake by human oc-lipoprotein, 257. water systems, E.M., (title 17) 5048.
- absorption, intestinal** (see also **-transport below**), by different regions of small intestine, 4530. depressed by raw soybean meal, chicks, 31?*I expt. studies, 4535. in soc. proc., (title 30) 7152. malabsorption during radio therapy, m¹, 2019.
- [¹⁴C] trolein tolerance tests, 811.
- assays & separation**, chromatog., 223, 225-6, 2813, (title 43) 714*1 extraction from mouse carcasses & tissue* 3525. histol, staining with Sudan Black B, 35. in unicellular algae, 7002. of lipid hydroperoxides, 2815. of physiol. active lipids, 2816. total, in tissues, 221.
- biosynthesis**, blocked by fat feeding, 2818. by cell components, 213. imipramine & desmethylimipramine effect on, 3312. in aortic prep., 256. in bacteria, from mevalonic acid, (title 7148).
- in Ehrlich ascites tumour cells, 218. in liver & plasma, choline-deficient rats, 268. in milk, 268. in muscle : atrophic, 5177; insulin stimm., 669. in plants, 3432. in polymorphonuclear leucocytes, 214. in yeast, *Cryptococcus*, 1495, 2426. phenethylbiguanide effects, 2820. role in non-shivering thermogenesis, (title 7154).
- deposition** (see also **Atherosclerosis**), in liver, 29, 217, 1695, 2704, 3163, 3782, 4134, 4545-6, 6002-3.
- in Niemann-Pick disease & other lipidoses, 30.
- dietary** (see also **Fatty acids**; **Foodstuffs**; **tion & diet**), activation of enterogastrone 4524. ACTH adrenal stimm. affected by, 5562. animal fats: affecting fibrinolytic act 6440; butterfat, precursors of m ketones in, 227; lard, 29, 229; milk fat, 268. blocking lipogenesis, 2818.

- Lipids,** dietary, edible oils contaminated with synthetic ester lubricants, 5522 f. effects of, on : blood coagulation, platelet economy & blood lipids, man, 3157 ; cholesterol metabolism, 52581 ; plasma fibrinolytic activity, man, 3170, 6440 ; plasma, liver & aorta lipids, chicks, 3171 ; tissue lipid fatty acids, (title 40) 7148. fat-free diets, 5562. hepatic liposis & myocardial damage affected by mice, 2704. high-fat diet effects, 2033, 3777. inducing fatty liver, 3163. low & moderate intake effects, 3156. post-heparin plasma lipolytic activity affected by, 785. relation to plasma cholesterol, man, 5699. vegetable oils: coconut, hydrogenated, atherogenic effects, 3160, 6000' ; corn, 624 ; corn & coconut, inducing cirrhosis, 6003 ; olive (a) radioprotective effect, 1093, (bj) stimn. of phospholipid biosynthesis, 2834 ; incompatibility with cooked wheat flour, (title 14) 5044 ; peanut, 5562 ; rapeseed, 3158.
- metabolism,** ACTH effects on, 1835. benzhydrol deriv. effects on, 3164. disturbances: Niemann-Pick disease & others, ^ 30 ; triolein tests in, 811. during stress, (title 13) 7152. hydrolysis, taurocholate stimn., 2805. in adipose tissue, 622. in blood cells, radiation effects, 3576. in liver, 1007. in mammary gland, 224. p review, (title 7) 2593. hpolysis : by aortic wall, (title 16) 7155 ; by staphylococci, 1386, 6169 ; in adipose tissue, hormone effects, 3226. oxidation, catalysis by Fe protoporphyrin deriv, 2811. tfansmethylation reactions, bacteria, 234.
- Melanoid** (see also **Blood lipids**), from depot fat, rate, cow, sheep, 2797. into liver, ethionine-induced, 232.
- morphine** effects on, 4037.
- nsport** (see also **absorption** above), between blood & fat cells, E.M., 2649. nylomicro : isolation, 2904 ; surface prop., 6449.
- JJ liver, noradrenaline effects, 3258f.
- Lipo-amino acids**, from *Bacillus* sp., 5233.
- Lipocarboxylic acids**, effects on cirrhosis, 6351.
- Lipoprotein**, s. **lipoproteins**.
- Liposaccharides**, chlorophyll electron transfer reactions, 5756. H₂O regeneration affected by, 7039. O₂ uptake by, 257. Raised, effects on DNA synthesis, 5395f. reduction of thiosulphate, 611.
- Lipoproteins**. See **Phospholipoproteins**.
- Lipoproteins** (see also **Blood lipoproteins**; **Immnobiologics** ; **Toxins**), bacterial: cell wall, 886 ; pyrogenic prop., 1709. of plants, 5186.
- lipoproteins** (see also **Blood lipoproteins**; **proteolipids** under **Sphingolipids**), lipid uptake by, man, 257. (S₁-10) : damaged by lipid-coated Celite, 257. ^ in c.s.f., 3358. toto ^ subfractionation, in swinging bucket, 201, 2041.
- Ag. See **Antigens**. membranes : neg. staining, 259 ; ultrastructure, (title 5) 5048.
- microsomal» transplantation Ag in, 3679.
- of blood. See **Blood lipoproteins**.
- of c.s.f. : in hydrocephalus, 3359 ; in intracranial tumour bearing man, 3358.
- of egg yolk, lipid composition, 2810.
- of hepatic cells, irradiated rabbits, 5816.
- role in thyroid hormone transport, man, 782.
- rate diffusion through, 3078.
- Liquid paraffin**. See **Laxatives**.
- Lithium**. See **Biliary tract disorders**; **Saliva**; **Urinary constituents**.
- Lisochloroacetic acid**. See **Elae acid**.
- Liver** (see also **Biliary tract**; **Hepatopancreas**), accumulation of »_{Cr} m_g 5223. Ag, 1164, 279, (title 5) 5047.
- Liver,** as food. See **Foodstuffs**. auto Ab, 3657-8. chem. & cellular composition, 6622 f. developmental studies, 3267, 3271, 5082, 5194, 5488. electrical potentials, 2029. embryonic/foetal, 177, 1317, 3267, 3583, 5194, 5465. function, depressed by methohexitral, 6273. haemopoietic function, 3583. hepatocyte effects, 495, 600, 993, 1310, 1698, 2030, 2256, 2529, 5393, 5819. high temp. effects on, (title 8) 7154. localisation in of protein-bound aminoazo dyes, 768-9, 771. radiation effects, 1077, 2256, 3575, 3578, 3583, 4215, 5816, 5819, 5823, (title 32) 7152. species studies : frog & rat compared, 3123 ; *Rana pipiens*, 4926. techniques of study : biopsy, 627 ; perfusion technique, 2028 ; simult. H₂O distillation & fat extraction, 3525. temp. of, man, (title 20) 7154. wt. increased by CCl₄, 1747.
- Liver circulation*** arterial blood flow, effects on metastases, 1289. Eck fistula, 6001. hepatic vein occlusion, expt., 3783. portacaval shunting, 6608. portal insulin infusion effects, 4543. portal vein occlusion, dog, mice, 1924-5. temporary hepatic ischaemia, rabbit, 6004. tolbutamide effects on, 6297.
- Liver composition ft metabolism**, abnormal polysaccharide-protein complex, 830. acetoin formation from pyruvic acid, 999. acetyl Co A, increase in ketosis, 543. ai-acid glycoprotein, biosynthesis, 498. a-amino-isobutyric acid uptake, hydrocortisone effects, 4087. anti-mitotic substances in, 5633. ascorbic acid, 657, 659, 3218. carbohydrates, duodenal perfusion of, glucose effects on, 2032. fructose, 2755, 3111. glucose metabolism, 3311, 4543. Maleic acid, effects on kidney, 3322.
Maleuric acid, cytotoxic effects, 3726.
Malnutrition. Refer to **Nutrition**.
Malonate & malonic acid, accumulation, amphibian hybrids, 545.
 deriv. in polyacetylene biosynthesis, 5744.
 hydrogen transfer stim., liver, 5766.
 respiration as affected by, *Cryptococcus*, 2426.
Malonyl CoA, in mevalonic acid synthesis, 2802.
 prep. by thioester exchange, 544.
Malpighian tubules. See **Insects**.
Maltose (see also **Isomaltose**), effects on intestinal fluid transfer, 6612.
Mammalism by yeast, 1503, 3032.
for behavioural, immunol., metabolic, physiol. & reproductive studies, refer to relevant headings; for comparative studies in morphol., physiol., etc., see Species comparisons; for development, see Development & related headings; for genetics, see Genetics & related headings, also individual animals below & in the Taxonomic index; for parasites & infections, see relevant heading, e.g. Helminth infections; Viruses; for studies on young animals, see Infants; Neonates; or expt. tumour studies, see Tumour headings.
 brain, light penetration in, 4476, 6575.
 fossil forms: Echimyinae rodents, dentition, 87;
Merychippus primus, 2385f.
 grazing animals, plant toxicity effects in, (titles 1-6), 5038.
 wild & domesticated spp., as bacteria & virus reservoir, 1437, 3857, 6048, 6051, 6155.
Mammals, specific— (see also individual spp. in Taxonomic index), *studies using mammals as standard lab, animals are not indexed but some aspects are treated under Laboratory animals*, antelope (see also *Adenoto*, *Antilocapra*), kob, reproduction, 6706.
 pronghorn, kidney alk. phosphatase, 2659.
 baboon (see also *Papio*): susceptibility to human enterovirus, 1454; thyroid lymph iodoproteins, 3245.
 bat (see also *Artibeus*, *Myotis*, *Plecotus*, *Tadarida*), audition, 1997.
 blood vessel dimensions, wing, 4391.
 gastric mucosa, E.M., 2640.
 lipids, brown adipose tissue, 2092.
 neurophysiol., 6551.
 placenta & foetal membranes, 2681.
 reproductive cycle, 5016.
 bison, Hb & transferrin, 1804.
 buffalo, seminal plasma proteins, 3321.
 camel, rumen function, 2007.
 cats (as expt. animal in behaviour studies, see **Behaviour**, etc.), body temp., 6384.
 brain & nervous system, structure, 2610, 2612-3, 2615, 5052t.
 diaphragm, blood supply, 1922.
 high altitude effects on, 4397.
 polydactylism, 2710.
 pulmonary artery branching, 2703 f.
 spleen, 5071.
 visual discrimination ability, 2196.
cattle (see also **Milk**), biogenic amines, separation, 3552.
 blood: anti-mitotic factor, 5633; arterial flow, calf, 4413; J group, status, review, 2376; pressure, 4414; r.b.c., Ag development on, 2377.
 diseases & infections: brisket, 1918, 6500; rinderpest, vaccn. reactions to, 6109; trypanosomiasis, 6157.
 gestation period, Indian breeds, 2093-4.
- Mammals, specific**, cattle, heat acclimatisation in, (title 1) 7154.
 I levels, pasture & stored feed as related, 1103.
 mineral absorption, calves, 2021, 4539.
 nutrition & diet, 1103, 3151, 5514.
 pituitary, ACTH & MSH separation, 676.
 pulmonary vasoconstriction at high altitude, 4411, 5060.
 reproductive system: corpus luteum, pro-gesterone content, 2111; expt. superovulation, 2107, 6710; seminal plasma proteins, 332f; spermatozoa, 2137-41.
 retina, enzymic activity, 3113.
 saliva composition, 3151.
 sweat glands, O₂ consumption, Zebu, 4263.
 thyroid: CNS content, endemic goitre areas, 5682; I levels, 3606.
 wt. & heat loss: 4240; measurement, 4241.
 chimpanzee, environmental restriction effects on, 4688, 6768.
 malaria in, 6154.
 social stimm. effects on, 6769.
 deer, Virginia, parathyroid cytol., E.M., 2627.
 dog (as expt. animal in behaviour studies, see **Behaviour**), blood: calcacmia, 3086; r.b.c. PO₄ cpd., 5176.
 brain, structure, 2607, 2611.
 Ca metabolism, in, 5591.
 deciduous teeth, calcification, 2711.
 puppies: conditioning response, 4673; sucking behaviour, 4665.
 spleen, 5071.
 dolphin (see also *Tursiops*), fright-associated sounds, 2215.
 elephant, LSD as affecting, 1703.
 ferret: hypothalamus, 2700, 5051; thyroid autotransplantation effects, 2099; virus infections in, 1124, 3617.
 galago (see also *Galago*), Hb, 1803.
 gibbon (see also *Hylobates*), food motivation & delay response, 4687.
 goat, brain phosphodiesterase activity, 3021.
 protein turnover during lactation, (title 7), 5044.
 seminal plasma proteins, 332f.
 taste preference, 4638.
Trypanosoma evansi infection in, 1516.
 gorillas, learning-set formation, 2208.
 ground squirrels (see also *Citellus*, *Spermophilopsis*), adrenalectomy effects, 2106.
 brain pigmentation, 4986.
 (+)-glucose absorptions in, 4533.
 visual cortex structure, 2609.
 guinea-pig (see also *Cavia*), blood: r.b.c. survival, 4279; vol. during development, 4278.
 embryonic membranes, 6792.
 enzymes: asparaginase, 313; kallikrein, 2876.
 genetics, 6880.
 lungs, lesion pathol., 1292.
 reproductive system: seasonal changes, 5085-6.
 Staphylococcal infections in, 6026.
 hamster (see also *Cricetus*, *Mesocricetus*), adrenal inhibp., 3263.
 brain "atlas", 5127f.
Mycobacterium infections in, 1401.
 serum protein distribution, 5309.
 superovulation, coital block, 2110.
 hedgehog, retina, e.r.g., 6593.
 horses (see also *Equus*), & mule, natural immunity to *Cl. welchi*, India, 5858.
 caries incidence, 2734.
 genetics, 2380.
 infections, bot fly, 4219.
 pancreatic islets, 2635.
 pituitary enzymes, 4581.
 pregnancy diagnosis method, 6702.
 mink, hypergammaglobulinaemia, 2382.
 monkeys (see also *Macaca*, *Saimiri*; for rhesus monkey, see *Macaca mulatta*), as expt. animals in behaviour studies, see **Behaviour** & related headings).
 brain: anatomy, 2604-6; caudate nucleus, 1954; cerebellar dyskinesia, 4456.
 dominance relationships, 2199.
 endotoxin shock, 1298.

Mammals, specific,

monkeys, expt. renal hypertension, 4402.
eye & vision: discrimination ability, infant, 2198; e.g., 6591.
genetics, 2379.
infections & diseases: expt. anthrax, 1294; viral, pathogenesis, 1112.
learning & task performance, 4639, 4670.
nerves, iris angle, 5060.
sex chroma tin, 5 spp., 6799.
tongue innervation, 4458.

Monotremes (see also *Ornithorhynchus, Tachy-glossus*): cerebellum, structure, 2698; ureotelism in, 7055.

mouse, (see also *A cornys, Mus*), behaviour: differences, mutant strains, 6753; social & territorial, 6766.
cervical nerve fibres, 2618.
choline deficiency, E.M., 29.
faecal flora, 1584.
genetics, 2368, 2370-1, 2375, 4776-79f, 6836-7, 6876-8.
ileum mucosa, bacterial flora as affecting, 2644.
infections & diseases: cleft palate, 2693; expt. scrapie, 1352, 3871-2; hepatic liposis, 2704; viral, 3864.
lactate dehydrogenase isozymes, 3132.
litter size, effects, 2109.
liver, golgi bodies, 2271.
milk secretion, E.M., 5065.
muscles, oxidative phosphorylation in, 3499.
reproduction & reproductive system: implantation, 2113f; oestrous cycle, quant. by cell counts, 2100; ovary, testosterone production in pregnancy, 3282; uterine epithelium, histol., 5084.
temp., adaptation, (title 2) 7154.
thymus: changes with age, 11; E.M., 2628, 2630.
thyroid: nucleolar extrusion, epithelium, 47G9; ultrastructure, 2626.
wt., antibacterial drugs as affecting, 1583.
opossum, cardiovascular system, catecholamines as affecting, 1906.

pig*
Ab, absorption, retention, & production, piglets, 3691.
arteries, effects of ageing, 5069.
behaviour & learning, 4673, 6761.
Cu deficient, aorta prop. in, 1904.
expt. groundnut poisoning, 4220.
gastric ulcers, 2013.
y-globulin, 5316.
kidney: cerebrosidase-cleaving enzymes, 2830; Se con en., 5444.
milk, ^{89}Sr & Ca content, 1104.
muscle: 5074-75f; degeneration, 6258; glycogen structure, 156; post, mortem changes, E.M., 22.
nutrition & diet, 2013, (titles 8 & 9) 5044.
pancreas, protoplast bursting factor from, 3426.
pituitary, ACTH & MSH fractions, 676.
temp., response, neonates, (title 28) 7154.
primates, vocalisation & expression, 2252.
rabbit (see also *Oryctolagus*), anaesthetic for, 1597.
blood: haptoglobin life, 5305; vol., 6403.
blood-vessels: aorta, E.M., 24; arteries, 2702.
brain: diencephalon, arteries, 2702; hypothalamus, nuclei gemini, 5128.
genetics, 2378.
high altitude effects on, 4397.
infections, pox, 6112.
liver mitochondria, hexokinase, 5200.
maternal behaviour, 2170, 4593.
N excretion rhythm, 7074.
19S protein, allotypy in, 2909.
reproduction & reproductive system: 6715, 6724; ova & spermatozoa, structure & composition, 6773-4; placental structure, E.M., 5116; spermatogenesis, 6802.
L-tyrosine O-sulphate metabolism in, 303.
raccoon (see also *Procyon*), skin sensory innervation, 2652.
rat (see also *Cricetomys, Rattus*; as expt. animal in behaviour studies, see **Behaviour**, etc., & in caries studies, see **Teeth**), adrenals: composition, 4565; seasonal changes 6655.

Mammals, specific,

rat, behaviour: parental, 2156; preference & learning, 4636, 4669, 6749; sexual, 2180; social, 6767.
blood: eosinophil life, 4297; vol. during development, 4278.
blood vessels: aorta, E.M., 5068; capillaries, histocom., 4.
brain & nervous system, anatomy & histol., 4, 2614, 2621, 2699, 4457, 5049-50 f, 5053, 5131.
coprophagy, role, 631.
diaphragm, histophysiol., 2655.
intestinal villi, 2643.
liver, enzymes, 5552, (title 127) 7148.
muscle, incisive, 2714.
nasal septum epithelium, 2636.
pancreas, islets, new cell type, E.M., 2634.
parasites, 7106.
pituitary, E.M., 2624.
placebo effects in, 2151.
reproduction & reproductive system: accessory glands, 6^a, 2662-3; oocyte, nuclear changes, 5113; rete testis, E.M., 33; uterine sensitivity, post-partum, 2118; vaginal mucosa, 704 f.
sexual capacity, 6^a, 2158.
teeth: ameloblasts, structure, 4693; enamel origin, 2716.
temp., adaptation, (title 3) 7154.
rodents (see also "rat" & "mouse" above); enzymes (a) asparaginase, S. American spp., 5959; (b) reductase, w.b.c., 2512.
sea lion, sonar signals, 2580.
sheep (for wool, see **Hair**; for rumen, etc. & its micro-organisms, see **Gastrointestinal tract**), antihelmintics, potency, 4181.
blood: arterial flow, 4413; leucocytes, 6422; pressure, artery occlusion effects on, 4414.
Cu levels, pregnancy as affecting, 3099.
endotoxin shock in, 4168.
glucose & lactate, metabolic interactions in, 5184.
heat acclimatisation, (title 1), 7154.
high altitude effects, 4412.
histamine levels, diet as related, 1781.
infections & diseases: *Echinococcus*, 3624; facial eczema, 896 f; scrapie, 1352; *Toxoplasma*, pathol. in pregnancy, 3922.
kidney, glucose reabsorption, 4553.
pituitary, hormones, 676, 6683.
reproduction & reproductive system: induced oestrus, 2097-8; parturition, 6732; scrotal temp., effects on semen quality, 6743; spermatozoa, 2141, 4628; uterus, chem. constituents, 2097.
saliva composition, 3152, 4511.
seleno-cpd. biosynthesis, 3096.
water diuresis, 2043.
squirrel, retina, e.g.r., 6593.
whale: cartilage polysaccharides, 171; muscle composition, 2939, 5466.

Mammary glands (see also **Lactation**; **Milk**; **Prolactin**), chr., mouse, 6836.
composition & metabolism: acetate & glucose metabolism, goat, 5181; enzymes (a) carbonic anhydrase, several spp., 609, (b) dehydrogenase & malic enzyme, 5557, (c) lipase, guinea-pig, 224; fatty acid biosynthesis, 208; (title 55) 7148; milk fat synthesis, 268; monoiodotyrosine synthesis, 692; nucleic acids, 2996-8; propionate metabolism, 3102, (title 54) 7148.
denervation effects, goat, 2120.
epithelium, B particles, 67.
growth & morphogenesis: in transplant, 5952; stimn. by (a) methandrostenolone, 6728, (b) pituitary homograft, 6679.
hormone effects on, 4613.
immunol., 3739.
involution, cytomorphol., E.M., mouse, 5065.
lymphatics, function in bacterial infection, sheep, 1389.
mitochondria, succinate oxidation in, 988.
nipple epidermis, changes with age, man, 6386.
organ & tissue culture, 67, 5181.
pituitary implant as affecting, 4576.
transplantation, 2120, 5952.

Mammary gland disorders, malformation, expt., rat foetus, 5126.
mastitis, sheep, 1389.

Mammary gland disorders,

neoplasms: associated virus, 5234, 5949^A; chemotherapy, 6320; chr. in, 6836; EM», 5978; induction, 1248, 1253, 3388, 3760, 5921, 5950-1, 5963; inhibn., 1274, 6321; man, 3364, 3757, 5978; metabolism, 1097, 4095; regression, 3760, 5969; spout., 1273, 5969.

Mandibular glands. See **Salivary glands**.

Manganese (see also **Metals**), deficiency, 3089.

electron paramagnetic resonance, in spores, 520.
leaf content, mustard, 4848.
role in bone formation, 3089.

stimn. of DNase, 5384.

Mannitol: deriv., tumour-inhibiting, chromatog* 758; -induced polyuria, 4554.

Mannose (see also **Carbohydrates, sugars**), GDP-, in r.b.c., 797.

in bovine plasma acid glycoproteins, 2748.

polymers, mannans, hydrolysis by a-amylas* 2788.

Mannomustine (degranol). See **Cytostatic** * cytotoxic agents.

Mast cells,

& anaphylactoid reactions, 1139.
discharge, siderocalciphylactic sensitatio* 4129.

in eye, study method, 5061.
in g.i. tract: haemorrhage effect, 4523; ^b post-mortem, 2645.

in lung, 1315.
mastocytosis, histaminuria in, 5687.

periosteal, study method, 2647.
peritoneal, & hemoconia, 2645.

response to cestode infection, 3764.

role in fixation of blood-borne particles, 131⁵ tissue, in review, 7156.

tumours: organ culture, 5986; SO₂ metabolism* 402.

Mastitis. See **Mammary gland disorders**.

Mastocytosis. See **Mast cells**.

Mathematical & statistical methods (see **Computer studies**; **Genetics**, theoretical investigation), analysis of ACTH effects in Cushing & ^{horm} tism, 6649.

models, ionic systems, 5814.

nuclear DNA distribution, 3002.

random walk method, c.v.s. tracers, 4387.

statistical mechanics, (title 6) 5036.

vol. of cellular nuclei, 3003.

Maxillo-facial region (see also **Bones**; **Jaw**; **Nasopharyngeal region**; **Skull**), cephalometric analysis, children, 5135.

sensory innervation, role of supr^{ligament} nucleus, 4453.

Measles. See **Viruses, animal, myxo-group**.

Meat. See **Foodstuffs**.

Mecamylamine. See **Ganglion blocking agents*** J

Mechlorethamine (N mustard). See **Cytostatic** I cytotoxic agents.

Meclozine. See **Antihistamines**.

Media. See **Contrast media**; **Environment** Nutrition; Preservation; & sp. organisms I tissues.

Medroxyprogesterone. See **Steroids**.

inhib. of: Ab response, 1207; reverse mutations yeast, 4761.

sulphoxime: & O₂ enzyme effects, 730;

radiomimetic effects, 3564.

synthesis of methyl group, 642.

transport & histidine interactions, brain, 5270.

vit. B₆, interrelationships, 3204, 3206, (title 8) 7148.

Methohexitol. See **Barbiturates**.

Methonium compounds. See **Cholinergic headings**; Ganglion blocking agents; Neuromuscular blocking agents.

Methoprapone (metyrapone). See **Aldosterone antagonists**.

Methosterol. See **Sterols**.

Methotrexate (amethopterin). See **Folic acid antagonists**.

Methotriprazine. See **Phenothiazine derivatives**.

5-Methoxy-IV-acetyl tryptamine (melatonin). See **Melanocyte-stimulating substances**.

Methoxyflurane. See **Anaesthesia/anaesthetics, general**.

Methoxyhydroxymandelic acid (vanilmandelic acid). See **Catecholamines, metabolic products**.

Methyoxyoestrone. See **Steroids**.

***W**Methylinamine-IV-oxide, biosynthesis, 555.

Methylaminobenzene. See **Dyes, azo**; Tumours, inducing agents.

TzMethylinamoleamic acid, hydrolysis, 6969.

Methylandomastoidole. Refer to **Steroids**.

oc-Methylaspartate, effects on NH₂ intoxication, (title 79) 7148.

Methylation. See **Methyl groups**.

Methylazoxymethanol, occurrence in *Cycas* nuts, 5739.

rfMethylbenzanthracene. See **Hydrocarbons, aromatic polycyclic**.

Methyl bromide, stimn. of ¹³¹I uptake by pine trees, 4841.

Methylcellulose: c.v.s. response to, 1879; -induced lymphosarcoma regression, 1268.

Methylcholanthrene. See **Hydrocarbons, aromatic polycyclic**.

Methylcobalamin. See **Cobalamins**.

O,O-**rfMethylcurvulinic acid**, synthesis, 3414.

Methyldopa. See **Dopa, analogues**.

Methylene Blue. See **Dyes**.

2-O-C-Methylenely-myoinositol, antagonism with myoinositol, 1693.

5,10-Methylenetetrahydrofolate. See **Folic acid**.

Methyl Green; -Orange; -Yellow. See **Dyes**.

Methyl groups (see also **Enzymes, specific, trans-ferases, methyl**; **Formate**; for demethylation & methylation of foreign cpd., see **Biotransformations; Drug metabolism**).

N-demethylation: mechanism, 1008; of drugs, 4004.

incorporation into transfer RNA, 447.

methylation: in review, (title 8) 7141; of thiopyrimidines & -purines, 606.

of methionine: enzymic synthesis, 642; role in vit. B₁ biosynthesis, 3206.

of methylcobalamin, methane biosynthesis from, 3409.

of tranquillisers, importance, 4004.

transmethylation of bacterial lipids, 234.

Methylhexobarbital. See **Barbiturates**.

1-Methylimidazole-4-acetic acid, isolation from urine, 695 f.

Methylisatin 1-thiosemicarbazone, vaccinia necrosum therapy, 6175.

Methyl ketones, in Upids, 227, 240.

Methyl ketone acid butanolamide (methysergide). See **Ergot-type alkaloids & derivatives**.

o/oMethylmetacrylate, radiation destruction, 5843.

Methylmetanephrine. See **Catecholamines, metabolic products**.

A⁵Methyl-morpholinium propylene oxide, reciprocal action, anionic polysaccharides, 1014.

5,5-<ft>-Methyl-2,4-oxazolidinedione, for intracellular pH assay, 101SI.

Methylphenidate. See **Stimulants, c.n.s., analgesic/convulsant**.

fe; roMethyl-/->phenylenediamine, oxidation, mitochondria, (title 33) 7148.

IV-Methylpyrrolidinylalkanols, esters, synthesis, 4192.

Methyreserpate, & deriv. Sec **Rauwolfia-type alkaloids**.

Methylselenocysteine, biosynthesis, plants, 3441.

rf⁵Methyl sulphoxide. See **Sulfoxides**.

Methyl testosterone. See **Steroids**.

5-Methyltetrahydrofolate. See **Folic acid**.

Methylthiourea. See **Thyroid inhibitors**.

3/3-⁵-Methyltrimethylene oxide, carcinogenicity, 5643.

4-Methyl-*mp*-toloprolone, pharmacol., (title 14) 7163.

oc-Methyl-*mt*-tyrosine, effect, amphetamine toxicity, 1601.

Methysergide. See **Ergot-type alkaloids & derivatives**.

Metopirone (metyrapone). See **Aldosterone antagonists**.

heparin. See **Heparin**.
histochem.: (titles 3 & 4) 7159; tobacco smoke inhalation as related, (title 24) 7155.
hyaluronic acid: assay, 142; biosynthesis, cell-free prep., 159, 170; hydrocortisone effects in rheumatism, 1648; in brain, 2780; in pleural tumours, 835; in synovial fluid, 163, 1648; i.r. dichroism, 162; interaction with albumin, 160; metabolism, connective tissue, 169.
in bone, Mn deficiency, 3089.
in embryonic chick, 2779.
in neonatal cartilage, 166.
isolation from spleen, amyloidosis, 5693 f.
keratosulphate: elasmobranch & whale, 171; metabolism, 169.
metabolism: & aldosterone production, 4566; in connective tissue, 169.
sialo-, brain mitochondria, 168.
urinary heterogeneity, 173.
uronic acids in, 5218.
Mucoproteins. See **Glyco- & mucoproteins**.
Mucous membranes & **mucosa**. See sp. glands & system...
Mullerian ducts. See **Reproductive tract**.
Multiple sclerosis. See **Sclerosis**.
Mumps. See **Viruses, animal**, myxo group.
Munetone. See **Flavonoids**.
Murexide. See **Dyes**.
Muscarine (see also **Cholinergic agents**), & arecoline, c.n.s effects compared, 4006.
Muscle (see also **Heart muscle**; **Neuromuscular**; **Reflexes**, **Work**), for sp. musculature refer to relevant organ or part, e.g. **Uterus**; **Muscles**, specific, below).
blood flow. Keier to **Cardiovascular system**, **haemodynamics**.
development, enzymic maturation, 21.
pharmacol. studies. Refer to individually named drug, dnif^troup or hormone, e.g. **Cholinergic**; **Catecholamines**; **Histamine**; see also—contraction/relaxation, & —relaxants below.
receptors/spindles. Refer to **Nervous system**, afferent & sensory.
regeneration: heterotopic muscles effects, *Ambyxstoma*, 4942; myoblasts origin, 5072.
survival under stretch in KCl, (title 8) 7155.
temp. adaptation, 7138.
thermogenesis, non-shivering, role in, 4247.
Muscle apparatus & **techniques** (see also—electrical properties below), electrode, permanently implanted, 1716.
ergograph, 4239.
force transducer, extraluminal for g.i. tract, 4517.
relaxing factor prep, method, 3257.
transducer for respiratory movements, small animals, 1854.
Muscle composition & **metabolism** (see also—contractile proteins below; **Heart composition** & **metabolism**), ATP & phosphocreatine, low temp, effects, 3507.
amino acids, N supplement effects, low-protein diet, rat, 3177.
carbohydrates: glucose, 1782, (title 59) 7148; glucose & glycogen, 2746, 6294, (title 57) 7148; glycogen, 155-6, 4272-3, 5196, 5543, 6399; insulin effects, 2746, 4273, 5555, 6294.
C & PO₄ incorporation, insulin stimm., 669.
contraction factor effects, 3256.
electrolytes: changes in vitro, frog, 6396; Na, 3080, 4271.
electrolytes, & water, 4270.
enzymes, 155, 565, 2957, 3112, 5175, 5389, 5473.
histamine, stress effects, 3382.
lipids & liposol. vit., fish (*Scorpaena*), 3166.

Muscle composition & metabolism.

mitochondria, Na, K, N, P, & lipids, 3503.
nicotinamide nucleotide reoxidation, atrophic muscles, 5177.
ophidine & carnosine, whale, 5466.
oxidative phosphorylation, temp. effects, 3499.
proteins, post mortem lability, 367.
sol. fraction stimulating ribosomal leucine incorporation, 487.
spectrophotometry, 6393.

Muscle contractile proteins (for general aspects of proteins, see **-composition & metabolism**, above).

actin: bound Ca exchange, 3084 f; SH group reactivity, cations effects, 3076.
actomyosin-like protein, liver mitochondria, 365.
fractions correlation, different muscle types, 2900.
meromyosin, heterogeneity, carp, 5298.
meromyosin H, actin binding ATPase activity, 5391.
myosin A, optical-rotatory dispersion, 366.
of crayfish, 5290.

SH regions, peptide charts of, 5325.

Muscle contraction/relaxation (see also **-contractile proteins** above; **-relaxants** below; **Spasmodics, Stimulants, etc.**).

phosphate in, (title 70) 7148.
relaxing factor: from blood platelets, 5585;
independence from of ATPase substrate inhibn., 5389; prep. method, 3257; structure & physicochem., 6392.
succinyl choline effects, (review) 6232, 6233.
tetanus, neonatal, pulmonary compliance in, 6333.
tetany, heat-induced, (title 42) 7154.
twitch & tetanus, birefringence changes in 6390.
work capacity, SHT effects, 6249.

skeletal,

contraction factor, metabolic effects, 3256.
isotonic, energy production & phosphocreatine hydrolysis in, 6391.
potentiation by piperidylmethylandrostane, 4031.
tetanus, isometric, phosphocreatine metabolism, in 1794.
smooth (see also **Gastrointestinal tract, intestine**), active relaxation, noradrenaline induced, 4269.
adrenaline-induced contraction dissociated from lactic acid production, 6398.
Ca & Mg effects, uterus, 1795.
glycogenolysis as related, 6399.
electrolyte effects: Ca, 1901.
SHT, mechanism of action, 1797.
pharmacol., 4044, 4150-1.

Muscle disorders (see also **Neuromuscular incoordination**).

atrophy, changes during recovery from, 3504.
degeneration, anabolic steroids & glucose effects 6258.
dystrophy: e.g. & circulation changes in, 4378; enzyme changes in, 3114; fish, amphibia, reptiles, 23; fixed glycogen absence in, (title 73) 7148; glycolytic & citric acid cycles in, 986; kidney Se concn. in, pig, 5444; -like lesions, expt. auto-immune, 1181; lysosomes & tissue damage, (title 61) 7148; methylandrostenediol dienanthroacetate treatment, 1645; nucleic acid metabolism in, 438; plasma proteins in, 31731; testis in, 5689; transamination in, 5550; ubiquinones & phytolubichromenol effects, 3150.
myasthenia gravis: anaesthesia in, 6697; -like condition, production, rat, 4186.
tumours, 1257.

Muscle electrical properties (see also **Electroplax, Heart-, Neuromuscular**),

e.m.g., thyrotoxicosis patients, (title 4) 2598.
fibrillation potentials, drug effects, advanced local tetanus, 4032.
membrane potentials, Na & K as related, insects, 7108.
psychomimetics effects, 1659.
repetitive discharge, anti Chases-induced, 4035.
resting potential changes in vitro, 6396.
slow & twitch muscles, frog, 1793.
tetraethylammonium effects, taenia coli, 1796.
X-rays effects, 1930.

Muscle electrolytes. See **-composition & metabolism; -electrical properties**, above.**Muscle, invertebrate,**

crustacean: amino acid concn., *Eriocheir*, 4958-9; contractile proteins, crayfish, 5290; GABA effects, *Cancer*, 6397; giant fibres, barnacle, 2579; glutamate-induced depolarisation, *Cambarus*, 6394; membrane current, *Cancer*, 4972.
insect: denervation response, locust, 4978; flight muscle, enzymes as related to age & flight ability, 7021; glutamic acid enzymes, cockroach, 5278; of ovipositor, *Nasonia*, 4991; K contracture, Ca effect, 6395; Na & K related to membrane potentials, 7107.

Muscle relaxants (see also **-contraction/relaxation** above),

acting at neuromyal junction. See **Neuromuscular blocking agents**.
acting on smooth muscle. See **Spasmolytics**. centrally acting (see also **Anaesthesia & anaesthetics; Anticonvulsants; Sedatives; Tranquillisers**), 2-ethyl-3-methyl valeramide, 3985.

Muscle structure/histology (for histochem. & function, see preceding **Muscle** sections), cell membranes, radiation damage, 1087.
cytoskeleton & cement, (title 125) 7148.
fascia, collagenase effects, 1357.
filament lattice, X-ray & light diffraction, 4268.
irregular bands, E.M. pig, 5075 f.
of thyrotoxic patients, (title 4) 2598.
post mortem changes, E.M., pig, 22.
precapillary sphincters, nervous & chem. control, 6525.
Muscles, specific, diaphragm (as prep. for metabolic studies see **-composition & metabolism** above; & e.g. **Amino acids; Carbohydrate metabolism**), blood supply, 1922.
histophysiol., 2655.

innervation, dog, 4444.
stretch receptors, (title 3) 7155.

gastrocnemius, in ankle jerk, man, 4274.

incisive, rat, 2714.
longissimus dorsi, post mortem colour change, pig, 5074.

soleitis, in ankle jerk, man, 4274.
Mustard, thiamine sparing action in diet, rat, 3188.

Mutagens (see also **Chromosomes, aberrations; Cytostatic & cytotoxic agents; Mutations; Radiomimetics**), effects on phage production & streptomycin-resistance, *Bac. megaterium*, 6016.

metabolic inhibitors & metallic ions as affecting yeast, 2337.

named cpd.: acenaphthene, 4726; Acridine Orange, 3816; acriflavine, 2338; dimethyl sulphate, 6073; ethyleneimine, (title 35) 7155; ethyl methanesulphonate, 5623, 6073, 6873; 5-fluorodeoxyuridine, 6817; hydroxyalamine, 3816, 6073; lasiocarpine, 6819; 1-methy 1-3-nitro-1-nitrosoguanidine, 4724; monocrotaline, 6819; N mustard, 6818; HNO₂, 4754, 6073, 6864, 6866; 8-oxyquinoline, phenyl isocyanate & streptomycin, 3816.

review, (title 2) 2599.

synergistic effect with radiation, 6817.

Mutations (see also **Adaptation; Chromosomes, aberrations; Genes; Variation**), affecting antibiotic resistance, 1524.

affecting carbohydrate metabolism, *Aspergillus*, 2342.

affecting enzymes: ribitol dehydrogenase, *Aerobacter*, 182; steroid dehydrogenase, *Pseudomonas*, 714.

affecting nucleic acids, RNA biosynthesis, 464.

affecting phosphate metabolism, *Aerogenes*, 3837.

affecting proteins, *E. coli* A-protein, 2332.

affecting purines, adenine, yeast, 4761.

affecting resistance to pyrimidine analogues, *Streptococcus*, 763.

age as affecting somatic mutation, mice, 4777.

anti-mutagenic activity of: 8-ethoxycaffeine,

6817; Methylene Blue & Toluidine Blue, 2338.

as related to carcinogenesis, 2328, 3712.

attempted induction by centrifugation, *Drosophila*, 4789.

chem.-induced (see also **Mutagens**): affecting transduction, *Salmonella* phage P22, 6866;

dose & stage of gametogenesis as affecting, (title 35) 7155; in virus, 6073; tetraploid beet, 4726.

Mutations,

detection in mouse histocompatibility loci after X-irradiation, 1187.

directed mutations, yeasts & bacteria, 4759.

episomic control, *Salmonella*, 4758.

freq.; post incubation as affecting, *E. coli*, 6015; sex differences, haemophilia, man, 23**

spherocytosis, man, 2398.

human (see also "freq." above), as related to congenital malformations, 2401.

mutational load man, 2402.

nucleic acids as related to mutation frequency survival, *E. coli*, 6015.

of bacteria: *Aerobacter aerogenes*, 182, 3816.

E. coli, 464, 2332, 3815, 4755, 5207, 52015;

Noocardia rugosa, 648; *Pseudotrichia testosteroni*, 714; *Salmonella typhimurium*, 847, 4758; *S. typhosa*, 1524, 6043; *Shigella flexneri*, 1418; *Streptococcus faecalis*, 5201; *Streptomyces auxotrophs*, 3816.

of bacteriophages: affecting transduction, *Phage*, 6866; fr. plaque mutants, 4754; u.v.-sensitive, 6864; T5, density change, 6865.

of fungi: *Aspergillus nidulans* carbohyd^r metabolism, 2342; *Coprinus lagopus* mat^h type factor, 2336; *Neurospora* (a) affect^h complementation & enzyme phenot^h 4762, (b) incompatibility factors, 2342; *Penicillium expansum*, 4765.

of higher plants: affecting pigments & chloroplasts, 968, 2357-60, 3484; as related to plant breeding, 2348-50, 4726; chem.-induced, 4724, 6817, 6819, 6873; solid stem, 2342; *durum*, 6871.

of mammals, mice, 4776-7.

of viruses: induction in NDV, 6073; poly^U mutants, 6125.

of yeasts: *Saccharomyces* respiratory mu^W 2337-8; *Schizosaccharomyces*, suppression

reversion, 4761.

radiation-induced, by fluorescent lights, 1004.

by v-rays, 3815, 4765.

by u.v., 3816, 4765, 6015.

by X-rays, 1187, 2348, 2357, 3816, 6817, & in plant breeding, 2348-50.

mutagenic risk estimated, man, 2401.

reversion: 2nd site reversion, 2332; to adenine independence, suppression, *Schizosaccharomyces*, 4761.

somatic, age as related, mice, 4777.

Myasthenia; -gravis. See **Muscle disorders**.

Mycorrhizas. See **Fungi**.

Mycose. See **Trehalose**.

Mycoses. See **Fungal infections; Lungs, disorders**.

Myelin sheath myelination. Refer to **nerve system, structural elements**.

Myeloblastosis, avian. See **Viruses, tumour associated**.

Myelocytes; **Myeloma**; **Myelomatosis**.

Myelosis. See **Bone marrow; Tumours, malignant**.

Myleran (busulphan). See **Cytostatic & cytotoxic agents**.

Myocardium. See **Heart**.

Myoclonus. See **Neuromuscular incoordination**.

Myoglobin (see also **Haem proteins**), & protein structure, 5303.

cleavage with cyanogen bromide, sperm whale, 2939.

differentiation from Hb, 5304.

metmyoglobin, Cu & Zn ions inter., sperm whale, 3098.

Myometrium. See **Uterus**.

Myoneural junction. See **Neuromuscular junction**.

Myopathies. See **Muscle disorders**.

Myosin. See **Muscle, contractile proteins**.

Myriapods. See **Chilopoda** (centipedes); **Diplopoda** (millipedes).

Myristic acid. See **Fatty acids, sat., C₁₄**.

Myxoedema. See **Thyroid disorders**.

Myxomas. See **Tumours, specific**.

Myxoviruses. See **Viruses, animal**.

X.

Nails. See **limbs, digits**.

Nalorphine. See **Morphine antagonists**.

Naphthoquinones. See **Quinones**.

Naphthocopherol. See **Tocopherols**.

Naphthylamine. See **Amines, aromatic**.

INDEX OF SUBJECTS

- Karoots**: Narcotics. See Anaesthesia & anaesthetics.
hypno: Sedatives & hypnotics.
Macropharyngeal region (see also Adenoids; Larynx -carinae of *Haemophilus influenzae*, children, 6052.
nasal: septum epithelium, structure, rat, 2636.
transpi: mucosal glands, man, (title 46) 7152.
nitration: studies, *Ambystoma*, 7037.
Iu^tis: Natriuretics. See Diuretics; Kidney function.
Sodium.
focX^ion: See M^ation; Orientation.
re^Kspot: See Viruses, plant.
W t S: Helminth anti-agents.
HoEj^on: Aschelminthes; Helminth infec-rekbl^: -agents; & Taxonomic index.
remers: (Pentobarbitone)—See Barbiturates, fehl.
compon: gestation, *Lineus ruber*, 4947.
compon: structure, 3471.
lecar: See Antibiotics.
bovi: Development; Infants; Umbilical 02. See also Development; Infants; Umbilical
^H^ serum: enzyme levels in hydrocephaly, 6384.
dog: b^y temp., 6384.
stem^in loing: responses, 4672; suckling, guinea-pig: as affecting, 4665.
pig: hepatic fructokinase development, 177; O₂ consumption, on cold exposure, 8474.
hamate: Viscum album m. relationships m., 107.
neat: Viscum album m. relationships m., 107.
hUn^oduction: control, (title 50) 7154.
hUn^od:
 4227, pressure (a) measurement method, 4410; (b) venous, during transfusion, 2200; r.l.c. composition & metabolism, 4227.

poliomyelitis, 1448, 6078-9.
various c.n.s. lesions, 1180.
Nervous system, electrical properties & activity, including excitation, conduction & transmission (see also **Brain electrical activity/e.g.**), action potential, electrolytes effects, sympathetic ganglion, 4448.
Chase inhibitors effects, 4035.

- Nervous system, electrical properties & activity,** conduction: ACh role, 4026, 6530; morphine effects, 4027; velocity, ethyl alcohol effects, 1932. excitability changes in Ca deficiency, 4435. fusimotor activity, cat, 1934. ion movement during, 3077. miniature potentials, spinal motoneurones, 6534. postsynaptic potentiation by presynaptic stimm. 4052. refractory & super-normal periods, 4436. Schwann cells & axon potential differences, squid, 6531. slow potentials, pre- & postsynaptic, sympathetic ganglia, 4446. synaptic potentials, spont., sympathetic ganglion cells, frog, 4449. synaptic transmission, 4447, 4450, 6540-1. X-rays effects, 1930. venoms effects, dependence on penetration, 6532.
- Nervous system, invertebrate** (see also **-invertebrate** subsections of **Neurohumoral mechanisms**; & **Neuromuscular function**), annelid: brain extirpation effects on learning, polychaetes, 4680; giant fibre response, *Myxicola*, 7085; nuclear structure, nerve cord, *Hirudo*, 6778. coelenterate, mathematical model, 4969. crustacean: chemoreceptors, various spp., 4973; giant fibres, structure, 4971; stretch receptors, crayfish, 4974. echinoderm, fine structure, *Asterias*, 7077. insect: brain cytol. & cytochem., cockroach, 4977; dieldrin absorption, cockroach, 1741; electrode implantation, locust brain, 7081; frontal ganglion removal effects, locust, 7065; georeceptors, Hymenoptera, 4976; inter-pseudotracheal papillae innervation, blowfly, 2506; maxillary chemoreceptors, *Bombyx*, 2543; stretch receptors (a) cockroach, 4975, (ty locust, 7079. mollusc: dopamine in ganglia, 6253; excitatory & inhibitory pathways, arm, *Octopus*, 7086; memory systems, *Octopus*, *Sepia*, 7084; movement receptors, *Buccinum*, 2539; nerve cells, no. & size, *Octopus*, 2541; pulsating ganglion, octopods, 2540.
- Nervous system, motor function** (see also **Motor activity**; other **Nervous system** headings; **Neuromuscular**; **Reflexes**), alcohol effects, rat, 4477. extensor motoneurones, ipsilat. excitation, 4439. y-motoneurones, 2159, 6538.
- Nervous system, pharmacology** (see also **Drug headings**), autonomic (see also **Adrenergic agents**; **-blocking agents**; **Ganglion blocking agents**; **Vaso-active agents**): eserine, 4083; picrotoxin on sympathetic c.v.s. control, 4142. block by ACh, cetyltrimethylammonium-treated fibres, frog, 6236. central (see also **Behaviour**, drug effects; **Convulsions**, drug-induced; **Psychotropic agents**): arecoline & muscarine, 4006; benzodiazepines on amygdala & hippocampus, 3976; brain metabolism as affected, 3991-3, 3997; cyclo-propane, 6207; etryptamine acetate, 1604; hydrazine deriv., 3980; iproniazid, 3998; meprobamate, 4003; morphine, 1617; nicotine 4019; strichnine, 4020; sulphonylurea cpd., 6222; tubocurarine, 3984; various depressants, 3968. drug-binding protein from electroplax effects, 3974.
- Nervous system, regeneration**, peripheral nerves, E.M., 5058. spinal cord, 4437.
- Nervous system, structural elements, including histol. & histochem.** (see also **-composition** & **metabolism** above; & **Brain, histology**), astrocytes, dehydrogenase activity, 3365. beading phenomenon, stretched myelinated fibres, 1931. communicating rami, myelinated fibres, 2619. dendritic patterns in nerve cell classification, 2602. myelin sheath: Ca role, 4433; Largactil effects, (title 10) 7155; phosphoglycerides of, 2; ultrastructure, 5054-5.
- Nervous system, structural elements.** nerve granules, adrenergic noradrenaline uptake & release, 4486. paranodal apparatus, myelinated fibres, 5056. plasma membrane, ultrastructure, 5054. Schwann cells, 2621, 5057, 6531. synapse at central node of Ranvier, 1. synaptic vesicles isolation & ACh system, rat brain, 4484.
- Nests & nesting**, edible haemaggl. inhibitor in, 746. structure comparison, weaver birds, 7137.
- Neuraminic acids**, JV-acetyl- & IV-glycolyl-, in blood, 2748; in blood-clotting, 1827; in brain during ethanol intoxication, 5198; in gastric mucus, 4516; in inflammatory poly-nuclear cells, (title 9) 7164; in r.b.c. & tumour cell, 3748; serum levels, carcinogen injn., 1290. colominic acid, enzymic synthesis, 195. metabolism, 2778f. sialomucopolysaccharides, in brain mitochondria, 168. sialyl-lactose, enzymic synthesis, 189.
- Neuroblastoma**. See **Tumours, specific**.
- Neurogia**. See **Nervous system, structural elements**.
- Neurohumoral mechanisms** (for neuro-effector junction studies refer to **Nervous system**; & **Neuromuscular** headings; see also **Endocrine systems**), antiplasmin system, 6444.
- MAO system**. See **Enzymes**; **oxidoreductases**; see also **Monoamine oxidase inhibitors**, non-cholinergic endings, brain, 32601. tryptamine receptors, c.n.s., 6211.
- adrenergic** (see also **Adrenergic** & related headings; **Gatecholamines**; **Nervous system, autonomic**; & **-central**): a & fi receptors, radio-pharmacol., 2010; c.v.s. effects, various vertebrates, 1906; noradrenaline release (a) pH effects, 4486, (b) sympathetic postganglionic fibre, 6241; spleen, cat, 4452.
- cholinergic** (see also **Acetylcholine**; **Cholinergics** & related headings; for Chase, see **Enzymes, specific esterases**): conductance changes at end plate, 1928-9; role in conduction, non-myelinated nerves, 4026; sympathomimetic, spleen, cat, 4451.
- invertebrate** (see also **Endocrine systems, invertebrate**), annelid, neurosecretion, *Pelodrilus*, 5004. crustacean, light-adapting hormone, neurosecretion, 5005. echinoderm, cholinergic, from sea urchin pedicellariae, 2577. insect: brain hormone, prop., *Bombyx*, 3230; corpus cardiacum, glycogen mobilisation by, cockroach, 5554; neurosecretory cells response to dehydration, cockroach, 7064; pars intercerebralis neurosecretion, cockroach, 4977. cholinergic receptors, ACh effects, 4981.
- neurohormones & transmitter substances** (see also named hormones, e.g. **Acetylcholine**; **Aminobutyric acids**; **Catecholamines**; **5-Hydroxytryptamine**; for receptors refer to **Nervous system, afferent & sensory**), release, quantal, sympathetic synapse, 4450. substance P, 6606.
- neurosecretion/neurosecretory systems, vertebrate**. See **Brain, hypothalamus**; **Pineal**; **Pituitary**, etc.
- Neurohypophysis**. See **Pituitary, posterior**.
- Neuroleptics**; **Neurolegics**. Refer to **Sedatives & hypnotics**; **Tranquillisers**.
- Neuromuscular blocking agents** (see also **Cholinergic agents**; **-blocking agents**; **Ganglion blocking agents**), alkalosis effects, 6229. chem. structure, 1620. choline analogues, 4029. curare/tubocurarine & deriv.: antagonism by caffeine, 6230; central effect, analysis, 3984; seizure produced by injn. into cerebral ventricles, 6555. decamethonium & gailamine, post-tetanic relief, 1624. onium cpd., bis- & poly-, 4030. orphenadrine, 4033. site of action, 4028. X-rays, 1930.
- Neuromuscular coordination**. Refer to **Brain, central control areas**; **Motor activity**; **Nervous system, motor function**; **Reflexes**; **Wards**; also other neuromuscular headings above below.
- Neuromuscular incoordination** (see also **Convolusions**; & **disorder** sections of **Brain**; **1** & **Nervous system**; for therapeutic refer to **Anticonvulsants**; **Muscle relaxants**).
- Neuromuscular blocking agents**, myoclonus, intention or action, 4470. paralysis, familial periodic, production of fit resembling, rat, 4186. Parkinsonian, action tremor & **coospasm**, tremors, minor, sensory stimm. effects, 1957. **Neuromuscular junction & transmission** (**synapses** & **Muscle**), poisons affecting, refer to **Phosphoforphorus**; **pounds, organic**; **Toxicology**; **Toxins**, Ca release, 4434. conductance changes with ACh: 1928; effects, 1929. facilitation: crayfish, (title 11) 7155; ethyl induced, 1932. drug action: flux-carrier hypothesis, miniature end-plate potentials as ai 4034. 5HT effects, 6249. miniature end-plate potentials, drug 4034. of annelids, 4970. tropine & v/tropine aryl esters effects, 6229. vesicular nerve endings, smooth muscle*. **Neurones**. See **Nervous system**.
- Neurosecretion**. See **Neurohumoral mechanisms**.
- Neurosporoxanthin**. See **Carotenoids**.
- Neurotropic drugs**. See **Nervous system, pharmacology**.
- Neutral Red**. See **Dyes**.
- Neutron**; **-activation analysis**. See **Radiation**; **Radiological headings**.
- Neutral salts**, metHb & metmyoglobin pb²⁺ chem. as affected, 336.
- Newborn infants**. See **Neonates**.
- Newcastle disease virus** (NDV). See **animal, myxo group**.
- Niacin**; **Niacinamide**. See **Nicotinamide**; **time acid**.
- Niamamide**. See **Monoamine oxidase inhibitor**.
- Nickel** (see also **Metals**), stim. of mitosis, broad bean roots, 6828.
- Nicotinamide** & **nicotinic acid** (see also **Ipf**; **Isoniazid**; **Vitamins**), requirements of mosquito larvae, 3145. uptake by ascites cells in vitro, 3196. **nicotinamide**, analogues/deriv: 3145; 6-amino-, terai activity, 5124; N-methyl, uridine increased by nicotinylalanine admin., nuclear RNA metabolism affected kidney, 3195.
- nicotinic acid**, analogues: 3-acetyl pyridine & 6-amino-**tinamide**, interaction in terai toxicity, 5124; effects on mosquito 3145; poisoning, 735. antimeta Wolte, imidazole, as pestcide, biosynthesis, by *Mycobact. tuberculosis*, U depressing growth-stim. effects of yeast, 6148. effect on expt. nephrosis, 3662. in coffee, 900. release from niacinogen in rice extracts, 5540. renal excretion, drug effects, (title 5) \$ stim. effects in hypo-oxaemia, rs-tryptophan metabolism after viral 810. u.v. radiation effects on, (title 36) 71*
- Nicotinamide nucleotides**, & apoenzymes, (title 3) 7143. biosynthesis, reduced by orotic acid, 41F. in chloroplasts, 3487. in r.b.c., newborn infants, 5664. in skeletal muscle, 6393. -linked reactions, catalysed by **milk oxidase**, 594. non-enzymic H transfer between, 297 reduction, energy-requiring, 5364. separation, TLC, 2966.

INDEX OF SUBJECTS

- Nicotinamide nucleotides,** ^{DP residue in, role in dehydrogenase action mechanism, 3118.}
- Synthesis:** orotic acid effects, 409.
- ArDonyl addition reactions:** in frozen alk. soln., 2973.
- Pa.** formed by glyceraldehyde 3-PO₄ dehydrogenase, (title 90) 7148.
- Inversion to NADP:** 5557.
- Zymic breakdown:** 2976.
- Wrolysis:** buffer effects, 2967.
- X⁺ageenin-induced granulomata:** 2965.
- linked systems:** 3-hydroxyanthranilic acid effects on, (title 102) 7148.
- Purification &c effects of impurities:** 2969.
- Isotopes with Δ^2 :** 2963.
- Induction:** by ascorbate, with CoQ or menadione, 3214; by succinate, sub-mitochondrial particles, 400, 403; energy-linked, ATPase control by, heart mitochondria, 3029.
- JPS* of Δ^2 uptake by mast cell tumour.**
- NAD & NADH:**
- (i) liver: depleted in steatosis, 5518; ratio, normal & alloxan diabetic rats, 3232.
 - (ii) ^{58}Zn mocyte S ionism S radiation effects, 5822.
 - (iii) pyridine deriva in brain, 735.
 - (iv) Patoma 8c regenerating, 5367.
 - (v) oxygen action, with peroxidase, 705.
 - (vi) dehydrogenase isoenzyme demonstration, 5481.
- NADH & NAD PH:**
- (i) complex with alcohol dehydrogenase, crystn., 584.
 - (ii) inducing chemiluminescence of phenazine methosulphate, 997.
 - (iii) inhibn. of pregnenolone to progesterone conversion, adrenal, 707.
 - (iv) menadione interactions, brain, 2962.
 - (v) oxidation: & transhydrogenation, xanthine oxidase, 594; ox heart enzyme, 2970.
 - (vi) reaction with 0-aminobenzaldehyde, 2974.
 - (vii) H₂ transfer from, to squalene, 2838.
 - (viii) brain, 2962, 2975.
- NADP:**
- (i) action, 558.
 - (ii) adipose tissue metabolism in vivo, 558.
 - (iii) reduction: by glucose 6-PO₄ dehydrogenase, adrenal, 5802; energy-linked, sub-mitochondrial particles, 3029; photochem., by algae extracts, 2977.
 - (iv) in retina, low in alloxan diabetic rats, 5556.
 - (v) oxidation: by flavoprotein, liver microsomes, 401; in muscle with increased glucose-metabolising enzymes, 5177; liver microsomes, 5797; stimn. by neuroamines, 5797.
 - (vi) in retina visual cycle, 628.
 - (vii) activation of Poly-A polymerase, nuclei, 306.
 - (viii) W ithalkal, 2963.
 - (ix) Δ^2 headings: Cotinine;
 - (x) Δ^2 action, TBr & chlorazanil effect, 2980.
 - (xi) biosynthesis, acetate, & succinate precursors, 2980.
 - (xii) ascidin, acting reticular system, 4019.
 - (xiii) biogenic acids, 2980.
 - (xiv) Nicotinamide ft nicotinic add. Nicotinamides. See Nicotinamide ft nicotinic add.
 - (xv) Nicotinamide, activity, 742.
 - (xvi) **See Precautions.** See Bye/vision.
 - (xvii) **See Phena.** —ly, implantation.
 - (xviii) **See Lipids.** metabolism.
 - (xix) **See Dyes.**
 - (xx) assimilation: NH₃, inhibn., Chlorella, 959; Ca & Na, 959; impaired, 4846.
 - (xxi) formation affected by, 4846.
 - (xxii) reduction in light, chloroplasts, 5761.
- Nitrate,** respiration coupled to oxidative phosphorylation, *Pseudomonas*, 866.
- root nodulation affected by, 4845.**
- Nitrite,** assay, 3527 f.
- Effects on vit.A storage, 3136.**
- 1-ethylglyceryl trinitrate, pharmacol., 1678.**
- reduction, chloroplasts, 960, 3483, (title 37) 7148.**
- diNitrochlorobenzene, as hapten, 1147.**
- rfiNitrofluorobenzene, as Ag, 5868.**
- NitroSuran derivatives,** nitrofurazone, resistance to, *Staph. aurens*, 6192.
- tuberculostatic effect, 6193.**
- Nitrogen,** assay in nucleoproteins, 3528.
- diln. of Δ^2 -butane in, olfactory threshold technique, 2005.
- liquid, blood preservation in, 4290.
- pulmonary clearance, as related to age, man, 1860.
- transfer across skin, man, 1786.
- Nitrogen cycle.** Refer to Nitrogen metabolism.
- Nitrogen dioxide, toxicity, thyroid effects, 4103.**
- Nitrogen isotopes, "N, excess in N cpd. of biol. origin, 5781.**
- Nitrogen metabolism, animal,** α -amino N, urea N & non-protein N, in r.b.c. & plasma, man, 1832.
- balance: after feeding different amino acid patterns, man, 3182; painful stimuli effects on, 4256.
- faecal excretion, nycthemeral rhythm, rabbit, 7074.
- GH effects on, 5561.
- N requirements, factors affecting, rat, 3174.
- Nitrogenous excreta, *Helix pomatia*, 4964.**
- "non-essential" N, effects on growth, infants, rats, 3175, 3177.
- of cold-exposed rats, 5527.
- radiation effects on N excretion from spleen, 3603.
- thyroid-dependent phases, (title 18) 7154.
- tissue N content: brain, after protein depletion, rat, 4479; muscle mitochondria, 3503; of reptiles, 4968; of wood boring pholad, 3516.
- Nitrogen metabolism, bacteria** (see also Nitrate, etc.), nitrification, *Arthrobacter globiformis*, 1553.
- of rumen proteolytic spp. 3801.
- Nitrogen metabolism, plant,** in ripening beans, 6944.
- N fixation by algae, 4872, 6161.
- N mineralisation in soils under grass, 6988.
- N nutrition: effects on chlorophyll formation, 4846; fungi, 3951.
- N sources for fungi & yeasts, 3901, 3912, 3951, 6929.
- review, (title 8) 5042.
- Nitrogen mustard(s).** See Cytostatic & cytotoxic agents.
- Nitrogenous compounds,** distribution in cornea, rabbit, 2887.
- effects on yeast speculation, 3901, 3912.
- N-containing peroxides, cytostatic effects, 3327.
- "N excess in, 5781.
- quaternary, chromatog., 5792.
- Nitroglycerine, as coronary vasodilator. See Vasoactive substances.
- Nitro-oleins,** inhalation effects, 6358.
- Nitrophenols, DNP,** deriv., chromatog. & assay, 2849-50, 2854, 5262.
- effects on: blood-brain transport, 4492, 4494; carbohydrate metabolism, 981, 2746; oxyntic cell ultrastructure, 5077.
- induced ATPase, mitochondria, 5771.
- inhibn. of CO, fixation, *Thiobacillus*, 722; pituitary adenoma formation, 1272.
- />Nitrophenylacetate, peptide imidazole, amine & phenolic groups reactivity, 2878.
- reaction with trypsin in dimethyl sulphoxide, 2938.
- 2,4-<ftNitrophenylhydrazones, paper chromatog., 5799.
- 2,4-<ftNitrophenylosazones, chromatog. of homologous series of, 1038.
- Nitropyrimidines.** See Purine & pyrimidine analogues.
- NitroQuinoline oxide.** See Tumours, inducing agents.
- Nitrosamines, tumour induction, 5933.
- Nitrous acid.** See Mutagens.
- Nitrous oxide, uptake & excretion, 1589.**
- Nivaquine B (Chloroquine).** See Protozoal antiagents.
- Noradrenaline; Norepinephrine.** See Catecholamines.
- Norandrosterone; Norethandrolone; Norethisterone** (norethindrone; 17a-ethynod-19-nortestosterone); Norethynodrel. Refer to Steroids.
- Normetanephrine.** See Catecholamines, metabolic products/methoxy-derivatives.
- Nomicotine, deriv.** See Alkaloids.
- Nose.** See Nasopharyngeal region; Olfaction.
- Novocaine.** See Procaine.
- NSD 1039 (JV-2-hydroxybenzyl-W-methyl hydrazine), b.p. effects, 1602.**
- Nuclei** (see also Chromosomes), anomalies: cytophotometric studies, 6859; E.M., 4695.
- anticellular Ab: auto-Ab in freeze-dried thyroid, 5882; in disseminated L.E., 3652.
- chromatin (see also Chromosomes), heterochromatin: cytochem., mammalian w.b.c, 6420; sex chromatin (a) as related to X-chr. inactivation, mammals, 2368, (b) at interphase, monkey tissues, 6799, (c) nuclear size as related, 6798, (d) of human neonates, 4731.
- composition & metabolism (see also Cell division), amino acids: 5419; incorporation, 1062.
- enzymes: DNA nucleotidyltransferase, 5396-7, (title 19) 7148; lactic dehydrogenase isozyme, 578; NAD pyrophosphorylase, 2254; 5'-nucleotidase, 5639; of liver nuclei, (title 21) 7148; RNA polymerase, 2031.
- nucleic acid & protein biosynthesis in normal & tumour cells, 3064.
- nucleic acids DNA: biosynthesis, 426; content, statistical analysis, 3002-3; in developing xylem, 6957; in Feulgen-neg. plants, 2279; in mammary cells, rat, 2996.
- nucleic acids RNA: actinomycin D-resistant, animal cells, 3059; biosynthesis, 2290, 2299, 3054, 5404-5; breakdown, 5406; fractionation & prop., liver, 427; of kidney cells, rat, 3195, 5407; rapidly labelled fraction, 3065; relationship with cytoplasmic RNA, 3066.
- protein: 5294; biosynthesis, 501, 3052, (title 20) 7148; in tumour cell nuclei, (title 17) 7148.
- pyroninophil granules, 2261.
- dimensions/vol.: size in relation to Barr bodies, 6798; vol. (a) growth in developing xylem, 6957, (b) statistical analysis, 3002.
- division. See Cell division.
- drug & toxic chem. effects, 2299, 6823-4.
- fate during autolysis, liver, 433.
- intercellular transfer in mixed cell cultures, 2282.
- localisation in cell, effect of 0-mercaptoethanol & dithiodiglycol, *Artemia* eggs, 6823.
- macronucleus of protozoa: 2260; -cytoplasmic relations, 2281.
- membrane. See Cell membranes.
- micronuclei, colchicine-induced, 70 f.
- multinucleation, effect of inflammation on liver cells, 6794.
- nucleoid, vaccinia virus, 6063.
- nucleoid: abnormalities, E.M., 4695; amino acid activation &c incorporation, frog egg, 5419; components, mitosis, bean, 6810; effect of 4-nitroquinoline AT-oxide, 6824; extrusion, thyroid, 4709; of regenerating liver cells, structure & X-ray effects, 2256; of tumour cells, review, 2255; origin & development, E.M. insect, 6781; prep. techniques, 2326, 6793; RNA, 2290; transfer of material to cytoplasm, plants 6800.
- of algae, 2279, 2485.
- of amphibian cells, 2326.
- of bacteria, 3072, 5404-5.
- of blood cells, r.b.c: 578, 2258; Hb in, newt, 4699.
- of crustacean eggs, 6823.
- of feathers, pheasant, 6777.
- of Feulgen-neg. plants, 2279.
- of fungi: heterokaryosis (a) estimation of nuclear ratios, 6858, (b) somatic recombination as related, *Cephalosporium*, 4766; of sexual organs, *Achlya*, 4717.
- of higher plants: 501, 2290, 6800, 6957; effects of plasmolysis & deplasmolysis, 2257.
- of kidney cells, 3195, 5407.
- of liver cells, 427, 433, 2031, 2256, 6794, (title 21) 7148, (title 10) 7163.

- Nuclei,**
of mammary cells, 2996.
of nerve cells: mammals & birds* comparison, 2608; quant. study, human hypoglossal, 2616.
of protozoa, 2260, 2281.
of thymus cells, 2261, 3590, 5396-7, 5789, (titles 19 & 20) 7148.
of thyroid cells, 4709.
of tumour cells, 2254-5, 3064, 5639, (title 17) 7148, (title 10) 7163.
of yeasts, 2262, 2275.
participation in virus formation (SV40), 3876-7.
physiochem. prop., review, (titles 13 & 16) 5036.
pyknosis, radiation-induced, 3590.
radiation effects (see also **Cell division; Chromosomes; aberrations**): 2485; of y-rays, 3590; of X-rays, 2256, 3590, (title 20) 7148.
size, activity as related, 467.
stability during histogenesis ageing & carcinogenesis, review, 4700.
structure: at interphase, *Triturus r.b.c.* 2258;
leech, 6778; *Rhodotorula glutinis*, 2262; *Saccharomyces cerevisiae*, 2275, (title 4) 5048.
techniques of study: E.M. autoradiography, 1024; isolation methods, 2254, 3072, 4746, 5789, (title 21) 7148; nucleolar prep., 2326, 6793.
transfer in amphibia, 4710, 6801.
virus development in, 3879.
- Nucleic acids,**
for studies of sp. tissues, organs & organisms, refer to composition & metabolism subsections of relevant bold headings.
chromium uptake, X-ray effects, 5823.
coding & decoding of enzymes, 3038.
interaction with actinomycin, 2993.
leukaemia inducing acción, tumour cell prep., (title 40) 7155.
plant, in rust-infected leaf, 2495.
viral glycoprotein complexes, 6113.
virus & cigarette smoke effects on, (title 7) 7156.
assays, detection ft separation,
brain intralaminar distribution, 2999.
cytophotometry, anomalies in, 6859.
nuclear fraction isolation, 3072.
plant, Feulgen negative, 2279.
biosynthesis ft metabolism,
bacterial, 471, 3061, 3565, 6015.
from labelled precursor, 456.
fungal, 4914.

730; -inducing convulsions, THAM protec-
tion, 4007.
infusion into ileum, rat, 2016.
inhalation effects, modifying local anaesthetic
toxicity, 1596.
inhibn. of metabolism, *Azotobacter*, *Aerobacter*,
859, 3838.
low, ventilatory responses to, Korean diving
women, 4332.
mode of admin, during respiratory acidosis,
4349.
promoting temp, adaptation, isolated cells,
7138.
radiation damage affected by, RNase inactivation,
y-rays, 1069 f.
succinic dehydrogenase ESR spectrum affected
by, (title 96) 7148.
tensions in biol. tissues/fluids: alveolar, during
diving & submarine escape, 4339-41; alveolar-
arterial gradient, newborn infant, 4343;
blood (a) arterial pO₂ in respiratory tract
disease, infants, 6476, (b) factor in respiration
after apnoea from hyperventilation, 1865;
normal & tumour tissues, during high pres-
sure O₂ breathing, 5985; r.b.c. 1805; tumours
(a) effects on sensitivity to alkylating agents,
5962, (b) polarographic assay, 5783 f, (c)
sensitivity of respiration to, 52.
therapy in infection, man, (title 38) 7152.
lack (see also Altitude; Asphyxia; Carbon di-
oxide),
anoxia: broncho-dilatation caused by, 4326;
cerebral, causing cerebral oedema, 1984;
** (contd.)

Oxygen, (contd. from **)
effects on glutamine utilisation by
tumour cells, 309; foetal, 46111; in the
phase of rabbit anthrax, 1406; inhib.
brain respiratory enzymes, 1353; of
phosphafide effects on, 5245.
effects on isolated retina function, 6589.
hypo-oxia: acute, cocarboxylase effects,
cardiac output during, 4368; effects on
pulmonary blood flow, arterial hypo-oxaemia, relation to
ventilation of chronic liver disease,
blood O₂ capacity in, rat, 6475; changes during, guinea-pig, 6286;
(a) effects on erythropoiesis, rat, 6415;
pulmonary vasoconstriction in,
sheep, 4411-2; effects on blood PO₂,
7024; effects on renal circulation,
effects on serum erythropoietin &
juxtaglomerular cell, 2039; hypo-oxaemia
expt., rat, 6471; hypo-oxic encephalopathy,
4470; inducing atelectasis & pulmonary
oedema, 6472; pressor response to
line during, 4398; radioprotective
1069t, 1096, 1099, 3566, 3605; resists
acidosis & alkalosis effects on, mice
suppression of thermogenic respiration
noradrenaline, 6384.
increasing r.b.c. carbonic anhydrase,
tissue mechanism of adaptation to, 7155.
Oxygen isotopes,
"O, in lung function studies, 4345.
"O, reaction with dihydroxyfumarate, 891.
Oxintic cells. See Gastrointestinal tract, sto.
Oxytocic/Antidiuretic/Vasopressor substance,
Antidiuretic hormone; Oxytocin; Pitressin
posterior.
Oxytocin (see also Pituitary, posterior),
analogues & deriv., synthesis & biol.,
3240.
8-arginine form (Vasotocin): assay*
isolation & biol. activity, 678.
effects of, on: adrenaline inversion, 678;
rat, 6245; aldosterone action, 678;
kidney, 6640; Na transport, "P up",
oxidative metabolism, toad bladder, 678;
spermatozoa transport, ram, 4628;
motility, 4605.
-inactivity enzymes, distribution in pre-
(title 20) 5038.
-induced labour, inhibn. by gestagenSi
6726.
inhibitor, from toad bladder, 3241.
-like activity: from pineal peptide, 678;
neurointermediate lobe, elasmobranch,
of vasopressin analogues, 677, 3242.
metabolic activity, puerperium, 4606.
post, pituitary content, estimation, 673.
release, inhib., by ethanol, rat, 4605.
uterine sensitivity to, 2118, 4608.
Ozone: fatty acid stereoisomer formation in
photosynthesis & transpiration as
leaves, 2422; toxicity, thyroid effects o²
P.
P-1727, toxic retinopathy, 6357.
Pacinian corpuscles. See Nervous system
& sensory.
Paedogenesis. Refer to Reproduction.
Pain (see also Analgesia; Nervous system
& sensory),
learning as affected, chick, 6750.
N balance effects, rat, 4256.
receptors, visceral, 4040.
threshold: ant. teeth, man, 5143; Mg²⁺
effects, (title 7) 7163.
Palatinose (isomaltulose), hydrolysis, 337.
Palmitic acid. See Fatty acids, sat., do-
Palmitoleic acid. See Fatty acids, unsat.
Paludrine. See Protozoal anti-agents.
Panaxadiol. See Saponins & sapogenin.
Pancreas (see also Olugagon; Insulin),
composition & metabolism,
enzymes: amylase, 6237, 6670; DNA
RNase, 3022, 5384, 5427; endopeptidase,
4516; esterase, 265; Upasases, 244,
6237; protease, 5573.
P cpd., 6624.
protein biosynthesis, 2277.

INDEX OF SUBJECTS

- creas,** Ration for E.M., 5096.
S⁺on , assay, 6672.
tissue, cells; a & o, 10, 2635; new type, E.M., 2634. obesity as affecting, mouse, 3784, 6669.
D⁺min method for, 5095.
Sto⁺rectom y effects, 4515, (title 3) 7155.
toplast bursting factor in, pig, 3426.
Jjj in gastric secretion, 4515.
etions & extracts, action, 4404.
 *s affected by: diet composition, 613; gastric distension, 4520; secretin, 2025.
Jitzyne content, 3135, 3375.
ynamide transfer in, 5498.
 *n. n. in vitro, 671.
thS⁺y technique, 2024.
Po⁺ extract admin, effects on, 6670.
Diabetes disorders (see also **Diabetes mellitus**), cystic fibrosis, 2003.
hypertrophy, chick, 744, 3148.
edema 2026
pancreatitis
tumours, islet cells, 1293, 5981.
Pantothenate & **Pantothenic acid** (see also **Vitamin**), deficiency, 633, 647, 3197, 6393.
 effects on serum C, (title 3) 7165.
 excess, adrenocortical effects, 3197.
 in adrenal, reduced in hepatoma-bearing rats, 5598.
Papaverine. See **Spasmodics**.
Papovavirus. See **Tumours**, specific.
papovirus See **Viruses**, animal, papova group.
arterial abr. - See **arteries** animal, papova group.
3776: lesion induction by humoral factor in, intoxicated & normal pairs, cross circulation in, 1193.
male-female, X-ray effect on bone marrow, sex difference, 3772.
tow! hydrogen in, 2706.
tr. I² ne & caries, 2731.
ans! o-inuinu nephrosis, 3667.
 *j⁺gantion of immunol. competent cell by,
 a chamber, for cell culture studies, 2588.
Hydrocarbons, aliphatic. See **Hydrocarbons**, aliphatic.
fcon! See **Viruses**, animal, myxo
 *J. immunol.; neuromuscular. See **Immunocompetence**; **unresponsiveness**; **Neuromuscular coordination**, respectively.
magnetism. See **Spectroscopy**, resonance.
enzymol. biosynthesis, *Euglena*, 869, 5190.
organic oec Phosphorus compounds, organic.
See also **Nervous system**, disorders.
Fungi; **Helminth**; **Pest control**, diseases; **Predation**; **Protozoal infections**, "Parasites" & "diseases" under affilic class names; & Taxonomic index), 5Q25! superseude in honeybees, effects on host, of nematode on *Chironomus* blood, Prop., 2558.
host-parasite relationships; as affecting parasites, *Dahlbominus*, 4994; effective to **traeon ceph** in *Cephas*, 5023; nemata, *Hypera postica*, 5025; pteromalid CS! ec ton by *Bracon bohemica* on sawflies, kches as frog endoparasites, 2556.
parasitic surveys of human infections, N. & C. America, 1519-20.
Parasitoid, insects enemies of Acridioidea, 5021.
Parasympathetic a.n.s.; **Parasympathomimetics**; **Parasympatholytics**. See **Nervous system**, autonomic; Cholinergic agents, & -blocking agents. See **Insecticides**.
Parathyroid glands, cytol & cytochem., 9, 2627, 6674. function, role, 1790, 2066, 3788. growth & secretion regulation, 2065, 5445. hormone: action site, (title 1) 5040; effects, 1791, 4558-9, 4574, 5430; immunoassay, 3673. hypertension, 4575.
kidney-relationship, (title 1) 7163. trachoma-relationship, (title 1) 4573.
- Paratyphoid.** See **Bacterial infections**; *Salmonella* in Taxonomic index.
Pargyline. See **Monoamine oxidase inhibitors**.
Parietal eye. See **Pineal body**.
Parkinsonian anti-agents (see also **Muscle relaxants**), Neuromuscular blocking agents; Phenothiazines; Tremorine, antagonists), efficacy & central anticholinergic activity, 3999.
Parkinson's disease/syndrome. See **Nenromuscular inco-ordination**.
Parotid gland. See **Salivary glands**.
Parthenogenesis. See **Reproduction**.
Parturition (see also **Neonates**, **Pregnancy**), analgesics, 6206. associated physiol. & biochem. changes, 224, 2092, 4595. hypocoagulaemia in, review, 6438. inhibn. by gestagens, rabbit, 6726. interpubic ligament, mouse, 4595. progesterone as related, sheep, 6732. puerperium: oxytocin effects in, 4606; vit. B₁ deficiency, 4609.
Pasteur effect. See **Carbohydrates**, metabolic pathways.
Pasteurisation. See **Disinfection** & **sterilisation**.
Paternity, probability determination, 2399.
Pectin ft pectic substances, in diet of various spp., 620. radiation-induced gelation of, 5824.
Pediatrics. See **Infants**.
Pendiomid. See **Ganglion blocking agents**.
Penicillamine. See **Chelating agents**.
Penicillin. See **Antibiotics**.
Penis. See **Reproductive tract**, male.
Pentaerythrite dibenzoate. See **Depressants**.
Pentobarbitone (nembutal). See **Barbiturates**.
Pentose pathway; **Pentoses.** See **Carbohydrates**, metabolic pathways, & sugars.
Pentosuria in Lebanese families, 4820-1.
Pentothal (thiopentone). See **Barbiturates**.
Pentylenetetrazol (metrazol; leptazol; cardiazol). See **Stimulants**, c.n.s.
Peptides, analysis: azophenyl-d⁺ isocyanate use, 5282; fluorescent reagent, (title 108) 7148. as protein degradation products, refer to individual proteins & Proteins. -chains, horse anti-toxins, 1233. cysteinyl-, ethyleneimine reaction, 2946. cytotoxic activity. See **Cytostatic ft cytotoxic agents**. denaturation by urea & guanidinium Cl, 5326. depsi-, cyclodepsipeptides, structure & formation, 873t, 2872l.
DNP deriv., chromatog., 5262.
 di-: chromatog., 2877; glycyl-leucine, metabolism, *E. coli*, 848; growth inhibn., *E. coli*, 3413; i-nitrophenyl acetate reactivity, 2878; valyl-leucine, Hb uptake, 490.
 endeca-: eleodoisin, structure, 2931.
 enzymic cleavage. See **Enzymes**, especially **peptidases**. glutaminyl-, cyclisation, 310.
 hepta-, related to evolidine, synthesis, 325 f. iodinated. See **Iodinated compounds**.
 lipo-: bacterial, 329; of ascites tumour, 218.
 -nucleotides. See **Nucleotides**. of Hb chains, chromatog., 5284.
 photolysis, 3560.
Soly-: antigenicity, 1226, 2961, 5867, 5904; hélices stabilisation, 2921; lysine (a) chromatog., 392, (b) mol. wt., 354; proline, structure 5330; synthesis, 3048; two-phase separations, 393.
 poly-, biol. active (see also named substances e.g. **Kinins**; **Oxytocin**): ACTH-releasing activity, 6647; adipokinetic action, review, 3255; albumin bound, separation, 344; in bovine pineal, 678.
 radiolysis, 1073.
 synthesis: 3048; enzyme study, 327; glucagon tetra peptide, 331; imidazole role in, 2873; racemisation, 2874.
 tetradeca-, structure, 3137.
 transport, peptidase activity as related, 5283. uptake, bacteria, 2875.
Peptides. See **Peptides**, poly.
Perception (see also **Discrimination**; **Eye ft vision**; **Nervous system**, afferent ft sensory; & related headings), visual: lag, as function of luminance, 4498; of size & distance, 6599.
Pericardium. See **Heart**.
Perchloric acid, tissue extracts by, tumour proteins in, 5686.
Periodate, cell wall Ag as affected, streptococci, 1395. -fuchsin reaction with orosomucoid, 2930. v-globulin glycopptide oxidation, 2879. oxidation in corticoid analysis, 3360.
Periodontium (see also **Bones**, alveolar; **Mouth**; **Teeth**; **Tongue**), references to man unless otherwise stated, argyrophilic fibres, chronic gingivitis, 2742. development of attachments, rat, 91. diseased, 2742, 2745, 5162-4.
 epithelium, mitotic rates, rat, 2718. gingiva: epithelium cells, mouse, 5140; pocket, 5144-5; water binding in, 5148.
Peristalsis. See sp. organs & systems, e.g. **Gastrointestinal tract**; **Muscle**, contraction.
Peritoneal cells (see also **Lymphoreticuloendothelial system**), mast cells, in haemoconia, 2646.
Permeability. See **Diffusion**; **Membranes**; **Osmotic phenomena**; & individual substances, tissues, organs & organisms.
Peroxides, hydrogen peroxide: carbohydrates interaction with, 5180; inhibn. identification as, 3324; inhibn. of tumour glycolysis, 2798; oxidation of 3,5-diiodotyrosine, 5572; role in phenazine methosulphate chemiluminescence, 997; use for PO₄ ester detection, 1034f; use in study of Methyl Green interaction with DNA, 414. lipid peroxides. See **Lipids**. N-containing, cytostatic effects, 3327.
Peroxyacetyl nitrate, action spectrum of damage to bean plants, 3314.
Perphenazine. See **Phenothiazine derivatives**.
Persantin. See **Vasoactive substances**.
Pertussis. See *Bordetella pertussis* in Taxonomic index.
Perugia cat virus. See **Viruses**, unclassified.
Pest control ft pesticides (see also appropriate headings under various animal taxa, e.g. **Arachnids**, anti-agents; **Insect control**; **Insecticides**), chemosterilants used against mites, aphamide, apholate, Tepa, 1743.
 chlorinated hydrocarbons: chromatog. detection, 5787, 5803t; in human fat, England, 6359.
 repellents for pigeons, 2148.
 rodenticides, warfarin dust & soln., 6363.
 toxic hazards to mammals: chlordane, effect on liver microsomes, rats, 6353; dieldrin (a) absorption in lung, rats, 6361, (b) fatal acute poisoning, 6362; organophosphorus cpd. potentiated by phenothiazine deriv., 1735; tri-o-cresolphosphate, man, 6365.
Pethidine (meperidine). See **Analgesics** (strong).
pH. See **Hydrogen ion concentration**.
Phaeochromocytoma. See **Tumours**, specific.
Phagocytes. See **Phagocytosis** & related headings.
Phagocytosis (sec also **Blood cells white**; **Lymphocytolendothelial system**; **Pinocytosis**), activity of RE system: bimodal stimm., 3429; cell (tumour) opsonisation by isoAb, 3737; endotoxin tolerance correlation, 3695; in chick embryo, 3773; i.v. cholesterol oleate effects, 1349.
 activity of w.b.c. spp. differences, 6421.
 C & natural Ab role in, 5996.
 inhibn. by: intact neoplastic body fluids in vivo, 5984; uterine secretions in vivo et vitro, 3284.
 of bacteria, opsonins' effect: on intracellular survival, 1108; rickettsiae, 1118.
Phalloidin. See **Fungi**, composition & metabolism.
Pharmacology. See **Drugs** & -pharmacology subsections of organs & systems, e.g. **Nervous system**.
Pharynx. See **Nasopharyngeal region**.
Phemerol, antibacterial effect, 1546.
Phenacetin. See **Analgesics** ft **antipyretics**.
Phenamine (amphetamine). See **Adrenergics**.
Phenanthrene, & derivatives. See **Hydrocarbons**, aromatic polycyclic.
Phenanthridinium, purine metabolism inhibn., tumour cells, 1706.
Phenazine compounds, methosulphate, chemoluminescence, 996-7. oxides, reduction, micro-organisms, 868.

- PheneMne.** See **Monoamine oxidase inhibitors**.
Phenergan (promethazine). See **Phenothiazine derivatives**.
Phenethylamines. See **Phenylethylamines**.
Phenethylbiguanide, in triglyceride biosynthesis, 2820.
Pheniprazine. See **Monoamine oxidase inhibitors**.
Phenobarbitone. See **Barbiturates**.
Phenol, bacterial metabolism, 867.
Phenolamines, mono- & poly-, methyl ethers, catatonic, 4196.
Phenolic compounds (see also **Amino-, Nitro-phenols, etc.; Lignin; Tannins**).
the following are indexed separately or further cross-referred: **Hydroxybenzoic acids**; **Hydroxycinnamic acids**; **Hydroxyphenylacetic, -lactic, -pyruvic acids**; **Phlorhizin**; **Propylgallate**; **Pyrogallol**; **Salicylates**.
"acetate derived", biosynthesis, 5744.
antithiamine activity, in review, 2595.
caffic acid: 605; dehydroxylation, caecum & rumen, 6203.
catechol acids, dehydroxylation, intestinal, 6203, (title 19) 5038.
catechols, enzymic oxidation, *Pseudomonas*, 479.
chlorogenic acid: 605; allergenic, 1148; biosynthesis, 1016; in castor bean & oranges, 3477.
1,2-dihydro-1,2-dihydroxybenzene & others, in benzene metabolism, 1002.
dihydroxyaromatic acids, chromatog., 3549.
dimethylcurvulinic acid, synthesis, 3414.
enzyme reactions with, 605.
filtration from cigarette smoke, 5648.
fungal biosynthesis & metabolism, 936, 3415, 3417.
in cockroach ootheca, 70201.
5-(10-pentadecenyl) resorcinol, in *Grevillea*, 935.
phloretin, inhib. r.b.c. stromal ATPase, 3321.
polyphenols: formation, trees, 3469; glycosidic, plants, 932-3, 942; in *Acacia* seed pods, 3473; in *Lithospermum* roots, 3470.
resorcinol, formation, *Aspergillus*, 3415.
y-resorcylate, inhib. malate dehydrogenase, 1661.
sinapic acid, & lignin biosynthesis, 3474.
tetrahydrofranklinone, in *Acradenia* oil, 944.
tritium labelling, 682.
vanillin, metabolism, effect of phthiviasid, 3513.
wedgefolactone, enzymic oxidation, 5745.
Phenolic groups, reactivity towards £-nitrophenyl acetate, 2878.
Phenolphthalein diphosphate, enzymic hydrolysis, crude juice, wheat, 5489.
Phenol Red. See **Dyes**.
Phenothiazine, antihelminthic potency, 4181.
effects, brain cyt., oxidase, sheep, 3500.
Phenothiazine derivatives, general entries are followed by named drugs.
anti-Parkinsonian & central anticholinergic activity, 3999.
chromatog. separation, 1619, 4190.
demethylation, conversion to antidepressants, *4004.
effects: audiogenic crises, 3978; brain phospholipids, 5249.
inducing ACTH hypersecretion, 3977.
potentiating organo-P poisoning, 1735.
named drugs, chlorpromazine: 1735, 3978; ADH-like effect, amphibia, 1607; action site, reticular formation, 3995; behavioural effects (a) 1610, (b) & e.e.g. effects, 3996, (c) intracarotid & intravertebral admin., 3968; effects (a) body temp., 4017-8, (b) brain amino acids, 3997, (c) brain limbic system, 3979, (d) brain membrane potentials, 6216, (e) brain phospholipids, 2832, 5249, (f) liver, 3036, (g) peripheral nerve myelin sheath, (title 10) 7155; growth effects, axolotl embryo, 1614; -induced agranulocytosis, 6306; inhib. alcohol dehydrogenase, 5614; inhib. starvation ulcers, 1615; -insulin interaction in teratogenesis, 2692; interaction with drug-binding protein, 3974; -nalorphine antagonism, 6213; tolerance development, 1658; toxicity, grouped fish, 4203.
diethazine ethopropazine, 3999.
methotrimeprazine, effects, respiration, 6212.
phenazepine, behavioural effects, 3987.
promazine, 1735, 4004, 5249.
Phenoxyacetic acids. Sec **Growth substances, for plants**.
Phenoxyauxins. See **Herbicides**.
Phenoxybenzamine (dibenzyline). See **Adxenergic blocking agents**.
Phenylalanine (see also **Amino acids; Dopa; Phenylketonuria**), i.v.-acetyl deriv., excretion in phenylketonuria, 804f.
affecting brain 5HT, rat, 694.
enzyme inhibn., 5275.
fluoro- inhibn. of (a) cholesterolaemia, 621, (b) viral nucleic acid synthesis, 749, 3390.
low temp. ESR study, 292.
reduction of cysteine analogue toxicity, 1733.
Phenyl-boric acid. See **Growth substances, for plants**.
Phenylbutazone. Sec **Anti-inflammatory agents**. /mns-2-Phenylcyclopropylamine (tranylcypromine). See **Monoamine oxidase inhibitors**.
JnPhenylene; /rJnPhenylmethane. See **Hydrocarbons**, aromatic polycyclic.
Phenylephrine. Sec **Adrenergic agents**.
Phenylethylalcohol. See **Alcohols**.
Phenylethylamine, b.p. responses, potentiation, 1 (S1).
flt-Phenyl-a-ethylglutarimide (glutethimide). See **Sedatives & hypnotics**.
flrPhenylhydantoin. See **Anticonvulsants**.
Phenylhydrazine (see also **Hydrazides**), acetyl, in Heinz body determination, r.b.c., 6411.
Phenyl lactate, melanoma respiration inhibn., 5960.
Phenylphosphates. See **Phosphates**.
Phenylthiourea (phenylthiocarbamide; PTC), sensitivity, relation to Rh factor, 6901.
Phenizidole. See **Helminth anti-agents**.
Pheromones (see also **Endocrine systems, invertebrate; Neurohumoral mechanisms, invertebrate**), of insects, 2144-5, 2549.
Phlebiarbrane. See **Plant pigments**.
Phlebotomy. See **Blood, haemorrhage**.
Phloretin, stromal ATPase inhibn., sonic disruption effects, 3321.
Phloroxine B. See **Dyes**.
Phlorrhizin, amino acid transport as affected, kidney slices, 6636.
glucose reabsorption as affected, 6642.
stromal ATPase inhibn., sonic disruption effects, 3321.
Phonocardiography. See **Heart**.
Phosdrin. See **Insecticides**.
Phosphates, acid-sol.: in insect haemolymph, 3519; pilocarpine effects (a) after hepatectomy, 1698, (b) submaxillary gland, 1699.
esters, detection, 10341.
ethanol injn. effects on P cpd. in liver & pancreas, 6624.
groups, in collagens, role in cross-linkages, 384.
high energy. See **Adenosine phosphates; Creatine phosphate; Phosphorylation**.
incorporation into w.b.c. during leucocidin treatment, "P, 881.
lozenges, effects on calculus formation, 114.
of Ca, retention of Ca from, 5431.
ortho-, incorporation into phospholipids, frog, "P, 2834.
poly-: accumulation by *Aerobacter* mutants, 3837; role in glucose uptake by yeast cells, (title 6) 2594; tripoly-, release from ATP during vit. B₁₂ coenzyme biosynthesis, 3207.
pyrophosphate, effects on myosin A optical rotatory dispersion, 366.
structurally bound, role in muscle contraction, (title 70) 7148.
thiophosphate, inhibn. of ATP-inorg. PO₄ exchange, mitochondria, 3310.
inorganic, accumulation by mitochondria, 3087.
-ATP exchange, 3310.
blood levels, in puerperum, oxytocin effects, 4606.
distribution in biphasic extraction system, 220.
Phosphates, inorganic, in thyroid, TSH effects, 6691.
in washed ascites tumour cells, 998.
incorporation into phospholipids, ntp acids, etc., see **Phospholipids; Nucleic acids**, liberation by ATPase, oligomycin incl. 5613f.
plant virus infectivity affected by, 1489.
Phosphates, balance & metabolism (see also **BG; Cartilage; Electrolytes; Kidney function; Mineral metabolism; Parathyroid**), absorption & secretion in rumen, calves, blood levels: hypo-oxaia effects, tench, inorg. PO₄ levels, man, 4606.
blood cells, red, PO₄ cpd., dog, 5176.
bone, vit. D & parathyroid hormone < 5430.
dietary aspects, interrelations with Ca D₁ 2723, 3154.
fish ova, 2979.
muscle, "PO₄ incorporation, 669 f.
of bivalve molluscs, 7060.
of protozoa *Tetrahymena*, temp. effects, pilocarpine effects on, 1698-9.
plants: P levels, tobacco callus tissue *Trifolium* response to, 4847, 6923.
skeletal uptake, excess pyridoxine effects, thyroid, inorg. PO₄, TSH effects, 6691.
tumours: inorg. PO₄, 998; virus-induced neoplasia, 3388; washed Ehrlich ascites 998.
urinary excretion: after irradiation, rats, org. esters, man, 3363; parathormone ei dog, 4556.
uterine washings, anocalous sheep, 2097.
yeast, transport system, 5625.
Phosphatides. See **Phospholipids**.
Phosphatidic acid (see also **Phospholipids**), ACh salt formation with, 3109.
biosynthesis, r.b.c. membrane, 266.
P uptake, brain mitochondria, 5521.
Phosphatidylcholine; -ethanolamine; -serine. See **Phospholipids**.
Phosphocreatine. See **Creatine phosphate**.
Phosphoenolpyruvate, phosphatase action chloroplasts, 5762.
Phosphoglycerides (glycerophosphatides).
Phospholipids.
Phosphohistidine. See **Histidine phosphate**.
Phosphoinositide. See **Phospholipids; Phospholipids (sec also Blood Choline; Ethanolamine, etc.)**, acidic, pharmacol. active, 4131.
assays & separation, 226, 253, 2813, 197* biosynthesis, 62, 213, 218, 252, 255-6, 2832-4, 3308, 3312, 4562, 5244, 5248-9.
breakdown in mild alk. hydrolysis, 247, fatty acid composition, 3169, 5234, (tit*) 7148.
fraction activating cyt. c oxidase, 242.
in adrenals, man, 228.

J^rate reduction, wheat, 949.
nucleic acids,
synthesis : DNA, 761 ; RNA (a) isolated nuclei, 3054, (b) tobacco leaf fractions, 5402.
composition : RNA (a) metaphase chr. *Trillium*, 2290, (b) leaves, (title 19) 2594, 3013 ; xylem cells, 6957.
Metabolism: barley embryo, 6956; corn, 2991.
nucleotide levels, wheat, 2987.
of infected plants. See **Plants, diseases;**
of I¹³¹, Plant.
Pharmacological importance. See **Drugs, pharmacology.**
ganoboron cpd. breakdown, 4908.
acids levels : 3428f ; Crassulaceae, 4865.
succinic acid : biosynthesis, *Oxalis* shoot, 5748-9 ; leaves, saltbushes, 6920 ; metabolism, *Begonia*, 5747.
peptides : evolidine, *Evodia* leaves, 3251 ; saponinogluthathione content, bean seedlings, 28.
Phosphatidylglycerol isolated, spinach leaves, 34 2594.
Phosphorylation, 3486, 3492, 3498.
Photosynthesis. See **Chloroplasts; Photosynthesis.**
pecolinic acid deriv., isolated, *Strophanthus* spp., 956.
Prot³³ : biosynthesis, 501, 949, 2430, 3033f ; isolated, potato, 5751.
pyrimidine biosynthesis, wheat leaf, 3436.
respiration (see also **Respiration, cellular/tissue**):
affected by fumigants, 2422.
aerobic, swede tissue, 2425.
effect of DNP, pea shoot segments, 981.
electron transport system, 3492, 3494.
excised roots: pea, 6808; soya bean, 6943.
infected leaves, 2421.
fusion, rice, 4860 ; uptake, pea, 2459.
bean cotyledon, 4859; potato slices, 4858.
affected to age, *Phaseolus* seedling, 6939.
it & 2453.
respirating grapes, 6940.
steroid biosynthesis, maize, (title 41) 2594.
sulpholipid, (title 13) 5038.
thymidine degradation, *Lilium* buds, 5356.
toxic constituents. See **Toxicology.**
wood: synthesis, barley roots, 955.
constituents. See **Wood.**
J-ops (see also **Fruits; Foodstuffs; facad² & diet; Pastures; Plants sub-**
Vxngs; **Seeds;** for specific crops see
**onomic index.)
- Plants, crops.**
diseases affecting. See **Plants, diseases.**
for breeding expt. See **Breeding, plant.**
processed products : cacao curing, (title 10) 7141; coffee bean, nicotinic acid content, 900 ; tea, chem. analysis, 5733-4.
residue decomposition products, effect on soil fungi, 2476.
storage, potatos, 2474, 2482, 4896.
"Sr contamination: cereals, 6874; potato, 6919.
varietal populations, oat, 2313.
yield : affected by nutrition, wheat, spinach, 4846 ; potato, 2474 ; productivity, (title 4) 5039.
- Plants cytology/histology** (see also **Cell- headings** ; Chromosomes, of plants),
apical meristem,
histogenesis : aubergine, 4875 ; *Pisum*, 6958 ; *Sinapis*, 6973.
radiation effects on, oak, 4900.
callus tissue, P levels, tobacco, 951.
cell wall structure, (title 5) 2594, (title 15) 5048, 6962, (title 5) 7156.
cutin formation, *Gasteria* leaf, 3475.
fine structure,
Golgi apparatus: *Citrus* tissue, 6800; *Zea* root, 6787-8.
protoplasm, (title 2) 7156.
root hairs, 6992.
root tip cells, 1024, 6785, 6810.
gas spaces, roots, 4860.
intercellular cohesion, pea root, 2445.
mitochondria prep., (title 36) 2594.
plastids (see also **Chloroplasts**),
carotenoid-body, new organelle, *Mimosa*, 8994.
development & structure, *Liriopae*, 6934.
protoplast prep., (title 29) 2594.
rust infected leaves, 2495.
staining techniques, 2504, 7005.
stomata : movement (a) *Crassulaceae*, 4864, (b) *Xanthium*, 4920 ; width, effect on transpiration, 2403.
tissue cultures, 2460-1.
wound vessel differentiation, *Coleus*, 2447.
xylem : differentiation, bean root, 4884; DNA content, 6957 ; diquat transport, tomato, 6946.

Pyruvate & pyruvic acid (see also **Citric acid cycle** ; **Hydroxypyruvate** ; **Eeto acids** ; **Phosphenolpyruvate**), biosynthesis from D-glucarate, bacteria, 3401.

in acetoin synthesis, effect of endogenous amines, 999.
 -lactate ratio, perfused liver, 987.
 metabolism, effect of thyroid hormones, 4257.
 shikimic acid biosynthesis, *Pinus*, 3439.

Pyrvium pamoate. See **Helminth anti-agents**.

B.

Quartz dusts. See **Air pollution**.**Quercitrin.** See **Flavonoids**.

Quinalbarbitone (secobarbital). See **Barbiturates**.
Quinazolines, tricyclo-, carcinogenicity, 1249, 3329.

Quin binding, myocardium, 16811.
 polygalacturonate : & quinidine plasma levels, 4144 ; anti-arrhythmic, 4143.

Quinine, assay, 6337.

Quinones (see also **Ubiquinone** ; **Vitamin K**), -chlorophyll α electron transfer, 5756.
 hydroquinones, in isolated chloroplasts, 3482.
 naphthoquinones, isolation from *Mycobacterium phlei*, 3225.
 plastochinone, intracellular distribution & function, 3493-4.
 tetrahydroxy-, protection against X-rays, yeast, 5844.

Quinolinol. See **Chelating agents**.

Quinosol. See **Fungal anti-agents**.

B.

RA-8 (persantin). See **Vasoactive substances**.

Babies. See **Viruses, animal, myxo group**.
Rabbit pox. See **Viruses, animal, pox group**.

Radar, studies of bird migration, 2242, 2247, 2249.

Radiation, -chemistry, (title 15) 5036.
 food sterilisation by, 3943.

genetic effects. Refer to **Chromosomes** ; **Genes** ; **Mutations** ; see also **-ultra-violet & -ionising** headings below.

hazard from fluorescent lights, 1004.
 in space, (title 7) 5035.

ultrasonic. See **Ultrasound**.

Radiation chimaeras. See **Immunological unresponsiveness** ; & **Transplantation immunology**.

Radiation sickness/syndrome. See **-ionising hazards**, below.

Radiation, electromagnetic (see also **Energy levels** ; **Fluorescence** ; **Light** ; **Spectra** ; **Spectroscopy**), laser, production of skin lesions, 1060.
 solar : artificial, enzyme synthesis inhibn., 3561.

Radiation, electromagnetic, ultra-violet,

& cathepsin C, mitochondrial inactivation, 1075.
 enhancement of damage, by 5-fluorouracil, 6137.

intermittent dosage effects, protozoa, 7009.
 micro-organism effects : bacteria, 1061, 1065, 1067, 1076, 1549-50, 2331, 3829, 5825 ; bacteriophage, 1061, 3942, 6867 ; virus, 6137.

mutation induction by, 3816.
 on amino acids, 292, 3560.
 on catecholamines, 3581.

on nicotinic acid, (title 36) **7148**.
 on nucleic acids, 1068, 3569, 5820-1.
 on skin phospholipids, 3577.

plant effects, 967, 2297, 2480, 6971.
 protective agents, 1550, (title 39) **7152**.
 sensitivity : & cell division, 3597 ; **Paramoecium**, 5837 ; phage mutants, 6864.

Radiation, electromagnetic u.v./ionising effects during developmental stages, for animals refer to **Development** & related headings ; for plants refer to **Plants**, radiation effects. See also **Chromosomes** ; **Mutations** ; & -hazards below.

Radiation, ionising, direct & indirect effects, algal cells, 2485.
 enhancement of: Ab formation, 5903 ; atherosclerosis, 3777 ; mutation induction, 6817.
 enhancement of damage : by 5-bromodeoxyuridine, 6816 ; by humidity, seeds, 6981 ; by prior dark period, flower, 6980.

gelation induction, pectin soln., 5824.
 immunol. depression by. See **Immunological unresponsiveness**.

of DNA, denaturation, 5818.
 of peptides, pyrazine deriv. production, 1073.
 of prebiotic components, 1074, 3558.

of tryptophan in water, 3559.

radiation chimaeras. See **Immunological unresponsiveness** ; & **Transplantation immunology**.
 sources. Refer to **Radioactivity**; see also -hazards below.

therapeutic & diagnostic uses. Refer to **Radiological techniques**; see also -dose-effect relations & -hazards below; & **Tumours**, inhibn./inhibitors.

tumour induction by. Refer to **Tumour induction**.

Radiation, ionising, dose-effect relations (for dose-measurement methods see **Radiological techniques**), chronic & acute doses, relative biol. effectiveness, 5840.

DNA denaturation, 5818.
 dose rate : gliadin structure, 3562 ; intestinal cell population, 4720 ; potato sprouting, 2482.

dose response curves, tumours, 4721.
 fungal luminescence, 1510.

herbaceous plants & trees, 4899-4902.

in vit. A deficiency, 1082.

local irradiation: head, 1083-4 ; peripheral blood & marrow effects, 5831 ; regenerating liver, 5819.

massive dose, histamine effects, 3580.
 met Hb formation, 3587.

optimal dose, mutation induction, 3816.

radio sensitivity: & N-mustard resistance, 5104 ; bacteria, 3565, 3574 ; cells, 2256, 3597 ; eggs, 2562, 5114 ; embryos, 3583, 5834-5 ; learning, 2203 ; leucocytes, 1088 ; phage, 5836 ; protozoa, 1078, 2586, (title 26) 7155 ; seeds, 2348, 2350 >, tumours, 2669 ; virus, 3944.

single exposure, blood cell recovery, 3585-6.

whole body irradiation : blood cells, 4719 ; brain SHT, 3582 ; kidney, 3598, 3600 ; tumour metastases, 3602.

whole body & local exposure, adrenal effects, 3596.

Radiation, ionising; effects at cellular level. See **Cell division** ; **Cells** ; **Chromosomes** ; **Genes** ; **Mutations** ; & individually named chem. components & organelles, e.g. **Nucleic acids** & **Mitochondria**.

Radiation, ionising, hazards, including expt. exposures (see also **Radioactivity**; & **Tumour induction**), detoxication mechanisms as affected, 5827.

diagnostic X-rays & leukaemias, 3717.

Radiation, ionising, hazards,

during developmental stages : brain, 1961, 1983 ; foetus, 1085, 3607, 5835 ; haemopoiesis, 3583 ; limbs, 1092, 5834 ; oocyte maturation, 1086, (title 31) 7152 ; postnatal growth, 3594.
from internal emitters : plutonium, liver, 3608 ; tritium, cells & bacteria, 1070, 5839.
GIT injury, (title 13) 7163.
isotope blood transport damage, 1080.
lipid absorption as affected 2019.
radiation sickness, pneumonia in, (title 22) 7155.
reproduction-tissue/organ damage : eggs, 4722, 4939, 5114; ovary 3579 ; pine cones & acorns, 4898.

Radiation, ionising, of invertebrates. Refer to radiation subheadings under phylum or class name ; & individual spp. in Taxonomic index.

Radiation, ionising, of micro-organisms. Refer to radiation subheadings under **Bacteria** ; **Bacteriophages**; **Micro-organisms**; **Protozoa**; **Yeast**; & individual spp. in Taxonomic index.

Radiation, ionising, of plants. Refer to radiation subheadings of **Plants**; named plant structures (e.g. **Flowers**; **Seeds**); plant groups (e.g. **Fungi**) ; & individual spp. in Taxonomic index.

Radiation, ionising, of vertebrates. Refer to radiation subheadings of named groups (e.g. **Birds**); tissues, organs, systems & body fluids (e.g. **Muscle**; **Liver**; **Blood**) ; & individual spp. in Taxonomic index.

Radiation, ionising, protection/survival/recovery, oxygen effect : anoxia & cysteamine, 1099 ; hypoxia & chem. agents, 3605 ; hypoxia & thiouracil cpd., 1096 ; on RNase, 1069 ; on sensitised cells, 3566.

pre- & post-irradiation treatment, mechanisms, 6979.

post irradiation treatment: cooling, 3593 ; various cpd., 6979.

protective effect of : antibiotics & amino acids, 4718 ; aromatic amines, 5843 ; bacterial incubation medium, 3570, 3574 ; cold acclimatisation, rat, 5840 ; histamine, 3603 ; mesenteric vessel clamping, 4216 ; olive oil, 1093 ; paramagnetic ions, 6982 ; partial shielding, 3588 ; prior CCl₄ treatment, 4215 ; quiescent centre, root meristem, 4903, 6814 ; serum, 5832 ; tetrahydroxyquinone, 5844 ; various agents, 1092, 3605, 3815, 6979.

protective effect of S-containing cpd.: *P*-aminoethylisothiouronium Br, HBr (AET), 1096-7, 1738, 4085, 4221, 5842, 6355, 6815 ; colloidal S in model system, 3604 ; cysteamine, 1098-1100, 3603 ; cysteine, 1100, 6815 ; dimethyl sulphoxide, 1095 ; 0-mercaptopethylamine & mesenteric vessel clamping, 4216 ; tri-iodomethyl-sulphur complex, 1094 ; various, 6979.

recovery : from lethal dose, 2483, 3772 ; index of, liver : Cr, 5823 ; mechanism, oocyte & zygote, 1091 ; of mitochondria, 1077 ; RNase role in, 3572 ; thymus role in, 5830 ; time of day as related, 1089.

Radiation, ionising, specific emission types,

a-rays, long term effects on bone, 3589.
a-rays & thermal neutrons, protection against, 6979.
fast neutrons, radiobiol. effect, 1063.
v-rays, radiobiol. effect, 1063.
heavy particles from boron thermal neutron capture, 6872.
high energy electrons, org. cpd. synthesis, 1074.
X-rays, retinal response, 3595, 4509, 6587.
X-rays & ¹⁰Co therapy compared, 2019.

Radioactivity,

artificial sources (see also **Radiation, ionising, hazards**; **Isotopes**) ; & isotope sub-headings of individual elements, e.g. **Iodine**; **Sr**; **Strontium**:

¹¹⁷Cs, body levels, 5849.

¹¹³Inmilk, 1103, 3606.

¹³³PuO₂, inhalation study, 3609.

radionuclides : in aquatic vegetation, 6999 ; marine plankton, 1102 ; storage of, 1026 ; uptake, snail, 517.

⁸⁹Sr : in hair, 5848 ; in milk, 1104, 5845-6 ; in skeleton, 1101, 5847.

natural sources,
ot-emitting nuclides in man, 5850.
ot-particle activity of tobacco, 5647.

Radioactivity,

natural sources, 3095.
aio_b & aio_{po} in bone
soil Th, 518.

Radiological techniques (see also **Contrast media** ; **Isotopes** ; **Spectra** ; **Spectroscopy**),

heavy ion techniques, (title 4) 5035.
neutron activation analysis, (title 2) 5035.

small y source, 6983 f.

X-ray diffraction : muscle, 4268 ; stem inter-nodes, 6962.

X-ray spectrochem., blood, (title 1) 5035.

radioactivity counting, calibration of body ¹³⁷Cs, 5849.
combustion technique, low level "C, 3553.
gas-flow counting, 1048.
liquid scintillation, 1025, 2836, 2856, 5786.
of chromatograms, 1047.
of expired ¹⁸CO₂, 4235.

radiography,

angiography, 4408.
auto- dry mounting, 5178 ; liquid emulsion, 44 ; processing of, 1046f ; squashing under Scotch tape, 46 ; standardisation, 45 ; thin films for, M₆₂ 1024.

cholangiography, 6623.

che-arteriography, 1911, 2010.

fast-neutron source for, 3386f.

of cy.s., review, 1897.

scintillation scanning: biochemical applications, (title 3) 5035 ; kidney, (title 2) 5046 ; liver, 4542 ; spleen, 3374 ; thyroid, 3606.

Radiomimetic agents (see also **Chromosomes, aberrations**; **Cytostatic/cytotoxic agents**; **Mutagens**),

lasiocarpine & monocrotaline, 6819.

1-methyl-3-nitro-1-nitroso-guanidine, 4724.

AT-mustard, cells, 6818.

various cytostatic agents, 5125, 6355.

Radioprotective agents. See **Radiation, ionising, protection-**.

Radiotelemetry. See **Telemetry**.

Radium isotopes,

"Ra : in bone & soft tissues, man, 3092, 5850.

"Ra in plants, 518.

Raffinose (see also **Carbohydrates, sugars**),

in vine, 5187.

metabolism in cotton seeds, 129.

Ramulosin. See **Fungi, composition & metabolism**.

Rare earth compounds,

ATP biosynthesis as affected, 513.

distribution & excretion, mouse, 5455.

Rauwolfia-type alkaloids & derivatives,

ajmalicine, 913.

ajmaline & related alkaloids, biosynthesis, 892.

methyl- 18-epi-O-methyl reserpate HC1, effect, pituitary lactogen release, 1655.

mitraphylline, optical isomers, 913.

reserpine : & syringopine, potentiating sympathomimetic amines, 1631 ; antagonists, anti-depressant activity, 4067 ; antidiuretic effect, 4093 ; behavioural effects, (a) 3983,

(b) & e.e.g. effects, 3996 ; effects (a) adrenal medullary catecholamines, 3261, 4059, 4067,

(b) body temp, 4017, (c) brain amines, 4062, (d)

brain 5HT, unmodified by histamine & cold exposure, 4491, (e) brain metabolism, 3993,

f) cardiac catecholamines, 4064, 4069, (g)

cardioaccelerator tone, 6489, (h) cold resistance, 6252, (i) corpus striatum dihydroxyphenylacetic acid, 6255, (j) fish melanophores, 4140, (k) pituitary gonadotrophins & prolactin, duck, 4580, (l) tadpole mortality, 2552, (m)

ventricular contractility, 4138 ; increasing audiogenic seizure susceptibility, 4075;

-induced adrenergic nerve block, 4071 ; -induced changes in sympathomimetic sensitivity, ileum, 4066 ; -induced gastric ulcers, mechanism, 4180 ; -induced supersensitivity to catecholamines, (a) 4070, (b)

heart, 1628 ; inducing milk secretion, 2121 ; protective, in anaphylactic shock, 4074

therapy, (a) & anaesthesia, 1590, (b) in aorta coarctation, 4139.

yohimbine, -induced anxiety, for tranquilliser screening, 3988.

Reaction kinetics (see also **Thermodynamics**; for enzyme kinetics see **Enzymes**).

fast reactions in soln., (title 2) 5036.

handling of data, 1058.

of biol. processes, tracer studies, 3116.

Reaction kinetics,

of helix formation, 3069.

of solids, (title 10) 5036.

Reagin. See **Antibodies**.

Receptors, sensory. See **Nervous system, afferent & sensory**.

asthma: steroids effects, 1649, 6479; uropepsin excretion in, (title 23) 7155.

common cold, (title 2) 5043.

Kartagener's syndrome, blood groups in, 4800.

lesions, cigarette smoke & influenza virus induced, mouse, 5927.

paralysis, buffer fish toxin-induced, cat, 6371.

thrombo-embolism, bronchiolar proliferation in, 3721.

Respiration ft respiratory system, invertebrate, crustacean: copepod (*Tetraora*), 7059; seasonal variation, *Uca*, 4945; tidal cycle effects, *Naesa*, 7058.

insect, physical gill efficiency, *Notonecta*, 4943.

Respiration, cellular ft tissue (see also Carbohydrates, metabolism; Carbon dioxide; Citric acid cycle; Metabolism; Mitochondria; Oxidation-reduction; Oxygen; Phosphorylation; & -composition/metabolism sections under sp. organs, tissues & organisms), animal, NH, inhibn., reversal, 3505.

in hypercholesterolaemia & atherosclerosis, various organs, 2846.

magnetic field effects on, 3556.

respiratory control, mechanism, 981.

tumour & embryo cells compared, 5426.

Respiration, *bacteria*. See Bacteria, composition ft metabolism.

plant. See Plants, composition & metabolism & named lower plant groups, e.g. Algae.

Respiratory chain. See Cytochromes; Enzymes, specific, oxidoreductases; Mitochondria; Oxidation-reduction.

Respiratory inhibitors. Sec Cytostatic & cytotoxic agents; Metabolic inhibitors; & sp. cpd.

Respiratory pigments. See Cytochromes; Haemoglobin.

Respiratory syncytial virus. See Viruses, animal, myxo group.

Respiratory tract. See Respiration ft respiratory system.

Restraint. See Environment, captivity; Stress.

Reticulin. See Scleroproteins.

Reticulocytes. See Blood cells, red, formation.

Reticuloendothelial system. See Lymphoreticuloendothelial system; & Tumours, specific, RE.

Retina. See Eye ft vision.

Retinene. See Eye, visual pigments; Vitamin A.

Revonal. See Sedatives ft hypnotics.

Rhabdomyosarcoma. See Tumours, specific.

Rhamnose (see also Carbohydrates, sugars), deriv., 2-deoxy-D- (canarose), 3456.

L, oxidation by higher plants, 2747.

Rheumatic/rheumatoid conditions, anti-agents. Refer to Analgesics ft antipyretics; Anti-inflammatory agents; Steroids.

rheumatic: fever (a) & blood groups, 4765-6 f, (b) serodiagnosis, antistreptolysin O assay, 58551; heart lesions in mitral stenosis, E.M., 6498.

rheumatoid arthritis: serum chem. (a) Cohn's fraction VI glycoproteins, 779, (b) polysaccharides, 3787; synovial (a) fluid hyaluronic acid, hydrocortisone " effects, 1648, (b) tissue acid phosphatase & catheptic activity, 837.

Rheumatoid factor, detection, human, rabbit & bovine* v-globulin in, 3644.

incidence in families of agammaglobulinaemic patients, 1154t.

-like prop. of cryoglobulins, 3646.

rheumatoid arthritis sera reactivity with* altered & aggregated human y-globulin, 1155; heated y-globulin, 3645.

Rhino virus. See Viruses, animal, picorna group.

Rhizome. Refer to Plants, structures.

Rhodamine, in Th determination, 5454.

Rhodinase, isolation & prop., 143.

Rhodomychine, structure of, 737.

Rhodopsin. See Eye, visual pigments.

Rhodoxanthin. See Carotenoids.

Rhythmol (Ro 2-5803), cardiovascular effects, amphibian & mammalian hearts, 1683.

Rhythms (see also Heart beat; Migration; Mouthing; Photoperiodism; Seasonal differences), diurnal & circadian, in insects: cuticle growth, locust, 7116; recording device for, cockroach, 2544.

in mammals: body temp., man, 1769; N excretion, rabbit, 7074; steroid, thyroid effects, 2086f.

in plants: cell structure, *Mimosa*, 6994; root exudation, legumes, 4867.

in trace element concn. in cerebrospinal fluid, (title 23) 7152.

in *Uca pugnax*, respiration, 4945.

feeding cycle, mosquito popln., 2536.

mitotic. See Cell division, mitosis.

muscular activity. Refer to Muscle & related headings.

reproductive. See Reproduction-, cycles.

rhythmic movements of *Cordylophora*, 2534.

Ribitol phosphates, 5-PO₄, polymer, biosynthesis, *Lactobacillus*, 127.

Bifoflavin (see also Vitamins), -chlorophyll a interaction, 5756.

deficiency, 3217.

production, *Eremothecium* sp., 5615.

Ribonucleic acid; Ribonudeoproteins; Ribonucleotides. Refer to Nucleic acids; Nucleoproteins; Nucleotides.

Ribose: deoxy-, of DNA, assay, 422; oxidation by *Pseudomonas*, 2753.

Ribosides; Ribotides, purine & pyrimidine. See Nucleosides; Nucleotides & individual names.

Ribosomes (see also **Nucleoproteini**; & **Nucleic acids, RNA**), amino acid incorporation, 487, 3051, (title 23) 7148.
bacterial 85S, 541 It.
biosynthesis during amphibian development, 3044.
-bound intermediate in polypeptide synthesis, 3048.
interactions with : hydroxylamine, 488 ; sRNA, 450 ; synthetic polyribonucleotides, 480, (title 24) 7148 ; viral RNA, 486, 6077.
isolation & prop., (title 8) 2594, 5412, (title 25) 7148.
low mol. wt. RNA associated with, 5408.
papain dissociation of, 5410.
phosphodiesterase activity, 3021.
poly- & Hb synthesis, 483 ; & messenger-RNA, 3049 ; assay, (title 22) 7148 ; breakdown & protein synthesis, 3047 ; in r.b.c., stability, (title 26) 7148.
protein Ag distribution, 423.
protein release from, 3035.
protein synthesis, 484, 3040, 5416.
staining for E.M., 5090.

Rice. See **Foodstuffs** ; & *Oryza sativa* in Taxonomic index.

Ricin. See **Alkaloids**.

Ricinoleic acid. See **Fatty acids, unsat., C₁₈**.

Rickets. See **Bone disorders**.

Rickettsiae » Rickettsiosis. See named spp. in Bacteria section of Taxonomic index ; see also **Antibodies** ; **Antigens** ; & **Virus-like organisms**.

Riley virus. See **Viruses, animal, tumour-associated**.

Riminothenazine, RE uptake, 1350.

Rinderpest. See **Viruses, animal, myxo group**.

Rivers. See **Waters, natural**.

Ro 2-5803. See **Rhytmol**.

Rodenticides. Refer to **Pesticides**.

Roots (see also **Plants** ; **Soil**), CO, uptake, tomato, 4863.
constituents & metabolism. Refer to **Plant pigments i Plants, composition & metabolism**.
cytol. studies (see also **Cell division** ; **Chromosomes**), 1024, 2290, 2445, 4716, 4771, 6785, 6787, 6807-8, 6810, 6819-21.
excised root culture,
culture media for : *Acer*, 2446 ; *Zea*, 2443.
inhibn. by RNase, 4873.
light response, wheat, 2479.
metabolic studies, soybean, 6943.
response to auxins, 4878-9.
exudates (see also rhizosphere below) ; amino acids, jute, 1554 ; rhythmic output, legumes, 4867.

growth & development (see also **Plants, growth & development**),
characteristics of root systems, Douglas fir, 6953.
response to organoboron cpd., wheat, 4908.
response to growth substances (see also **Growth substances for plants**), 2450-2, 2454, 4878-9, 4884.

response to pH, *Schoenus*, 2414.
root production & net productivity as related, herbaceous spp., 6954.

mycorrhiza (see also **Fungi**, mycorrhiza), in *Cucurbita*, effect of fertilisers, 6921.
in decomposing rye grass, 3913.
in Douglas fir, 6953.

O, diffusion, rice & barley, 4860.

pharmacol. studies. See **Drugs**, pharmacognosy.

radiation effects : on mitosis, 6813-5, 6817 ; role of quiescent centre in recovery, *Vicia*, 4903.

rhizosphere microflora,
affected by root extracts, 3953.
algae, 4911.

Azotobacter, 3948.
fungal popln., peanut, 4912.
gibberellins as affecting, 1555.
of jute seedlings, 1554.
temp. effects on, 3954.

root hair : Ca content, mustard, 4839 ; E.M. study, 6992.

root nodules (see also **Nitrogen metabolism** ; & **Rhizobium** in Taxonomic index) : auxin metabolism, 4845 ; development cycle, *Rhizobium lupini*, 6178 ; of peanut, 4912.

Roots, solute uptake, (see also **Plants, nutrition**), amino acid, inhibn. by chloramphenicol, carrot, 4844.
I, *Pinus*, 4841.
K & Rb, mechanism, 4837.
Na & Ca flux, *Ricinus*, 4836.
translocation of sugar, mustard, 2432.

RotenonO, mitochondrial effects, 982.

Rotifers. See **Aschelminthes** ; & Taxonomic index for individual spp.

Rous sarcoma virus. See **Viruses, animal, tumour-associated**.

Rubarth virus. See **Viruses, animal, unclassified**.

Rubella. See **Viruses, animal, unclassified**.

Rubidium (see also **Electrolytes** ; **Metals**-), transport, plant roots, 4837.

uptake by *Staph. pyogenes*, 5443.

Rubidium isotopes, Rb : metabolism, snail, 517 ; use in coronary blood flow measurement, 4406.

Rumen. See **Gastrointestinal tract, stomach**.

Runt disease/syndrome. Sec **Thymus**, thymectomy ; **Transplantation immunology**, graft-v.-host.

"**Ruthenium**, storage of soln. in polythene, 1026.

Rye. See *Secale cereale* in Taxonomic index.

B.

Saccharic acid, metabolism, *E. coli*, 3401.

Saccharides. See **Carbohydrates**.

Saccharine, conditioned aversion, atropine sulphate effects, 4637.

Salicylamide, glucuronide conjugation : hormonal effects, 4623 ; in parturients, 4622.

Salicylates (see also **Analgesics** & **antipyretics**), acetyl- : & gastrointestinal blood loss, 6304 ; & Na, effect, kallikrein systems, 4177.

choline, effects : arterial pressure, 4043 ; smooth muscle, 4044.

effects, connective tissue, 700.

inhib. : glutamate dehydrogenase & -decarboxylase, 5609 ; malate dehydrogenase, 1661.

oral absorption, indices, 1660.

Na : antib Bradykinin activity, 4079, 4090, 6301 f. effects, (a) blood sugar, 6296, (b) plasma FFA, 6303 ; mitigating anaemia, tumour-bearing hamster, 3761 ; organ distribution after parenteral admin., 6302.

topical action, g.i., 4178.

Saline. Diuresis induction, see **Kidney function**, **diuresis**. Other physiol. effects, see relevant organ or system.

Salines, physiol. See **Culture & physiological media** ; for sp. salt soln. (e.g. NaCl), refer to "salts" under the relevant cation.

Salinity (see also **Electrolytes** ; **Environment** ; named salts, e.g. **Sodium salts** ; & **Waters, natural**), amino acid concn. as affected, *Rangia* (mollusc), 4962.

lowered: adjustment to, starfish, 7044 ; growth & survival, oyster, 6918 ; plankton vertical migration as affected, 7126.

tolerance : *Eriocheir sinensis*, 4958 ; intertidal crabs, 4957.

Saliva (see also **Mouth**; **Toxins & Venoms**), antibacterial action, man, 1536.

blood group substances in. Refer to **Blood groups**.

calculus : early formation, 113-4, 5166f, formation on foils, man, 5165 ; in germ-free rats, 5167-8 ; inorg. content & histol., man, 113.

constituents : acid phosphatase, & caries incidence, 5154 ; changes during development, (title 27) 7152 ; electrolytes, 100, 1081, 14511, 3151-2, 4511 ; glucose, as related to dental caries, 2738 ; mucin, effects on y-globulin mobility, 5146f ; proteins, electrophoresis & immunochem., 824, 1162.

cortisol & cortisone in during pregnancy, man, 2095.

effects on marked enamel, 101.

electrophoresis, man, 824.

NMR, man, 5147.

parotid : diet effects, cows, 3151-2 ; during development, man, (title 27) 7152 ; flow rate as related to dental caries, 2738 ; glucose in, as related to dental caries, 2738 ; resting & stimn., composition, man, 100 ; Na & K, steroid effects on, sheep, 4511.

Saliva, salivary excretion of penicillins, 6187.

sediment, glycolysis in, as related to caries, 103.

thiourea desulphuration by, 612.

yeasts in, 110.

Salivary glands, cyt. studies : chr., of *Drosophila*, 68391

eosinophilic cells (oncocytes), 9 ; nucleus, E.M., 6781 ; of cockroach, E.M., 6782.

denervation effects, 2006.

development, isoproterenol effects, rats, 4169* expt. enlarged & atrophied, histol., rat, 2638.

of castrated rats, steroid stimn., 6270, 6605.

of *Eledone*, eledoisin from, 2931.

parotid : parotitis, virus-induced, mice, 1452 ; staining of secretory capillaries, 26.

parotid & submaxillary, ducts compared, 2639.

submaxillary: ablation effects, guinea-pig* 2104, 2131 ; acid-sol. PO. cpd., pilocarpine effects, 1699 ; choline acetylase, normal & denervated glands, 2006 ; mucins, composition, bovine, 359 f. of castrated mouse, response to steroids, 6270 ; ultrastructure, ma» 2637.

tumours, ABO blood groups in, 2387.

Salt gland, seagull, 3107f.

Salts. See **Electrolytes** ; **Salinity** & the cation (e.g. Calcium salts).

Saluretics. See **Diuretics**.

Sap. plant. See **Cells**, plant ; **Plants**, water relations.

Saponins & **sapogenins** (see also **Terpenoids**), diosgenin, from *Dioscorea belizensis*, 4200.

glycoside, from *Gypsophila*, 3465.

of *Reineckia carnea*, 3454.

of spirostanol series, digitonins, 927.

panaxadiol, from *Panax ginseng*, stereochem- 924.

Sarcoma. See **Tumours, specific**.

Sarcomere ; **Sarcoplasm.** See **Muscle**.

SC-8109, -19420, -11480, -11927 (Spirolactones) Sec Aldosterone antagonists.

Scar tissue. Refer to **Wound healing**.

Scent-glands, of hemiptera, 7121.

Scents. See **Off action**.

Schistosomiasis. See **Helminth infections**.

Schizophrenia. See **Mental disorders**.

Sciadini. See **Terpenoids**.

Sideroproteins (see also **Collagen**; **Cutio** Feathers ; Hair ; Skin), elastin : aortic (a) acidophilia of, 5066, (P changes in Cu deficiency, swine, 1904, (c) newborn rat, E.M., 5068 ; amino acid co³⁵ position, 825 ; cross-linkages in, 383 ; elastas* action on, 350.

fibron : biosynthesis, silkworm larvae, 5420 thermodynamically bound water, 3522 f.

keratin : & pre-keratin, staining, 18 ; calcif*^u position, 7014 ; of feathers, development, chick embryo, 2524 ; of oral tissues, amino composition, 2724 ; of wool, S-carbo*^y; methyl-, 2883 ; thermodynamically bound water, 35221.

of arterial wall, 369.

reticulin, in bone marrow, in haematol. disorder 3383.

Sclerosis, artero- ; athero- ; myelo- ; & osteo- Arteriosclerosis ; Atherosclerosis ; Bone ip* row disorders.

multiple : measles Ab in, 3615 ; no Ab to o*^{**} tissue in, 1179-80.

Scopolamine (hyoscine). See **Cholinergic blockers** agents.

Scrapie. See **Brain disorders** ; **Viruses, animal** unclassified.

Scrotum. See **Testes**.

Sea ; **Sea water.** See **Waters, natural**.

Seasonal differences (see also **Climatic factors** ; Environment; Hibernation; Migration ; Photoperiodism ; Rhythms), in adrenal cortex, guinea-pig, rat, 5088, 5089.

in feeding, gudgeon, 4953.

in leaf sorbitol, *Mai us*, 5188.

in pituitary gland, newt, 7071.

in r.b.c. fragility, man, 4277.

in serum PBI, man, 2084.

Sebaceous glands & sebum, low values in eunuchs & oophorectomized women, 4265.

thyroidectomy effect, rat, 16.

Secobarbitol (quinalbarbitone). See **Barbiturates**

- Secretin.** commercial prep., potency, 2025.
inhibn. of gastric secretion, pancreatectomy effects, 4515.
- securinine.** Sec Alkaloids.
- Sedatives & hypnotics** (see also Barbiturates ; Depressants; *Rauwolfia*-type alkaloids; Thalidomide) ; Tranquillisers), activity of local anaesthetics, 1609.
allylisopropylacetylcarbamide (sedonnid), -induced porphyria, 3512.
clinical trials, psychiatric patients, 3972.
ethinamate, poisoning, treatment, 6341.
glutethimide: 3972 ; detection, tissues, 6226 ; effects, gestation & foetal development, 6345 ; isomers, stereosp. metabolism, 1009 ; N-methyl deriv. isomers, metabolic dealkylation, 1008.
methyprylon, 3972.
non-barbiturate, chromatog. separation, 4189.
revonal, poisoning, detection, 6225.
- Sedimentation,** triacromolecular substances in soln., comparison with other physical factors, 3555.
short column separations, optical analysis, 3539.
- fadoheptulose 7-PO₄**, 3190.
- ædormed.** See Sedatives & hypnotics,
seedlings. See Plants, growth & development.
Seeds (see also Flowers ; Fruit; Plants), as food. See Foodstuffs ; Nutrition & diet.
chloroethanol treatment, increasing resistance to : herbicides, 24551; salinity, wheat, 4907.
constituents (see also Gluten ; Lectins), alkalooids, *Convolvulus* sp., 907.
amino acids : *Cocos*, 2488 ; y-hydroxyarginine, *Vicia* spp., 316; *Litchi*, (title 7) 5038; *Vicia*, (title 11) 2594.
arginase inhibitor, sunflower, (title 96) 7148.
cyt. c, wheat, 362.
enzymes: a-carboxylase, wheat, 5535 ; galactosidase, *Plantago*, 2781 ; S-S bond reductase, ground wheat, 5746.
gliadin, analysis, wheat, 3562.
naemagglutinins : *Lupinus*, 5285; *Vicia*, 5873.
- morellin, *Garcinia morella*,** Z447.
nicotinic acid, coffee, 900.
oil, heritable variation, corn, 2359.
Polyhydroxyphenols, *Acacia*, 3473.
Pyrazole, cucumber, 3435.
- toxic epd.** groundnuts, 14 g7f.
dormancy; affecting poplin dynamics, *Lithanus*, 2384 ; & enzyme activit^y as related, *Avena*, 4892.
- z²nbyo.** See Plants, growth & development, summation, depressed by centrifugation, cereals, 4894 f.
z²A as affecting: *Avena*, 4892 ; lettuce, 2456 ; *Melampyrum*, 6975.
inhib. by X-rays, *Pkalaris*, 2350.
inhibitor extracted, immature wheat, 6968.
z²Melampyrum linear e, 48951.
Elated to age, wheat, 6821.
z²475 by 5-hydroxybenzofuran deriv., rye, te_{mp}. & light effects, *Lythrum*, 4893.
metabolic changes during germination, amino acids, *Vicia*, 954.
z²hydroxikimic reductase, various spp., 4866.
z²thanol degradation, pea, 4861.
z²e distribution, wheat, 6976.

composition & metabolism. See Plants, composition & metabolism.
- cytol. studies, histogenesis, role of light, *Pisum*, 6958.
internode cell wall structure, 6962.
wound vessel differentiation, geotropic stimm., *Coleus*, 2447.
- growth & development, elongation, temp. & light effects : hop, 2440 ; tomato, 2466.
light effects, *Vicia*, 2437.
sections in culture, response to growth substances, 2454, 2459.
radiation damage : pine, 4901 ; oak, 4900.
response to growth substances. See Growth substances for plants,
solid stem mutant, wheat, 6871.
translocation in. See Plants, nutrition ; Plants, water relations.
- Shope papilloma virus.** See Viruses, animal, papova group.
- Shwartzman reaction phenomenon** (see also Toxins, bacterial) : & blood clotting, 1342 ; enteroxin non-provocative, 1300 ; [³H]-endo-toxin toxicity for, 3804 ; in pregnancy, 5991 ; response to hypersensitivity, 5993.
- Sialic acids.** See Neuraminic acids, AT-acetyl.
- Sickle cells ; Sickling.** Anaemia; Blood cells, red, anomalies-.
- Siderophilin.** See Blood proteins, transferrins.
- Sideroblasts ; Siderocytes.** See Bone marrow, cells.
- Siderosis.** See Blood cells red, anomalies.
- Sikkim toxin**, structure, 3442.
- Silicic acid**, polymerisation & reaction with H₂ bonding agents, 2925.
- Silicosis.** See Lungs, disorders.
- Silk** (see also secreting organisms in Taxonomk index, e.g. *Bombyx mori*), fibroin. See Scleroproteins.
- gland, amino acid incorporation, 5415.
thermodynamically bound water of, 3522.
- Silver** (see also Metals-), AgCl electrodes, 1758.
- Sinapic acid.** See Phenolic compounds.
- Sindbifl-virus.** See Viruses, animal, arbor group.

- Sipunculoidea**, haemerythrin sp., *Dendrostomum, Golfinaria*, 2383.
- Sitosterol**. See **Sterols**.
- Skeletal muscle**. Refer to **Muscle**.
- Skeleton** (see also **Bone**; **Cartilage**; **Joints**), as affected by unbalanced protein diet, rats, 5523.
- bony pelvis, development, mice, 86.
- skull: midline structures measurement by ultrasound, 4233; sutures, "Ca uptake, monkeys, 2712-3.
- vertebral column : blood flow sheep, calf, 4413 ; spina bifida occulta, man, 4822.
- SKF 525-A**, liver glycogen & drug metabolism as affected, 4130
- SKF 90054**. See **Anaesthetics**.
- Skin** (see also **Cuticle**; **Epithelium**; **Sebaceous glands**; **Sweat glands**; for studies on sp. animals, see named groups, e.g. **Amphibia**; for allergic & injury reactions, sp. & non-sp., refer to **Hypersensitivity**; **Immunological techniques**; **Inflammation**; **Wound healing**), blood flow & capillary permeability (see also **Cardiovascular system**): Forssman Ab effects on, 1199; reactivity to catecholamines, 1300, 6517.
- changes during senescence, human nipple epidermis, 6386.
- composition & metabolism (see also **Collagen**; **Connective tissue**; **Scleroproteins**): chondroitin SO, B & hyaluronic acid, 169; DNA, changes after application of tumour-inducing agent, 770; elastin, composition, 825; enzymes (a) epimerases, rabbit, 2757, (b) histidine α -deaminase, man, 3379; phospholipids, u.y. irradiation effects, 3577; proteins, amino acid composition, man, 2724; sterols (a) biosynthesis, 2835, (b) /riparanol-treated rat, 3315-6; -SH levels mice, 1251, 6385; surface lipids, fatty acids & alcohols, man, 197; triglycerides, fatty acid composition, 2817.
- : cutaneous pain threshold, (title 7) 7163.
- dermal light sense, (title 3) 7149.
- dermal loss of K, man, 1785.
- electrical potential across, detergent & Ca action on, 4262.
- epidermis: embryonic, thymidine incorporation, 5121; kinetics of hairless mouse, 6806.
- follicles, hair, hardening in, E.M., 15.
- galvanic skin response, unilat. differences, man, 1788.
- gas transfer across, man, 1786.
- grafts. See **Transplantation**.
- heat loss from cattle, 4240-1.
- hydrocortisone effects on, mice, 4264.
- isolated flagella in, man, 2650.
- mast cells. See **Mast cells**.
- microsomes, proline incorporation into protein, 484.
- optical prop., man, 5063.
- pigmentation, etc. Refer to **Pigment-cells**; *Urolophus rufus*.
- radiation effects on: axolotl, 1084; laser beam, 1060; u.v. 3577.
- receptors, sensory responses. Refer to **Nervous system, afferent & sensory**.
- resistance: racial differences, 1787; recording in unrestrained rat, 1789; unilat. differences, man, 1788.
- role in temp. regulation, (title 51) 7154.
- Na transport, 6387-8.
- stratum corneum, histidine α -deaminase in, man, 3379.
- temperature (see also **Body temperature**): relation to heat acclimatisation, (title 41) 7154; topography, in endarteritis obliterans, (title 5) 7152.
- Skin disorders** (see also **Burns**), actinic elastosis, 825.
- cutaneous calcinosis, expt., (title 1) 7163.
- dermatoses, various, associated folic acid deficiency, 3357.
- eczema, sheep, 896 f.
- herpes simplex keratitis, chemotherapy, 3966.
- ichthyosis, 1696.
- infection with mouse pox virus, 1296.
- necrosis, induced by bacterial toxins, 6030.
- pseudoxanthoma elasticum, 825.
- staphylococci isolation in, 6028.
- tumours : carcinogenesis, 3714-6 ; test for carcinogens, 3329.
- Skull**. See **Skeleton**.
- Sleep**, activated phase, rat, 1972.
- b.p. changes in, man, 4400.
- electrically induced, cat, 1973.
- e.g. patterns in, man, 1974-5.
- eye movements in, man, 1988.
- hypothalamic temp, in, cat, 1946.
- insomnia in psychotics, barbiturates effects, 3969.
- movement, cardiac freq. & respiration in: alcohol & caffeine effects, 1883; fatigue effects, 1882.
- narcosis, prolongation, (title 22) 7152.
- pentobarbital-induced, 3973, 6354.
- respiratory response to CO₂ in, man, 1864.
- Slime moulds**. See **Fungi**; & individual spp. in Taxonomic index.
- Slow reacting substances**, 1141, (title 7) 2597, 4151, 4490.
- Smallpox** (variola). Sec **Viruses, animal, pox group**.
- Smegma**. See **Reproductive tract, female**.
- Smell**. See **Olfaction**.
- Smoke**, cigarette: acetonitrile in, 5646; & influenza virus, respiratory tract effects, mouse, 5927; cells & nucleic acids as affected, (title 7) 7156; *Paramecium* responses, 1548; phenols, filtration, 5648.
- tobacco: α -particle emitters & free radicals in, 5647; carcinogen precursors in, 772; connective tissue mucopolysaccharides & proteins as affected, (title 24) 7155.
- Smoking**, airway resistance & expiratory flow rate as affected, 6462-3.
- blood coagulation effects, 6431.
- exercise effects, smokers, 1855.
- heavy, lipid metabolism as affected, 5698.
- Smooth muscle**. See **Muscle**.
- Smooth muscle stimulating substances** (see also **Angiotensin**; **Histamine**; **5-Hydroxytryptamine**; **Kinins**; **Oxytocin**; **Peptides, poly-**; **Prostaglandins**; **Renin**; **Vaso-active substances**), cumulative dose-response curves, 6272.
- darms off, 4131.
- hydroxy-acids from brain, 4149, 4157.
- inhib, by lysolecithin, 4151.
- lipid type, & histamine liberation, 4156.
- Social & economic factors** (see also **Behaviour**; **Environment**), blood groups as related, 6885.
- Cornell index & social dependency, man, 2209.
- future of man, review, 7151.
- Sodium** (see also **Electrolytes**), assay, glass electrode method, 1849.
- binding: by heparin, 164; in rat brain, 1987.
- in media: deficiency, effects on frog heart membrane activity, 6481; effect on e.r.g. of isolated retina, 1994.
- tissue/fluid content,
- aorta, in hypertension, 1321.
- blood: after glucose infusions, 6455; effects on aldosterone secretion, 6652; hydrochlorothiazide effects, 6290.
- distribution in adrenalectomised & aldosterone-treated rats, 6454.
- gingival pocket fluid, man, 5144.
- mitochondria, 3503.
- muscle, 4270, 6454, 7107.
- saliva: cows grazing heavily fertilised grass, 3151; man, 100; radiation effects, 1081; steroid effects, sheep, 4511.
- balance-absorption/metabolism/excretion**, after adrenalectomy, 6457.
- depletion, sheep, 4511.
- endocrine control in hot conditions, (title 6) 7154.
- imbalance, in hypertension, 4401.
- in **Tetrahymena**, 2531.
- metabolism, in "electrolyte-steroid cardio-pathy," 4385.
- renal excretion (for tubular mechanisms, refer to **Kidney function**): 3296, 4165, 4401, 4551, 4554-5, 4570-2, 6639-40, 6653, 6656.
- biol. activator/co-factor/inhibitor role**, ATPase stimn. 535-6, 3079, 3081, (title 22) 5038, 5613t.
- transport**, active: intestine, 4532; muscle, 3080; sea urchin eggs, 3083.
- bladder, stimn. 4562.
- Sodium, transport**,
- brain, 514, 4148, 6007.
- efflux from gill of killifish, 4966.
- H⁺ effects, 1850.
- isolated ileum, 6610.
- muscle, smooth, 4271.
- phosphoproteins role in, 514, 537.
- renal cortex, 3075.
- root cortex, hydrostatic pressure effects, 4836.
- skin, frog, 6387-8.
- Sodium isotopes**,
- "Na: metabolism, snail, 517; turnover in cs.f. 4493.
- Sodium salts** (see also **Asride**; **Cyanide**; **Fluoride**; **Salicylate, etc.**), admin., causing "electrolyte-steroid cardio-pathy", 4385.
- bicarbonate, massive infusion effects, 6637.
- chloride: depressing sugar response, 6604; dietary supplementation effects, adrenal-ectomised rats, 5999; hypertonic, injn. effects on thyroid hormone secretion, 2083; intake effects in partially nephrectomised dogs, 6511; i.v. admin., poisoning, man, 6340; media concn., uterine smooth muscle affected by, 4275; optimum for lymphocyte survival *in vitro*, 1814; tablets, absorption, 1715.
- glutamate, hypertensive action, 6250.
- pentachlorophenate, molluscicide, 1727.
- penta- & tetraborate, toxicity, 6370.
- phenylphosphate, enzymic hydrolysis, 5490.
- selenite, effects on blood components, 1685.
- "SO₄, incorporation into hypophysis, fish, 3523.
- taste preferences for, adrenalectomised rats, 2002.
- Sodium gluconato-dihydroxoaluminate*** antacid* 1717.
- Soil** (see also **Nitrogen metabolism**; **Plants, nutrition**; **Roots**), aeration affecting vegetation, 2438.
- fertilizers, affecting mycorrhiza in *Cucurbita*, 6921.
- bituminous mulches, effect on soil & vegetation, 6989.
- superphosphate: Cd uptake from, 6925; effect on wheat metabolism, 2441.
- micro-organisms, algae, 4911.
- bacteria (for *Rhizobium* see **Roots**, nodules; & **Taxonomic index**): *Aleurogenes faecalis** 872 ; *Azotobacter* popln., 3948 ; nitrifying spp., (a) *Arthrobacter*, 1553, (b) survival of 3947 ; various spp., (a) lysing soil fungi 3952, (b) popln. changes, 3953.
- flora of earthworm casts, 1556-7.
- fungi: cellulolytic spp., isolation, 6152; *Fusarium oxysporum* popln., 3952, 3955; *Fusarium solani*, 2476; related to soil moisture (title 1) 7149.
- rhizosphere microflora. See **Roots**.
- yeasts, *Histoplasma capsulatum*, 1496-7.
- mineral content,
- P levels affecting *Trifolium* popln., 4847.
- K availability, 6917.
- sulphate: determination, 1028; review, 4849T; org. constituents: humic acid content, 700*; mineralisation of N under grass, 6988 f.
- sterilisation by me-hyl bromide, 4841.
- types,
- blanket bog peat, 2414.
- calcareous, 2412.
- recent marine, related to caries in *cladaceae* 5158.
- water, affecting plant distribution, 2438.
- effect on fungal ecology, (title 1) 7149.
- potential, effect on: *Coleus* popln., 2407, 4832.
- plant growth, 931; transpiration rate, 2407, 4832.
- sampling for gas analysis, 1023].
- Solar radiation**. See **Radiation, solar**.
- Solanesol**, in green tobacco leaves, 3493.
- Soludcadron**. See **Steroids**.
- Solute uptake**. See **Plant nutrition**.
- Somatotrophin**. See **Growth hormone**.
- Sorbitol**,
- assay, gas-liquid chroma tog., 5189.
- in *Malus* buds & leaves, 5188f.
- Fe complex, 4128, 4287.
- protecting chicks against vit. B deficiency, 3211.

- Sound**, (see also Ear & hearing; Ultrasound), as stressor. See Stress.
 -induced convulsions. See Convulsions.
 levels & concentration, man, 4678.
 nervous system responses to, 4466-7.
 perception: intensity discrimination, 6550; rat, 1998.
 production (see also Communication; Speech):
 birdsong, 2222, 2241, 2244, 2252, 7082;
 dolphin, 2215; origin & evolution of primates, 2252.
 sonar signals, sea lion, 2580.
 trans thoracic & diaphragmatic propagation of, 4379.
- Space research**, behaviour & psychol. studies, (title 14) 7147.
 radiation physics, (title 7) 5035.
 simulated flight, e.g. in, 1977.
- Sparteine**, hypertensive effects, 4056.
 *nhib. adrenaline b.p. effect, in methane anaesthesia, 6245.
- Basmodesics**. See Smooth muscle stimulating substances.
- Dtsmolytics** (see also Adrenergic headings; Analgesics; Bronchodilators; Cholinergic headings; Muscle contraction/relaxation, smooth; Vaso-active substances), activity of: thyme extracts, 1623; trihydroxypropiophenone, 6307.
 lew, (2-benzoyloxyethyl) dimethyl(JV-octyl)-ammonium Br, 1622.
 Papaverine, inhib. oxidative phosphorylation, 3309.
 structure-activity, 1620.

 freezing : methods, dog, 4631-2 ; & thawing, role of glycerol, bull, 2137 ; immunol. studies, 1151, 1169, 1280.
 maintenance in vitro, 5553.
 motility, 2134, 2138-40.
 movement & capacitation in Q reproduction tract, 6714.
- of mollusc, Barnea Candida, E.M., 2266.
 of salmon, Na-DNA photoconductivity, 3006.
 O₂ uptake : bull, 2138 ; chicken, 6745t.
 penetration : changes during, rabbit, 6773; hypothesis, Dendraster, 7028 ; mono- & poly-, insects, 7033.
 radiation effects, 1091.
 review, 4630.
 storage, ? lizards, 7098.
 study methods for, 4745.
 tail, structure, 4692.
 transport, vas deferens, ram, 4628.
- spermatogenesis** (see also Cell division, meiosis), arrest/disturbance, 6742, 6746.
 cycle, man, 2661.
 cytology & kinetics, 6802.
 in Planococcus, 4712.
 intratesticular homotransplants, 1184.
 restoration after hypophysectomy, rat, 4629.
 Sertoli cells, 6775.
 spermatocytes, 2285.
 spermatogenic cells, structure, 6775.
- Spherocytosis**. See Blood cells, red, anomalies.
- Sphingolipids** (see also Lipids; Phospholipids, etc.), Ab against, in c.n.s. lesions, 1180.
 ceramide lactoside, synthetic, 131.
 cerebrin, from yeast, 5247.
 cerebrosides : enzymic hydrolysis, 2830 ; fatty acids of, biosynthesis, 203 ; in artery, normal & atherosomatous, 832, 5697.
 cytolipin H, synthetic, 131.
 gangliosides : biosynthesis & solubility prop., in Tay-Sach's disease, 826 ; cpd. fixation by, 3811 ; cryst. disaccharide from, 152 ; enzymic degradation, 187 ; ethanol intoxication effects on, brain, 5198 ; physicochem. prop., 5197 ; separation, human brain, 5692.
 globose, structure, 230.
- Sphingolipids**, glycolipids : neutral of human blood, spleen & liver, 5239 ; of blood serum, man, 3345 ; of runner bean leaves, 2311 ; pharmacol. active, 4131.
 of arteries, 832, 5697.
 of brain, 152, 826, 3811, 5197-8, 5246, 5692.
 of cs.f. 235.
 of r.b.c., 230.
 sphingomyelin : distribution in brain, 5246 ; in artery, normal & atherosomatous, 5697 ; in cs.f., man, 235 ; in quartz-dusted guinea-pig lungs, 5224.
 sulphatides : conversion to cerebrosides, 2381 ; structure, 236 ; SO₄ assay in, 239 ; SO₄ uptake, light effects, Euglena, 237.
 sulpholipid, plant, (title 13) 5038.
- Sphingomyelin**. See Sphingolipids.
- Sphingosine**, & deriv., TLC, 246.
- Spinal cord**. See Nervous system, central.
- Spiramycin**. See Antibiotics.
- Spirolactones**; spironolactone. See Aldosterone antagonists.
- Spiropliperidinium Br**. See Surface active agents.
- Spirostolen**. See Saponins & saponins.
- Spleen** (see also Lymphoreticuloendothelial system), abstracts refer to lab. mammals unless otherwise stated.
 cell/tissue admin. effects (for transplantation tolerance/immunity see Immunological tolerance ; Transplantation immunology) : adult tissue implantation in *Salmonella*-infected chick embryo, 3842 ; allogeneic cell injn. on heteroagglutinins, 3639.
 circulation : artery occlusion & N mustard toxicity, 6369 ; sheathed capillaries structure & function, 5071.
 composition & metabolism : acid mucopolysaccharide in primary amyloidosis, 56931 ; histamine adenine dinucleotide synthesis by microsomal NADase, 2985 ; Fe (a) content lowered by oestrogens, 1846, (b) ferritin> horse, 5288, (c) storage as ferritin or haemosiderin, man, 809 ; neutral glycolipids of, man, 5239 ; phosphatases, in bone marrow transplantation, 3684.
 histol. of Ab response : plasma cell histogenesis, & reactions after X-ray, 3686 ; to 2 injn. of Ag, 3687 ; red & white pulp during primary response, endotoxin effect, 1202.
 homogenates cytolytic effect in vitro, 1190.
 liver implantation into, producing hepatoma, 5953^t.
 post-ganglionic sympathetic ACh role, evidence for/against, rat, 4451-2.
 radiation effects on : lymphoid centres, 5830 ; plasma cells & Ab, 3686 ; protection by histamine or cysteamine, 3603.
 response to sound stress, 1472.
 scintillogram with ¹³¹Cr-r.b.c., man, 3374.
 splenectomy effects on cardiovascular responses : heart to inj. methylcellulose, 1879 ; splanchnic bed to catecholamine infusion, 4423.
 tissue cultures : in vitro, microcinematography of 61 ; in vivo, in diffusion chamber, 65.
- Spleen disorders** : effect on liver & pituitary-adrenal system, (title 18) 7152; in tumourous animals, cortisone & Na salicylate treatment, 3761 ; revealed by scintillation scanning, man, 3374.
- Spores**. See individual taxa, e.g. Algae ; Bacteria ; Fungi; also Plants, reproduction.
- Sporidesmin** : effects on bile, rat, (title 9) 5038 ; structure, 896.
- Sputum**, cancer cytol., 3754.
- Souvaleno**, biosynthesis : H ion insertion, 2837-8 ; inhibn., 729.
 free radical additions, 914.
 isolation from brain, man, 5252.
- Stachyose**, 129, 5187.
- Staining** (see also Dyes & stains ; Microscopy), for cytol. & histochem. See Cytology, in chromatographic & electrophoretic procedures. See Chromatography ; Electrophoresis. in vivo techniques, with Neutral Red in plants, role of tannins, 2504.
 of sp. substances. See relevant headings, e.g. Lipids.
- Stamens**. See Flowers.
- Staphylococcin**; Staphylocycin. See Antibiotics.

INDEX OF SUBJECTS

Steroids, compounds, natural & synthetic, (cont'd. from *)**

hypothalamo-pituitary stimn., 6644 ; immunol. response inhibn., 1176, 1304 ; lesion production by, 1650, 2057 ; lipid storage stimn., 2092 ; lysosome stabilisation, 5592 ; noradrenaline potentiation, 6515 ; peristalsis inhibn., 6619 ; RNA synthesis stimn., 703 ; salivary levels, 2095 ; teratogenicity, 5170 ; thymolytic activity, 1652 ; thyroid I, binding, 6687 ; tumour inhibn., 3761 ; vit. B₁, inhibn. (title 3) 5044.

deoxycorticosterone (DOC; pregn-4-en-21-ol-3,20-dione) : ATPase inhibn., 701 ; effect on (a) atrial infarction, 1888, (b) catecholamines, 6665, (c) muscle glycogen formation, 4272 ; hormonal interactions, 6681 ; 17-hydroxy-, microbiol. oxidation, 702 ; 19-hydroxylation of, 3263-4 ; in dogfish semen, 7070.

dexamethasone (9a-fluoro-16a-methylprednisolone) : 1643, 1649, 1652, 3235, 4089, 6268.

hydrocortisone (cortisol; pregn-4-en-11f, 17a,21-triol-3,20-dione) : anti-inflammatory activity, 1647 ; assay, 1839 ; binding, 699, 1800, 5594 ; biosynthesis, 32691 ; 11-deoxy-deriv. in metopiprone & toxin admin., 6648 ; effect on (a) connective tissue 700, 4264, (b) electrolytes, 4511, 4555, (c) glucose metabolism, 5595, (d) lipid mobilisation, 4315, (e) mitochondrial metabolism, 3262, (f) rheumatoid mucopolysaccharide, 1648, (g) urinary trypsin inhibitor, 1653 ; inhibn. of (a) ACTH secretion, 6645, (b) coronary blood flow, 6518, (c) uterine oestrogenic response, 4619 ; metabolism, 2061, 2095, 5596, 5685 ; -resistant lymphoma, 68 ; stimn. of (a) aminoisobutyric acid uptake, 4087, (b) glucose polymerisation, 3270, (c) mammary gland development, 4613 ; tumour induction by, 3716.

hydrocortisone deriv.: 9<x>-fluoro-, (a) & electrolyte balance, 4385, (b) embryonic effects, 69, (c) tumour resistance, 3724. 17-hydroxy-20-oxo-20-methyl steroids, ? excretion of, 6662.

Prednisolone (pregna-1,4-diene-11f,17c,21-triol-3,20-dione) : effects on (a) heart, 5597, (b) thyroid function, 5678 ; in lathyrogenic drug admin., 1316 ; intestinal absorption, 4089 ; metabolism, 6269 ; pituitary-adrenal axis blockade, 3235, 4088 ; thymolytic activity, 1652 ; treatment of CCl₄ cirrhosis, 749.

Prednisolone deriv.: 6<x>-fluoro, GIT absorption, 4089 ; 6a-fluoro-6a-methyl-, Ca metabolism inhibn., 5591 ; 9a-fluoro-16<x>-hydroxy, GIT absorption, 4089 ; 9<x>-fluoro-16a-methyl-Ca- & mitochondrial metabolism effects, 3262, 5591.

Pregnna-4,6-diene-3,20-dione, 17a-acetoxy-6-methyl-deriv. prop., 6265.

* 0 -pregna-1,4-diene-14-ol-3,20-dione, 11a, *9. 21-triacetoxyderiv., prep., 3461 f.

Pregnanol : assay, 718f, 3292 ; excretion, 4608, 6657.

Pregnanetriol, excretion, 816, 6657.

pr^{gn}-5-ene,30,21-diol, sulphate conjugation, 709.

pr^{gn}-5-ene,3/9,17a,21-triol-20-one, sulphate conjugation, 709.

pr^{gn}-4-en-20-O-ol-3-one, in corpus luteum, 11.

pr^{gn}enolone (pregn-5-en-3-ol-20-one) & 17a,¹-dihydroxy-deriv., metabolism, 707, 3274, 3286, 5604.

Progesterone (pregn-4-en-3,20-dione) : assay, 3281, 3550, 5599 ; biosynthesis, 707, 2111, 3288, 6713, 6729 ; effect on (a) glucuronide conjugation, 4623, (b) hypothalamus activity, 4460, (c) mandibular gland, 6605, (d) ovaries, 6732, 2119 ; pregnanone, 6656, 6780, W, 6722 ; in ovaries, fish & toad, 3290 ; metabolism, 2111, 2128, 3282, 3285-6, 3550, 5599, 6713 ; 6729 ; microbiol. transformations, 1404 ; plasma binding, 699 ; pseudogestation induction, 6712, 6731.

Steroids, compounds, natural & synthetic,

progesterone deriv.: 6-dehydroretro-, labour inhibn., 6726 ; 17a-hydroxy-, adrenal metabolism, 3268 ; 17a-hydroxy-17-caproate, oestrus induction, 2098 ; 17a-hydroxy-6a-methyl-, pregnancy maintenance, 6730 ; 6a-methyl-17-acetoxy-, (a) oestrus induction, 2098, (b) oxytocin induced labour inhibn., 6726. soludecadron (9a-fluoro-16a-methyl A-hydrocortisone 21-NaPO₄), embryonic effects, 69. triamcinolone (pregna-1,4-diene-9a-fluoro-11,16a,17a,21-tetrol-3,2Odiolone-16a,21-diacetate) : mitochondrial metabolism, 3262 ; pituitary-adrenal blockage, 3235.

Steroids, metabolism,

aromatism, norandrostene deriv., 715. blood levels: 821, 2060, 3273, 3275, 4566, 4618f, 5562, 6553, 6729, 6735.

conjugation (see also **Conjugation**) : 5688, 6660-1, 6734 ; glucuronides, 149, 3289, 3294, 4622 ; sulphates, 698, 706, 709, 717f, 5600, 5690.

enzymic reactions (see also **Enzymes specific**), 264, 705, 3071, 3263-4, 3266-7.

in organ/tissue : adrenal, 713, 3268, 3280, 3286 ; allantoic fluid, 4617 ; blood, 5601, 5605f, corpus luteum, 6713 ; liver, 5645 ; ovary, 3282 ; placenta, 3280.

in pathoL/abnormal states: of adrenal, 2061, 2085f, 4570, 6649 ; retarded children, 6658, 5690.

intestinal absorption, 4089.

metabolic fate: oestrogens, 711, 823, 2123, 4621, 5603, 6741 ; prednisolone, 6269 ; progesterone, 5599.

microbiol. conversions: 714, 1366, 1404 ; dehydrogenation, 2839 ; hydroxylations, 3265f, 3276, 3824 ; oxidations, 702, 1403. review (title 4) 7143.

salivary levels, in pregnancy, 2095.

secretion : 2128, 6652 ; adrenal 6648, 6651, 6655, 6663, 6678 ; corpus luteum, 3285 ; milk, 4614 ; testis, 5691.

semen levels, 3691, 7070.

urinary excretion : 5604, 6264 f, 6271, 6657 ; androgens, 817, 6663 ; corticoids, 805, 4570, 6649, 6653-4, 6658 ; 17-KS, 3274, 4096, 6649, 6658 ; oestrogens, 2124-5, 4618, 6741 ; progestogens, 816, 2128, 4608, 6662.

Steroids, pharmacol. active,

admin, methods & studies, 1649, 2127, 4089, 4092, 4615, 4626.

anti-fertility agents (see also **Contraceptives**), 6262t, 6265, 6267.

anti-inflammatory activity, 1647, 6268.

implantation inhibn., 4099.

in alcoholism, 5593.

in CCl₄ cirrhosis of liver, 1749.

in lathyrism, 1316.

in muscular dystrophy, 1645.

in rheumatoid arthritis, 1648.

in semen disorders, 4629, 6744.

in Stein-Leventhal syndrome, 1643.

oestrus induction, 2098.

ovulation induction, 6709 f.

pregnancy maintenance, 6733.

serum lipid effects, 1644.

Steroids, structure/activity relations,

androgenicity, 2130.

cytotoxicity, 2672.

oestrogenic activity, 3287, 4615.

thymolytic activity, 1652.

Sterols (see also **Cholesterol; Vitamin D**), named sterols are followed by general entries.

bolanol, pentahydroxy-, 5260 ; campesterol, 274 ; Av<x>-cholestadienol, 3315 ; cnoicstan-30-ol, 2841 ; cholesterol, 278 ; coprostanol, 278, 52611 ; desmosterol, 1399, 2843, 3315, 5251 ; dihydrocholesterol, 2845, 5606 ; ergosterol, 2337 ; lanosterol, 2835, 2843, 3315 ; methosterol, 3315 ; sitosterol, 274, 34791 ; stigmasterol, 274 ; taraxasterol, 3479f.

assay as digitonide, 2841.

bile, 5260, 52611.

biosynthesis : (title 10) 2599 ; developing c.n.s., 5251 ; fungal, 745 ; liver, 2843 ; skin, 2835, 3315-6.

chromatography : 273, 278, 2840, 3316.

deposition in atherosclerosis, 1322.

dihydrotachysterol. See **Vit. D**.

Sterols,

in fig leaves, 3479 f.

in gallstones, 2845.

in tobacco & cigarette smoke, 274.

metabolism : biliary stone formation, 5606 ; developing c.n.s., 5251 ; A¹⁴" reduction, 2835, 2843.

respiratory mutant inhibn., yeast, 2337.

Steviol. See **Terpenoids**.

Stilboestrol. See **Sterols**.

Stilboestrol. See **Oestrogen-active compounds**, diethylstilboestrol.

Stimulants, c.n.s. (see also **Adrenergic agents** ; **Caffeine**),

effects, spont. motility, assessment, 3994.

analectic/convulsant,

activity of : hydroxylamine, 1613 ; tremor-producing amino alcohols, 1612.

benemegride, pentylenetetrazol & picrotoxin :

anaesthetic antagonism, 4005 ; body temp. & blood sugar effects, 4012.

methyphenidate, antagonising drug coma,

4008.

picrotoxin, brain ventricle injn., c.v.s. responses, 4142.

strychnine : effects, (a) jaw reflexes, 4024, (b) spinal inhibn., 4020 ; fixation, brain ganglion-side, 3811.

antidepressant (see also **Monoamine oxidase inhibitors**),

antireserpine activity, 4067.

arylalkyl- & araloxyalkylhydrazines, 3980.

demethylimipramine, clinical study, 4000.

formation from tranquillisers by demethylation, 4004.

imipramine : & demethylimipramine, effects, lipid biosynthesis, 3312 ; behavioural effects, (a) pigeons, 3986, (b) rat, 1610 ; inhib. brain MAO, 4001 ; potentiating barbiturates & meprobamate, 3970 ; suicide, 6224 ; toxicity, & thyroid function, 1736.

Stimulants, respiratory, dimefline, evaluation, 1603.

Stomach. See **Gastrointestinal tract**.

Storage. See **Preservation**.

Strain differences. See named groups (e.g. **Bacteria** ; **Mammals**) ; **Laboratory animals** ; **Species comparisons**.

Strawberry green petal disease. See **Viruses, plant**.

Streptolysin. See **Toxins, bacterial**.

Streptomycin. See **Antibiotics**.

Stress (see also **Adrenals** ; **Emotional states** ; **Shock** ; **Surgery** ; **Trauma**),

acceleration (g) effects. See **Acceleration**, in caries development, 2732.

in space flight, 1977.

lipid metabolism in, 229, (title 13) 7152.

maternal, effect on offspring behaviour, rat, 2187.

mucosal bleeding in, 4523.

pituitary as affected, 2071.

restraint, liver glutathione as affected, 4544.

sound induced : amphetamine effects, 4014 ; liver glutathione in, 4544.

ulcers induced by, 1616, 2155, (title 10) 7164.

viral infectivity as affected, mouse, 1472, 5940.

Strongyloides. See **Helminth anti-agents**.

Strontium, & 13a, comparative metabolism, rat, 533.

absorption by gastropod, 7051.

accumulation: by brown trout, 4965 ; by higher plants, 2410 ; by hydroxyapatite crystals, 5439 ; by mitochondria, 532.

effects on **Paramecium** avoidance reaction, 2581.

tetracycline chelates, 1101, 5847.

isotopes,

"Sr : metabolism, man, 3091 ; metabolism, snail, 517.

•Sr, accumulation by plants, 6874, 6919.

•Sr : & "Y separation, TLC, 3548 ; assay in biol. materials, 1105; i.p. injn. after X-irradiation, "Sr/⁸⁷Y blood content, 1080 ; in hair, 5848 ; in milk, miniature swine, 1104 ; plant absorption & milk contamination, 5846 ; removal from milk, 5845.

radio-: distribution in human & animal organs, (title 34) 7152 ; effects on expt. rickets, (title 1) 7157 ; removal from bone by tetracycline, 1101, 5847.

- Strophanthinidin, Strophanthin.** See Glycosides & aglycones, cardiac.
- Strychnine.** Sec Stimulants.
- SU-4885** (mctopirnec ; metyrapone). See Aldosterone antagonists.
- Subcommisural organ.** See Brain, hypothalamus.
- Submandibular gland.** Sec Salivary glands.
- Substance P.** See Einins.
- Succinate & succinic acid** (see also Citric acid cycle), in NAD reduction, mitochondrial fractions, 400, 403.
- methyl deriv., metabolism of, 57211.
- nicotine biosynthesis from, 890.
- reductive animation, kidney, 3322.
- Succinylcholine** (succamethonium). See Neuromuscular blocking agents.
- Sucrose** (see also Carbohydrates), as drinking stimulus, rat, 4583, 4636.
- as electrolyte replacement in media. See Culture & physiological media ; Electrolytes.
- digestion & absorption, rat, 4534.
- distribution in thyroid, 5178.
- effects on RNA & nucleotide spectra, 5371.
- hydrolysis, 3377.
- 3-keto- formation, glucose inhibn., Agrobacterium, 2762.
- metabolism, Agrobacterium, 2762.
- tongue sensory response to, dog, 6604.
- Sudan Black B.** Sec Dyes.
- Sugar beet yellows.** Sec Viruses, plant.
- Sugars.** Sec Carbohydrates.
- Suint**, -acids of wool, composition, 349.
- Sulphadiazine** ; sulphamethomidine ; sulphamamide ; sulphapyrimidines. See Sulphonamides.
- Sulphate**, absorption by plants, Dionaea, 4843.
- assay in lipid extracts, 239 ; in soil extracts, 1026.
- containing fraction, in mast cell tumour, SO₄ incorporation, 402.
- < esters, quant. i.r. analysis, 1019.
- incorporation : into chondroitin sulphate, 5217 ; into fish prehypophysis, SO₄ study, 3523 ; into sulfolipids, Euglena, 237.
- Sulphated carbohydrates & mucopolysaccharides.** See Carbohydrates ; Mucopolysaccharides.
- Sulphatides.** Sec Sphingolipids.
- Sulphides**, heterocyclic-aromatic, acaricide prop., 1559.
- role in cysteine biosynthesis, 3061.
- Sulphide bonds & groups.** increased in virus-infected liver, 6113.
- inhibn. of hexokinase, 738.
- interchange, initiation by light, 3560.
- of chymotrypsinogen A, (title 109) 7148.
- reaction with protein thiol groups, 2935.
- reagents, effects on cyt. oxidase, 56121.
- reduction in wheat flour, 5746.
- Sulphipyrazone.** See Uricosuric agents.
- Sulphite**, -modified urease, 5495.
- Sulphobromophthaléin.** See Dyes, BSP.
- Sulpholipids.** Sec Sphingolipids.
- Sulphomucopolysaccharides.** See Mucopolysaccharides.
- Sulphonamides** (see also Diuretics ; Hypoglycaemic agents), carbonic anhydrase inhibn., 4163, 5628.
- caripamide, effects, thiosulphate renal secretion, 1692.
- effect, iver CCl₄ damage, 6351.
- inhib. chloroplast Hill reaction, 5628.
- sulphadiazine & triple sulphapyrimidines, plasma concn. & antibacterial activity, 1558.
- sulphamethomidine, glucuronide conjugation, 6182.
- trachoma agent susceptibility, 1562.
- iV-(L-valyl-L-valyl)sulphanilamide & analogues, synthesis, antibacterial action, 1530.
- Sulphonate esters**, i.r. analysis, 1019.
- Sulphonated hydrocarbons**, as molluscicides, 1727.
- Sulphones**, heterocyclic-aromatic, acaricide prop., 1559.
- Sulphonylureas**, antidiabetic. See Hypoglycaemic agents.
- Sulphoxides**, dimethyl- as preservative, 66 ; />-nitrophenyl acetate in, reaction with trypsin, 2938 ; radioprotective action, 1095 ; removal from frozen blood, 1801.
- Sulphoxime**, of methionine, 730, 3564.
- Sulphur**, -bacteria. Refer to Bacteria.
- balance in wool, 295.
- colloidal, radiation protection by, 3604.
- containing cpd. (see also Amino acids ; Proteins, etc.) for radioprotective effect, see Radiation, ionising, protection: biochem., (title 12) 2593 ; detection on paper chromatog., 5796 ; enhancing tellurite toxicity, *E. coli*, 5626.
- metabolism, rat, 3180.
- soil constituent & plant nutrient, review, 48491.
- isotopes**, 'S, labelling of turnip yellow mosaic virus, 6139.
- Sulphur dioxide**, assay in ciders, 1030f.
- Sulphylipid groups & compounds** (see also Mercapto- ; Sulphide; Thio-), & morphogenesis, amphibia, algae, 4930.
- auto-oxidation, catalysis by vit. B_{1a} deriv., 5542.
- in blood platelets, relation to clot retraction, 3508.
- in blood proteins, reaction with disulphides, 2935.
- in human r.b.c, 3349.
- in virus-infected liver, 6113.
- inactivation of atopic Ab by, 1146.
- inducing recurrence of Arthus-type inflammation, 1136.
- interactions with vit. B₁, deriv., (title 10) 7148.
- of contractile muscle proteins, 3076, 5325, 5391.
- protease susceptibility to, in Arthus phenomenon sites, 1305.
- radioprotective effects. See Radiation, ionising, protection.
- required for penicillinase activity, Aerobacter, 877.
- role in histamine release, 5584.
- skin levels, mice, 1251, 6385.
- stmn. of ATPase, 5390.
- wool proteins reduction by, 372.
- inhibitors**, ^chloromercuribenzoate : 3076, 4494 ; effects on myosin A optical rotatory dispersion, 366 ; inactivation of fibrin stabilising factor, 6437.
- W-ethylmaleimide, 1069, 3508.
- iodoacetate, 5077.
- Sunlight.** See Light; Radiation, electromagnetic, solar.
- Superconductivity**, (title 7) 5036.
- Superoxidation.** See Reproduction, cycles.
- Supra-renal.** See Adrenals.
- Surface active agents**, action on frog skin p.d., 4262.
- anionic, dodecyl sulphate: enzyme disorganisation, 5473 ; micelle concn., 3524.
- cationic : cetrimide (a) affecting nerve response to ACL, 6236, (b) fungal metabolism inhibn., 745 ; spirolipoperidinium bromides, activity, 1673 ; triburon, & fungal metabolism, 745.
- enzyme inactivation by, 3300, 5473.
- non-ionic : glycol determination in, 1032 ; pH effects, 4188 ; Tween (a) hydrolysis by bacteria, 6169, (b) radioprotection of bacteria, 1550.
- Surface phenomena** (see also Membranes), cell surface, chlorambucil interaction, 724.
- duplex film method, phospholipid-salt interactions, 2821.
- film penetration & adsorption, 4197.
- prevention of excessive foaming, 1017.
- surface active prop., phosphatidyl ethanolamine sols., 1669.
- surface tension lowering, radioprotection of bacteria, 1550.
- Surgery** (see also Anaesthesia-; Regeneration; Transplantation ; Wound healing ; & under sp. organs & systems), all entries refer to man unless otherwise stated.
- bedside biochemistry in, 5705.
- blood proteins after, 1230.
- calf blood flow as affected, 4428.
- endocrine- selection of breast cancer patients for, 3757.
- fibrinolytic activity as affected, 6440.
- intracardiac, open, anaesthesia in, 6205.
- massive blood replacement in, K levels & acidosis, 1843.
- pituitary-adrenal responses, 4577.
- post-operative therapy, 1720.
- preoperative therapy, 1590, 1594.
- wound sepsis, staphylococcal sources, 1382-3.
- Suxamethonium** (succinylcholine). See Neuro* muscular blocking agents.
- SV.** See Viruses, animal, myxo group.
- SV 40.** See Viruses, animal, papova group.
- Swallowing**, respiratory neurones activity in, 4443.
- Sweat** : Ca in, man, 3088 ; proteins, immunochenu 829 f.
- Sweat glands** : activity in foot pad, cat, 1772 ; O₂ consumption, Zebu cattle, 4263 ; staining of secretory capillaries, 26.
- Sweating** (see also Body temperature), in cattle, measurement, 4240-1.
- Swimming.** See Locomotion.
- Symbiosis** (see also Fungi, mycorrhiza ; Lichens, Root, root nodules ; & sp. organisms), bacterium in protozoon, DNA type of, 420.
- Sympathetic a.n.s.** ; Sympatholitics ; Sympathom* metics. See Nervous system, autonomic I Adrenergic.
- Synapses** ; synaptic potentials. See Nerve synapses.
- Syndromes.** See specific names, specific organSr & Hereditary abnormalities & diseases.
- Synovial fluid**; -membrane; Synovitis. See Joints.
- Synthalin**, pancreatic a-cells as affected, 10.
- Synthetic materials** (see also Macromolecules), for tissue responses to implantation, see TISSU* response), Dacron, aorta grafts, 1324.
- high polymers, (title 14) 5036.
- polymethylvinylsiloxane, radiation model, 360* polystyrene-methylethylketone system, physico-chem. prop., 1020.
- poly vinyl alcohol: eclampsia-like effects, 1318 J nephrotic effects, 1347.
- polyvinylchloride : prosthesis, ureter, 6626.
- polyvinylpyridine-iV-oxide, inhibn. of quart* dust cytotoxicity, 2676.
- PVP : as plasma expander, 5995 ; bone marro^ preservation, 66.
- Syphilis.** See Venereal diseases ; & Treponema i" Taxonomic index.
- Syringopine.** See Rauwolfa type alkaloids.

- Taxonomy.** of fish, *Salmo gairdnerii* & *S. clarki lewisi*, sp. status, 4732.
 of fungi, differentiation by carotenoid pigments, 922-3.
 of higher plants, *Hypericum*, biochem. study, 4904.
 of mammals, *Papio*, esterases as subgeneric character, 2513.
 of molluscs, immunoelectrophoresis as taxonomic tool, 7129.
R Sachs' disease. See Brain disorders.
W (in)lactic acid. See Herbicides.
 (see also *Camellia sinensis* in Taxonomic index):
 caffeine content, 1021.
 essential oil content, 5733.
Thiomaxine. See Alkaloids.
Teeth (see also Bones; Maxillofacial region; Mouth; Periodontium), effects refer to man unless otherwise stated.
 calcific. See Saliva.
 caries (see also "enamel" below), anti-treatment evaluation, 102.
 ^termination methods, evaluation & reliability, 2737, 5155.
 ^excavation: E.M., 104; role of stress, rat, 2732.
 dietary factors affecting, 5158; B-vit. antimetabolites, (title 11) 7157; food Particle size, rat, 107; lysozyme supplementation, rat, 5160.
 ^n vitro, 2730.
 incidence: Australian children, 5156; body glucose levels as related, 2738; in horses, 2734; in progeny of CO₂ treated mothers, at, 108; in twins, 5157; micro-organisms as related, 109; salivary enzymes not affecting, 5154.
 Parabiosis & tolerance effects on, rat, 2731.
Phylaxis: fluoridated salt, 5159; tooth-pastes, 2733, 2739.
 -<stance, genetic determination, rat, 106.
 ^secondary dentine, incidence, 2735.
 ^cepitibility: & glycolysis, no correlation, 103; rat strains, 105.
 <k^th area as related, 2736.
 ^riduous crown development, 5138; extract effect on permanent dentition, 5136.
 ^dental anaesthetics, presence in pulp, 115, 5150.
 ^dental treatments, pulp & root filling prep.,
 dentifrices. See Mouth, oral hygiene.
 }^e: collagen, 384, 2727f, expt. formation, s^o^hem, dog, 2719; matrix, rat, 5138;

 scrotum, temp. effects on, 6743.
 Sertoli cells, fine structure, rat, 6775.
 submaxillaryectomy as affecting, 2131.
 wt., 2132.
Testes disorders (see also Sexual development, dysgenesis), atrophy, as drug toxicity assay, 6334.
 cryptorchidism, expt., 6746.
 insufficiency, 4254, 6744.
 Klinefelter's syndrome, & lesions, myotonic dystrophic patients, 5689.
 tumours, 1280.
Testosterone. See Steroids.
Tetanus. Tetany; Tetanic contraction. See *Clostridium tetani* in Taxonomic index; Toxins, bacterial; Muscle contraction.
Tetrabezaine. See Tranquillisers.
Tetracyclines. See Antibiotics.
Tetraethyl-methyl-onium. See *tetra* Ethyl- etc.
Tetrahydropterin. See Pteridines & pterins.
Tetrameprazine. See Phenothiazine derivatives.
Tetrazolium compounds. As dyes, see Dyes & stains; as electron carriers, see Oxidation-reduction.
Tetrodotoxin. See Toxins & venoms, fish.
 a-Tetronic acids, 3423-4f.
Thalassaemia. See Anaemia.
Thalidomide, detection, tissues, 6226.
 embryotoxic, monkey, 6344.
 teratogenicity, 4170-3.
 toxicity, protozoa, 725.
Thallium, assay, 5454.
Theaflavin. Sec Flavonoids.
Thearubigin, of tea, 5734.
Theophylline. See Vasoactive substances.
Thermodynamics (see also Energy; Energy levels), green leaf as heat engine, 6990.
 metastable mol., control of cyclic functions, 3495.
 of solute flow across membrane, 5780.
 of soln. at low temp., (title 12) 5036.
Thermoregulation. See Body temperature.
Thiabendazole. See Helminth anti-agents.
Thialisobutam (butthalitone). See Barbiturates.
Thiamine (see also Vitamins), & pyridithiamine, separation & assay, 3189.
 antagonists: phenol deriv., (title 10) 2595; pyridithiamine, 3189.
 biosynthesis, 631, 5536, 5575.
 deficiency, 631, 3188, 4184, 4519, 4854, 6235, 6493.
 excretion, thiazide effects, 632.

- Thiamine,** in yeast autolysates, 5533.
role in sedoheptulose 7-PO₄ formation, birds, 3190.
-sparing action: of hydrolysed glucose acetate, coprophagy effects, 631; of mustard, coprophagy effects, 3188.
stability in prep. 1718.
tissue storage in hypo- & hyperthyroid rats, 5575.

Thiamine phosphates, hydrolysis, 5534.
pyrophosphate (cocarboxylase): co-enzyme of α -carboxylase of wheat germ, 5535; effects on cardiac output in hypo-oxia, 4368.
separation & assay, (title 34) 7155.

Thiazides, thiamine & pyridoxine excretion as affected, 632.

&-3-Thiophylalanine, distribution, tumour-bearing rats, 3749.
hepatotoxic effects, rats, 6006.

Thio- See also prefixes **Meroapto-**; **Snlp-**

Thioacetamide, as thyroid inhibitor. See **Thyroid inhibitors**, effects on orotic acid incorporation into liver RNA, 5637.
-induced liver cirrhosis, 1749.
radioprotective effect, 6979.

rft-Thiocarbamates, as trichomonacides, 1722.

Thiocarbamide. See **Thiourea**.

rft-Thiocarbamoylhydrazine, inhibitor of pituitary gonadotrophic activity, 4097-8.

Thiocholine iodide esters, enzymic hydrolysis, 3117.

Thiocctic acid. See **Lipoic acid**.

Thiocyanate, action on thyroid, 2080, 5619, 5682.
passage out of c.s.f., 6450.

<**r**-Thiodiglycol, inhibn. of cell division, bacteria, yeast, 1545.

a-Thioethylglucopyranoside, transport in 5. *cerevisiae*, 845.

<**r**-**ThioEtyl**, effects on nuclei localisation in blastomeres, 6823.

Thioguanine. See **Purine & pyrimidine analogues**.
Thiol groups/compounds. See **Sulphydryl groups**.
Thionin. See **Dyes & stains**.

Thiopentone (pen to thai). See **Barbiturates**.

Thiophosphate, inhibn. of ATP-inorg. PO₄ exchange, 3310.

Thiopurines; -pyrimidines. See **Purine & pyrimidine analogues**,

Thiophosphate, oxidation by *Thiobacillus*, 722.
reduction by reduced lipoic acid, rhodanese-catalysed, 611.
secretion in renal tubules, drug effects on, 1692.

Thiotepa (triethylenethiophosphoramide). See **Cytostatic & cytotoxic agents**.

Thiooracil. See **Thyroid inhibitors**.

Thiourae, as thyroid inhibitor. See **Thyroid inhibitors**.
desulphuration by saliva, 612.
effects on guppy, 5011.
inhibn. of oxidative phosphorylation in lettuce seeds, 2471.
radioprotective effect, 6979.

Thioxanthine derivatives. See **Purine & pyrimidine analogues**.

Thirst. Refer to **Drinking**.

Thiuronium compounds, /0-aminoethyl isothiuronium Br.HBr (AET): deriv., pharmacol., 4085; radioprotective effects, 1096-7, 1738, 5842, 6355, 6815, 6979; toxicity & tolerance, 4221.

INDEX OF SUBJECTS

- Tocopherol,** relation to enzyme -SH sites, 662. tissue content, protein status effects, rat, 3224.
- Totranil** (imipramine). See **Stimulants, c.n.s., antidepressant,**
- Tolazoline** (priscol). See **Adrenergic blocking agents.**
- Tolbutamide.** See **Hypoglycaemic agents.**
- Tolerance** (immunol.). Refer to **Immunological unresponsiveness.**
- Toluene.** See **Hydrocarbons, aromatic.**
- Toluene di-isocyanate,** thrombocytopenic purpura induction, 1730. toxicology, 63(54).
- Toluidine Blue.** See **Dyes.**
- Tolyl maleimides,** mosquito repellent, 1734.
- Tomatideno.** See **Alkaloids.**
- Tongue** (see also **Taste**), innervation, monkey, rat, 4457-8. of pangolin, 20f.
- pressure on teeth, measurement, 2720.
- role, in cleft palate induction, mouse, 2693. root movements, 4323.
- stimn., cations & anions, frog, 2001.
- Torulene.** See **Carotenoids.**
- Touch.** See **Nervous system, afferent & sensory.**
- Toxicology** (for metabolism of foreign cpd. see **Biotransformation**; **Conjugation**; **Drug absorption**), environmental contamination (see also "pollution" under **Air, Soil, & Waters, natural; & Radioactivity**), by sugar factory & distillery wastes, 1732. food additives/contaminants (see also **Anti-oxidants**; **Dyes**; **Preservation**) : di-terf-butylhydroquinone, effects, rat, 4175; insecticides, human fat content, England, 6359; synthetic lubricants in edible oils, 55221; tri-o-cresol PO₄, effects, 6365.
- industrial/occupational hazards (see also **Lung disorders**, pneumoconioses): bagassosis, mill workers, 1331; beryllium disease, review (title 6) 7147; cadmium pigment workers, renal & pulmonary dysfunction, in review, 2598; CO poisoning, clinical picture, 6347; dental practice & Hg poisoning, 6342; diehrin (a) absorption, moist atm., 6361, (b) fatal poisoning, 6362; neuropathy due to 2,4-D & deriv., 4209, 6356; toluene diisocyanate (a) max. atm. concn., 6364, (b) thrombocytopenic purpura in workers, 1730.
- separation of poisons, chromatog., 1619.
- toxicity/poisoning by (see also **Drugs, toxicity/ side effects**; **Metabolic inhibitors**; **Tumours, induction/inducing agents**) : aconitine, pulmonary oedema, 1328; amino nucleoside, kidney, 1343, 1346; ammonia, review, (title 79) 7148; arsenate & CN, grouped fish, 4203; benzene vapour, 1752; boron cpd., Na penta- & tetra-borate decahydrates, 6370; carbon monoxide (a) blood content in, 6347, (b) cardiac O₂ consumption in, 6346, (c) hyperventilation in, 4213; carbon tetrachloride (a) & thioacetamide, liver, 1695, 1747-50, (b) expt., liver, 1335, 4215, 4217, 6350-2, (c) oral, fatal, 6349; cigarette components, *Paramecium* study, 1548; citric, fumaric & tartaric acids, 1725; cyanide (a) child, 6343, (b) protection/therapy, 1729, 4212; 2,4-D & deriv., 4209, 6356; dichlorovinylcysteine, protection, 1733; fluorine, India, in review, 2596; glycerol, spp. difference, 4137; hydrazine, liver, 1751; insecticides (a) chlordane, liver, 6353, (b) cyclodiene, 6336, (c) diehrin, 6361-2, (d) organo-P, phenothiazine potentiation, 1735; lead (a) haematol. effects, 4289, (b) parathyroid role, 3788; mercury (a) in dentistry, 6342, (b) kidney, 1341, 17311; Methyl Orange, metabolic effects, 3319, 3320; nitro-olefines, inhaled, 6358; optical brighteners, 1737; oxalate, symptoms, 6339; ozone & NO_x thyroid factors, 4103; poly vinyl alcohol, inducing (a) eclampsia, 1318, (b) nephrosis, 1347; sodium chloride, i.v. admin., 6340; tobacco, inducing angina, in review, 2598; tri-o-cresol PO₄, 6365.
- toxicity of plants to animals (see also **Alkaloids**; **Anaemia, haemolytic**; **Antigens, allergens**; **Glycosides**; **Lathyrism**; **Lectins**; **Oestrogen-active-compounds**) : bracken poisoning, (titles 3, 8) 5038; groundnut toxicity, 24871, 4220, (title 5) 5038; *Lithospermum* extract, thyroid inhibn. by, 4102; review, (titles 1-9) 5038 ; ** (contd.)
- Toxicology, (contd. from 88)** soybean fractions in growth inhibn. & pancreatic hypertrophy, chick, 744; sporidesmin causing eczema, sheep, 8961. toxicity testing, testicular atrophy as index, 6334.
- Toxins, bacterial** (for immunol. aspects, see **Antibodies, antitoxins**; **Antigens, bacterial**; **Immunisation**), **general entries are followed by named bacterial types**, endotoxin(s)/lipopolysaccharide : 8c Schwartzman reaction, 5991, 5993; & viral meningoencephalitis, 6074; action mechanism, 5994; antitodal effect of unsat. fatty acids, 3774; "Cr-labelled (a) characterisation, identification, 6011, (b) circulatory removal, 3803; effects (a) ACTH release, 6648, (b) gastric haemodynamics, 1297, (c) kidneys, 6013, (d) spleen Ab response, 1202; -induced shock (a) primates, 1298, (b) sheep, 4168; of *E. coli* & other enterobacteriaceae, common hapten, 3835; pyrogenic responses, 1709; serol. reactivity, 6012; tolerance (a) expt. pylonephritis, 5992, (b) RE role, 3695; "H-labelled, prep., analysis, 3804; vascular wall localisation, 1299.
- named types**, *Bacillus thuringiensis* ; factors, 3827; toxicity, monkeys, HOT.
- Clostridium**: *C. botulinum* (a) c.n.s. effects, man, 6372, (b) type A, mol. wt., pepsin action, 353; *C. perfringens*, toxins & anatoxins compared, 3833; *C. septicum* & *C. histolyticum*, -antitoxin interaction, 1411; *C. tetani* (a) effects, parental behaviour, rat, 2156, (b) fixation, brain tissue/gangliosides, 3506, 3811, review, 4204, (c) local <x c.n.s. effects, 4032.
- Coryne diphtheriae* : effects, vascular reactivity, 6257; -like strains, prop., 6030; toxoid, 6031-2.
- E. coli*, haemolysins, 6037.
- Salm. enteritidis* endotoxin, -Al citrate complex, 1417.
- Shig. shigae*, effects, brain amines, 4063.
- staphylococcal: & food poisoning, review, 1374; enterotoxin, emetic effects, 1710; -haemolysin, prep., prop., 6023-4; 6-haemolysin, prep., prop., 5348; leucocidin, effects, polymorph., 881-3; -O-lysins, purification, 3418; toxins & anatoxins, (a) "antagonist complexes" in review, 5047, (b) review, (title 2) 7165.
- Staph. aureus* enterotoxin, effects, adrenaline dermal reactivity, 1300.
- streptococcal: streptolysin O, inhibn., in hepatobiliary disease, 3337; streptolysin S, formation & inhibn., in serum, 3612.
- Streptococcus pyogenes*, streptolysin S, prep., prop., 879.
- Toxins & Venoms**, ciguatera, food chain passage, 1723. fish : puffer fish, tetrodotoxin, physiol. effects, 6371; weeverfish, prop., effects, 6373.
- fungal : *Aspergillus* aflatoxin (a) components, 6150, (b) groundnut contamination, 24871, 4220, (title 5) 5038, (c) protein biosynthesis effects, (title 48) 2594; phalloidin, action mechanism, 4214; sporidesmin (a) binary effect, (title 9) 5038, (b) structure, 896 f.
- insect : bee (a) axon effects, 6532, (b) bioassay, 3428; Hymenoptera, pure prep., 2575; *Pieris brassicae*, digestive fluids, 4951.
- molluscan, Conidae, study, 4211.
- scorpion, electrophoresis, 2898.
- snake : *Agkistrodon halys*, immunol. reactions, 3705; *Agkistrodon rhodostoma*, blood coagulation effects, 4104-5; antitodal effect of unsat. fatty acids, 3774; *Bothrops neuwiedi* sub spp., comparison, 4210; Bulgarian sand viper, immunol. aspects, 1182; *Crotalus* 8c *Naja*, electrophoresis, 2886; *Echis carinatus* & *Bugarus caeruleus*, electrophoresis, 2899; *Echis colorata* & *Vipera palestinae*, effects, blood platelets, 1819; effect of snake sera, 4111; effects (a) axons, 6532, (b) *Pseudoboa clelia*, 4125, (c) r.b.c. membrane ATPase, 3028; Egyptian black snake, antivenin prep., 4110; *Vipera ammodytes*, cardiac effects, 4109; *Walterinnesia* & *Pseudocerastes* spp., prop., 1728.
- Toxohormone**, effects, localisation, 5586-8.
- Toxoids.** See **Antibodies**, anti-toxins; **Immunisation, active.**
- Toxoplasmosis.** See **Protozoal infections**; *Toxoplasma* in Taxonomic index.
- TPN.** See **Nicotinamide nucleotides, NADP**.
- TR 495.** See **Depressants.**
- Trace elements.** See **Electrolytes**; **Metallic ions**; & sp. elements.
- Trachea.** See **Respiration & respiratory organs.**
- Trachoma.** See **Virus-like organisms.**
- Tramesanguin.** See **Plant pigments.**
- Tranquillisers** (see also **Anticonvulsants**; **sedatives**; **Muscle relaxants**; **Phenothiazine drugs**; **Sedatives & hypnotics**), **general entries are followed by named drugs**, activity of: ethylmethylvaleramide, oxazoline-naphthylamine deriv., 622.
- ADH-like effect, amphibia, 1607.
- behavioural & e.e.g. effects, analysis, 398.
- behavioural effects, study method, 3987.
- effects : brain autonomic control systems, brain phospholipids, 5249.
- metabolic conversion to antidepressants, screening technique, 3988.
- named drugs**, azacyclonol, effects, brain phospholipids, 5249.
- benzodiazepines, effects, amygdala & hippocampus, 3976.
- benzquinamide, anti-anxiety effect, 1608.
- chlorodiazepoxide : 1607; & metabolite, plasma, 3975; behavioural effects, 3982; chromatog., 4190; effects, 6231.
- haloperidol: 3987; effects, audiogenic 3978; related basic ketones, stx activity, 3981.
- meprabamate : 1605, 1607, 3972, assay, & urea interference, 6227; & metabolism, 1667, 4002; effects (a) phosphorylase & e.e.g., 4003, (b) system, 3979, (c) liver, 3036; potential by imipramine, 3970.
- tetrazenazine, effect, fish melanophore.
- Transamination.** See **Amino groups**; & specific transferases, amino.
- Transferrin.** See **Blood proteins**.
- Transfusion.** haematol. See **Blood Bone marrow.**
- Translocation.** See **Plants, nutrition; relations.**
- Transmethylation.** See **Methyl groups**; & specific transferases, methyl.
- Transphosphorylation.** See **Phosphorylase**; Enzymes, specific, transferases, phosphoc.
- Transpiration.** See **Plants, water relations**.
- Transplantation apparatus, techniques** & plant work see **Plants, techniques**; sp. organs/tissues above, & below, diffusion chamber in vivo, 1196, 5954. for developmental studies : gonadal p⁺ duck embryo, 81; intrasp., blastula * frog, 4710. for graft rejection mechanism interplay (title 5) 2597. for mammary glands, quant., 5952. for urodele limb regeneration studies*, 4942, 7043. graft-y-host reactions as research tools*, 2597. histocompatibility tests, 1186-7, 1187, 3683, 5893.
- parabiosis**, 1196.
- prophylactic/therapeutic** (see also **Blood fusion**) : bone marrow (a) auto-induced medullary aplasia, man, homo-, in X-ray &/or drug-treated rat, dog, 1215, 5889, 5910, (c) drumstick appendage freq. monkey, 5890; immunol. compete cancer, 1274, 1274; vascular rep. phised grafts, (title 17) 7155.
- Transplantation immunology** (see **groups**; **Tumours, immunology**), Ag : antigenicity of cultured 1y? 3681; genet., 1187; microsomal fr⁺ 3679, 5888. cytotoxins & haemagglutinins homografting, 3683.

- Transplantation immunology.**
 graft rejection/survival (see also "-homograft immunity" below),
 Prolongation, bone marrow & kidney homografts, by X-ray &/or drugs, dog, 5910, 6630.
 prolongation, skin homografts: as function of RNA injn. ffeq., 3682 ; by amethopterin, 6310-1 ; by e-aminocaproic acid, 1227t ; by aj-protein fractions, 1028-9; by prior injn. of (a) allogeneic cultured spleen or medium, 3681, (b) donor cell Ag, 1217 ; in chronic renal insufficiency, 1183.
 rejection: intestine, homo-, ectopic, dog, 4526 ; mechanism interpretation, (title 6) 2597 ; skin homo- (a) & hetero-, plasma protein changes in, 1192, (b) histol. relation to vascular network, 1191, (c) inflammatory cell role in, 3678.
 graft-versus-host reactions : in cancer treatment, 1274 ; in F₁ hybrids (a) acquired tolerance, 1195, (b) homologous disease "Won," (title 7) 7164, (c) fuit disease, "hymectomised parent strain cell-inj., 5891 ; v title 5) 2597.
 "erografting": chimaeras, 3680 ; skin, 1192 ; >mour, 1275.
 ^compatibility (see also **Antigens, species Specific, iso-; & Immunogenetics**): barriers (strong & weak), graft-host interactions across (to) assay, 5893, (b) donor tissue Ag injn. effect, 1217 ; tests for (a) evaluation, 1197, (b) ^grafting as, in inbred mice, 1186-7, 2374.

5339, 5340, 5341, 5342, 5343, 5344, 5345, 5346, 5347, 5348, 5349, 5350, 5351, 5352, 5353, 5354,

Tyramine,
 & acetoin production, in uraemia, 999.
 cardiovascular effects, 1675-6, 4076, 6251, 6282.
 catecholamine depletion/release : adrenal medulla, 4081 ; heart, 1626-7, 1675, 1878, 4061, 4076, 6282.
 methyl ether, catatonic, 4196.
Tyrosinase inhibitors, phenyl lactate, inhib. melanoma respiration, 5960.
Tyrosine (see also Amino acids ; Iodotyrosine ; a-Methyl-m-tyTOSine),
 at Ab active site, 2944, 2960.
 blood & urinary levels in collagenosis, (title 14) 7152.
 conversion to : melanin, 5459 ; noradrenaline, heart prep., 6239 ; thyroid hormones, thyroid prep., 6811.
 enzyme studies, 302, 5274, 5353, 5569.
 fluorescence, 5276.
 halogenation in acid hydrolysis, 2868 f.
 O-sulphate, metabolic fate, rat, 303.
 toxicosis, relation to vit. C synthesis, 653, 657.

U.

Ubichromenol,
 effects on heart muscle prep., 233.
 phyt., preventing encephalomalacia & muscular dystrophy, chick, 3150.
 tissue content, protein status effects, rat, 3224.
UbiQuinones (see also Quinones ; Vitamin K),
 conversion to ubichromenol, yeast, (title 106) 7148.
 in kidney, neonatal rat, 571.
 in liver, B.M.R. increase effects on, 690.
 in protozoa, 2511.
 in respiratory chain, 233.
 preventing encephalomalacia & muscular dystrophy, chick, 3150.
 review, (title 5) 7141.
role in maintenance of sperm motility, 5553.
tissue^acontent, protein status effects, rat, 3224.
UQ₁₀ role in NAD reduction by ascorbate, 3214.
UQ₁₀ & UQ₁₀, in protozoa, 2511.
UQ₁₀, metabolism in chick embryo & rat, 5551-2.

Udder. See Mammary glands.

Ulcers. See -disorders of sp. organs & tissues.
Ultracentrifugation. See Centrifugation.

Ultrasound,
 alkaloid extraction, 5731.
 perception, man, 1999.
 reflection pattern, mitral stenosis, 6497.
 skull measurement by echoencephalography, 4233.

UmbeUiferone. See Coumarins.

Umbilical cord (see also Embryos-; Neonates ; Placenta) : blood, Ab in, 1128, 3650 ; oestrogen concn., blood vessels, 6735.

Uncoupling agents. See Phosphorylation, oxidative.
Uracil (see also Pyrimidines),

 analogues. See Purine & pyrimidine analogues.
 carbamoyl-0-alanine as precursor, plants, 3436.
 control of carbamyl phosphate synthesis, bacteria, 510.

 methyl sulphone, biochem. & pharmacol., 1665.
Uracil mustard (bis [2-chloroethyl] aminouracil).
 Sec Cytostatic & cytotoxic agents.

Uraemia ; Uraemic-. See Urea, blood levels.

Uranyl acetate. See Dyes.

Urea,
 activation of dihydrofolic reductase, 3203.
 biosynthesis (see also Arginine; Citrulline ; Ornithine ; Ornithine cycle) : in foetal liver, 5465 ; in young barley roots, 955 ; reduced after >³Pu admin., 3608.

 blood levels, uraemia, 999, 3342.
 distribution after haemodialysis, 6459.
 effects on : blood a-lipoprotein, 379 ; lactic dehydrogenase activity, (title 88) 7148 ; RNA & nucleotides spectroscopic behaviour, 5371.

 in plasma & r.b.c., 1832.
 infusion, as drinking stimulus, rats, 4583.
 inhib. of kidney mutarotase activity, 3304.
 interference in meprobamate assay, 6227.
 intestinal absorption, dog, 2018.
 protein denaturation, 377, 385, 391, 604, 721, 5236, 5334.

renal excretion, rabbit, 2045.
utilisation : by *Candida* sp., (title 23) 5038 ; by cattle, 5514.

Ureter. See Urinogenital system.
Urethane,
 -anaesthesia, adrenaline b.p. effects in, 6245.
 as mutagen, lysogenic, 6016.
 carcinogenicity, 1255-6, 1266, 5936.
 immunol. suppression, 5910.
 inhib. proteases, 740.
Urethra ; Urethritis. See Urinogenital system.
Uric acid,
 hyperuricaemia, 6293.
 production by *Helix pomatia*, 4964.
Uricosuric agents, sulphinypyrazone, Na depleting effect, 4165.
Uridine (see also Nucleosides),
 analogues as antimetabolites. Sec Purine & pyrimidine analogues.
 2'-deoxy, u.v. & low temp. effects, 1068.
 incorporation into nucleic acids. See Nucleic pseudo-, orotic acid incorporation, 755.
Uridine phosphates (see also Nucleotides),
 & RNA metabolism, hepatoma, 53681.
 formation from uracil, bacteria, 2983.
 oligosaccharides, in milk & colostrum, 2989.
 -peptides, isolation, bacteria, 2986.
 psudouridine phosphates, yUMP, in insect RNA, 5374.
UDP,
 -glucose, & glycogen synthesis, 32, 5195.
 -hexose & -hexosamine, liver, 5363.
 in substance P assay, 1697.

UMF,
 of nucleic acids. See Nucleic acids,
 poly- : & tumour microsomes, 478, (title 24) 7148 ; double helix formation, 30171 ; in hepatoma & regenerating liver, 5363.
UTP,
 biosynthesis, ox cristallin, 5362.
 mineralising action, bone & cartilage, 5357-8.
Uridylic acid. See Uridine phosphates, UMP.

Urinary bladder. See Urinogenital system.
Urinary constituents & tests (see also Biotransformations ; Excretion ; Kidney function),
 individual substances & groups of compounds are indexed under their own headings.

acidification after Ca salts injn., (title 2) 7164.
 acidity & ammonia in hypothermia, 6638.
 calculi, (title 127) 7148.

collection, 5 hr. & 24 hr. periods compared, for diuresis measurement, 4164.

extracts, antihistamine & antib Bradykinin effects, 6278.

gonadotrophin-inhibitor from, 6739.

infections, enzymes raised in, 807.

Urine. See Urinary- above ; & Kidney function.

Urinogenital system (see also Reproductive tract),
bladder : electric stimm. of evacuation, paraplegic dog, 2049 ; electrolyte transport, 4562 ; fine structure, toad, 2508 ; glucose uptake, insulin dependent, toad, 4561 ; implantation, as carcinogenic detector, mouse, 5924 ; neoplasms, 1250 ; oxidative metabolism, pituitary hormones effect, toad, 4563 ; oxytocin inhibitor release, toad, 3241.

infections : SV-40 virus, 1482 ; urethritis, non-gonococcal, Troponin activity, 1533.

ureter : obstruction, effect on kidney lymph production, 6625 ; polyvinyl prosthesis, 6626.

Urocanic acid. See Histidine, metabolites.

Urochordates (see also Eggs; Embryos; & Taxonomic index),

ACh & AChase, *Ciona intestinalis*, 2577.
I binding : *Ciona*, 5008 ; *Salpa*, 7068.

popln. biology, *Ascidia nigra*, 7133.

predation on *Oikopleura*, plaice larvae, 7063.

radioactivity as function of surface area, *Salpa*, 1102.

thyroid hormones in, *Salpa maxima*, 7068.

tissue reaggregation, zooids, *Attnaroecium*, 7041.

V_{max} uptake & absorption : *Ascidia pygmaea*, E.M., 7056 ; *Phallusia mammillata*, 2532.

Uscharin. See Glycosides & aglycones, cardiac.

Ussing criterion, thermodynamic derivation, 4276.

Uterus (see also Pregnancy; Reproduction; Reproductive tract),

anti-histamine effects on, 6279, 6719.

cervix : oestrogen effects on, 5085 ; tumours, 1247.

composition & metabolism, 32, 2097, 3381,

5086, 5580, 6716, 6719, 6723, 6776.

contractions : drug effects on, 6233 ; origin & propagation, man, 4607.

Uterus,
cytolytic histol.: cervix, E.M., 5085 ; connective tissue, E.M., 5086 ; epithelium, E.M., 9h 5084, 6776.

deciduation, 6279, 6722-3.
deciduoma formation, 2116, 6280.

endometrium, 3283, 4597, 3722, 6724.
foreign body in, effects, 6699.

implantation of ova. See Pregnancy.
leucocyte infiltration after mating, hamster*, 6721.

luteotropic function, badger, 83.
myometrium, 1795, 4275, 4608, 6716.

oestrogen effects, 31, 2116-7, 3762, 4619, 5084, 6717, 6719.

oestrus as related, pigs, 4604.
pathol., cow, 6725.

progesterone effects, 6730.
relaxants, bradykinin, 1663.

secretions, inhib. phagocytosis, 3284.
sensitivity, post-partum, rat, 2118.

Uvea ; Uveitis. See Eye.

canine distemper, multiplication in chick embryo, 6105.
horse influenza, adaptation to cell cultures, 3858.
influenza,
A, interferon production, 1470.
A2, absent in domesticated animals, 3857.
B, Ag structure, 6069-70.
haemaggl. inhibn., 746, 6071.
immunol. study, 3616-8.
inhibn. by aliphatic amines, 1537.
interference with EEE, 6095.
interferon induction, 3933-4.
neutralisation, 1443.
pathophysiol. effects, (title 27) 7155.
purification, 3856.
serol. study, 5859.
surface state, 6068 f.

measles : Ab in y-globulin prep., 1450; clinical characteristics, 1464; haemaggl., 3867, 6091; serol. study, 3615; vaccine efficacy, 1122-3.
mumps, effect on chick embryo, 2114.
myxoviruses : antigenic relationship, 1124; inhibn. by serum factors, 3940; morphology, 6072.

Newcastle disease (NDV),
inactivation, 3861.
inhibn., 1242, 3933.
interference with vesicular stomatitis, 6094.
mutagenic effects of HNO., 6073.
pathol. effects, mice, 6074.
vaccine prep., 3861-2.
rabies interference with WEE, 3866.
rinderpest : in bovine kidney cells, E.M. study, 6111; lapinised strain, vaccination of cattle, 6109.
respiratory syncytial Ab response to, 1473.
SV5, interferon effects, 1470.

Viruses, animal, papova group (see also **tumour-associated viruses** below),

polyoma,
DNA: structure, 6127; biosynthesis, 1066.
haemaggl. inhibn., 6128.
in L cells, carrier state, 6129.
interference with herpes, 6067.
infective DNA, 416.
interferon production, 3880.
metabolic effects, mouse embryo, 3881.
no interference with carcinogenesis, 5923.
purification, 6126.
S & M variants, interference, 5937.
transformations induced, 5938, 5943, 6123, 6125.
tumour induction, 5939-40.
variants, Ag structure, 6124f.
virulence, 5942.

shape papilloma : induction of arginase in infected cells, 1263; infective DNA prep., 5382.

SV-40,
biophys. prop., 5710.
carrier state: HeLa cells, 3878; monkeys, 1482.
cytopath. effect, organ cultures, 3877.
fluorescent Ab study, 3876, 3879.
inducing transformation, 6106.
interferon effects, 1470.
tumour induction, 1264, 6107.

picorna group,
bovine enterovirus, sensitivity to interferon, 1106.
Columbia SK : inhibn. by $(\text{NH}_4)_2\text{SO}_4$, 1468; pathol. effects in mice, 1469.
Coxsackie,
A4, causing poliomyelitis, 6079.
A9, pathol. effects, mice, 3864.
B1, pathol. effects, mice, 1451 f, 1452f.
RNA synthesis inhibn., 754.
ECHO : causing poliomyelitis, 6079; haemaggl. prop., 3865; RNA, 5375 f.
encephalomyocarditis : in ascites cells, RNA synthesis, 5398; RNA, S prop., 1474.
enteroviruses : 60901; human, cultured in baboon kidney cells, 1454; inhibn. by serum, 1453; role in nervous diseases, 6080.
foot & mouth : Ag structure, 6099, 6100; inactivated strain, prop., 3874; purification, 3873.
polio:
Ab in y-globulin prep., 1450.
effect on, of acids, 1445.
epidemiology, 1448-9, 6078.
grown in chick embryo, 60751.
growth in tissue cultures, 5101.

 - Yeasts (see also Fungi; & Taxonomic index), entries refer to *S. cerevisiae* unless otherwise stated.
 - anti-agents, activity of marine bacteria, 1542.
 - antibiotics, 1534-5.
 - β-mercaptopropanol & dithiodiglycol, 1545.
 - Zntoxicity, 1501.
 - cytol./cytochem. studies, analysis of cytoplasmic particles, 3398.
 - cell division, 3898-9.
 - cell wall lysis by *Streptomyces*, 6034.
 - fine structure: mitochondria, 6149 ; *Rhodotorula* spp., 2262, 3905 ; *S. cerevisiae*, 2275.
 - ribosomes, 541 Of.
 - flora of: earthworm casts, 1557; faeces, Antarctic, 3813.

Yeast

genetic studies,
adaptation to 3-amino-1,2,4-triazole, 3902.
directed mutations, 4759.
genet. control of : enzyme biosynthesis, 4760;
glycoside transport, 845; respiration, 2337.
petite mutant induction, 2337-8.
reverse mutations, adenine dependence,
Schizosaccharomyces, 4761.
strains resistant to paludrine, 1505.
growth & reproduction,
budding, u.v. study, 3898.
of industrial yeast, maltase activity, 1503.
sporulation affected by nutrition, 3899, 3901.
stimn. by inositol, *Sacch. carlsbergensis*, 6148.
infections. See **Fungal infections**.
isolation.
from saliva, *Candida*, 110.
from soil, *Histoplasma capsulatum*, 1496-7.
new sp.: from air, *Rhodotorula* sp., 3904; from
laryngeal swab, *Rhodotorula slooffii*, 3906.
nutrition,
affecting sporulation, 3899, 3901.
nutritional requirements : *Blastomyces dermatitidis* yeast phase, 3907; *Schizosaccharomyces acidodevoratus*, 5503.
uptake & transport of : amino acids, model,
(title 21) 2594, 3900; glucose, (title 6) 2594;
glycosides, 845; phosphate, 5625; D-xylose, 3405.
osmotic behaviour, effect of biotin, 1502.
radioprotection by tetrahydroxyquinone, 5844.
resistance to temp.: & dessication, *Cryptococcus*,
3896; *Rhodotorula*, 4915.
strain typing, *Candida albicans*, 1499.

Yeast

techniques : for detecting *Saccharomyces* in
mixed popln., 1504; large scale prép. sol.
RNA, 455.
ultracentrifugal patterns, yeast extracts, 5720.
Yeast, composition & metabolism,
amino acid,
biosynthesis : histidine, 3902; methionine &
threonine, 5271.
proline utilisation, *Candida*, 496.
benzaldehyde utilisation, 3411.
carbohydrates,
glycoside transport, 845.
polysaccharide : analysis, yeast-like spp.;
5209; effect on mouse tumours, 3728;
promoting infection in mice, 3805.
sugar oxidation & fermentation, protoplasts,
123.
trehalose, function of, 134.
cerebrin, analysis, *Torulopsis utilis*, 5247.
enzymes/enzyme systems,
acid phosphatase localisation, 853-4.
dehydrogenase activity, 527, 565, 2789, 5452,
(title 87) 7148.
α-D-glucosidase, biosynthesis, 4760.
hexokinase, 3121, 5199, (title 67) 7148.
maltase activity : 1503; induced, 3032.
glycerol formation, 861.
growth factors for *Tribolium*, 4948.
lipid : formation, *Cryptococcus*, 1495; isolated,
Candida krusei, 2812.
metabolism inhib. by org. solvents, 3903.
new acidic cpd., 860.
pyridoxamine isolated, *Candida utilis*, 5538.
respiration,
inhib. by Zn, 1501.
light effects on, 1500.
stimn. by malonate, *Cryptococcus*, 2426.

Yeast, composition & metabolism

RNA : large scale prep., 455; terminal nuclei,
tide sequence, 448, 451.
thiamine content, 5533.
ubiquinone conversion, *Candida utilis*, (tfw)
106) 7148.

Yellow fever. See *Viruses, animal, arbor group**
Yohimbine. See *Rauwolfia-type alkaloids*.

Yolk. See *Egg-yolk*.

Yolk sac. See *Embryos, extraembryonic membranes*.
Yttrium chloride, i.v. admin., rhesus monkey 6331.

Yttrium isotopes,
"Y : -"Sr ratio in blood, after **X-irradiation**,
1080; TLC, 3548.
"Y, uptake in rabbits, 519.

Z.**Zinc (see also Metals)**

assay, 5241, 525.
deficiency, 6684.
dietary, antagonism with Cd, chicks, 526.
enzyme content, 527, 5452.
interaction with metmyoglobin, 3098.
-8-quinolinol complexes, fluorescence, 3094.
requirements : of *Gloesporium* sp., 6928;
subterranean clover, 6923.
toxicity in brewer's yeast, 1501.
isotopes,
"Zn, faecal excretion, 4541.
radio-, distribution in rat plasma, 5453.
Zirconium hydroxide, tumour induction, 5926.
Zirconium isotopes, "Zr : storage of soln., 1026.
TLC, 3548.

TAXONOMIC INDEX

INTERNATIONAL ABSTRACTS OF BIOLOGICAL SCIENCES

1963

Volume 31

The index is in three parts, **Bacteria**, **Plants** and **Animals**, preceded by a key to generic names. In the index itself, *gen** are in bold type and species in italics. Occasionally names of taxa higher than genera are used.

>U In the main subject index are references to the larger systematic groups, e.g. **Algae** ; **Birds**. These contain information on general biology and references to organisms under their common names, e.g. **Mammals, specific, sheep**. There is also a section on **Taxonomy** covering general studies and taxonomic methods.

INDEX

BACTERIA

There is fuller information in the subject index on the following :—bacteriophages, under **Bacteriophages**; immuno-
y> under **Antibodies, Antigens, Immunisation**; typing, phage-typing under **Bacteriophages**, serotyping under **Bacteria**.

A.

Aerobacter, relationship with *Gluconobacter liquefaciens*, 3853.
cell glycol oxidation, 3402.
cellulose microfibrils, 6784.
enzymes, 2594, 5539.
stram IVS, biotin biosynthesis, 638.
habitat, 1428.
Aeromonas, nitrate reductase, 586.
Aeromycetes, steroid transformations, 1404.
Aerobacter, aerogenes, cell surface physical prop., 885.
enzymes, 182, 575, 058, 3838f.
mutants, isolation, P metabolism, 3837.
classes, composition & metabolism : penicillinase, 87.
Aerobacter, undine nucleotide peptides, 2986.
bacteriophages, 3892.
2- β -D-glucuronic acid metabolism: carbohydrates, 2762-3.
1-Pids, transamination reactions, 234.
nitrate assimilation, Mo as affecting, 5446.
Aerobacter faecalis, metabolism of isoxanthopterin, 872.
Aerobacter in soil counting technique, population, ^{14}C rhizosphere, 3948.
***ceil* 5' yme localisation, 855.
dissimilatory imposition & metabolism: acid pro-
-3061.

B.

Bacillus, resistance, 1115 ; parenteral, H_2O_2 respiratory, 1294 ; terminal phase, 3827.
compo. agent, penicillin, 1566, 6165.
enzymes, 1566, 3952, 5617, 6165 ;
lipoprotein production, 3829 ; phospho-
-364. SOC. Proc., 2594 ; RNA biosynthesis
insecticidal prop., 3832.
lysis of soil fungi, 3952.
radiation effects of u.v., 3829.
spores, 38 ; sporulation, 3806.
swarmers, 38.
toxins, 3807, 3808.
nucleic acids & protein during cell cycle, 3844.
resistance, anti-agent streptomycin, resistance, 6018.
bacteriocin-like substance from, 3830.
bacteriophage, 3427, 6016.
cell fractionation, 1408, 3072.
composition & metabolism : enzyme, 5226f;
lysosomes, 5233 ; RNA synthesis, 5226.
cell fractionation, 1408, 3072.
enzymes, 5244-5, 5233 ; RNA synthesis, 5226.
cytolysis, 1360.
growth, by 8-azaguanine, 1541.
protoplasts, 1541.
spores, 1541.
polymer, 3809.
spore growth & pectolytic enzyme formation, 3809.
Microbacteriophiles, spores, 3807.

Bacillus

subtilis, absorption of Na bentonite particles, 3949.
anti-agent, penicillin, 1566.
antibiotics isolated from strain B334, 1575.
bacteriophages, 415, 1488, 3890.
chr. replication, 2333.
composition & metabolism : citrovorum factor, biosynthesis, 641 ; enzymes, 193, 1566, 3407.
radiation effects of y-rays, 3946.
spores, 3807, 3946.
lukuringensis, insecticidal prop., 3831-2.
Bacterioma matruchotii, extracts, calcifying action, 112.
Bacterium, *antratutum*, size & shape, temp, effects, 1429.
cadaveris, metabolism after X-irradiation, 3565, 3574.
coll. See *Escherichia coli*.
lactis aerogenes. See *Aerobacter aerogenes*.
Bacteroides, *melaninogenicus*, in gingival debris, 2741.
symbiosus, carbohydrate metabolism, 120.
Bordetella, cytochromes, 2894.
fieri, immunol. studies, 1113, 1425, 3613, 3846, 5856, 6664, 7163.
Brucella, *abortus* anti-agent, streptomycin, 3931.
immunol. studies, 1426-7, 3931.
respiration after y-irradiation, 3945.
virulence, chem. basis, 1427.
abortus melitensis & suis, immunol. studies, 1114.

C

Chromatium, photosynthesis, 4851.
Citrobacter freundii. See *Escherichia freundii*.
Clostridium, spore Ag of 3 spp., 6036.
botulinum, radiation resistance, 3943.
toxin, 353, 6372.
chauvoei & *septicum*, differentiation, review, 7164.
histolyticum, collagenase, 2903.
histolyticum & *septicum*, immunol. relationships, 1411.
kluyveri, fatty acid biosynthesis, 2803.
pasteuriatum, metabolism: enzymes, 587 ; hydroxylamine reduction, 5728.
perfringens, enzymes, 3073.
immunol. studies, 3614, 5858.
toxins, 1410, 3833.
tetani, immunol. studies, 1116, 3796, 5047 (review), 5857.
infections, behavioural effects, rat, 2156.
toxin, 3506, 3811, 4032.
welchii. See *C. perfringens*.
Corynebacterium, antagonism of *Staphylococcus* strains, 6027.
antiviral activity, 1460.
DNA base composition, 5379.
non-haemolytic forms, enzymes, 2806.
diphtheriae, immunol. studies, 3797, 5853, 6031-2.
infections, cardiovascular effects, rabbits, 3502, 6257.
-like strains, 6029-30.
pyogenes, infections in bovine uterus, 6725.
vaginale, taxonomic position, 6053.
Coxiella burnetii, immunol. studies, 1438.

D.

Desulphovibrio desulphuricans, nutrition, 3848.
Diplococcus, *glycinophilus*. See *Peptococcus glycinophilus*.
pneumoniae, DNA transformation, immunol. aspects, 1365, 5388.
enzyme induction, 3392.
expt. pathol. study, 1351.
infections, peritonitis in hypothermic mice, 5988.

E.

Escherichia, *aureescens*, cytochrome c, 3034.
coli.

anti-agents (see also " antibiotic effects " & " growth, inhibn." below) : chalkones, 1571 ; glycine, 3938 ; H-labelled cpd., 5839 ; selenite & tellurite, 5626.
antibiotic effects of : actinomycin D on protoplasts, 5630 ; chlortetracycline, 750 ; colicin F, 3387 ; mitomycin, 1485 ; penicillin, 3930.
bacteriophages, 476, 756t, 1061, 1484-5, 2295, 3004, 3887-8, 5717, 6861-5, 6869t.
bacteriophage-infected cells: DNA metabolism, 5715 ; effects of phenylethyl alcohol, 3317 ; inducing agent for lysogenic cells, 756 f; RNA-DNA relations, 476.
cell wall: chem. constituents, 886, 3425 ; surface structure, 6010.
classification, serol., 1412.
composition & metabolism,
amino acids, 464-5, 504, 2594, 2870.
carbamyl phosphate biosynthesis, 510.
carbohydrates, 2750t, 5210.
colanic acid, 136-7.
colicine production, 3836, 6038-9.
cytochromes : b, 5292 ; c, 3034.
enzymes : acetylglutamine synthetase, 504 ; alk. phosphatase, 3137 ; amino acid decarboxylase, 5346 ; galactokinase, 175 ; O-galactosidases, 5207 ; in 3-deoxyoctanoate metabolism, 408 ; in fatty acid biosynthesis, 2803 ; in nucleic acid methylation, 2994 ; peptidase, 5283 ; phosphodiesterase, 3009 ; RNase, 3572 ; succinoadenyl kinase, 442 ; sunlight as affecting, 3561 ; transaminase, 5353 ; tryptophan synthetase, 299.
fatty acids, 2803, 5227.
D-glucarate conversion to glycerate & pyruvate, 3401.
glucoside, oc-methyl-, uptake, 3404.
2-keto-3-deoxyoctonate, 408, 886.
mucopeptides, 3425.
nucleic acids DNA, 476, 756t, 1061, 2295, 3317, 3393, 5715, 7148.
nucleic acids RNA, 449, 464-5, 1065, 2594, 3057, 3062-3, 5408, 5930, 6328.
peptide amides, phenylalanine-containing, 3413.
peptides, 848, 3137, 5283.
phenazine-N-oxide reduction, 868.
protein biosynthesis, 502, 750.
RNP (ribosomes) : 423, 486, 5408 ; interaction with poliovirus RNA, 6077.
thymine starvation, 3057, 3063.
conjugation, 3393.

Esoherichia,

genetic studies,
chromosome ; galactose region, mapping, 4755, 6863 ; P, prophage localisation, 6861-2 ; replication, 2295
gene for u.v.-sensitivity, 2331.
mutations : arginine-requiring, 510 ; freq. & survival, metabolism as affecting, 6015 ; induction (a) by y-rays, 3815, (b) by HNO₂, 6018 ; 2nd site reversion, 2332 ; with abnormal RNA biosynthesis, 464.
recombinants, parental DNA incorporation into, 4756.
recombination & heterozygosis, inhibn., 3317.
sex factor F, transfer & multiplication, 4757.
transduction hybrids with *Shig. dysenteriae*, 299.
growth, inhibn. by : 6-azauracil, reversal, 759 ; hydroxyamino acids, 2863 ; laevorphanol, 6328 ; 9-mercaptopethanol & di-thiodiglycol, 1545.
immunol. & serol. studies, 423, 1412-3, 3835, 6037.
infections : diarrhoea & gastroenteritis, colic reactions of strains, 6039 f. in piglets, 3834 ; infantile diarrhoea, diagnosis, 1413 ; oedema & gastroenteritis, pigs, 3628.
lysis by penicillin, 3930.
protoplasts & related structures : RNA biosynthesis, 5630 ; spheroplast production, 3938.
radiation effects,
of a-rays, 1485.
of artificial sunlight, 3561.

Calluna (Dicot.) *vulgaris*, ecology, 2438.
Calonectria (Fungi) *nivalis*, chr., 4741.
Calotropis (Dicot.),
 gigantea, latex, histamine-like prop., 6275.
 procera, cardiac glycosides, 925 f.
Calvatia (Fungi),
 fragilis & *gigantea*, vit. requirements, C sources, 2417.
 gigantea, basidiospore germination, 2478.
Calycanthus (Dicot.) *floridus*, extracts, use in cholecystography, 6623.
Candida (Fungi),
 albicans, anti-agents, 1534, 6189.
 identification & typing, 110, 1499.
 infections. See Fungal infections.
 flaveri, urea utilisation, soc. proc., 5038.
 krusei, lipids, 2812.
 utilis, composition & metabolism: proline utilisation, 496; pyridoxamine isolation, 5538; ubichromenol formation, soc. proc., 7148.
Capillipedium (Monocot.), hybrids with *Bothriochloa*, chr., 2316.
Capparidaceae (Dicot.), glycosides, 941.
Capraria (Dicot.) *biflora*, quinone deriv. from, 3462.

Carex (Monocot.), calcicole & calcifuge spp. compared, 2413.
Cephalosporium (Fungi) *mycophilum*, heterokaryosis & somatic recombination, 4766.
Ceratocystis (Fungi) *sagacearum*, temp. as affecting development, 1509.
Ceratodon (Bryoph.) *purpureus*, gametophyte induction, 2458.
Cercospora (Fungi) *melonis*, hydroxylation of Reichstein's substances, 3265 f.
Chlamydomonas (Algae), mating in heterothallic spp., 6995.
 temp. & light as affecting, 6974.
 reinhardi, enzymes, 508.
Chlorella (Algae), lyophilised cells, viability, 7003.
 metabolism: carbohydrates, soc. proc., 2594; enzymes, 124; INH effects, 4853; photosynthesis inhibitors as affecting, 2419.
 pyrenoidosa, photosynthesis, 728, 4851.
 response to trimethyl-0-chloroethylammonium chloride, 4890.
vulgaris, metabolism: chlorophyll *a* formation, 4865; enzymes, 2594, 4862; NO, assimilation, inhib., 959.
Cu uptake, effects, 4840.
growth factor from *Nostoc* sp., 6967.
selenomethionine adaptation, mechanism, 3440.

Chrysanthemum (Dicot.), chr. of 4 spp., 2319.
 cyclotols, including new cpd., 3476.
 greenhouse varr., effects of ¹⁴Cs, 4902.
Cirsium (Dicot.), cytotoxicity of 3 spp., 6850.
Citrus (Dicot.), cytogenetic & evolutionary studies, 6853.
 fruit flavonoids, 939, 3471.
 tissue cultures, cytol. studies, 6800.
 aurantium, fruit, chlorogenic acid in, 3477.
 medica var. *limonum*, tissue cultures, 6955.
 sinensis, citronin from, 940.
darida (Dicot.) *unguiculata*, cell division in trisomics, 6804.
Coccidioides (Fungi) *immitis*, infections, 1131.
Coccinellithus (Algae) *huxleyi*, measurement of coccinellith production, 2423.
Cocos (Monocot.) *nucifera*, meiosis & chr. no., 2318.
 seeds, endosperm amino acids, 2488.
Coifea (Dicot.) *arabica*, (see also Coffee), beans, nicotinic acid content, 900.
Coleus (Dicot.) auxin translocation, 2448.
 blumei, geotropic stimn. of wounded shoots, 2447.
 water content, stability, 6914.
Colletotrichum (Fungi),
 cokeanum, stimn. by dil. fungicides, 3964.
 derridis, steroid hydroxylation, 3276.
Collinsia (Dicot.), genomes of 2 fertile intersp. hybrids, 6852.
Collybia (Fungi) *velutipes*, cellulose production, 2428.
Coniophora (Fungi) *cerebella*, enzymes, 3914.
Convolvulus (Dicot.), alkaloids, 907.
Coprinus (Fungi) *lagopus*, mutations involving A factor, 2336.
Cordyceps (Fungi) *militaris*, adenosine deriv. from, 405 f.
Corydalis (Dicot.) *formosa*, extract, use in cholecystography, 6623.
Crassulaceae (Dicot.), stomatal movement, 4864.
Crotalaria (Dicot.) *goreensis*, autotetraploid, sterility, 2315.
Cruciferae (Dicot.), enzymes, 307.
Cryptococcus (Fungi),
 neofor mans, immunol. studies, 1132.
 infections. See Fungal infections.
 resistance to desiccation & high temp., 3896.
 terrilorus, lipid formation, 1495, 2426.
Cucurbitae (Dicot.)
 lundelliana & *maxima*, hybrids, 2354.
 pepo, mycorrhiza, influence of fertilizers, 6921.
 NO₃⁻ & hydroxylamine reduction, soc. proc., 7148.

Cunninghamella (Fungi) *blakesleeanaa*, oxidation of Reichstein's cpd. S, 702.
Curvularia (Fungi) *lunata*, steroid hydroxylation, 3276.
Cuscuta (Dicot.) *epithymum*, CO, fixation, 2429.
Cycas (Gymn.) *circinalis*, methylazoxymethanol from nuts, 5739.
Cynara (Dicot.) *cardunculus* & *scolymus*, anti-atherosclerotic effect of, 5515-6.

D.

Dacrymyces (Fungi) *deliquesens*, lab. culture, 6927 f.
Dactylis (Monocot.), chr., 2317.
 glomerata, flowering, environmental control 2463.
 subsp. *lusitanica*, chr., 6848.
Dalbergia (Dicot.) *latifolia*, heartwood, coumarin deriv., 945.
Daucus (Dicot.) *carota*, response to trimethyl-i-chloroethylammonium chloride, 4890.
 root: Ca distribution in, 2411; carotenoid* in cambial cultures, 3445.
Dictyostelium (Fungi) *discoideum*, glutamate oxidation, 308.
Digitalis (Dicot.) *canariensis*, glycosides, 3456.
Dionaea (Dicot.) *muscipula*, insectivorous operation of, biochem., 4843.
spont. electrical activity, 2492.
Dioscorea (Monocot.),
 belizensis, as source of diosgenin, 4200.
 rotundata, toxicity in rats, 3147.
 spiculiflora, cholesterol in, 6986.
Dipteryx (Dicot.) *odorata*, glycosides, 942.
Drimys (Dicot.), terpenoids, 918f.

E.

Echinochloa (Monocot.) cytotoxicity, 6851.
Eclipta (Dicot.) *alba*, leaf blackening, bioactive 5745.
Elodea (Monocot.) *canadensis*, lipid extract 3433.
Equisetum (Pterid.), spore germination, regulation & control of, 2481.
Eremotheium (Fungi) *ashbyi*, riboflavin P₄₅₀ formation, NaF as affecting, 5615.
Erica (Dicot.) *tetralix*, ecology, 2438.
Eriostemon (Dicot.), eristoic acid from, 934#
 brucei, coumarin (bruceol), 943.
Erysiphe (Fungi) *graminis* var. *hordei*, eit* in host metabolism, 2421.
Eucalyptus (Dicot.),
 blakelyi, leaves, as oviposition site for *psyllid* 4995.
 camaldulensis, roots, growth in vitro, 2446.
 sieberiana, polyphenol formation, 3469.
Euglena. See Animal section.
Euphorbia (Dicot.) *pulcherrima*, nectaries, *myrmecophytes* from activity, 2486.
Eurya (Dicot.) *japonica*, anthocyanins from berries, 5738.
Evodia (Dicot.) *xanthoxyloides*, hexapeptides, 525#.

F.

Fagopyrum (Dicot.) *esculentum*, carbohydrate metabolism, 2747.
Ficus (Dicot.) *carica*, leaf constituents, 3479#
Flindersia (Dicot.) *laevicarpa*, wood constituents ^30.
Fucus (Algae) *vesiculosus*, extracts, effect in echinoderm fertilisation, 4936.
Funaria (Bryoph.) *hygrometrica*, chlorophyll 6935.
Fusarium (Fungi), antibiotics from, enzy*
 874 f.*
 effect on tomato host metabolism, 7001.
 lateritiae, steroid transformation by, 1368.
 oxysporum, lysis by soil bacteria, 5352.
 f. cubense, clones, differentiation, 2490.
 competitive saprophytic ability, 2499.
 f. melonis, infections, soil as affecting, 905#
 solani f. *phaseoli*, chlamydospore germination in soil, 2476.
 udum, growth & sporulation, nuv* affecting, 3912.

G.

Galanthus (Monocot.) *nivalis*, epidermal nucleic acid response to plasmolytics, 2257.
Oaleopsis (Dicot.) *tetraphala*, susceptibility to herbicides, 2454.
Garcinia (Dicot.) *morella*, seed pigment, 3447.
Gasteria (Monocot.) *verrucosa*, leaf cutin biosynthesis, 3475.
Gibberella (Fungi), chr., 4741.

TAXONOMIC INDEX

^{^48} *Lycopodium* (Gymn.) *Pollen* cultures, radiation effects, 301.

Psorium (Fungi) *fructigenum* f. *chromogenum*, mineral requirements, 6928.

Ure (Dicot.) *saja*, (soyabean) (see also *Pood-stuffs*), beans, metabolic inhibitors & toxic cpd. in, 721, 723, 727, 744.

Foot, metabolism after isolation, 6943.

(U) allocation of photosynthate, 2433.

Villea (Dicot.) *pyratinalidis*, resorcinol deriv.

Yucca (Dicot.) *935*.

Symploca (Dicot.) *pacifica*, terpenoids, 3465 f.

H.

Hamatanthus (Monocot.) *katherina*, dicentric chr., 8811.

Hamatococcus (Algae) *pluvialis*, growth inhibn. by Tris, 6162.

Heliotropia (Dicot.) *scleroxyla*, alkaloids, 910f.

Helianthus (Dicot.) *luis*, metabolism in rust-infected cotyledons, 2000.

Hydro seeds, arginase inhibitor in, (title 94) 7148.

Hyoscyamus tubers : enzymes, 2594, soc. proc., 2778 ; growth in vitro, effect of plant extracts,

> storage, temp, effects, 2473.

Hypothecium (Fungi).

Hyphomycetes, cellulases, 3915.

Hydrocinnamol, steroid transformation, 3276.

Hyphomycetes (Fungi) *vastatrix*, stimn. by dil. fungi-

3964.

Hyphomycetes (Fungi), lab. culture, 2497.

Hyphomycetes (Fungi), infections. See **Fungal infections**.

Ration from soil & bat guano, 1496.

Alminal hosts, 1497.

HTS¹*² P⁻ inactions, 1498.

en.? (Monocot.) *vulgare* (barley),

embryos : growth & development, 2442 ; Nucleic acid biosynthesis, 6956.

Jtetic studies : breeding, 2351 ; Sr accumula-

tion, 6894.

abolism in fungus-infected leaves, 2421.

rem! movement through, kinetics, 4860.

K absorption mechanism, 4837.

Lamium (Dicot.) *lupulus*, factors affecting stem

development, 2440.

Lamium (Dicot.) *eburnea*, alkaloid, 899.

Lamium (Dicot.) *hortense*, leaf extracts, effect

wheat seedlings, 4907.

Lamium (Monocot.) *morsus-ranae*, develop-

mentary substances as affecting, 6965.

Lamium (Dicot.), taxonomy, biochem. studies,

3278.

L.

Lamium (Dicot.) *holstii*, nectaries, lack of phos-

phatase, 2486.

Lamium (Dicot.), alkaloids, 907.

Lamium (Monocot.), induced tetraploidy, 4739.

M.

Leptosphaera (Dicot.) *bhssfeldiana*, flower formation,

W¹B²T³ as affecting, 2462.

fir ⁹⁸ (Fungi) *thujina*, infection in bal-

cot.) leaf oxalates, function, 6920.

N.

Leptosphaera (Fungi) *deliciosus*, choline content, 5741.

Leptosphaera (Algae), chr., 4740f.

Leptosphaera, ecology, vertical distribution, 4910.

Leptosphaera (Fungi) *japonica*, tumour inhibi-

tor in, 3965.

Leptosphaera (Dicot.) *odoratus*, anthocyanins, 932.

Leptosphaera (Dicot.) *officinalis*, coumarin & her-

barin formation, 3472.

Leptosphaera (Monocot.) a piso in, soc. Proc. 2594,

resp. S¹ w¹ H² of flashing light, 4852.

trimethyl- α -chloroethylammonium iodide, 4890.

Lilium (Monocot.), pollen, mitotic regulation, biochem., 3055.

longiflorum, thymidine degradation products, 5356.

Linanthus (Dicot.) *parryae*, popln. dynamics, 2364.

Linum (Dicot.) *usitatissimum*, seed germination, metabolism during, 3432.

Liriopae (Monocot.) *platyphylla*, plastid development in variegated leaves, 6934.

Lithospermum (Dicot.), officinale, extracts, effect on mouse thyroid, 4102.

ruderale, root polyphenols, 3470.

Lolium (Monocot.), sol. carbohydrates, 6875.

perenne, decomposing roots, fungi on, 3913.

Lophocereus (Dicot.) *schottii*, alkaloid, 911f.

Lanaria (Dicot.), alkaloid, 903 f.

Lunularia (Bryoph.) *cruciata*, dormancy & subsequent growth, 2470, 4891.

Lupinus (Dicot.), chlorosis, 2415f.

root nodule formation, 6179.

angustifolius, seeds, X-ray sensitivity, 2348.

luteus, lectins, 5285.

Lycopersicum (Dicot.), auto- & heterografts, morphol. & biochem. study, 6991.

esculentum, flowers & fruit, diffusible auxin in, 6961.

fruiting, associated histogenesis, 4875.

metabolism in Fusarium-infected plants, 7001.

roots, excised, auxin studies, 4878, 4882.

young plants, factors affecting growth & development, 2466, 4870.

Lycoris (Monocot.) *radiata*, chr., 2312 f.

Lythrum (Dicot.) *salicaria*, seed germination, 4893.

M.

Macrocytostil (Algae), translation in, 6945.

pyrifera, growth & reproduction, 6949.

Malus (Dicot.), sorbitol in 5188f.

Marchantia (Bryoph.), nucleic acids, 2279.

Marsilea (Pterid.) *vestita*, conversion of water- to land-form, 6951.

Matthiola (Dicot.) *incana*, anthocyanins, 932.

temp, effects on gibberellin biosynthesis, 4881.

Melampyrum (Dicot.) *lineare*, seed germination, 48951, 6975.

Melastomaceae (Dicot.), chr., 2320.

Mentha (Dicot.) *piperita*, extracts, use in cholecystography, 6623.

Merulius (Fungi) *lacrymans* & *Silvester*, enzymes, 3914.

Microcystis (Algae) *aeruginosa*, photosynthesis, 4851.

Microsporum (Fungi) *gypseum*, isolation from soil & bat guano, 1496.

Mimosa (Dicot.) *pudica*, pulvinus, new organelle in motor cells, diurnal changes, 6994.

Molinia (Monocot.) *caerulea*, ecological studies : effects of soil aeration & ground-water, 2438 ; factors affecting growth on calcareous soil, 2412.

Morea (Monocot.), chr., 2314.

Mundulea (Dicot.) *suberosa*, isoflavone, 937 f.

Musa (Monocot.) *paradisiaca* subsp. *sapientum*, wilt disease, 2490, 2499.

Mycosphaerella (Fungi) *latebricosa*, steroid conversion by, 3276.

Myrica (Dicot.) *gale*, ecology, 2438.

Myrothecium (Fungi) *verrucaria*, cellulase, 2787, 5208.

N.

Nectria (Fungi) *haematococca*, chr., 4741.

Nelumbium (Dicot.) *nuciferum*, seed, anaerobic respiration, 6937.

Neobulgaria (Fungi) *pura*, Golgi bodies, 2272.

Nenropsora (Fungi) *crassa*, composition & metabolism : enzymes, 185, 509, 5428 ; tryptophan anthranilic acid cycle, 5723.

genetic studies : complementation at leu-2 locus, 2340 ; \$ sterility, 4763 ; heterokaryon-incompatibility, 2339; pyr-3 mutant, 4762.

mitochondria formation, 4703.

use of cholineless mutant in determination of ChE inhibitor, 5622.

Nicotiana (Dicot.) (see also *Tobacco* ; *Viruses*, plant, TMV, etc.), regeneration, symposium, 2600.

rustica, chloroplast structure, 6786.

embryo development, v-ray effects, 6984.

tobacum, bacterially-infected plants, carbohydrate metabolism, 1419, 2494.

callus tissue, P levels, 951.

composition & metabolism : enzymes, 2494, 5763 ; phenolic cpd., 933.

genetic studies, haploids, 4773.

leaf plastoquinone & solanesol distribution, 3493.

Nitella (Algae), cellular morphogenesis, 2274.

opaca, internode cells, spiral growth & wall structure, 2444.

Nostro (Algae), growth-promoting substances from, 6967.

commune, growth & N-fixation, 4872, 6161.

muscorum, lyophilised cells, viability, 7003.

O.

Oedogonium (Algae) *cardiacum*, zoospore, flagellar structure, 4917.

Oenothera (Dicot.), attraction of pollen tube to ovule, biochem., 3437.

cytogenetics : chr. homologies in various spp., 4738 ; review, 2591.

blandina, non-disjunction in interchange heterozygote, 4768.

hookeri, chr., 6849.

organensis, incompatibility, influence of grafting, 2491.

Olpidiopsis (Fungi) *incrassata*, parasitism on Saprolegniaceae, 2469.

Olpidium (Fungi), as vector of tobacco virus, 6144.

Oncidium (Monocot.), chr., 6844.

Ononis (Dicot.) *spinosa*, extracts, use in cholecystography, 6623.

Ophiostoma (Fungi), induced therznosensitivity, 4915.

Oryza (Monocot.), meiosis, & chr. characters, 6843-4.

saliva, "O", movement through, kinetics, 4860.

Oscillatoria (Algae), nucleic acids, 2279.

Ozalis (Dicot.) *pes-caprae*, oxalic acid biosynthesis, 5748-9.

Oxytropis (Dicot.), chr., 4736.

P.

Fanaz (Dicot.) *ginseng*, root, sapogenin in, 924.

Panus (Fungi) *stipticus*, luminescence, 1510.

Peltigera (Lich.) *polydactyla*, carbohydrates, 6941.

Penicillium (Fungi), coremia development & characters, 4 spp., 3908.

metabolism : choline-O-sulphate hydrolysis, 8651 ; steroid conversions, 3276.

chrysogenum, composition & metabolism : adenosinesuccinic acid, 5369 ; penicillin biosynthesis, 878, 3956 ; trichothecinase, 849.

cyanescens, cyanene production, 1528.

expansum, parasexual cycle & linkage relationships, 4765.

oxalicum, cellulases, 3915.

patulum, griseofulvin biosynthesis, 5727.

roqueforti, amino acids, 286.

spinulosum, phenolases, 936.

Persea (Dicot.) *gratissima*, fruit, ethylene metabolism, 3443.

Pestalotia (Fungi) *ramulosa*, ramulosin production, 6151.

Petasites (Dicot.) *hybridus*, floral morphogenesis, 6952.

Petroselinum (Dicot.) *sativum*, chloroplast ferredoxin, soc. proc, 2594.

Petunia (Dicot.), tetraploids, genetics & breeding, 2356.

Phaeodactylum (Algae), "P-labelled, use in molluscan feeding expt., 7060.

Phalaris (Monocot.), *canariensis*, radiation effects, 2350.

canariensis & *tuberosa*, temp, effects on early growth, 2439.

Pharbitis (Dicot.) *nil*, flower initiation, inhibn. by y-rays, 6980.

gibberellin cpd. in, 6963-4.

- Phaseolus** (Dicot.),
aureus, seedlings, homoglutathione in, 5281.
mungo, seed, enzymes during germination, 2472.
radiatus, seed enzymes, 2968.
vulgaris, auxin herbicides as affecting, 2454.
 chloroplast structure, 6786.
 damage by peroxyacetyl nitrate, action spectrum, 3314.
 nutrition, Cs & K uptake, 4838.
 root meristem structure, 6785.
 seeds, cotyledon water uptake & respiration, 4859.
 translocation of growth substances, 6947.

Phlotheeca (Dicot.) *hasselli*, eriostic acid, 934.

Phlebia (Fungi) *strigosoconata*, pigment, 948.

Phycomycetes (Fungi), diseases caused by, review, 5042.

Phymatodes (Pterid.) *nigrescens* & *scolopendria*, cytogenetics, 2322.

Physalis (Dicot.) *floridana*, virus studies, 1494 f.

Physarum (Fungi), protein patterns during morphogenesis, 3427.

polycephalum, mitosis, arrest of plasmodial motility during, 7007.
 sporulation induction, 3917.

Phytophthora (Fungi) *infestans*, -infected tubers, metabolism, 3444.

Pioea (Gynn.) *excella*, cambial sap glycosides, 3453.

Pilobolus (Fungi), asexual reproduction, effects of light, 1508.

Pinus (Gynn.).
longifolia, terpenoids, 919 f.
monophylla, γ -radiation effects, 4901.
radiata, sapwood, resin metabolism, 6942.
restmosa, shikimic acid biosynthesis, 3439.
rigida, effects of chronic x-irradiation, 1090, 4898.
taeda, root I uptake, CH.Br as affecting, 4841.

Pisum (Dicot.),
arvense, root exudations, 4867.
sativum, auxin studies, 4877.
 rhizosphere effects on soil algae, 4911.
 roots : growth, effect of RNase, 4873 ; meristematic respiration & cell division, 6808.
 see's : glucose utilisation, 2427 ; metabolism during germination, 4861, 4866.
 shoots : Co as affecting stem growth, 6959 ; differentiation, role of light, 6958.
 Sr uptake, 2410.
 wrinkled & smooth var., 2361.

Plantago (Dicot.) *ovata*, seed enzymes, 2781.

Plumaria (Algae) *elegans*, sporeling growth, effect of light, 4871.

Podophyllum (Dicot.) *emodi* & *peltatum*, resin components, structure, 3442.

Polyporia (Fungi) *versicolor*, laccase, 5500.

Populus (Dicot.) *tremula*, auxins as affecting, 2452, 4889.

Proserpinaca (Dicot.) *palustris*, factors controlling plant morphol., 6972.

Protomyces (Fungi) *inundatus*, constituents: carotenoids, 923 ; nucleic acids, 4914.

Prunus (Dicot.) *domestica*, fruitlets, mitotic stimulators in, 953.

Psallio (Fungi) *campestris*, culture of mixed strains, 4913.

Pseudotsuga (Gynn.) *douglasii*, root system, 6953.

Pteridium (Pterid.), induced apospory, cytol., 6855.
aquilinum, abnormal stomata, 6993 ; mammalian toxicity, soc. proa, 5038.

Puccinia (Fungi) *graminis*, resistance to, in wheat, 4770.

Pyrenomyxa (Fungi) *domesticum*, apothecia development, 1506.

Pyrus (Dicot.) *cottnunis*, pollen germination, effect of boron cpd., 4897.

Pythium (Fungi) *debaryanum*, hyphal structure, 4916.

Quereus (Dicot.), radiation effects, 4898, 4900.

B.

Baphanus (Dicot.) *sativus*, roots : anthocyanins, 5737 ; root hairs, 6992.

Bauhonia (Dicot.), (see also **Bauhonia-type alkaloids**), *serpentina*, enzyme, 300.

Beineokia (Monocot.) *cornea*, steroid components, 3454.

Bhagodina (Dicot.), leaf oxalates, function, 6920.

Bhiolina (Fungi) *undulata*, growth & enzyme production, 1367.

Rhizopus (Fungi) *stolonifer*, spore germination, autoinhibn., γ -ray effects, 2483.

Bhodotorula (Fungi), induced thermosensitivity, 4915.

glutinis, fine structure, 2262, 3905.
mucilaginosa var. *sanguinea*, influence on *Calvatia* spore germination, 2478.
nitens, sp. n. isolated from a tin., 3904.
slooffii, sp. n. from laryngeal swab, 3906.

Ribes (Dicot.), GA-induced parthenocarpy & apomixis, 4767 f.

Biocia (Bryoph.) *fluitans*, response to trimethyl-0-chloroethylammonium chloride, 4890.

Bicinus (Dicot.) *communis*, fatty acid biosynthesis, 200.

oil, ricinoleic acid from, 4199.
 reaction to *Botrytis*, biochem. tests, 950.
 seed, chlorogenic acid in, 3477.

Biella (Irryoph.) *helicophylla*, regeneration, 2288.

Biava (Dicot.) *corymbosa*, alkaloids, 906.

Bubui (Dicot.), anthocyanins, soc. proa, 2594.

S.

Saooharomyces (Fungi) (see also **Yeasts** in general index), budding, cytol., 3898.

differentiation in mixtures with other genn., 1504.

mitochondrial changes, E.M., 6149.

carlsbergensis, growth stimn. by inositol, 6148.
 phosphatase localisation, 853.
 Zn toxicity, 1501.

cerevisiae, active transport of : a-thioethylglucopyranoside, 8451 ; D-xylose, 3405.
 adaptation to, & effects of 3-amino-1,2,4-triazole, 3902.

cell division freq. as indicator of NH_4^+ , 3899.
 composition & metabolism: amino acids, 5271 ; benzaldehyde transformation, 3411 ; carbohydrates, 134, 1503, 3405 ; enzymes, 3032, 5271, 7148 ; glycerol formation, 861.
 gene dosage, effect on enzyme biosynthesis, 4760.
 growth, effects of 0-mercaptoethanol & dithiodiglycol, 1545.
 growth factor for beetle larvae, 4948.
 mitochondria from normal & petite mutant cells, 3398.
 mutations : respiration-deficient, sterols as related, 2337 ; paludrine-induced, 1505.
 osmotic behaviour, effect of biotin deficiency, 1502.
 sporulation metabolism, 3901.
 structure, E.M., 2275.
 uptake of S-containing amino acids, 3900.

Salvia (Dicot.) *splendens*, flowers, effect of herbicides, 4887.

Saprolegniaceae (Fungi), parasitism by *Olpidiopsis incrassata*, 2469.

Scenedesmus (Algae),
acuminatus, photosynthesis, 4851.
obliquus, osmotic behaviour & growth in saline media, 2435.

Schizophyllum (Fungi), nuclear ratios in heterokaryons, estimation, 6858.

Sohuosaecharoynes (Fungi),
acidodevoratus, malic acid decomposition, 5503.
pombe, adenine-requiring mutants, suppression or reversion, 4761.

Sohoenus (Monocot.) *nigricans*, growth on blanket bog peat, expt. study, 2414.

Sciadopitys (Gynn.) *verticillata*, heartwood terpenoid, 917.

Solerotiniaceae (Fungi), stromata development, expt. technique, 2496.

Secale (Monocot.) *cereale*, genetic studies, recurrent selection, 2352 f.

Seourinaga (Dicot.),
suffruticosa, alkaloids, 894 f.
virosa, alkaloids, 9011, 3448.

Seneo (Dicot.), alkaloids, soc. proa, 5038.

Seseli (Dicot.) *sibiricum*, oil from, pharmacol., 6218.

Setaria (Monocot.) *sphacelata*, NH, & acidity levels, 6987.

Silene (Dicot.) *cucubalus*, susceptibility to aux herbicides, 2454.

Sinapis (Dicot.) *alba*, apical meristem development, photoperiod effects, 6973.
 sugar in intercellular spaces, 2432.

Siphonodon (Dicot.) *australe*, terpenoids, 91B V

Skimmia (Dicot.) *japonica*, leaf extracts, stimn. artichoke growth in vitro, 2460.

Solanum (Dicot.), S. American varr., 4737.

dulcamara, alkaloid, 898 f.
melongena, fruiting, associated histogen*, 4875.
tuberosum, composition & metabolism : cholesterol, 6986; in fungus-infected tissues, 3447.

leaf, GA as affecting, 2457.

roots, short-borne, mitotic freq. in, 4710 ; tubers : canarycin as affecting germination, 4896 ; pre-germination treatments, eff., 2474 ; radiation effects, 2482 ; "Sr α radiation, 6919.

Sorghum (Monocot.) *vulgare*, seeds, enzymes do*, germination, 2472.

Sparaxis (Monocot.), breeding expt., *induct* tetraploid, 2353, 4739.

Spinaeropla (Algae) *annulina*, cell division, & systematic position, 6856.

Sphagnum (Bryoph.) *magellanicum*, cell wall p κ merit, 9571.

Spinacia (Dicot.) *oleracea*, N nutrition, 4846.

Spirogyra (Algae), nucleic acids, 2279.

Stanleya (Dicot.) *bipinnata*, seleniferous leaf ^A 4905.

Stereum (Fungi) *sanguinolentum*, selective & chance of balsam fir wood, 2500.

Streptocarpus (Dicot.), anthocyanins, 932.

Synechochloeus (Algae) *cedrorum*, growth, of uranyl nitrate, 1544.

T.

Tecoma (Dicot.) *stans*, alkaloids, 897-
Thraustochytrium (Fungi), development " " tion, 6929.

Thymus (Dicot.) *vulgaris*, extract, pharfl., 1623.

Tigridia (Monocot.), chr., 2314.

Torulopsis (Fungi) *utilis*, cerebrin from, str*** 5247.

Tradescantia (Monocot.), mitosis, u.v. 2297.

radulosa, mitotic cycle, "C- & ^{3}H -labelled during, 6807.

radiation recovery, enhancement, 47**.

reflexa, cell division, cytokinesis, 2286.

virginiana, pollen, germination, nuclear movement & mitosis, 6977.

Trametes (Fungi) *cinnabarina*, pigment, 5743.

Trichoderma (Fungi) *viride*, cellulose production 2428.

Trichophyton (Fungi) *mentagrophytes*, anti-angue morphol. response to methionine, 1511.

Trifolium (Dicot.), hybridisation, pre-*eff* barriers, 2355.

alexandrinum, mitochondrial ATPase, & mixed & mixed fragrans & repens, growth in pure popln., 4909.

incarnatum, leaf constituents, soc. pr^o C₃ pr^o P₀ repens, flavonoid, 938 f.

repens, nutrition, variable response - 4847.

subterraneum, nutrition, Zn, P & Co, 6991.

Trillium (Monocot.),
cernuum, chr. at metaphase, RNA in, 2290.
erectum, meiosis, protein biosynthesis 4717.

kamtschaticum, meiosis, effect of flower buds, 6822.

popln. studies, 2363.

Tripsaum (Monocot.), influence on *Agave* 6846.

Triticum (Monocot.) spp. (wheat), as food (flour, etc.), see *PoostrIW* t Proteins, i492.

diseases, agropyron mosaic virus, 244-1

enzyme, phosphatase distribution, 244-1

genetic studies : ancestry & genome D₁ content, 4771 ; diploid hexaploids, 4734 ; rust resistance, 4770

"Sr accumulation, 6874.

growth & development, dynamics, 4869.
 leaves, individual physiol. role, 4868.
 nutrition, N cpd., effect on chlorophyll &
 yield, 4846.
 radiation effects of heavy particles, 6872.
 response to trimethyl- β -chloroethylammonium
 chloride, 4890.
 roots: auxin studies, 4879 ; response to
 organoboron cpd., 4908 ; root hairs, E.M.,
 6992.
 seedlings, resistance to salt concn., enhancement,
 4907.
 seeds : age effects on germination & seedling
 chr., 6821 ; germination, Fe distribution
 during, 6976 ; immature, germination
 inhibitors in, 6968 ; vernalisation, water
 content & respiration, 2468 ; water con-
 tent, estimation, 4831.
 stem, cell wall structure, gibberellin as affect-
 $d_u \cdot B^8$, 6962.
 $d_u \cdot B^8 > n$, radiation-induced solid stem mutant,
 68^{11}
 (Monocot.), chr., 2314.
 (Monocot.) *latifolia*, cohesion within pollen
 ds, 6998.

U.

(Dicot.) europaeus, chem. constituents, 3467.
**0 (Fungi) zae*, spore germination, enzyme
synthesis during, 952.

1

V

Vaccinium (Dicot.) *angustifolium*, virus studies, 1493t.
Valeriana (Dicot.) *wallichii*, 0-bergamotene in, 3466.
Verticillium (Fungi) *alboatrutinum*, microsclerotia structure, germination & physiol., 2477.
Vicia (Dicot.), seeds : amino acids, taxonomic significance, soc. proc. 2594 ; y-hydroxy-arginine in, 316.
atropurpurea, root exudation, 4867.
faba, chromosomes : aberrations, chem.- & X-ray-induced, 6817, 6819 ; RNA in metaphase chr., 2290.
metabolism : DNA, 5-iododeoxyuridine incorporation, 761 ; nuclear protein biosynthesis, 501 ; thymidine degradation products, 5356.
mitosis : effects of Co, Ni & Fe, 6820 ; nucleolar behaviour during, 6810.
mutant with metabolic block in photosynthesis, 3484.
radiation effects, role of quiescent centre in meristems, 4903, 6814.
seeds : composition changes during ripening, 6944 ; germinating, arginosuccinic acid in, 954.
graminea, lectins, 5873.
Vinca (Dicot.), (see also **Vinca alkaloids** in general index).
minor, alkaloids, 8931.
Vitell (Dicot.) *vinifera*, buds, induced breaking of dormancy, 4885.

ANIMALS

Amoeba movement, p.d. as related, 5030.
transplantation studies, 2525.
striata, morphol. & movement, 5031.

Amphimima (Amph.), heart fibres, electrical responses, 6400.

Anas (Aves) *c. crecca*, food & feeding habits, 25381.

Ancistrodon (Rept.). See **Akistrodon**.

Anguis (Rept.) *fragilis*, urodaeum epithelium, histol. & histochem., 7012.

Anolis (Rept.) *carolinensis*, tubules in \$ for sperm storage, 7098.

Anopheles (Dipt.),
albimanus, genet, studies, dieldrin-resistance, 6883.
hackeri, trapping method, 7105.

quadriraculatus, infection by *Brugia pahangi* microfilariae, 2557.

Anseranas (Aves) *semipalmata*, behaviour, 2240.

Antherea (Lepid.) *eucalypti*, cytoplasmic poly-hedrosis, 5028.

Anthonomus (Coleo.) *grandis*, mating in autumn or autumn & spring, effects, 7094.

Anthrenus (Coleo.) *verbasci*, larvae, photoperiod studies, 7067.

Antilocapra (Mamm.) *americana*, kidney enzyme, 2659.

Apheloria (Diplopoda) *corrugata*, cyanogenic gland & secretion, 7122.

Aphis (Hem.Wafow), behaviour : after landing on plants, 2237 ; aggregation, (title 13) 7142.

Apis (Hym.) *mellifera*, behaviour in controlled environment room, 4684.
disease, *Nosema* infections, 5019-20.
queens : inhibn. of rearing, 2144-5 ; rearing, 4683 ; superscedure, 5020.
susceptibility to sprays on citrus, 1742f.
venom, assay & standardisation, 3428.

Aplysia (Moll.) *dilecta*, neurones, desensitisation of cholinergic receptors by ACh, 4981.

Apodemus (Mamm.) *sylvaticus*, homing, 2248.

Araneina (Arach.), sex chr., 2311.

Arbacia (Echin.), fertilisation, inhibn. by *Fucus* extract, 4936.
lixula, larval restitution from disaggregated embryo cells, 4935.

punctulata, eggs : effects of $^3\text{H}_2\text{O}$ on cell division, 7008 ; enzymes, 5474.
radiation of gametes, recovery, 1091.

Archachatina (Moll.) *marginata*, neurones, desensitisation of cholinergic receptors by ACh, 4981.

Argobuccinum (Moll.) *oregonense*, egg, enzymes, 552.

Armadillidium (Crust.) *vulgare*, moulting cycle, enzyme in tegumental glands as related, 4923.

Artemia (Crust.) *salina*, egg cleavage, effects of 0-mercaptoethanol & dithiodiglycol, 6823.
reproductive cycle, 4784.

Artibeus (Mamm.) *lituratus*, reproductive cycle, 5016.

Ascaris (Asch.), Hb, 2918-9.
lumbricooides, eggs, enzymes, 5479.
immunol. studies, 5865.
var. *suum*, eggs, survival in night soil, 7102.

Ascidia (Urochordata),
nigra, adult survival & mortality, 7133.
pygmaea, V absorption, 7056.

Astacus (Crust.) *astacus*, muscle proteins, 5290.

Asasia (Prot.) *klebsii*, ubiquinone content, 2511.

Asterias (Echin.),
forbesi, bacterial infection & reaction to injury, 7132.
ovary, enzyme, 5474.
rubens, adjustment to reduced salinity, 7044.
ampullae, structure & innervation, 7077.

Australorbis (Moll.) *glabratulus*, apertural lamellae, epiphragms & aestivation, 7130.
blood & egg proteins, 5291.
immunol. prop. in relation to taxonomy, 7129.
radionucleide uptake, distribution & excretion, 517.

Austropotamobius (Crust.) *p. potamobius*, K metabolism, ^{133}Cs accumulation, 7048.

Automeris (Lepid.) *cinerea*, rocking response, metabolic inhibitors as affecting, 2142.

Vitia

fruit development & ripening, 6940,

四

Wisteria (Dicot.) *floribunda*, gibberellins in seeds, 6964.
Wolfia (Monocot.) *microscopica*, in vitro control of flowering, 2464.

2

Zanthium (Dicot.) *pennsylvanicum*, stomatal rhythm, photoperiod effects, 4920.
Xysmalobium (Dicot.) *undulatum*, glycosides, 3457.

z

Zea (Monocot.) *mays*, chr. arm lengths, 6846.
composition, effect of 3-amino-1,2,4-triazole,
2453.
genetic studies : mutants, chem.-induced,
6873 ; pigments of mutants, 2360 ; seed oil
content, 2359.
roots : culture in vitro, 2443 ; Golgi appara-
tus, function, 6787-8.
seedlings : chloroplasts & etiolated plastids,
composition, 6931 ; coleoptiles, photo-
tropic responses, 6978.
Sr uptake, 2410.
Zygnema (Algae), rhythmic effects, 2485.

at

- Blatta** (Dicty.) *orientalis*, eye pigment, 5461.
Blepharisma (Prot.), cell division, retardation by u.v., 7009.
undulans americanus, nucleic acid digestion, macronuclear form, 2533.
Bombyza (Lepid.) *mori*, eggs, enzymes, 5344. eggs & larvae, trehalose content, **7018**. eye, eccentric retinula cell, structure, 2545. larvae : fibroin biosynthesis, 5420 ; maxillary chemoreceptors for carbohydrates, 2532 ; virus diseases, 3884, 5373.
 Malpighian tubules, fluorescent cpd. in, **4934**. neurosecretion, brain hormone a protein, 3230.
Bothrops (Rept.) *neuveidi*, venom, immunol. study, 4210.
Bracon (Hym.) *cephi*, variation in effectiveness as *Cephus* parasite, 5023.
Bradyis (Dipt.) *myorum*, salivary gland cells, micleoli, 6781.
Brevicoryne (Hem.) *brassicae*, eggs, development, 7032.
Brugia (Asch.) *pahangi*, microfilariae, behaviour in *Anopheles*, **2557**.
Bryobia (Arach.) *arborea*, low temp, as affecting, *μ*
Bubo (Aves) *bubo*, eye muscles, innervation, 2657.
Bucoinum (Moll.) *undatum*, mechanoreceptors, 2539.
Bufo (Amph.).
marinus, eggs, osmotic studies, 4967. nervous system, cytol. techniques, 2269. urinary bladder, fine structure, 2508.
terrestris americanus, parasitised by *Bufolucilia silvarum*, **2560**.
vulgaris, cyt. c, **2895**. embryos, Hb, 5301. ovarian steroids, 3290.
Bufolucilia (Dipt.), *silvarum*, parasitising *Bufo terrestris americanus*, **2560**.
Bngula (Polyzoa) *nentina*, ^mI absorption & assimilation, 5007.
Bungarus (Kept.) *caeruleus*, venom components, 2899. -
Buthus (Arach.) *quinquestriatus*, chitin in hyaline exocuticle, 4925.
- C.**
- Cactospiza** (Aves) *pallida*, behaviour, 4686.
Caenorhabditis (Asch.) *briggsae*, excretion products, 3517.
Callinectes (Crust.) *sapidus*, chemoreceptors, 4973. metamorphosis of megalops, eyestalk removal as affecting, 4998.
Calliphora (Dipt.) *erythrocephala*, intestinal protease, endoclines as affecting, 7066.
Calliphoridae (Dipt.), sex chr. & sex-determination, 4733.
Cambarus (Crust.).
clarkii. See *Procambarus*.
virilis, nervous system : giant axons & synapses, fine structure, 4971 ; photoreceptor in ventral cord, 2546.
Camnula (Orth.) *pellucida*, dispersal of nymphs, **2570**.
Cancer (Crust.).
borealis, muscle, action of GABA on, 6397.
magister, muscle, transmembrane current, 4972.
Carassius (Pise.) *auratus*, food input & energy extraction efficiency, 5509. pituitary, studies with Na⁺SO₄, 3523.
Carausius (Phasmida) *morosus*, muscle, Na & K in relation to membrane potential, 7107.
Carcinides (Crust.) *maenas*, chemoreceptors, 4973.
Cardiaspina (Hem.) *albitextura*, oviposition, attractiveness of *Eucalyptus* leaves, 4995.
Cardisoma (Crust.).
armatum, ionic & osmotic regulation, 7046. *guanhumi*, O- haemocyanin relationships, 4944.
Carpocapsa (Lepid.) *pomonella*, mating & oviposition behaviour, 7096.
Carpodacus (Aves) *mexicanus*, agonistic behaviour, 2218, 2221.
Cecropia. See *Hyalophora* (Lepid.) *cecropia*.
Cepaea (Moll.) *hortensis* & *nemoralis*, pigmentation, 2582 f.
Cephus (Hym.) *cinctus*, parasitism by *Bracon cephi*, **5023**.
Chalcides (Rept.) *ocellatus*, tissue N content, 4968.
Chaoborus (Dipt.) *crystallinus*, larval excretory system, 4960.
- Charonia** (Moll.) *tampas*, charoninsulphuric acid biosynthesis, 148.
Chironomus (Dipt.), parasitol. & biochem. relationships, 2558. salivary gland chr., distribution of solid material in, 4698.
tentans, salivary gland chr.: Balbiani rings, cytochem., 6797 ; ecdysone-dependent activity, **4711**.
Chlamydodon (Prot.) *pedarius*, cytoplasm-macronucleus relationships, 2281. oral apparatus, E.M., 2505.
Chlamys (Moll.), sexuality & spawning, 5 spp., 7093.
Chlorospingus (Aves) *opthalmicus* & *pileatus*, display patterns, 2216.
Choristoneura (Lepid.) *fumiferana*, tests with microbial insecticides, 3831.
Chorizagrotis (Lipid.) *auxiliaris*, longevity & fecundity, 7095.
Chrysochromulina (Prot.) *polylepis*, sp.n., origin of scales, 7026.
Chrysomya (Dipt.) *albiceps* & *rufifacies*, parthenogenesis, 4733.
Chrysops (Dipt.).
centurionis, swarming above forest canopy, 2212. *silacea*, adult longevity & food requirements, 7062.
Chthamalus (Crust.) *depressus* & *stellatus*, temp. effects on cirral activity & survival, 7123.
Ciona (Urochordata) *intestinalis*, "U-binding by tunic, 5008. nervous system, ACh & Chase in, 2577.
Citellus (Mamm.) *tridecemlineatus*, g.i. tract, active absorption of glucose, 4533. ovary after adre n a lec torn y, 2106. vision, 2609.
Coccinella (Coleo.), chr., 2310.
Columba (Aves),
domestica, nictitating membrane, "feather epithelium", 2509.
livia, eye muscles, innervation, 2657.
Conidae (Moll.), venoms, 4211.
Corypha (Lepid.) *cephalonica*, growth response to antibiotic supplements, sex differences, 2537.
Cordylophora (Cnidaria), rhythmic movements, 2534.
lacustris, growth, environmental factors as affecting, 7027.
Corthylus (Coleo.) *punctatissimus*, storage of ambrosia fungus spores, 5026.
Corvus (Aves) *furilegus*, blood lipids, 5250.
Crania (Brachiopoda) *anomala*, lophophore & ciliary feeding mechanism, 7061.
Cricetomyces (Mamm.) *gambianus*, adrenal cortex, ACTH & lipid content, 4565.
Cricosphaera (Prot.) *carterae*, alternation of generations, chr. studies, 6840.
Crithidia (Prot.).
fasciculata, ubiquinone content, 2511.
oncopelti, DNA from possible symbiote, 420.
Crocodilus (Rept.) *niloticus*, tissue N content & blood proteins, 4968.
Crotalus (Rept.) *adamanteus*, venom, electrophoresis, 2886.
Culex (Dipt.) *p. pipiens*, hibernating \$, resistance to DDT, 7104.
Cura (Plat.) *foremani*, conditioning, 7076.
Cnispidaria (Moll.) *cuspidata*, feeding & excretion, 7060.
Cymomyopsis (Dipt.) *cadaverina*, prepupae, g.i. tract bacterial content, 5029.
Cyprinidae (Pise.) *carpio*, eggs, RNA, **3008**.
- D.**
- Dahlbominus** (Hym.) *fuliginosus*, sex ratio variation, causes, **4994**.
Delichon (Aves) *u. urbica*, reaction to predators, 2217.
Dendraster (Echin.) *excetricus*, eggs, fertilisation, 7028.
Dendrostomum (Sipunculoidea) *cymodoceae*, haemerythrins, 2383.
Didelphis (Mamm.) *marsupialis*, histoplasmosis in, 1497.
Diodora (Moll.) *aspera*, haemocyanin, absence of Bohr effect, 5332.
Diphyllothorium (Platy.) *latum*, extract, action on combined vit. B₁ 3208.
- Diprion** (Hym.),
hercyniae, parasitism by Tachinid, 5024.
similis, sex attractant, 1744.
Dolichonyx (Aves) *oryzivorus*, migration, analysis*, 2229.
Doryteuthig (Moll.) *plei*, nerves, Schwann cells, 505-
Drino (Dipt.) *bohemica*, host selection, 5024.
Drosophila (Dipt.), air sacs, function, 4952. ft body size, relation with larval duration » diet, 2366.
 chr., origin of repeats, 2367f. ^ developmental abnormalities & maternal ag* 4752.
 radiation effects on chr. exchanges, 4790. ^m
flavoreplata, salivary gland cell nuclei, m brane prop., 4696.
hydei, salivary gland chr., cytol., 6839.

Influence (Echin.), spermatozoa, adenine nucleotide content, 5366.
Influence (>) (Crust.) *nudus* & *oregonensis*, osmotic regulation, 4957.
Echinus (*calcaratus*), 7040.
Hippocampus (*caeca*), 7040.
Hippocampus (*calcaratus*), regeneration of neuromuscul. tissue, 7025.
Hippocampus (*calcaratus*), life cycle, parasitism, 2212.
Hippocampus (*calcaratus*), jacoti, swarming above forest canopy, 2212.
Hippocampus (*calcaratus*), medicinalis, ventral nerve cord • 6778.
Tot. *meleagridis*, immunol. studies,

Homarus (Crust.) *vulgaris*, K metabolism & ⁷Cs accumulation, 7048.

Hyalophora (Lepid.) *cecropiae*, juvenile hormone, role during development, 5002.
Hydatigena (Platy.) *taeniaformis*, in rats, mast cell response, 3764.

Hydra (Cnidaria), feeding reaction, reduced glutathione as related, 7057.

maintenance of form, (title 2) 2600.
littoralis & *oligactis*, regeneration of tentacles, 7039.
pirardi, response to mechanical & light stimuli, 4679.

Hyla (Amph.) *labialis*, eggs, osmotic studies, 4967.

Hylobates (Mamm.) *lar*, food motivation & delayed response, 4687.

Hynobius (Amph.) *nigrescens* & *tokyoensis*, pteridine biosynthesis during chromatophore differentiation, 4927.

Hypera (Coleo.) *postica*, lipid content in relation to response to insecticides, 6360.

parasitism by nematode, 5025.

L

Idotea (Crust.) *granulosa*, osmoregulation, 7047.

Ixodes (Arach.), *caninus*, survival of *Leptospira canicola* in, 6057.

trianguliceps, ecology, 7103.

J.

Junco (Aves) *oreganus*, song development in hand-reared birds, 2222.

K.

Eatherina (Moll.) *tunicata*, biochem. changes during reproduction, 7022.

L.

Labeo (Pisc.) *dero* & *gonius*, chr., 6842.

Laccifer (Hem.) *lacca*, jalaric acid from, 3478.

Lacerta (Kept.) *agilis*, kidney, innervation, 4987.

Lacistorhynchus (Platy.) *tenius*, urease activity, 4922.

Lambdina (Lepid.) *fiscellaria somniaria*, nuclear polyhedrosis, 3883, 5027.

Lanius (Aves) *excubitor*, reaction to, by house martins, 2217.

Larus (Aves), *atricilla*, chicks, pecking response, 2227.

ridibundus, orientation after displacement, 2243.

Laverania (Prot.). See **Plasmodium**.

Leander (Crust.) *serratus*, moulting cycle, effect of amputating ocular peduncles, 4999.

Lebistes (Pisc.) *reticulatus*, melanophores, response to drugs, 4140.

ovary, pellicid membrane formation Sc structure, 7011.

thiourea treatment, effect on ? & progeny, 5011.

Leishmania (Prot.) *donovani*, cell membrane, 7017.

infections & vectors, Sudan, 1317, 6155.

lysis by myostatin, 6190.

Leucophaea (Dicty.) *maderae*, circadian rhythms, recording technique, 2544.

Libinia (Crust.) *etnarginata*, chemoreceptors, 4973.

Ligia (Crust.) *oceania*, osmoregulation, 7047.

Linens (Nemertina) *tuber*, digestion, 4947.

Lipaugus (Aves) *cineraceus*, behaviour, 2232.

Loa (Achs.) *loa*, infections, prophylaxis, 6198.

Locusta (Orth.) *migratoria*, blood composition, 7049.

gonad development, inhibn. by frontal ganglion removal, 7065.

learning & aggregation, environmental factors, 2239.

muscle, Na & K in relation to membrane potential, 7107.

popln. density, effect on progeny survival, 2146.

Loligo (Moll.), eyes, light- & dark-adaptation, 2542.

Lophius (Pisc.) *piscatorius*, islet tissue, protein biosynthesis in, 3043.

Lucilia (Dipt.) *sericata*, prepupae, bacterial content of alimentary tract, 5029.

Lumbricus (Ann.) *terrestris*, ionic balance in body fluids, 4956.

Lymnaea (Moll.), immunol. prop, in relation to taxonomy, 7129.

stagnalis, Ca & Sr absorption from medium, Ca fluxes, 7051-2.

Lytechinus (Echin.) *variegatus*, pedicellariae, ACh-like cpd. in, 2576.

M.

Macacus (Mamm.) *mulatta*, anthrax, expt. studies, 1294-5, 1407.

behaviour: avoidance of complex objects, 4653; coercive, 4671; conditioning, 4674; learning, 2203, 6762-3, 6765; of infants, 2202.

brain, anat. & histol., 2604-5.

eye, iris angle, nerve fibres, 5060.

genetics, inheritance of serum transferrins, 2379.

skull, studies with "Ca, 2712-3.

Macropodidae (Mamm.), brain, comparative studies, 70911.

Macrosiphum (Hem.) *pisi*, resistance to, in alfalfa, 2563.

Malimbus (Aves) *rupiceps*, nesting, 7137.

Manis (Mamm.) *pentadactyla*, tongue, anat. & neurohistol. study, 20 f.

Mansonia (Dipt.) *aurifrons*, swarming above forest canopy, 2212.

Martesia (Moll.) *fragilis*, chem. composition, 1011, 3516.

Megoura (Hem.) *viciae*, determination of form, photoperiod & temp. effects, 5001.

Melanargia (Lepid.) *galathea*, flavonoid pigments, 553 f.

Meles (Mamm.) *meles*, ovary, corpora lutea, 83.

Menochilus (Coleo.), chr., 2310.

Mercenaria (Moll.) *mercenaria*, heart, 5HT as mediator of excitation, 7087.

Merychippus (Mamm.) *primus* (fossil), selection in natural popln., 23851.

Mesocricetus (Mamm.) *auratus*, brain, stereotaxic atlas, 5127t.

Mycobacterium from, 1401.

radiation effects on ova & derived embryos, 4722.

Microgadus (Pisc.) *totmcod*, resistance to freezing, 7135.

Molothrus (Aves) *ater*, intersp. preening display, 2224.

Mopalia (Moll.) *hindsi*, biochem. changes during reproduction, 7022.

Moraba (Orth.) *scurra*, chr., complex translocation, 6841.

Murgantia (Hem.) *histrionica*, biology, 2565.

Musca (Dipt.) *domestica*, enzymes, esterases, 3136, 4924.

ovary development, effect of synthetic queen substance, 2549.

parasitism by chalcid, 5022.

Mya (Moll.) *arenaria*, feeding & excretion, 7060.

Myotis (Mamm.), blood vessels, dimensions, 4391.

lucifugus, gastric mucosa, fine structure, 2640.

hearing, neurophysiol., 1997, 6551.

Myoxocephalus (Pisc.) *scorpius*, resistance to freezing, 7135.

Mysidium (Crust.) *gracile*, swimming, orientation 7083.

Mytilus (Moll.), *californianus*, shell proteins, composition, 285.

edulis, larvae, response to hydrostatic pressure, 5033.

muscle, ATP level in relation to "catch", 2980.

Myxicola (Ann.) *infundibulum*, nervous system, rapid response, 7078.

Myxine (Marsipobranchii) *glutinosa*, slow & fast muscles, 7108.

Myzua (Hem.) *persicae*, nutrition, amino acid utilisation, 3181.

N.

Naesa (Crust.) *bidentata*, respiration 8c feeding, 7058.

Naja (Kept.) *flava*, venom, electrophoresis, 2886.

Nasonia (Hym.) *vitripennis*, parasitism of house-fly, 5022.
reproductive organs, structure & function : ovipositor, 4991 ; spermatheca, 4992.
Natriz (Rept.) *natrix*, blood proteins, 5311.
Nauphoeta (Dicty.) *cinerea*, induced hypersexual activity in ♂, 2550.
Necturus (Amph.), heart muscle fibres, electrical response, 6400.
Nematodirus (Asch.) *battus* & *filicollis*, epidemiology, 5018.
Neodiprion (Hym.), parasitism by Tachinid, 5024.
Nereis (Ann.).

diversicolor, motor axon termination, 4970.
diversicolor & *virens*, learning & retention, 4680.

Nomadacris (Orth.) *septentrionalis*, popln. density, effect on progeny survival, 2146.
Nosema (Prot.) *apis*, infections in bees : anti-agent, 5019 ; effect on queen supersEDURE, 5020.
Notonecta (Hem.), respiration, 4943.

O.

Ochromonas (Prot.) *malachitensis*, photosynthesis during thiamine & biotin deficiency, 4854.
Octopus (Moll.), eyes, light- & dark-adaptation, 2542.
 nervous system : cell no. & size, 2541 ; delayed response, 7085 ; neural memory systems, 7084 ; pathways in arms, 7086.
briareus, behaviour, 4681.
vulgaris, discrimination of shape, 2163, 4682.
nervous system, pulsating ganglion, 2540.
taste by touch, 2143.
white body, purine bases of, 554.
Oopodea (Crust.), aggregation, (title 4) 7142.
Oikopleura (Urochordata) *dioica*, predation on, by plaice, 7063.
Oncomelania (Moll.) *formosana*, ovicides, 1727.
Oncopterus (Hem.) *fuscatus*, embryonic development energy expenditure, temp., effects, 2518.
Oncorhynchus (Pisces), coded wire identification system, 7110.
nerka, steroid metabolism, 3273.
Ophiocoma (Echin.) *nigra*, pigmentation, 7131.
Orchelimum (Orth.) *vulgare*, song, temp., effects, 7082.
Oroonectes (Crust.).

propinquus, stretch receptor neurones, response to 3-hydroxytyramine, etc., 4974.
virilis, gastrolith formation, 7013.

Ornithorhynchus (Mamm.), excretion, 7055.
anatinus, cerebellum, 2698.
Oryctolagus (Mamm.) *cuniculus*. See **Mammals**, specific, rabbit.
Ostrea (Moll.) *edulis*, feeding & excretion, 7060.
 larval survival & growth at lowered salinities, 4963.
 reproduction, 4931.
Ostrinia (Lepid.) *nubilalis*, diapause, photoperiodic induction, 5003.
Oxycarenus (Hem.) *hyalinipennis*, digestion of starch, 2535 f.
Oxytricha (Prot.), effect of plant growth substances, 2574 t, 5034.
fallax, feeding organelles as related to encystment, 2555.

P.

Pacilstaacs (Crust.) *leniusculus*, stretch receptor neurones, response to 3-hydroxytyramine, etc., 4974.
Pagurus (Crust.) *pollicaris*, chemoreceptors, 4973.
Palaemon (Crust.) *serratus*, K metabolism & ¹⁴C accumulation, 7048.
Pandinos (Arach.) *imperator*, chitin in hyaline exocuticle, 4925.
Panonychus (Arach.).

citri, chemosterilisation, 1743.
ulmi, competition with *Tetranychus telarius*, 2571.

Panotirus (Crust.), visual system, 2547.
Papio (Mamm.), esterases in relation to classification, 2513.
doguera, kidney cells, susceptibility to human enteroviruses, 1454.
Paracentrotus (Echin.) *lividus*, larval restitution from disaggregated embryo cells, 4935.

Paramecium (Prot.), mate-killer particles, 2345-6.
aurelia, macronucleus, 2260.
radiosensitivity during interdivision growth cycle, 5837.
response to cigarette components, 1548.
bursaria, genet, studies, mating types, 2343-4.
caudatum, behaviour, study of reactive inhibn., 2161.
multimicronucleatum, avoidance reaction, effects of Ca, Sr & Ba, 2581.

Paramerismis (Asch.) *rosea*, effect on *Chironomus* spp., 2558.

Passer (Aves) *domesticus*, mass-roosting, 2231.

Pediculib (Phthiraptera) *humanus*, control, 6367.

Pelodrilus (Ann.) *terrestris*, neurosecretion, 5004.

Pelomyxa (Prot.).

carolinensis, locomotion, 7006.

illinoiensis & *carolinensis*, transplantation tolerance, 2525.

Perca (Pisces) *fluviatilis*, kidney & head kidney, blood vessels, 2584.

Peridroma (Lepid.) *sauvagei*, haemocyte monolayer cultures, prep., 5032.

Perimereis (Ann.) *cultivifera*, learning & retention, 4680.

Periplaneta (Dicty.) *americana*, brain, neurones & their inclusions, cytol. & cytochem., 4977.

cuticle, permeability to malathion, 7115.

haemolymph, quant. study during last moulting cycle, 7117.

muscle Na & K in relation to membrane potential, 7107.

pericardial cells, stimm., 5537.

salivary gland, E.M., 6782.

sex attractant, 551.

spematogenesis, meiosis, cytol., 2284.

Perissopcephalus (Aves) *tricolor*, behaviour, 2232.

Peromyscus (Mamm.) *maniculatus*, weaning age of 2 subspp., 7140.

Petromyzon (*Marsipobranchii*) *marinus*, larva, spinal cord regeneration, 2526.

Phaenocora (Platy.) *unipunctata*, Hb, 2578.

Phallusia (Urochordata) *mammillata*, larva, V uptake, 2532.

Philaemon (Ann.) *grandidieri*, as frog endoparasite, 2556.

Philander (Mamm.) *fuscogriseus*, histoplasmosis, 1497.

Philohela (Aves) *minor*, summer crepuscular flights, 2223.

Phlebotomus (Dipt.) *orientale* & *papatasi*, as *Leishmania* vectors, 6155.

Phoeniconaias (Aves) *minor*, feather & skin pigment, 552.

Phormia (Dipt.) *regina*, behavioural aspects of protein ingestion, 4950.

interpseudotracheal papillae, E.M., 2506.
larvae, phospholipid, 2831.

Photuris (Coleo.) *pennsylvanica*, light organ, structure & innervation, 4980.

Phthirus (Phthiraptera) *pubis*, control, 6367.

Pieris (Lepid.) *brassicae*, larvae, toxin in digestive fluid, 4951.

Planococcus (Hem.) *citrifolia*, spermatogenesis, 4712.

Planorbis (Moll.) *corneus*, immunol. prop. in relation to taxonomy, 7129.

Plasmodium (Prot.).

cynomolgi & *gallinaceum*, tissue stage, technique of study, 1518.

falcipara, pre-erythrocytic forms, 6154.
ovale, tissue phase, presumed 2nd generation, 6154.

Platynemis (Hem.) *rhadamanthus*, development & predatory habit, 2213.

Plecotus (Mamm.) *townsendii*, hearing, neuophysiol., 1997.

Pleurodeles (Amph.) *wallacei*, embryo : actinomycin as affecting morphogenesis, 4929 ; fimb development, 2523.

fertilised eggs, sensitivity to neutrons, 4939.

Plenronectes (Pisces) *platessa*, fecundity in Norwegian waters, 7097.

larvae : predation on *Oikopleura dioica*, 7063 ; swimming speeds, 7134.

rearing, use of antibiotics, 7034.

Ploceinae (Aves), nest structure, 7137.

Pneumonyssus (Arach.) *simicola*, infection in monkeys, 1294.

Porcellio (Crust.) *dilatatus*, heart (semi-isolated), recording of mechanical activity, 4351.

Priapulus (Asch.) *caudatus*, solenocyte tree, structure, 7045f.

Procambiaris (Crust.).
blandingii & *clarkii*, stretch receptor neurones, response to 3-hydroxytyramine, etc., 4974.
clarkii, giant axons & synapses, fine structure, 4971.
muscle, glutamate-induced depolarisation, 6394.

Procnias (Aves) *alba*, behaviour, 2232.

Procyonidae (Mamm.), cerebral cortex, sig. of sulci in somatic sensory-motor area, 7092.

Prodenia (Lepid.).
eridania, chitin biosynthesis, 5211.
lituraria, sex attractant, 54571.

Proechimys (Mamm.) *semispinosus*, histoplasmosis, 1497.

Prymnium (Prot.) *parvum*, metabolism, methionine & vit. B₁₂, 3204, 3923.

Psammichinus (Echin.) *miliaris*, embryo, cellular basis of morphogenesis, 2516.

Pseudoaxine (Platy.) *trachuri*, life history & popln. dynamics, 7100.

Pseudoboa (Rept.) *cloelia*, ophiophagus habit, 4125.

Pseudocentrotus (Echin.), spermatozoa, adenine nucleotide content, 5366.

Pseudocerastes (Kept.) *fieldii*, venom, action, 1728.

Psychodidae (Dipt.), spp. pairs, 4993.

Pterobothrium (Platy.) *lintoni*, urease activity, 4922.

Pulvinaria (Hem.) *hydrangeae*, meiotic parthenogenesis & heterochromatinisation, 6803.

Q.

Quisqualis (Aves) *versicolor*, visual discrimination development, 2230.

R.

Rana (Amph.), as expt. animals for physiol. studies. Sc⁶ relevant heading, e.g., **Muscle**.

adspersa, adrenals, 5012.
caesiabiana, sympathetic ganglia, fine structure, 2279.

caesiabiana & *grylio*, Hb changes during met* morphosis, 7025.

cyanophycis, oocyte, lampbrush chr., 6783.

esculenta, epiphysis cerebri, E.M., 4982.

piapiens, eggs, protein biosynthesis, 5419.
egg-jelly Ag, 7038.

eggs & embryos, ribosome, RNA*, ferritin, 3044.

embryos : catecholamines in, 4938 ; *Insectula* tion, nucleotides as affecting, 4937.

gynogenetic diploids, 6838.

intrapar. nuclear transplantation, 4710.
liver enzyme, 4926.

pipiens & *sylvatica*, eggs, intersp. *nucleus* transfer & back-transfer, 6801.

hybrid embryos in vitro, CO, fixation malonate accumulation, 545.

platyrrhina, egg permeability after fertilise or activation, 7036.

temporaria, brain, preoptic magnocellular cleus, extirpation, 7072.

larvae, drug effects, 2552.

phototaxis, 7089.

venous system abnormality, 7136.

Rangia (Moll.) *cuneata*, amino acids, salinity, tf affecting, 4962.

Rastrelliger (Pisces) *canagurta*, chem. compos^{**don}, changes during storage, 551 If.

Rattus (Mamm.).
assimilis, hair ball formation, 4954.

norvegicus. See **Mammals**, specific, rat.

rattus, infections with *Leishmania*, 6155.

Rhinocoris (Hem.) *carmelita*, development predatory habit, 2213.

Rhinopoma (Mamm.) *kinneari*, sperm dimorp^{*ui} 7015.

Rhodnius (Hem.) *prolixus*, nymphs, contro* diuresis, 7050.

Rhyacionia (Lepid.) *buoliana*, trials with nu insecticides, 3832.

Rissa (Aves) *tridactyla*, egg size & shape, vari^{**} 2573.

Rupicola (Aves) *rupicola*, breeding behav¹ 2219.

TAXONOMIC INDEX

S.

mega, DNA biosynthesis, 474.
rhodesiense, serol. studies, 3920.
Tubifex (Ann.) egg cytoplasm, cytol., (title 7) 5048.
Turbatrix (Asch.) *aceti*, effect of antibiotics on heat stress, 3957.
Tursiops (Mamm.) *truncatus*, fright, sounds produced, 2215.
Typhlodromus (Arach.), low temp. as affecting, 2567.

U.

- Uca** (Crust.) *pugnax*, respiration, seasonal variation, 4945.
Ureohis (Echiuroidea), eggs, separation of fertilisation membrane, 5616.
Tjrogale (Mamm.) *everetti*, metabolic rate, 4928.

V.

- Varanus** (Rept.),
griseus, neurosecretion, effects of starvation, 5015.
 tissue N content & blood proteins, 4968.
niloticus, kidney cholinesterase, 2660.
Venus (Moll.) *striatula*, feeding & excretion, 7060.
 larvae & early post-larva, 7030.
Vipera (Rept.)
ammonodes, serum, immunol., 1182.
 venom : immunol., 1182 ; pharmacol., 4109.
palestinae, venom, haematol. effects, 1819.

W.

- Walterinnesia** (Rept.) *aegyptia*, venom, action, 1728.

X.

- XenopM** (Amph.), eggs, morphogenesis, effect of actinomycin D, 4929.
laevis, oocytes, cell membranes, electrophysiol., 4696.

ABBREVIATIONS ETC. USED IN INDEX

The same abbreviations are used for the singular and plural forms of nouns.

A	Angstrom	C-R	crown-rump	FMN(H)	flavin mononucleotide (reduced)
Ab	antibody	o~, e+ cryst*	/crystalline \crystallised	freq.	frequency
abs.	absolute	crystn.	crystallisation	FSH	follicle-stimulating hormone
a.c.	alternating current	c/s	cycles per second	ft.	foot
a.c.d.	acid citrate dextrose	CS	conditioned stimulus	g	acceleration due to gravity
a.c.g.	acid citrate glucose	c.s.f.	cerebrospinal fluid	g.	gram
ACh	acetylcholine	CTP	cytidine triphosphate	GA	gibberellic acid
AChase	acetylcholinesterase	c.v.s.	cardiovascular system	GABA	Y- ^{aminob} utyric acid
ACTH	adrenocorticotrophic hormone	cyt.	cytochrome	GDP	guanosine diphosphate
ADH	antidiuretic hormone	cytol.	cytological, -ly	genet.	genetic, -s, -ally
ad lib.	ad libitum	2,4-D	(2,4-dichlorophenoxy)- acetic acid	GFR	glomerular filtration rate
admin.	administration, -ered	d.c.	direct current	GH	growth hormone
ADP	adenosine diphosphate	DEAE	diethylaminoethyl- (applied to cellulose)	g.i.	gastrointestinal
Ag	antigen	d.e.f.	number of decayed extracted or filled deciduous teeth	GLC	gas-liquid chromatography
aggl.	agglutinate, -d	deriv.	derivative	GMP	guanosine monophosphate (guanylic acid)
aggl.	agglutination	DFP	diisopropyl- phosphorofluoridate	GOT	glutamic-oxaloacetic transaminase
alk.	alkaline	diam.	diameter	GPT	glutamic-pyruvic transaminase
Amp.	ampere	dil.	dilute	GSH	reduced glutathione
AMP	adenosine monophosphate (adenylic acid)	diln.	dilution	GSSG	oxidised glutathione
anhyd.	anhydrous	DMB A	9,10-dimethyl 1,1,2- benzanthracene	GTP	guanosine triphosphate
a.n.s.	autonomic nervous system	DMF	number of decayed missing or filled permanent teeth	g.u.	genitourinary
ant.	anterior	DNA	deoxyribonucleic acid	haematol.	haematological, -ly
approx.	approximate, -ly	DNase	deoxyribonuclease	Hb	haemoglobin
aq.	aqueous	DNP	2,4-dinitrophenol	HCG	human chorionic gonadotrophin
atm.	atmospher-e, -ic	DOC(A)	11-deoxycorticosterone (acetate)	5-HIAA	5-hydroxyindolylacetic acid
ATP	adenosine triphosphate	dopa	3,4-dihydroxyphenyl- alanine	histol.	histological, -ly
ATPase	adenosine triphosphatase	DPN[H]	see NAD[H]	hr.	hour
a.v.	arterio-venous	i)	viscosity	5HT	5-hydroxytryptamine (serotonin)
A-V	auriculo-ventricular	E	extinction	5HTP	5-hydroxytryptophan
b.c.g.	ballistocardiogram	EaC'x,,	erythrocyte stroma-h ambceptor-r- C or components thereof	i.a.	intra-arterial, -ly
BCG	Bacille Calmette-Gue'r'in	e.c.g.	electrocardiogram	IAA	3-indolylacetic acid
biochem.	biochemical, ly	ED _{B0}	median effective (or exciting) dose	ICSH	interstitial cell stimulating hormone
biol.	biological, -ly	EDTA	ethylenediaminetetra- acetic acid	i.d.	intra-dermal, -ly
B.M.R.	basal-metabolic rate	e.e.g.	electroencephalogram	IDP	inosine diphosphate
b.p.	blood pressure	E.M.	electron microscope, -y	i.m.	intra-muscular, -ly
BSA	bovine serum albumin	embryol.	embryological, -ly	immunol.	immunological, -ly
BSP	sulphobromophthalein sodium	e.m.f.	electromotive force	IMP	inosine monophosphate (inosinic acid)
c	curie	e.m.g.	electromyogram	in.	inch
C	complement	EPR	electron paramagnetic resonance	inf.	inferior
cal.	calorie	equiv.	equivalent	INH	isonicotinic acid hydrazide (isoniazid)
calc.	calculate, -ed	E.R.	endoplasmic reticulum	inhib.	inhibit, -ed
calcn.	calculation	e.r.g.	electroretinogram	inhibn.	inhibition
CDP	cytidine diphosphate	e.s.r.	erythrocyte	inj.	inject, -ed
CF	complement fixation	ESR	sedimentation rate	injn.	injection
Chase	cholinesterase	e-V	electron spin resonance	inoc.	inoculate, -ed
chem.	chemical, -ly	expt.	electron volt	inocn.	inoculation
chr.	chromosome, -al	FAD	experiment, -al, -ly	inorg.	inorganic
chromatog.	chromatography, -ic	FFA	flavin-adenine dinucleotide	insol.	insoluble
CM-	carboxymethyl-	floccn.	free fatty acids	i.p.	intra-peritoneal, -ly
cm ⇡ ⇢	centimetre (squared) (cubed)	flocculation		i.r.	infra-red
CMP	cytidine monophosphate (cytidylic acid)			ITP	inosine triphosphate
c.n.s.	central nervous system			I.U.	international unit
CoA	co-enzyme A			i.v.	intravenous, -ly
coeff.	coefficient			k	kilo-
cone.	concentrate, -ed				
concen.	concentration				
cond. refl.	conditioned reflex				
const.	constant				
cpd.	compound				

Km	Michaelis constant	PBI	protein-bound iodine	serol.	serological, -ly
17-KS	17-ketosteroid	PCA	passive cutaneous anaphylaxis	sig.	significant, -ly, -ce
l	litre	p.d.	potential difference	simult.	simultaneous, -ly
X	wavelength	PD ₅₀	median protective or paralysing dose	sol.	soluble
lab.	laboratory	pharmacol.	pharmacological, -ly	soln.	solution
lat.	lateral	physiol.	physiological, -ly	sp.	specific, -ally
LD	median lethal dose	PMS	pregnant mare's serum	sp. spp.	species (singular, plural)
L.E ^M	lupus erythematosus	poll.	pollinate, -ed	sp.gr.	specific gravity
LH	luteinising hormone	polymorph.	polymorphonuclear leucocyte	sRNA	soluble (transfer) RNA
LSD	lysergic acid diethylamide	popln.	population	spont.	spontaneous, -ly
m	milli-	pos.	positive	stim.	stimulate, -ed
m. ² >< ²	metre (squared) (cubed)	post.	posterior	stimn.	stimulation
M	molar solution (also mega-)	PPD	purified protein derivative	S.T.P.	standard temp, and pressure
MAO	monoamine oxidase	p.p.m.	parts per million	sup.	superior
m ^g .	millimicrogram	ppt.	precipitate, -ed	temp.	temperature
(t	micro- or micron	PPtg.	precipitating	TCA	trichloroacetic acid
max.	maximum	pptn.	precipitation	TDP	thymidine diphosphate
min.	minimum, minute	prelim.	preliminary	tert.	tertiary (chemical)
MLD	minimum lethal dose	prep.	preparation, prepared	TLC	thin layer chromatography
mol.	molecul-e, -ar	prop.	property	Tm	maximum tubular
morphol.	morphological, -ly	prox.	proximal		reabsorption rate
m.p.	melting point	psychol.	psychological, -ly		thymidine monophosphate
MSH	melanocyte stimulating hormone	PVP	polyvinylpyrrolidone		tobacco mosaic virus
n	refractive index	qual.	qualitative, -ly		scio NADP[H J
N	normal solution	quant.	quantitative, -ly		thyroid-stimulating hormone
NAA	a-naphthalenacetic acid	r	Röntgen unit	TTP	thymidine triphosphate
NAD[HJ	nicotinamide adenine dinucleotide [reduced]	P	density	U	units
NADP[H _a]	nicotinamide adenine dinucleotide phosphate [reduced]	rad	radiation unit (100 ergs per g.)	UDP	uridine diphosphate
NDV	Newcastle disease virus	r.b.c.	red blood corpuscle	UMP	uridine monophosphate (uridylic acid)
^{ne} g.	negative	RE	reticulo-endothelial	US	unconditioned stimulus
neurol.	neurological, -ly	ref.	reference	UTP	uridine triphosphate
-NMR	nuclear magnetic resonance	rep.	Rontgen equiv. physical	u.v.	ultra-violet
no.	number	Rf	relative flow rate	V	volt
N.T.P.	normal temperature and pressure	R.H.	relative humidity	vac.	vacuum
O.D.	optical density	RNA	ribonucleic acid	vaccn.	vaccination
17-OHCS	17-hydroxycorticosteroid	RNase	ribonuclease	vit.	vitamin
org.	organic	RNP	ribonucleoprotein	vol.	volume
%	per cent, percentage	r.p.m.	revolutions per minute	v/v	volume for volume
PAB	parts per thousand	R.Q.	respiratory quotient	W	watt
H H	/>-aminobenzoic acid	S	sedimentation coefficient	w.b.c.	white blood corpuscles
[^] AS	/>-aminohippuric acid	sat.	saturated	wt.	weight
^A -A-Schiff	^A -aminoalicyclic acid	satn.	saturation	w/v	weight for volume
Pathol.	periodic acid-Schiff	s.c.	subcutaneous, -ly	yr.	year, years
	pathological, -ly	S.D.	standard deviation		
		sec.	second (time only)		
		sec.	secondary (chemical)		

Positive inorganic ions are written as, e.g., Ca^{2+} , Mn^{2+} , and negative ions as, e.g., Cl^- , SO_4^{2-} .

In addition, elements, groups, and easily recognised substances are denoted in the text by symbols and formulae, but in the case of salts of complex acids the symbol for the cation only is permitted. This applies only to inorganic impounds, excluding water; in general, organic formulae are not abbreviated. Centigrade scale of temperature is turned in the absence of other indication. The symbol for 10 Angström Units is m/x (not /x/x), the symbol for 10^{-g} is jig. (not y).

The principal Pharmacopoeias are denoted by B.P., U.S.P., and D.A.B., followed in each case by their identifying Numeral.

Where many different amino acids are named, they may be abbreviated according to the I.U.P.A.C. rules e.g. Gly-Ala-Lys- for peptides of known sequence ; Gly, Ala, Lys, for peptides of unknown sequence or mixtures).

For polynucleotides the prefix poly- followed by the standard abbreviation for the base(s) may be used (e.g. poly-U).

ERRATA

VOLUME 31, No. 1, 1963.

No.

- 106 for " Heppert " read " Hoppert " (author).
 443 for " ATPase " read " ATP " (line 1).
 605 for " o-methyl " read " O-methyl " (title and line 2).
 eiO for " Listema: " read " Listeria " (title).
 611 for " lipid " read " lipoic " (title).
 648 for " d -amino-levulinic " read " <>-aminolevulinic acid " (last line).
 999 for " 10¹⁰M pyruvate " read " 10->M tyramine " (line 4).
 1112 for " Macaca virus " read " Macaca irus " (title).
 1132 for " Cryptococcosis " read " Cryptococciosis " (title).
 1227 for " e-amino-N-caproic " read " e-amino-w-caproic " (title).
 1649 delete repeated sentence " In 7 of them " (line 12).
 1712 for " dates " read " dogs " (line 3).
 1771 for " 25.5° & 25.5° " read " 27.5° and 25.5° " (line 4).
 2163 for " Oxford Univ., U.S.A " read " Oxford Univ., England " (address).
 2364 for " Lithanus parrage " read " Linanthus parryae " (line 2).
 2447 for " blumeni " read " blumei " (line 2).
 2496 for " stomatal " read " stromatal " (title).
 2562 for " ⁴⁰Co " read " "Co " (line 2).
-

No. 2.

- 2640 for " rat " read " bat " (title).
 2791 for " diphosphate " read " diphosphatase " (title).
 2877 for " o-methyl " and " o-trimethyl " read " O-methyl, -trimethyl ¹⁵ (lines 3, 4, 5).
 2899 for " Bugarus " read " Bungarus " (line 1).
 3120,3121 reverse abstracts to fit titles & authors.
 3132 for " fine " read " five " (line 1).
 3322 for " of ATP " read " by ATP ¹⁵ (line 1).
 3627 for "charges " read " changes " (title).
 3900 for " ³⁵C " read " ³⁶S " (line 2).
 3952 for " Fusobacterium " read ¹⁵ Fusarium " (line 2).
 4608 for " significant changes " read " no significant changes " (line 7).
 4714 for " Tritium " read " Trillium " (line 1).
 4756 for " parenteral " read " parental " (title).
 4761 for " or " read " of " (title).
 4912 for " hypognea " r^aaf " hypogaea " (title),
 4943 /of " no " read " of " (line 8).
 4985 /or " Mormyoid " read " Mormyrid " (title).
 4994 /or " Dahbominus " read " Dahlbominus " (title).
 5038 /or " ATP ¹⁵ read " ATPase " (title 22).
-

No. 3.

- 5057 for " Dorytenthis " r^aⁱ " Doryteuthis " (line 3).
 5217 for " glutamic " read " glutamine ¹⁵ (title).
 5223 /or " Aspergillumaramin " read " Aspergillumarasmin " (title).
 5464 for " Cheironomus " read " Chironomus " (lines 4', 10).
 5476 /or " sempiflorens " read " semperflorens " (line 2).
 5487 for " sarcomas " r^aai " sarcosomes " (title IV),
 5747 as 5476 (line 1).
 5789 for " d " fwi " p " (line 1).
 5818 /or " F+ " read " F" " (line 6).
 5884 /or " Ag " r^aof " Ab " (line 6).
 6367 for " Prediculus " read " Pediculus " (title).
 6504 for " hypotension " read " hypertension " (title).
 6515-6 for " hypotensive " read " hypertensive " (line 1).
 6667 for " steroid " read ¹⁵ catecholamine " (line 6).
 6882 for " p-ebony " read " p-alanine " (title).
 7013 for " Arconectes ¹⁵ read " Orconectes " (title).

INTERNATIONAL ABSTRACTS OF BIOLOGICAL SCIENCES

Volume 31

Number 1

October 1963

• Denotes an Author's abstract edited primarily by the journal of origin:

ANATOMY

HISTOLOGY AND HISTOCHEMISTRY

1. SYNAPSE ARISING AT CENTRAL NODE OF FRANIER. AND NOTE ON FIXATION OF C.N.S. D.Bodian and N.Taylor: *Science*, 1963, 139, 330-332 (Dept. Anat., Johns Hopkins Univ. Sch. Med., Baltimore, Md., U.S.A.) E.M. investigations of normal and polio-virus-infected motor columns of the spinal cord of monkeys has been made after fixation through intra-arterial perfusion of formaldehyde followed by post-fixation with QSO4. The discovery of a synaptic bouton arising directly from a node of Ranvier in the motor horn and a node covered by expansions of 2 outer lamellae of the myelin sheath, suggests a degree of variation of central node structure and development not usually attributed to nodes of Ranvier. CM.Lewis

- 2* HISTOCHEMICAL IDENTIFICATION OF PHOSPHOGLYCERIDES IN MYELIN. F.Gallyas: *J. Neurochem.*, 1963, 10, 125-126 (Dept. Neurol. ftychol., Univ. Pécs Med. Sch., Hungary) The method described utilizes the conversion by phosphoglycerides of alk. NH₂OH to hydroxamic acid and this used to reduce AgN₃ to Ag. With formal-fixed c.n.s. tissue, washing J_h hot or cold acetone reduced stainability and ether or uroform/methanol washing abolished it. Pictures of man myelin sheath in medulla oblongata are presented. R.Woodman
- * CYTOMORPHOLOGICAL STUDY OF CHOLINESTERASE IN SYMPATHETIC GANGLIA OF THE CAT. B-Fiedriesson and F.Sjöqvist: *Aeta morph. neerl.-scand.*, 1962, 5, 140-166 (pept. Histol., Karolinska Inst., Stockholm, Sweden) Distribution of cholinesterases A normal pre- and paravertebral ganglia, and die effect by "Post-ganglionic denervation has been studied Holmstedt's modification of the thiocoline method on Phx ^{cr}yostat and freeze-dried material examined by ^{e*}contrast and light microscopy. Existence of 3 types

of ganglion cell based on differences in AChase activity was confirmed. Preganglionic denervation resulted in loss of AChase from presynaptic terminals; post-ganglionic denervation caused a considerable decrease of AChase in Type I and n cells. Distribution of butyryl-Chase was unaffected by these operations. Consecutive prep, stained for Nissl substance and AChase did not show obvious morphol. differences between ganglion cells exhibiting marked variations in AChase activity. Relationship between cellular AChase and peripheral function of the neuron is discussed. J.W.S.Harris

4. MORPHOLOGY AND ENZYMIC ACTIVITY OF RAT CEREBRAL CAPILLARIES. J.W.Landers, J.L.Chason, J.E.Gonzalez and W.J.Palutke: *Lab. Invest.*, 1962, 11, 1253-1259 (Pathol. Dept., Wayne State Univ. Med. Coll., Detroit, Mich., U.S.A.) The morphol., histochem. (oxidative and hydrolytic enzymes) and phagocytic ability of rat cerebral capillaries was compared with capillaries of other organs. Endothelium is enzymically active. The morphol., enzymic activity and lack of phagocytosis of Rouget cells suggests that they are modified muscle cells. A.M.Mackay

5. EXPERIMENTAL AND CYTOLOGICAL STUDIES OF PINEAL CELLS STAINING WITH ACID HEMATEIN IN THE RAT (*RATTUS NORVEGICUS*). W.B.Quay: *Acta morph. neerl.-scand.*, 1962, 5, 87-100 (Dept. Zool., Univ. California, Berkeley, Calif., U.S.A.) In an extensive series of expt. to study the response of acid hematein-pos. (type II) cells to a variety of pharmacol. agents and physiol. conditions, only massive injn. of noradrenaline and amphetamine significantly modified the no. of these cells/pineal section. Four subtypes of type II cells are described, based on morphol. differences and staining with acid hematein after various fixatives and extractions. These subtypes, although distinct, appear to bridge in cytol. characteristics the fibrous astrocytes and type I parenchymal cells. J.W.S.Harris

6. PITUITARY OF FOWL: A CORRECTION AND ADDITION. F.J.Payne: *Anat. Rec.*, 1961, 140, 321-327

ANATOMY

(Dept. Zool., Indiana Univ., Bloomington, Ind., U.S.A.) The large bodies which accumulate in the gonadotrophs of ageing and castrate fowl, accompanied by degeneration of cells, are formed by an increase in size and fusion of the secretory vesicles and not from mitochondria. Evidence is presented to support the theory that a cell which functions as a gonadotroph may synthesise more than one kind of secretory substance.

F.Beck

7. THE PREHYPOPHYSE OF THE PEKEN MALE DUCK THROUGH AN ANNUAL CYCLE. A.Tixier-Vidal, M. Herlant and J.Benoit: Arch. Biol. Liège, 1962, 73, 317-368. Six different types of cell have been identified in the ant. hypophysis of the ♂ Pekin duck. Cells which possess glycoprotidic granulations which stain histochem. the same as β and γ gonadotrophic cells and 6 thyrotrophic cells of mammals, reptiles, batrachians and fish, were identified, a acidophilic and either ϵ or T cells were present, together with a sixth type of cell, termed K, which appears to be peculiar to birds. The α and γ cells are located in the caudal subdivision of the prohypophysis while the β , δ , ϵ and η cells are found in the cephalic subdivision. The θ cells are equally distributed between the 2 regions. These cell types were followed during the course of a yr. This confirmed the gonadotrophic role of the β and γ cells, and the thyrotrophic significance of the θ cells.

(French) R.J.Walker

8. ANATOMY OF SECRETION OF FOLLICULAR CELLS OF THYROID GLAND. II. EFFECT OF ACUTE THYROTROPHIC HORMONE STIMULATION ON SECRETORY APPARATUS. S.L.Wissig: J. cell. Biol., 1963, 16, 93-117 (Dept. Anat., Yale Univ., New Haven, Conn., U.S.A.) Thyroid tissue dissected from Sprague-

Dawley rats 1-24 hr. after s.c. injn. of 0.5 u.s.p. units of thyrotrophic hormone was fixed in OSMO4 and studied in the E.M. and phase contrast microscope. The follicular cells elaborate colloid at an increased rate in the first few hr. after injn. but the accelerated secretory response subsides by 12-24 hr. and the follicles subdivide into smaller units. The no. of Golgi vesicles increases during secretion and small colloidal droplets appear to form from these. The follicular cells appear to utilise apical pseudopodia to release the contents of the mature droplets into the follicular lumen.

P.Barlow

9. THE EOSINOPHILIC CELLS OF THE PARATHYROID (OXYPHIL CELLS), SALIVARY (ONCOCYTES), AND THYROID (HURTHLE CELLS) GLANDS. LIGHT AND E.M. OBSERVATIONS. S.I.Roth, E.Olen, L.S.Hansen: Lab. Invest., 1962, 11, 933-941 (Armed Forces Inst. Pathol., Washington, D.C., U.S.A.) light and E.M. studies of formalin-fixed tissues have confirmed that oxyphil cells of parathyroid, salivary and thyroid glands have cytoplasm largely filled with mitochondria. The relation of structure to cellular activity is discussed.

A*M.Mackay

10. THE SECRETORY CYCLE OF THE PANCREATIC ISLET α -CELL. AN E.M. STUDY OF NORMAL AND SYNTHALIN-TREATED RABBITS. B.L.Munger: Lab. Invest., 1962, 11, 885-901 (Armed Forces Inst. Pathol., Washington, D.C., U.S.A.) The E.M. of normal α -cells of pancreatic islets of rabbits and the processes of degranulation and cytoplasmic vacuolation following synthalin administration are described. The α -granules, arising in the Golgi body disintegrate and secretory particles pass through cell membrane and endothelial cell.

Vacuolation is present in cells with at least a few (X-) granules. A.M.Mackay

11. AGE CHANGES OF THE THYMUS IN TWO HIGH-LEUKAEMIC STRAINS OF MICE, SL AND AKR, AND IN THEIR F₁ HYBRIDS. K.Nakakuki and Y.Nishizuka: Nature, Lond., 1963, 197, 1217-1218 (Dept. Pathol., Mie Prefectural Univ., Sch. Med., Tsu, Mei-Ken, Japan) A comparative study is made of the development of the thymus in SK and AKR mice and their F₁ hybrids, differences being correlated with the age of sexual maturity. A marked sex difference was noted, the developing significantly heavier thy muses. A difference in histol. of the thymus was noted between the strains.

G.M.Lewis

12. STUDIES ON DNA IN W.B.C. AND RELATED CELLS OF MAMMALS. I. ON MICROSPECTROPHOTOMETRIC ERRORS AND STATISTICAL MODELS. II. ON THE FEULGEN REACTION AND TWO-WAVELENGTH MICROSPECTROPHOTOMETRY. A.M.Garcia: Z. Zellforsch. Histochem., 1962, 3, 170-177, 178-194 (Dept. Zool., Columbia Univ., New York, U.S.A.)

I. A statistical model for the simult. analysis of several of the variables involved in cytophotometric determinations of the Feulgen-DNA content of w.b.c. is described. II. An account of the two-wavelength method used & microspectrophotometry of the nuclear reaction is given, together with a description of some complementary techniques (measurement of area, selection of wavelengths and overall performance of the apparatus used).

E.E.Hobbiger

13. LYMPHOPOEISIS OF ORAL MUCOSA. P.D.Toto and H.Kwan: J. dent. Res., 1962, 41, 1414-1423 (Loyola Univ. Sch. Dent., Chicago, Ill., U.S.A.) Thirteen formalin-fixed specimens which demonstrated lymphoid tissue were stained to show comparisons with normal lymphoid tissue. Loose connective tissue can organise lymphatic follicles locally to produce lymphocytes.

A.D.Dixon

14. A COMPARATIVE HISTOCHEMICAL EVALUATION OF VARIOUS DEHYDROGENASES IN THE ORAL SQUAMOUS EPITHELIUM. M.Mori, T.Mizushima and K.Koizumi: Z. Zellforsch. Histochem., 1962, 3, 111-121 (Dept. Oral Surg., Osaka Univ. Dental Sch., Kitaku, Osaka, Japan) The histochem. localisation of succinic, lactic, malic, a-glycerophosphate, glutamic, glucose 6-phosphate and TPN-isocitric dehydrogenase activities in the human oral mucosa, the buccal epithelium of rats and guinea-pigs, and the mucosa of the palate of cats and dogs was investigated.

E.E.Hobbiger

15. E.M. OBSERVATIONS ON HARDENING IN HUMAN HAIR FOLLICLE. F.Happéy and A.G.Johnson: J. ultrastructure Res., 1962, 7, 316-327 (Textile Ind. Dept. Inst. Technol., Bradford, England) The boundary between the outer and inner root Sheath of a human hair follicle is more irregular than was originally supposed. The Flitgelzellen of Huxley's layer contain trichohyalin granules. The β -keratose fraction from oxidised hair originates from both inter- and intracellular areas. Fibilar material in the keratinising hair cuticle is demonstrated.

H.B.Waynfirth

16. INFLUENCE OF THYROIDECTOMY ON SEBACEOUS SECRETION OF THE WKTAR RAT. G.Moulin, M.Millard, M.Croisille and G.Lapicorey: C.R. Soc. Biol., Paris, 1962, 156, 1418-1420 (Lab. d'Histol., Fac. Méd. Lyon, France) The epicutaneous lipid film secreted by the sebaceous glands was slightly modified in thyro-

ANATOMY

ectomised rats compared with normal animals. There was an increase in the amount of secretion in expt. animals, although the fatty acid composition as shown by chromatography was the same in both. Histol. examination showed a slight increase in vol. of the sebaceous glands and an increase in the sudanophilic material of the corneal layers of the epidermis in thyroidectomised rats.

(French) M.A. Price

17. FINE STRUCTURE OF NORMAL AND NEOPLASTIC MELANOCYTES IN SYRIAN HAMSTER, WITH PARTICULAR REFERENCE TO CARCINOGENIC-INDUCED MELANOTIC TUMOURS. H.Rappaport, T.Nakai and H.Swift: *J. cell. Biol.*, 1963, 16, 171-186 (Div. Oncol., Chicago Med. Sch., 111, U.S.A.) Normal melanogenesis is compared with that occurring during tumour formation induced in Syrian golden and white hamsters by a single application of 800 fig. of 7-12 dimethylbenz(a)-anthracene. Dermal, epidermal and hair follicle melanocytes were studied using OSO4 fixed, Epon embedded tissue. Details of the E.M. obtained are given but the origin of the melanin granules remains obscure in both the neoplastic and non-neoplastic tissue. P.Barrow

¹ 18. HAEMATOXYLIN-PHLOXINE-ALCIAN BLUE-ORANGE G DIFFERENTIAL STAINING OF PREKERATIN, KERATIN AND MUCIN. E.T.Dane and D.L.Herman: *Stain Technol.*, 1963, 38, 97-101 (Dept. Pathol., Los Angeles County Hosp., Los Angeles, Calif., U.S.A.) A modification of Kreyberg's stain which simult. demonstrates prekeratin, keratin and mucin in histol. sections described. Phloxine B and Orange G stain prekeratin and keratin orange to red orange, while Alcian Blue stains all mucopolysaccharides turquoise blue. MJ.Bell

¹⁹ 19. HISTOLOGICAL PHENOMENA ASSOCIATED WITH COLLAGEN TRANSFORMATION AND BREAKDOWN PROCESSES. A. Van Den Hooff: *Acta morph. neerl.-scand.*, 1962, 5, 101-116 (Histol. Lab., Univ., Amsterdam, Netherlands) Transformation and reabsorption of collagen in the pubic symphyses of pregnant mice are characterised by a marked increase in metachromasia and Alcian Blue staining and a simult. loss of PA-¹-Uff positivity and stainability with Van Gieson's picrosin. Fibres with these staining characteristics remain intact during relaxation but are replaced by an amorphous material during involution. The findings are considered to result from a lowering of collagen stability due to binding of acidic mucopolysaccharides to basic groups and breakdown of hexose linkages between adjacent polypeptide chains. J.W.S.Harris

²⁰ 20. COMPARATIVE ANATOMICAL AND NEUROHISTOLOGICAL OBSERVATIONS ON TONGUE OF PANGOLIN (MANIS PENTADACTyla, LIMNEUS). K.Kubota, J. Kubota, T.Nakamura, N.Fukuda, S.Asakura, S.Nakasawa and M.Mesui: *Aliat. Rec.*, 1962, 144, 43-55 (Dept. Anat., Tokyo Med. and Dental Univ., Yushima, Tc*yo, Japan). F.Beck

²¹ 21. ENZYMIC MATURATION OF SKELETAL MUSCLE. C.T. & H. Univ. sheffield. England) Sections of V% from human, guinea-pig, rabbit, rat and hamster less than 24 hr. old were examined for their degree differentiation and the activity of phosphorylase, NAD isozyme, NAD-linked lactate dehydrogenase and ATP. Attempts are made to correlate the results with gestation and degree of general maturity at birth. G.M.Lewis

22. E.M. OF POST-MORTEM CHANGES IN PORCINE MUSCLE. R.G.Cassens, E.J.Briskey and W.G.Hoekstra: *Nature*, Lond., 1963, 196, 1119-1120 (Dept. Meat and Animal Sci., Univ. Wisconsin, Madison, Wis., U.S.A.) Samples of the longissimus dorsi were removed from pigs at death, at the onset of rigor mortis, and 24 hr. post-mortem, and examined in the E.M. At death, the muscles were in the contracted state, but within 15 min., the I band was clearly visible and ruptured mitochondria were scattered between the myofibrils. By 24 hr. post-mortem, a complete banding pattern was seen. G.M.Lewis

23. MUSCULAR DYSTROPHY [MD] IN FISHES, AMPHIBIANS AND REPTILES. A.Stolk: *Acta morph. neerl.-scand.*, 1962, 5, 117-139 (Histol. Dept., Free Univ., Amsterdam, Netherlands) MD has been observed in middle-aged or elderly specimens of both sexes in 71 spp. Distribution of acid and alk. phosphatases in normal and atrophic muscles is described, together with results of a histochem. study of the ability of connective tissue in normal and affected muscles to dephosphorylate various deriv. of AMP and other compounds of physiol. importance. The results are considered to support the concept that the primary cause of MD is an aberration of the neighbouring connective tissue. J.W.S.Harris

24. E.M. OF THE NORMAL RABBIT AORTA. F.Bierring and T.Kobayashi: *Acta path. microbiol. scand.*, 1963, 57, 154-168 (Med.-Anat. Inst., Univ. Copenhagen, Denmark) A subendothelial layer of appreciable width containing as its most conspicuous element numerous branching elastic fibres separates the endothelium from the tunica media. The morphol. evidence supports the concept that this layer arises through a degenerative transformation of the inner parts of the tunica media. The dense areas which occur regularly along the basal endothelial plasma membrane represent zones where endothelial cells are attached to elastic elements of the subendothelial layer. Delicate filaments emanating from the surface of elastic fibres are interpreted as elastic structural units. LFriedmann

25. THE FINE STRUCTURE OF RAT AORTA IN EXPERIMENTAL LATH YRBM. K.N.Ham: *Aust. J. exp. Biol. med. Sci.*, 1962, 40, 353-366 (Dept. Pathol., Univ. Melbourne, Australia) E.M. study of lathyrous aorta has confirmed and extended earlier reports of increased collagen content and intercellular substance in aortic walls. This substance appears to coat elastic laminae and to project between the cells. The anatomical relations of muscle cells and elastic fibres are disrupted and changes in collagen fibrils characteristic of lathyrism are commonly seen. Changes described in the muscle cells are interpreted as being consistent with a high level of secretory activity in the early stages, but later they more resemble a degenerative change. B.A.Stone

26. STAINING SECRETORY CAPILLARIES OF EXOCRINE GLANDS WITH TECHNIQUES FOR SPECIFIC PHOSPHATASES. A.F.Baradi and R.Quinton-Cox: *Stain Technol.*, 1963, 38, 121-125 (Dept. Anat., Emory Univ., Atlanta, Ga., U.S.A.) The Wachstein-Meisel ATPase technique offers a reliable and consistent method for staining secretory capillaries of exocrine glands in laboratory animals. It has been successfully applied to intracellular secretory capillaries in parotid glands, eccrine sweat glands and intracellular secretory capillaries in parietal cells of gastric glands in rabbit, rat and guinea-pig. Secretory capillaries did not stain with Wachstein-Meisel 5-nucleotidase technique. MJ.Bell

ANATOMY

27. INTRA- CELLULAR LOCALISATION OF ACID PHOSPHATASE AS STUDIED IN MAMMALIAN KIDNEYS. M.Wachstein, E.Meisel and J.Ortiz: Lab. Invest., 1962, 11, 1243-1252 (Pathol. Dept., St. Catherine's Hosp., Brooklyn, N.Y., U.S.A.) A modified Gomori technique at pH 6 was used to demonstrate acid phosphatase in mammalian kidneys. It is present in granular structures assumed to be lysosomes and diffusely throughout the cytoplasm. Phosphatase activity of the brush border was also demonstrated. A.M.Mackay
28. AUTO-ENZYMIC BASOPHILIA, SWELLING AND DIS- SOLUTION OF FAT DROPS IN FIXED LIVER. D.Sinapius: Z. Zellforsch. Histochem., 1962, 3, 150-169 (Pathol. Inst., Univ. GOTtingen, Germany) Formalin fixation only causes a partial inactivation of lipase in liver slices. The residual lipase activity is responsible for the basophilia of fat droplets in formalin-fixed liver sections; it also accounts for a gradual swelling of these droplets and their later disappearance. Complete lipase inactivation can be obtained either by using lipase inhibitors or fixation in formalin adjusted to pH 2*5. (German) E.E.Hobbiger
29. ELECTRON AND LIGHT MICROSCOPY OF CHOUINE DEFICIENCY IN MOUSE, WITH SPECIAL REFERENCE TOSIXHOURHEPATIC UPSIS. R.D.Meader: Anat. Rec., 1961, 141, 1-9 (Dept. Anat., Louisiana State Univ. Sch. Med., New Orleans, La., U.S.A.) E.M. revealed the presence of submicroscopic lipid in the centrolobular hepatic parenchyma of mice 3 hr. before its initial appearance was revealed by light microscopy. The initial centrolobular liposis which involved most of the lobular zones at the end of 6 hr. of choline deficiency, was observed in mice fed a choline-deficient diet containing lard as the lipid component. F.Beck
30. CELLS IN NIEMANN-PICK DISEASE AND OTHER LIPOIDOSES. Y.Tanaka, G.Brecher and D.S.Fredrickson: Nouv. Rev. franc. Hemat., 1963, 3, 5-16 (Dept. Hlth., Educn. and Welfare, Hematol. Serv., Bethesda, Md., U.S.A.) Bone-marrow cells from 3 cases of Niemann-Pick disease, 1 case of hyperlipaemia with diabetes, 2 cases of Tangier disease, and 1 case with storage of esterified cholesterol were studied. Phase contrast microscopy did not reveal any differences between the macrophages of these cases. All corresponded in appearance to the classical Niemann-Pick cell. Under the E.M., granules of 0*5-5 μ diam. were seen. Their opacity varied inversely with their size. Although the lipids stored in the various cases were different, there were no definite differences in the ultrastructure of the granules. Only the cerebrosides stored in Gaucher's disease produce structurally different granules. (French) V.Eisen
31. EFFECT OF OESTROGEN ON HISTOLOGY OF UTERINE EPITHELIUM OF MOUSE. III. CHANGES IN CONCENTRATION OF CYTOPLASMIC SOLIDS. O.Nilsson and K.A.Norberg: Exp. Cell Res., 1963, 29, 380-388 (Dept. Histol., Karolinska Inst., Stockholm, Sweden) The interferometric quotients, which were obtained from the values of the optical path differences between control and oestrogen-treated animals, showed a decrease in the concn. of solids in the oestrogen-treated animals. This is interpreted as a consequence of an uptake of water into the cells. E.M. demonstrated that both the apical and the basal cell surfaces of the oestrogen-treated animals were more irregular. K.Jones
32. HISTOCHEMICAL COMPARISON OF GLYCOGEN
- SYNTHESIS FROM GLUCOSE 1-PHOSPHATE (G-1-P) AND URIDINEDIPHOSPHOGLUCOSE (UDPG) IN UTERINE SECTIONS. W.J.Bo: Proc. Soc. exp. Biol., N.Y., 1962, 111, 186-189 (Dept. Anat., Bowman Gray Sch. Med., Winston-Salem, N.C., U.S.A.) Phosphorylase but not UDPG-glycogen transferase was demonstrated in the uterus of rat and rabbit seeming to indicate only 1 polysaccharide forming pathway. M.M.Shapland
33. E.M. OF RETE TESTIS OF RAT. T.S.Leeson: Anat. Rec., 1962, 144, 57-67 (Dept. Anat., Univ. Toronto, Ont., Canada) A description of the epithelium lining the rete testis is given. Specialisations of the cell surface seen under the E.M. are noted and their significance discussed. F.Beck
34. FIXATION AND STAINING. AFFINITY OF NUCLEO- PROTEIN COMPONENTS FOR LEAD HYDROXIDE AND URANYL ACETATE. V.Marinozzi and A.Gautier: J. ultrastructure Res., 1962, 7, 436-451 (Lausanne Univ. E.M. Centre, Switzerland) Uranyl acetate and lead hydroxide did not preferentially stain the chromatin material in fragments of pancreas after OSO₄ fixation. After fonnol fixation, uranyl acetate alone stained the chromatin. If fonnol and OSO₄ fixation were carried out concurrently both acetate and hydroxide stained the chromatin. Fonnol had the ability to inhibit the denaturation action of OSO₄ on the deoxyribonucleoproteins. (French) H.B.Waynfirth
35. STAINING OF BOUND (MASKED) LIP(O)IDS WITH SUDAN BLACK B. H.J.Schott: Z. Zellforsch. Histochem., 1962, 3, 138-149 (Anat. Inst. Univ. Marburg/Latin, Germany) Two methods are described which are based on the use of Sudan Black B and capable of staining free and bound lipids without producing artifacts*. e.g. by staining proteins and mucopolysaccharides. Hist⁰¹ and chromatographic studies showed that Sudan Black B contains several components with different colours. (German) E.E.Hobbiger
36. THE HISTOCHEMICAL DEMONSTRATION OF FREE . AND ESTERIFIED CHOLESTEROL; A QUANTITATIVE COMPARISON BETWEEN CHEMICAL AND HISTOCHEMICAL TESTS OF THE FEIGIN REACTION. R.Schnabel: Z. Zellforsch. Histochem., 1962, 3, 1¹⁷, 137 (List. Pathol., Neuropathol. Abt., Med. Akad., Magdeburg, Germany) The method for the histochemical differentiation of cholesterol and its esters as described w Feigin is liable to lead to an underestimation of free cholesterol. This is because Feigin did not state the concn of ethanol and ether required for differential solubilisation of free cholesterol and its esters after their pretreatment with digitonin. The solubility of the cholesterol-digits complex in ethanol-ether mixtures and its rate of oxidation (under conditions used for histochem. purposes) are reported. (German) E.E.Hobbiger
37. THE STABILITY OF HYDROLYTIC ENZYMES IN FRESHLY-FROZEN SECTIONS WHICH HAVE BEEN KEPT IN DRY AIR. E.Kem-Bontke: Z.Zellforsch. Histochem., 1962, 3, 107-110 (Univ. -Frauenklinik m KOln, Germany) Alk. and acid phosphatase and n_{sp} esterase were demonstrated histochem. in non-fixed air-dried freshly frozen sections (of mouse tissues) which had been kept for 2 yr. in boxes (used for microscope slides) at room temp, and in dust-free atmosphere. (German) E.E.Hobbiger.
38. THE METACHROMASIA OF THE ABSORPTION AN^A FLUORESCENCE OF ACRIDINE DYES; WITH A RE^A TO THE PAPER BY Ch. M.A. KUYPER: THE META

ANATOMY

CHROMASIA OF FLUORESCENCE OF ACRIDINE DYES'. CScheibe and V.Zanker: Z. Zellforsch. Histochem., 1962, 3, 122-126 (Inst. Physik. Chem., Technische Hochschule, Mtnchen, Germany) A critical review of the literature clearly shows that the aggregation of the dye mol. is responsible for the metachromatic behaviour of acridine dyes. This is contrary to the conclusion leached by Kuyper. (German) E.E.Hobbiger

39. I.R. SPECTROSCOPY STUDIES ON ISOLATED SO-CALLED CALCIUM DEPOSITS FROM HUMAN ORGANS. M.Gade and H.J.Einbrodt: Naturwissenschaften, 1963, 50, 21-22 (Bergbauforschung GmbH., Forschunginst. Steinkohlenbergbauvereins, Essen, Germany) The crystal structure types of deposits from joint, premature Placenta and pancreas were analysed. (German) A.J.Wansbrough

40. THE PERIODIC ACID-SCHIFF REACTION. K.Aterman and S.Norkin: Nature, Lond., 1963, 197, 1306 (Dept.Pathol., Woman's Med. Coll. Pennsylvania, Philadelphia, Pa., U.S.A.) A little-known paper Published in 1947 by Shabadash on the subject of the PA-Schiff reaction is discussed. G.M.Lewis

41. COMBINED SCHIFF PROCEDURES. H.Elftman: Stain Technol., 1963, 38, 127-130 (Dept. Anat., Coll. Physn. Surg., Columbia Univ., New York, N.Y., U.S.A.) Details of methods for combining the PA-Schiff staining with iron hematoxylin, direct silver and aldehyde fuchsin, and for combining the Feulgen nuclear staining reaction with Sudan Black are described. MJ.Bell

42. DEMONSTRATION OF PA-SCHIFF-POSITIVE MATERIAL IN E.M. WITH LEAD STAINING. W.T. Daems and J.-P.Persijn: Z. Zellforsch. Histochem., 1962, 3, 79-88 (Lab. E.M., Univ. Leiden, Netherlands) Pb(OH)₂ increases the contrast in QsO₄ sections, probably by reacting with neg. sites, i.e. 02, °f the bound Os. In addition it causes the appearance of coarse ppt. at sites where there is no contrast previously; this stain resembles the PA-Schiff stain and is probably due to a reaction of Pb with OH groups. E.E.Hobbiger

43. PURIFICATION OF THIONIN, AZURE A. AZURE B AND METHYLENE BLUE. CNerenberg and R.Fischer: Stain Technol., 1963, 38, 75-84 (Biochem. Branch, Dept. Psychiat., Ohio St. Univ., Columbus, Ohio, U.S.A.) A simple and reliable analytical method for detecting impurities in the dyes Thionin, Azure A, Azure B and Methylene Blue is given: org. impurities detected by paper chromatography, inorg. impurities by Paper chromatography after ashing. The authors purify their dyes by the conventional methods using ion-exchange resins and alumina columns before use in the differential staining of excited and depressed c.n.s. tissue. MJ.Bell

44. THE USE OF LIQUID EMULSIONS IN AUTORADIOGRAPHIC STUDIES INVOLVING ³H-LABELLED SUBSTANCES. W.Oehlert, P.Nettesheim and R.Machemer: Z.Zellforsch. Histochem., 1962, 3, 99-106 (Ludwig-Aschoff Haus, Pathol. Inst.. Univ. Freiburgi. Br., Germany) A method using liquid emulsions for autoradiographic studies of tissue sections obtained from animals inj. with [3H]thymidine is described in detail. The advantages and disadvantages of the method, which is illustrated by results obtained on sections of mouse tissues, discussed. (German) E.E.Hobbiger

45. THE USE OF STANDARD SLIDES IN SEMI-QUANTITATIVE RADIOAUTOGRAPHY WITH TRITIATED COMPOUNDS. R.Baserga and K.Nemeroff: Stain Technol., 1963, 38, 111-116 (Dept. Pathol., Northwestern Univ. Med. Sch., Chicago, Ill., U.S.A.) To ensure that different batches of radioautographs have been processed in an identical manner and if not to supply a correction factor so that comparisons can be made between different batches of radioautographs the authors use the following method: essentially identical smears are prepared from a pooled suspension of cells, in this case Ehrlich ascites tumour cells labelled with [³H]thymidine, and the limits of variability for % labelled cells and mean grain count/labelled cell calc. Thereafter, one or more of these standard smear slides are processed with any batch of radioautographs and used to detect variations in the radioautographic procedure. MJ.Bell

46. SQUASHING UNDER SCOTCH TAPE NO.665 FOR AUTORADIOGRAPHIC AND PERMANENT HISTOLOGICAL PREPARATIONS. R.Jona: Stain Technol., 1963, 38, 91-95 (Lab. cytogenétique Végétale, Univ. Catholique, Louvain, Belgium) When removing cover slips from squash prep, before coating with autoradiographic emulsion much material is often lost or disturbed. The substitution of No.665 Scotch double-coated adhesive tape, outer side of tape downwards, in place of the glass cover slip improves results. The cells, particularly if soaked in 45% acetic acid before squashing, do not adhere to the tape which can be removed after pressure without disturbing the material. MJ.Bell

47. PAPER CHROMATOGRAPHY AS APPLIED TO HISTOLOGICAL SECTIONS. J.Ackermann and M.Samecka-Keller: Z. Zellforsch. Histochem., 1962, 3, 89-96 (Dept. Histol., Med. Acad., Krakow, Poland) Sections of frog liver were subjected to paper chromatography in a manner analogous to that normally used for substances in soln. Amino acids, lipids, carbohydrates, steroids and carotenoids were identified on the chromatograms. The results of parallel histochem. studies are also reported. E.E.Hobbiger

48. NEW EMBEDDING TECHNIQUE FOR E.M., COMBINING A WATER-SOLUBLE EPCXY RESIN (DURCUPAN) WITH WATER-INSOLUBLE ARALDITE. W.Staubli: J.cell.Biol., 1963, 16, 197-201 (Res. Labs. Phannaceut. Dept., C.I.B.A. Ltd., Basle, Switzerland) Animal tissues may be embedded using neither alcohol nor acetone dehydrating agents. Ultra-thin sections may be obtained if araldite replaces Duicupan as the final embedding agent. The method was tested using 2% OSO₄-fixed liver, kidney and pancreatic tissue of rats. P.Barrow

TISSUE CULTURE

49. CHARACTERISATION OF HUMAN CELLS: VARIATION IN GROWTH RATE, VOLUME, MORPHOLOGY AND GROWTH EFFICIENCY IN MEDIA SUPPLEMENTED WITH HUMAN SERUM OR BOVINE FOETAL SERUM. P.E.Treadwell and J.D.Ross: Exp. Cell Res., 1963, 29, 356-379 (Dept. Microbiol., Univ. Minnesota, Minneapolis, Minn., U.S.A.) Cubelines of 3 cell strains in process of cultural establishment were compared by

ANATOMY

examination of colony morphology, cell yield, cell-vol. distribution, single-colony growth and cell chr. no. Influence of cultural conditions was reflected quant. rather than qual. by effects on cell prop., and growth of sub-lines in single-serum medium did not enhance capacity for growth in that medium selectively. The results are interpreted to show that cellular prop. could be affected variously by cultural conditions, and that multiple criteria are needed for differential characterisation.

K. Jones

50. A CHEMICALLY-DEFINED MEDIUM FOR GROWTH OF ANIMAL CELLS IN SUSPENSION. S.C.Nagle, jun., H.R.Tribble, jun., R.E.Andereon and N.D.Gary: Proc. Soc. exp. Biol., N.Y., 1963, 112, 340-344 (U.S. Army Biol. Labs., Fort Detrick, Frederick, Md., U.S.A.) A chem. defined medium including 13 amino acids, 2 antibiotics, glucose and sodium pyruvate as energy supplies and 10 vitamin supplements has been used to grow a variety of mammalian cells in tissue culture as suspensions at concn. up to 3×10^6 cells/ml.

D.N.Wheatley

51. IMPROVED NUTRIENT SOLUTION FOR DIPLOID CHINESE HAMSTER AND HUMAN CELL LINES. R.G. Ham: Exp. Cell Res., 1963, 29, 515-526 (Dept. Biophys., Florence R.Sabin Labs., Univ. Colorado Med. Center, Denver, Colo., U.S.A.) A new nutrient mixture (F 10) is described for the diploid Chinese hamster ovary cells, in which each component was added at the expt. determined optimum concn. The new medium contains more arginine than other mixtures, among other alterations. Expt. data are presented to show that this nutrient mixture is not only superior for the cell strain used in the initial study, but also for several others, including a diploid human line.

K.Jones

52. METABOLISM OF H.A1. TUMOUR CELLS. GLYCOLYSIS AND CRABTREE EFFECT. SENSITIVITY OF RESPIRATION TO OXYGEN TENSION. B.L.Sorensen: Acta path. microbiol. scand., 1963, 57, 129-144 (Dept. Path., Finsen Inst., Copenhagen, Denmark) Under endogenous conditions the respiration of H.A1. cells is max. when the gas phase contains 10-20% O₂ which is characteristic of tumour cells. At increasing O₂ tensions the respiration of the tumour cells is inhib. The 'Cartesian diver respirometer' is considered more efficient in demonstrating slight differences in the respiration of cells than the ordinary Warburg apparatus.

L.Friedmann

53. GROWTH OF HeLa CELLS IN HUMAN ADULT AND BOVINE FOETAL SERUM MEDIUM. P.E.Treadwell and J.D.Ross: Proc. Soc. exp. Biol., N.Y., 1962, 111, 197-201 (Dept. Microbiol., Univ. Minnesota, Minneapolis, Minn., U.S.A.) Unchanged medium containing both human adult and bovine foetal serum maintained exponential growth of HeLa cells for 5 days, from 48 hr. after inocn. Change in growth rate was associated with change in median cell vol. and viability.

M.M.Shapland

54. PRIMARY CULTURES OF MACROPHAGES FROM NORMAL HUMAN PERIPHERAL BLOOD. L.Berman and C.S.Stulberg: Lab. Invest., 1962, 11, 1322-1331 (Pathol. Dept., Wayne State Med. Coll., Detroit, Mich., U.S.A.) A method of culturing human blood macrophages is described. In 15-25 days macrophages, giant cells and small lymphocytes- are present despite the absence of significant mitoses. The macrophages are resistant to type I poliovirus. They degenerate, lymphocytes disappear and lymphoblastoid cells undergoing

mitoses appear when phytohaemagglutinin is added to the culture.

A.M.Mackay

55. CULTURE OF STRAIN L CELLS IN SUSPENSION: REPLACEMENT OF POLYMER BY TRACES OF TRYPSIN IN A DEFINED MEDIUM. R.Sinclair, R.A.Reid and P. Mitchell: Nature, Lond., 1963, 197, 982-984 (Chem. Biol. Unit, Dept. Zool., Univ. Edinburgh, Scotland)

Culture of strain L mouse cells in a simple defined medium containing FeSO⁺ and-a-ketoglutarate is facilitated by addition of 10-50 fig./l. trypsin to prevent adherence of the cells to each other and to surfaces, which causes damage during motion of the medium. A continuous culture system has been set up.

G.M.Lewis

56. CELL GUIDANCE BY ALTERATIONS IN MONO-MOLECULAR FILMS. M.D.Rosenzweig: Science, 1963, 139, 411-412 (Rockefeller Inst., New York, U.S.A.)

Monolayers of stearic and behenic acids were transferred to quartz slides, troughs of different depths cut, and additional monolayers superimposed. When cultured and fresh embryonic cells were grown on such substrata, cells became entrapped within troughs as small as 6 mji deep. The results demonstrate cellular responses to mol. changes in contact surfaces.

CM.Lewis

57. CELL CULTIVATION IN SYRINGE CHAMBERS. E.H. Stonehill and J.Fogh: Exp. Cell Res., 1963, 29, 483-489 (Sloan-Kettering Inst. Cancer Res., New York, N.Y., U.S.A.) A method is described whereby cells can be cultured as monolayers on the syringe wall or on the plunger top permitting investigation of a no. of parameters. This technique allowed, in a simple manner, variations in the vol. of gas and liquid, with const. or variable area available for cell attachment to a glass surface.

K. Jones

58. A REGULATED INCUBATOR CONTROLLING CO₂ CONCENTRATION, HUMIDITY AND TEMPERATURE FOR USE IN ANIMAL CELL CULTURE. R.G.Ham and T.T.Puck: Proc. Soc. exp. Biol., N.Y., 1962, 111, 67-71 (Dept. Biophys., Univ. Colorado Med. Center, Denver, Colo., U.S.A.)

M.M.Shapland

59. IN VITRO PROGRESSION OF A BDF₁ ASCITES TUMOUR. G.F.Rabotti, J.Geldner and W.Hoffner: Cancer Res., 1963, 23, 165-168 (Charlotte Drake Cardeza Fdn., Jefferson Med. Coll., Philadelphia, Pa., U.S.A.) A tumour occurring spontaneously in a BDF₁ mouse was used to establish a long term cell line. The original tumour and the line kept by transplantation into isologous mice both failed to grow in CBA, A/Jax or C3H mice. After many transplant generations in spinner culture, cell suspensions did induce tumours in these strains. Growth and histopathol. characteristics were identical in tumours produced by the original strain sp. tumour and the nonsp. adapted cell lines.

B.M.Stevens

60. SUBMICROSCOPIC CHARACTERISTICS OF FOUR STRAINS OF YOSHIDA ASCITES HEPATOMA OF RAT⁵. A COMPARATIVE STUDY. M. Hoshino: Cancer Res., 1963, 23, 209-216 (Dept. Pathol., Nagoya Univ. Sch. Med., Nagoya, Japan)

E.M. showed that endoplasmic reticulum, mitochondria, mode of cell contact and other characteristics were increasingly developed in the order AH 13, AH 130, AH 7974 and AH 602. The Golgi complex was more developed in the former pair than in the latter. Variations in fine structure and freq. of degenerative changes were much higher in AH 13 and AH 130 than

ANATOMY

in AH 7974 and AH 602. The existence of intercellular substance in AH 602, of cytoplasmic filaments in AH 130 and AH 13 and of glycogen areas in AH 13 is described. Average diam. of mitochondria and average no. of mitochondria/cell were estimated from thin sections.

B.M.Stevens

- 61. MICROCINEMATOGRAPHY OF SPLEEN TISSUE CULTURES.** R.Robineaux, J.Pinet and R.Kourilsky: *Nouv. Rev. franc. Hémat.*, 1963, 3, 797-811 (Centre de Rech. d'Immuno-Pathol. de l'Association Claude-Bernard, Hop. Saint-Antoine, Paris, France) Guinea-pig spleen tissue was cultured in Rose chambers underneath a Visking cellophane membrane through which the medium was introduced by dialysis.. The cultures were filmed with the aid of phase contrast microscopy. Centrifugal spreading of cells started within a few hr., phagocytosis within 3 days, and mitoses after 10 days. Lymphocytes, plasma cells, mononuclear and reticular cells continued to proliferate for more than 3 weeks whilst remaining differentiated. Eventually only macrophages were found. The formation and functions of plasma cell islets are discussed. (French) V.Eisen

- 62. BIOSYNTHESIS OF PHOSPHATIDES IN SEVERAL TISSUE-CULTURE CELL LINES.** RX.McCarl and H.O. Triebold: *Exp. Cell Res.*, 1963, 29, 475-482 (Dept. Agric. Biol. Chem., Pennsylvania St. Univ., University Park, Pa., U.S.A.) HeLa cells, bovine lymphosarcoma cells, monkey heart cells and chick embryo endothelium cells grown *in vitro* varied in their phosphatide relative activities. In HeLa cells, P was used preferentially for the synthesis of P compounds other than phosphatides. Other 3 cell lines had a common biosynthetic pathway for phosphatides, as shown by determinations of % of total phosphatide activity for individual phosphatides. K.Jones

- 63. STARCH GEL 'ZYMOGRAMS' OF CULTURED HUMAN CONNECTIVE TISSUE CELLS.** C.W.Castor and R.K.Prince: *Lab. Invest.*, 1963, 12, 38-45 (Dept. Int. Med., Univ. Michigan, Ann Arbor, Mich., U.S.A.) Lactic acid dehydrogenase, acid phosphatase and non-sp. esterase activity in extracts of fibroblast cultures from synovium, pericardium and periosteum were qual. compared by histochem. methods on vertical starch gel zone electrophoretic protein separations. Different cell lines may be characterised by different patterns. A.M.Mackay

- 64. CYTOCHEMICAL STUDIES OF HUMAN BONE MARROW FIBROBLAST-LIKE CELLS.** I. ALKALINE PHOSPHATASE P.Fames and B.E.Barker: *Exp. Cell Res.*, 1963, 29, 278-288 (Dept. Pathol., Rhode Island Hosp., Providence, R.I., U.S.A.) Alk. phosphatase as demonstrated in the vascular network of marrow stroma, maturing myeloid cells and fibroblast-like cells developing in culture. It is concluded that the fibroblast-like cells originate from marrow stroma and not from any haemic cells, in this culture system, the most likely parent cell being endothelial cells. K.Jones

- 65. FATE OF RAT BONE MARROW, SPLEEN AND PERIOSTEUM CULTIVATED IN VIVO IN DIFFUSION CHAMBER, WITH SPECIAL REFERENCE TO BONE FORMATION.** A.Rosin, H.Freiberg and G.Zajicek: *Exp. Cell Res.*, 1963, 29, 176-187 (Dept. Expt. Med. Cancer Res., Hebrew Univ., Hadassah Med. Sch., Jerusalem, Israel) The histogenesis of bone formation in cultures *in vivo* of bone marrow and of periosteum was investigated. Under conditions studied, bone forma-

tion occurred only in the presence of osteogenic cells. The data did not show, however, whether bone formation in the cultures took place by the growth of surviving osteogenic cells or by the humoral influence of necrotising bone splinters on the reticulum cells of the bone marrow. K.Jones

- 66. OPTIMAL CONDITIONS AND COMPARATIVE EFFECTIVENESS OF DIMETHYLSULPHOXIDE [DMSO] AND POLYVINYL PYRROLIDONE [PVP] IN PRESERVATION OF BONE MARROW.** M.Persidsky and V.Richards: *Nature*, Lond., 1963, 197, 1010-1012 (Surg. Res. Lab., Presbyterian Med. Centre, San Francisco, Calif., U.S.A.) Expt. on the optimum recovery of rat bone marrow cells after freezing in DMSO or PVP showed that although DMSO offers 50% survival compared with 30% in PVP, there is a much larger variability range in the protective action of DMSO. DMSO has a considerable toxicity for the cells and many precautions must be taken when it is used. PVP is simpler to handle and gives more predictable results. G.M.Lewis

- 67. HORMONAL AND PHYSIOLOGICAL BACKGROUND IN THE PRODUCTION OF B PARTICLES BY MOUSE MAMMARY EPITHELIUM IN ORGAN CULTURES.** E.Y.Lasfargues and D.G.Feldman: *Cancer Res.*, 1963, 23, 191-196 (Dept. Microbiol., Columbia Univ., New York, N.Y., U.S.A.) Two peaks of higher production of B particles were found in explants of RIII mammary gland. One, in explants taken in early pregnancy, was induced by an ovarian-hypophyseal combination and corresponded to an active alveolar differentiation and growth of the epithelium. The other, in lactation, originated by the combined effects of mammotrophin and cortisol. In either case B particle formation occurred in a phase of high protein synthesis and depended on the complete physiol integrity of the cell. Absence of hormonal stimn. or an improper combination inhib. B particle production. Duplicate cultures of agent-free C57 mammary tissue reacted moiphil. like the RIII cultures but no B particles were formed. B.M.Stevens

- 68. DEVELOPMENT OF A HYDROCORTISONE-RESISTANT SUB-LINE OF MOUSE LYMPHOMA IN VITRO.** L.Aronow and J.D.Gabourel: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 348-349 (Dept. Pharm., Stanford Univ. Sch. Med., Palo Alto., Calif., U.S.A.) A steroid-resistant variant of ML-388 cells has been isolated by culture of the parent cell strain in the presence of 10-6 M hydrocortisone for several weeks. The cell line is also resistant to other potent anti-inflammatory steroids tested. M.M.Shapland

- 69. ACTION OF SOLUDECADRON (9a-FLUORO-16(X)-METHYL A-HYDROCORTISONE 21-SODIUM PHOSPHATE) ON CULTURES OF EMBRYONIC ORGANS OF CHICK.** J.V.Ruch, Y.Rumpler, J.Clavert and P.Buck: *C.R.Soc. Biol.*, Paris, 1962, 156, 1510-1512 (Inst. Embryol. Fac. Méd., Strasbourg, France) Embryonic tissues of chick were cultured on cock plasma and an embryonic extract. The liquid medium contained 0.1 mg. Soludcadron or plasma from cocks receiving 4-8 mg. Soludcadron 30-60 min. before the removal of blood. In all cases Soludcadron inhib. the growth of embryonic cardiac fibroblasts, but did not modify the growth of hepatic cells. (French) M.A. Price

- 70. MICRONUCLEI FORMATION IN TISSUE CULTURED CELLS TREATED WITH COLCHICINE.** E.F.Deig, T.J. Starr and K.K.Church: *Proc. Soc. exp. Biol.*, N.Y.,

ANATOMY

- 1962, 111, 248-250 (Lab. Comp. Biol., Kaiser Fdn. Res. Inst., Richmond, Calif., U.S.A.)
 M.M.Shapland
- 71. BIOLOGICAL CRYSTALS AND PARTICLES PRODUCED IN TISSUE CULTURE. I. INTRODUCTION.** G.G.Rose: Cancer Res., 1963, 23, 279-284 (Dept. BioL, Univ. Texas, M.D. Anderson Hosp., Houston, Tex., U.S.A.) A method for chick embryo tissue cultivation which gave rise to many and unusually large crystals and particles is described. Forms were helical, tubular, ribbon-like, hexagonal, rhomboidal and filamentous. Rhomboids and hexagonals often had surface areas several times the size of the broad and flat cultured cells. Helices were up to 300 μ long. Transformations of helical and related forms were observed. Conventional cytochem. techniques did not identify these forms but modified methods showed that helical and related forms gave a pos. reaction to pyronin staining which was inhibited by prior RNase digestion.
 B.M.Stevens

zone of the chick neural tube (presumptive spongioblasts) lack the ability to differentiate into neuroblasts or neurones. The differentiation of ependymal cells from presumptive ependymal spongioblasts depends upon a direct association with mantle layer tissue. If deprived of this, presumptive spongioblasts form typical choroidal epithelial cells which if associated with developing leptomeninges contribute to choroid plexus tissue.
 F.Beck

EMBRYOLOGY

- 72. SMALL INTESTINE DURING DEVELOPMENT.** II. INTRACELLULAR LOCATION OF INTESTINAL β -GALACTOSIDASE. R.G.Doell and N.Kretchmer: Biochim. biophys. Acta, 1963, 67, 516-519 (Dept. Pediat., Stanford Univ. Sch. Med., Palo Alto, Calif., U.S.A.) β -galactosidase and alk. phosphatase appeared to occupy similar sites.
 B.M.Stevens
- 73. ULTRASTRUCTURE OF CHICK EMBRYOS. I. ESTABLISHMENT OF INTERCELLULAR CONTACT IN THE NEURULA BETWEEN THE 17TH AND 40TH HOUR OF INCUBATION.** J.P.Zahnd and A.Porte: C.R. Soc. Biol., Paris, 1962, 156, 1506-1507 (Inst. Embryol., Fac. Méd., Strasbourg, France) E.M. examination of chick embryos revealed the presence of a fine basal membrane in embryos of 20 hr. incubation, situated on the lower face of the neural plate. After 40 hr. a basal membrane was seen in the region of the myotome and sclerotome. In 40 hr. embryos desmosomes were found in the region of the neural tube, in the ectoderm near the amniotic cavity and in the endoderm. In the advanced neurula, desmosomes were always to be found in the region of the embryonic cavities.
 (French) M.A. Price
- 74. CHANGES IN FORM AND RESPONSE OF NEURULA IN DEVELOPING OVUM OF WHITE LEGHORN.** S.O'hata, K.Ogura and S.Shinozuka: Jap. J. Physiol., 1963, 13, 14-23 (Dept. Physiol., Med. Coll., Tokyo, Japan) The relationship between stimuli and excitations of the primitive tissue was studied by recording the electric responses in fresh chick neurula. The newborn tissues like the primitive nervous and circulatory systems appeared one after another on a chick's neurula in the course of development, and the varieties of oscilloscopes accompanied with the transformation of animal life were all clearly observed at the end of the local elevation.
 K.Jones
- 75. TISSUE INTERACTION ASSOCIATED WITH DIFFERENTIATION OF PRESUMPTIVE SPONGIOPBLASTS OF CHICK NEURAL TUBE.** W.J.Birge: Anat. Rec., 1961, 140, 345-357 (Dept. Zool., Univ. Illinois, Urbana, Ill., U.S.A.) Epithelial cells of the germinative

MIGRATION PATTERNS OF PRECARDIAC MESODERM IN EARLY CHICK EMBRYO. RX.DeHaan: Exp. Cell Res., 1963, 29, 544-560 (Carnegie Inst. Washington, Dept. Embryol., Baltimore, Md., U.S.A.) The migration patterns and mechanisms of the clusters of precardiac mesoderm were studied in developing chick embryos by microcinematography. The mesoderm migrated both actively and passively, and at stages 6 to 7 all the preheart clusters appeared to be subjected to a distinct orienting influence, becoming arranged in a definite spatial pattern* It is suggested that the precardiac mesoderm may be influenced by the orientated lines of cell junctions, or by other linear structures at the exposed cell surfaces which become aligned by the alteration in cell shape. The correlation between direction and time of alignment of endoderm and migration of the mesoderm is believed to be suggestive of a causal relationship.
 K.Jones

77. HYPOXANTHINE DEHYDROGENASE [HD] IN THE DEVELOPING CHICK EMBRYONIC KIDNEY. S.Chaube: Proc. Soc. exp. Biol., N.Y., 1962, 111, 340-343 (Dept. Pharm., Yale Univ. Sch. Med., New Haven, Conn., U.S.A.) The period of most rapid increase of sp. activity of HD occurred at days 6 and 7 in the mesonephros and 13 to 15 in the metanephros, the latter reaching a plateau of HD by day 16.
 M.M.Shapland

78. EFFECTS OF MULTIPLE DOSES OF THYROXINE ON CHICK EMBRYOS. A.E.Adams: Anat. Rec., 1961, 141, 63-71 (Dept. Zool., Mt. Holyoke Coll., South Hadley, Mass., U.S.A.) Four series of eggs received varying doses of thyroxine into the yolk sac on different days of incubation. Autopsies were carried out between 16 and 20 days and body wt., third toe length and yolk sac wt. and retraction recorded. Thyroid glands were examined histol. Yolk sac retraction was greater in treated animals and the thyroid gland was retarded in growth and differentiation.
 F.Beck

79. ACTION OF 5HT ON THE THYROID OF EMBRYONIC CHICK. R.Maraud, R.Stoll and A.Sparfel: C.R.Soc. Biol., Paris, 1962, 156, 1375-1377 (Lab. Biol., Fac. Méd., Bordeaux, France) Administration of 0.1 mg. 5HT to chick embryos on the 3rd day of incubation resulted in an increase in the I fixation ability of the thyroid throughout incubation. Administration of 5HT to embryos on the 8th day of incubation resulted in inhibn. of I fixation from the 11th to 13th day and an increase in fixation in those embryos killed on the 16th and 17th day.
 (French) M.A.Price

80. COMMENTS ON THE PAPER BY C. MARIT AND J. MILAIRE: (A MODIFIED TECHNIQUE FOR THE DETECTION OF ACID AND ALKALINE PHOSPHOMONOESTERASES AND OF ADENOSINE-TRIPHOSPHATASE IN TISSUES OF EMBRYOS. Z. Zellforsch. Histochem., 1961, 2, 298-305. H.Voss: Z.Zellforsch. Histochem., 1962, 3, 97-98 (Anat. Inst., Friedrich Schiller Univ., Jena, Germany) The author points out that one illustration in the paper by Marit and Milaire shows that the cells ~~from~~ which the thyroid glands develop are very rich in acid ~~phos~~ phatase. This was not stated in the original paper.
 (German) E.E.Hobbiger

ANATOMY

- I. TRANSPLANTATION OF GONADAL PRIMORDIA IN 28- TO 38-SOMITE STAGE DUCK EMBRYOS.** I. van limborgh: *Acta morph. neerl.-scand.*, 1962, 5, 167-181 (Dept. Anat. and Embryol., State Univ., Utrecht, Netherlands) To investigate whether the tissues surrounding the gonadal primordia exert any influence on the assymetrical development of gonadal cortical tissue, right and left gonadal primordia were transplanted into the opposite somatopleure of hosts of equal age. Hetero-Jt. transplantation did not influence the prospective fate of the grafted cortical tissue, and normal development of follicles in the presence of a host gonad of the opposite sex did not confirm the hypothesis of early production of sex hormones.

J.W.S.Harris

- 83. POSSIBLE LUTEOTROPIC FUNCTION OF THE GRAVID UTERUS IN EUROPEAN BADGER MELES MELES** L. R.Canivenc, M.Bonnin-Laffargue and M.C. Relexans: *C.R. Soc. Biol. Paris*, 1962, 156, 1372-1375 (Lab. Histol., Fac. Méd., Bordeaux, France)

The corpora lutea of the ovary of badger involuted within a few days after the birth of the young. The cytoplasm was entirely occupied by osmophilic lipid material. In animals hysterectomised during gestation there was no degeneration of corpora lutea in ovary removed 8 or 12 days after operation. (French) M.A.Price

- 84. PROLIFERATION OF ELASTIC FIBRES AFTER X-IRRADIATION.** S.JelUnek: *Lancet*, 1962, ii, 1192-1193 (Dept. Electropathol., Univ., Vienna, Austria) Elastic fibres in the s.c. tissue of the ear of the rabbit disappear after irradiation but regenerate after 4 weeks.

G.H.Bell

- 85. RELATION OF MICROSCOPIC MINERALISATION TO INTRINSIC BONE STRENGTH.** G.J.Vose: *Anat. Rec.*, 1962, 144, 31-36 (Nelda Childers Stark Lab., Texas Women's Univ., Denton, Tex., U.S.A.) There was a high correlation between interstitial bone mineralisation and the ultimate yield loading of cortical bone. A lower correlation coeff. was found between the ultimate yield loading of rectangular cortical samples and the degree of osteoporosis as determined by a thinning of the cortical wall.

F.Beck

- 86. INFLUENCE OF TESTES ON SHAPING BONY PELVIS IN MICE.** E.S.Crelim and D.K.Blood: *Anat. Rec.*, 1961, 140, 375-379 (Dept. Anat., Yale Univ. Sch. Med., New Haven, Conn., U.S.A.) Brown-belt stock cT mice were castrated at intervals from 3 to 54 days of age and killed at 63 days in order to correlate features in the bony pelvis with the time of castration. The findings indicate that the presence of functioning testes is necessary during normal post-natal development from 12 to 30 days of age up to sexual maturity in order that the bony pelvis acquires all morphol. features characteristic of the adult.

F.Beck

MISCELLANEOUS

- 82. ORGANISATION AND FUNCTION OF THE TRIGEMINAL MESENCEPHALIC NUCLEUS.** CRJerge: *J. Neurophysiol.*, 1963, 26, 379-392 (Univ. Pennsylvania Sch. Med., Philadelphia, Pa., U.S.A.) Three types of units were observed in the mesencephalic trigeminal nucleus: (1) those innervating muscle spindles of the masseter, temporalis, and medial pterygoid muscles, (2) those innervating dental pressure receptors of a single tooth, and (3) those innervating dental pressure receptors of 2 or more adjacent teeth, and in some cases contiguous gingival areas. Muscle-spindle afferents from each of the muscles mentioned were observed throughout the rostrocaudal extent of the nucleus. The tooth pressure receptor units innervating several teeth were all located in the caudal half of the nucleus. Most of the units innervating single teeth were located within 2 mm. on either side of the Horsley-Clark zero coronal plane. All cells were activated solely from homolat. fields.

ODONTOLOGY

87. ECHIMYINAE (ECHIMYIDAE, RODENTS) OF PLEISTOCENE OF LAGOA SANTA (BRAZIL): INTERPRETATION OF THEIR MOLARS. M.Friant: *Acta anat.*, Basel, 1962, 51, 95-111 (Sch. Anthropol., Paris, France) A study of the cheek teeth indicates that these animals were true rodents; the premolar, P4, had disappeared and the deciduous molar, M4, persisted throughout life. (French) N.B.Symons
88. MORPHOLOGICAL STUDY OF CROWN OF JAPANESE PERMANENT TEETH BY CONTOUR LINES. III. MOLAR TEETH. IV. OCCLUSAL SURFACE. S.Wakamatsu: *Shikwa Gakuho*, 1963, 63, 150-173 (Dept. Anat., Dent. Coll., Tokyo, Japan) The relative heights and positions of cusps and depths of pits were determined in 100 each of 3 and 4 cusp upper molars and 4 and 5 cusp lower molars. (Japanese, English summary) C.P.Wallis
89. INTERRELATIONS FROM SERIAL DATA FOR ERUPTION OF PERMANENT DENTITION. J.E.Sturdvant, U.B.Knott and H.V.Meredith: *Angle Orthodont.*, 1962, 32, 1-13 (W-510 East Hall, Iowa City, Iowa, U.S.A.) Casts were collected biannually until the age of 12 yr. in 57 individuals from the emergence of the first permanent tooth and then annually to the completion of the dentition, excluding third molars. Mean eruption ages for mandibular incisor and canine teeth were earlier than for their maxillary counterparts. Variability of eruption age is lowest for first molars and increases with lat. incisors to a max. for canines and second premolars; this variability also exists between similar teeth in the same arch. Mandibular canine eruption can be predicted fairly satisfactorily from the age of eruption of the mandibular central incisor. R.D.Howard
90. ONTOGENESIS OF HUMAN TEMPOROMANDIBULAR JOINT. I. DEVELOPMENT OF CONDYLES. L.J.Baume: *J. dent. Res.*, 1962, 41, 1327-1339 (Inst. Méd. Dent., Univ., Genève, Switzerland) Stages in condylar development are described in 12 human foetuses from 15-72 mm. C-R length. The fate of Meeker's cartilage and sites of secondary cartilage are discussed. A.D.Dixon
91. DEVELOPMENT OF PERIODONTAL ATTACHMENT IN RAT. J.R.Trott: *Acta anat.*, Basel, 1962, 51, 313-328 (Dept. Periodont., Fac. Dent., Univ. Manitoba, Winnipeg, Canada) Histol. sections of the molar teeth of rats from 7 weeks to 1 yr. were examined. No indication of an intermediate plexus or a cushioned hammock ligament was found in the developmental stages, nor was there any sign of circular gingival fibres in the later stages. N.B.Symons
92. MINERALISATION OF DENTINE AND ENAMEL IN THE ACCOUNT OF METABOLISM OF GENERATIVE TISSUES. M.Pourtois: *Arch. Biol.*, Liège, 1962, 73, 491-520 (Fac. Med., Univ., Brussels, Belgium) The reduction sites of the nitrobluetetrazolium were studied in mouse tooth germs together with the dephosphorylation sites of certain mononucleotides, e.g. ATP, CTP, ADP and AMP. Succinic dehydrogenase and phosphatase activities were absent in tooth germs in the earliest stages and appeared only at the end of the morpho-differentiation period, in the enamel organ and in the pulp, and in the peripheral pulp. From the period of elaboration of hard tissues, the activities were localised in the apical regions of the odontoblasts and ameloblasts. A second dephosphorylating enzyme was identified in the endothelia and perivascular cells; it only cleaves ATP and CTP and is inhib. by the salyrgane. It may have a trophic role. (French) R.J.Walker
93. TOOTH GERM OF MOUSE. II. PHASES OF CYTO-DIFFERENTIATION, ORGANIC AND MINERAL ELABORATION. M.Pourtois: *Arch. Biol.*, Liège, 1962, 73, 225-309 (Lab. Human Embryol., Fac. Med., Univ., Brussels, Belgium) The presence of RNA, glycogen, mucopolysaccharides, alk., acid and neutral phosphatases and ATP-dephosphorylating enzyme, were studied in the tooth germs of the mouse. Alk. and acid glycerophosphatases occur in the 5 or 6 superficial cellular layers of the pulp, while RNA elaboration occurs only in the most peripheral layer. The odontoblasts contain both glycerophosphates and RNA. The odontoblasts contribute to the formation of an ATP dephosphorylating enzyme which migrates to the dentine. The development of the ameloblasts is effected in 4 stages marked successively by the synthesis of RNA, acid phosphatase, ATP-dephosphorylating enzyme¹ and alk. phosphatase. (French) R.J.Walker
94. GROWTH CHANGES OF PALATE. L.Lebret: *J. dent. Res.*, 1962, 41, 1391-1404 (Forsyth Dent. Infirmary, Boston, Mass., U.S.A.) Symmetrograph measurement and tracings in 30 longitudinal series of dental casts showed that the alveolar processes increased in height and breadth continuously. It was not possible to define the role played by suture growth and remodelling in the more active growth at the apex of the palatal vault. A.D.Dixon
95. HISTOCHEMICAL STUDY OF AMELOBLASTS AND ENAMEL MATRIX IN RAT MOLARS. E.Scheinmann, M.M.Weinreb and M.Wolman: *J.dent. Res.*, 1962, 41, 1293-1303 (Dept. Anat., Sch. Med., Hebrew Univ., Jerusalem, Israel) Histochem. methods for the detection of polysaccharides and lipids were applied to molar teeth of rats aged 2-16 days. Neutral and acidic polysaccharides were found which may form a framework for the deposition of Ca salts. Intra- and extracellular lipids were detected which may serve as an energy source for the cell and in primary nucleation of Ca respectively. A.D.Dixon
96. OBSERVATION OF INTERNAL STRUCTURES OF TEETH BY ULTRASONOGRAPHY. G.Baum, I.Greenwood, S. Slawski and R.Smirnow: *Science*, 1963, 139, 495-496 (Bronx V.A. Hosp., New York, U.S.A.) Some internal structures can be seen in vital teeth using high-resolution intensity modulated ultrasonographic techniques at 15 megacycles per sec. A relationship between time, too²* vitality and ultrasonic viewing was observed. G.M.Lewis
97. SOUND STIMULATION AND ITS EFFECT ON DENTAL SENSATION THRESHOLD. S.Carlin, W.D.Ward, A. Gershon and R.Jngraaham: *Science*, 1962, 138, 1258-1259 (Human Factors Res. Div.¹ Sch. Dent., Univ. S. California, Los Angeles, Calif., U.S.A.) The sensitivity to electrical stimm. of the teeth did not alter upon presentation of loud white noise. 'Auditory analgesia' therefore probably depends on distraction and suggestion not on cross-sensory masking. G.M.Le^{wis}
98. DENTINE SENSITIVITY. M.Braunström: *Dtsch. Zahn-, Mund-u. Kieferheilk.*, 1963, 39, 7-14 (TandläkarkOgskolan, Stockholm, Sweden) Droplets were observed on exposed dentine immediately after extraction of the tooth. The drops increased in size when pressure was applied to the apical foramen. It is suggested that in hypersensitive dentine there is an excessive loss of tubule contents from the exposed surface. (German) CPW^{Hi}^s

99. TRACER STUDY ON THE EFFECT OF DIETARY CALCIUM DEFICIENCY DURING PREGNANCY IN RATS.

J.W.Bowden and J.W.Osbome: *J. dent. Res.*, 1962, 41, 1349-1358 (Dept. Physiol., St. Univ. of Iowa, Iowa City, Iowa, U.S.A.) Two groups of rats were maintained during pregnancy on control and Ca-free diets respectively. Tracer doses of ^{45}Ca were given daily by stomach tube. Immediately after parturition litters and mothers were killed and relative uptake of ^{45}Ca in both was determined. Ash contents of litters and of the maternal femur were also determined. The Ca-stressed rats retained more ^{45}Ca than the controls, but with no apparent redistribution between maternal and litter bone. There was no difference between litter ash in the 2 groups but significantly lower maternal bone ash in the stressed animals.

100. VOLUME AND CONTENT OF SODIUM, POTASSIUM AND CALCIUM IN RESTING AND STIMULATED HUMAN PAROTID SALIVA.

J.Eschler and H.Krug: *Dtsch. Zahn-, Mund-u. Kieferheilk.*, 1963, 39, 14-20 (Hugstetter Str. 55, Freiburg i Br., Germany)

Analyses were carried out on samples obtained from 10 subjects by bilat. cannulation. (German) C.P.Wallis

101. IN VIVO AND IN VITRO EFFECTS OF SALIVA ON ETCHED OR MECHANICALLY-MARKED ENAMEL AFTER CERTAIN PERIODS OF TIME.

H.Lenz and H.R. Mühlemann: *Helv. odont. Acta*, 1963, 7, 30-33 (Dent. Inst., Univ., Zurich, Switzerland)

Smooth darel surfaces were marked with a steel needle or etched with 0.3 N HCl, and then exposed to saliva in the mouth or under in vitro conditions. The surface roughness of etched enamel was smoothed by a pellicle of salivary origin. Hie marks were filled by calculus-like globular deposits resembling micro-organisms.

D.S.Barker

102. EVALUATION OF ANTICARIES AGENTS BY USE OF ARTIFICIAL MOUTH.

W.Pigman and E.Newbm: *I. dent. Res.*, 1962, 41, 1304-1311 (Dept. Biochem., Univ. Toronto, Canada) The rate of softening of sound human tooth surfaces in the artificial mouth apparatus was followed by microhardness tests. Treatment of the surfaces with NaF and SnF₂ soln. greatly reduced the rate of softening. Of 6 commercial dentifrices, those containing F were the most effective in reducing softening rate.

R.J.Andlaw

103. GLYCOLYSIS IN FILMS OF ORAL SAMPLES FROM PERSONS WITH DIFFERENT CARIES RATES.

R.S. Manly, F.R.Shiere, A.O'Brien and D.Harrington: *J. dent. Res.*, 1962, 41, 1461-1474 (Dept. Dent. Sci., Tufts Univ. Sch. Dent. Med., Boston, Mass., U.S.A.) Dental plaque and salivary sediment were obtained from children with high or low caries susceptibility, prepared in the form of thin films and placed in contact with glass electrodes. The pH of plaque was 0.8-1 unit lower than that of sediment. Glycolysis rates were followed on addition of glucose and sucrose soln. Addition of salivary emanant from caries-susceptible or resistant children did not affect glycolysis rates of sediment. None of the measures of glycolysis rates appeared to be correlated with dental caries susceptibility.

R.J.Andlaw

104. E.M. OF CARIOUS DENTAL ENAMEL.

Y.Awazawa: *J. Nihon Univ. Sch. Dent.*, 1962, 5, 99-124 (Dept. Rath., Nihon Univ. Sch. Dent., Tokyo, Japan)

Replicas of carious lesions from 8 permanent teeth were shadowed with Cr and examined. The earliest alteration

in the carious process is mineral loss associated with fine defects within the enamel rods. The orientation of enamel crystals becomes indistinct as carious defects increase.

A.D.Dixon

105. COMPARISON OF DENTAL CARIES ACTIVITY IN STRAINS OF LABORATORY RATS.

J.H.Shaw, D.Griffiths and D.H.Wellman: *J. dent. Res.*, 1962, 41, 1312-1321 (Harvard Sch. Dent. Med., Boston, Mass., U.S.A.)

The caries activities of 14 strains of laboratory rats were studied under controlled and highly cariogenic conditions. Three susceptible and 2 resistant strains were extensively studied and managed by selective breeding to develop high predictability with respect to phenotypic expression of expt. caries. A further 9 strains were surveyed with regard to their potentiality for use in expt. caries work. It was concluded that further selective breeding of these strains, 5 of which were susceptible and 4 resistant, might produce offspring of high dependability.

A.G.Leaver

106. EFFECTS ON CARIES OF CROSS-BREEDING CARIES-RESISTANT AND CARIES-SUSCEPTIBLE RATS.

S.Rosen, G.T.Coleman, A.CSawant, H.R.Hunt and C.A.Heppert: *J. dent. Res.*, 1962, 41, 1033-1036 (Michigan State Univ., East Lansing, Mich., U.S.A.)

The progeny of cross-breeding expt. using caries-susceptible \times crossed with resistant \times and vice-versa were examined for caries experience. There was no difference in the caries experience of the progeny of the reciprocal matings indicating that caries resistance is determined by genetic factors contributed by both parents.

A.G.Leaver

107. EFFECTS OF PARTICLE SIZE OF CORN AND SUGAR DIETS AND OF MASTICATION ON CARIES INCIDENCE IN OS BORNE-MENDEL RATS.

K.G.KOnig: *J. dent. Res.*, 1962, 41, 966-985 (Dent. Inst. Univ., Zürich, Switzerland)

The incidence, and especially the initiation, of carious lesions was studied in 108 rats fed 9 coarse and fine corn and sugar diets both under mastication and non-function. Diets containing 66% corn induced markedly less sulcal lesions than did those containing 66% sugar. Fine particle diets caused more lesions than coarse, this effect being less noticeable in the case of corn. On the corn diets there were more lesions under mastication than non-function, the reverse being the case with the sugar diets.

A.G.Leaver

108. CARBON DIOXIDE INDUCED ACIDOSIS IN PREGNANT RATS AND CARIES SUSCEPTIBILITY OF THEIR PROGENY.

C.T.G.King, A.Wilk and F.J.McClure: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 486-489 (Nat. Inst. Dent. Res., N.I.H., Publ. Hlth. Serv., U.S. Dept. Hlth., Educn. and Welfare, Bethesda, Md., U.S.A.)

Respiratory acidosis in the rat induced by CO₂ exposure previous to the 10th day of gestation significantly increased the severity of dental caries in the progeny subsequently fed a cariogenic diet. Treatment had no significant effect when applied after 15th day of pregnancy.

M.M.Shapland

109. DEPRESSION OF ORAL MICROBIOTA BY ANTI BIOTICS AND ITS EFFECT ON CARIES INCIDENCE IN OSBORNE-MENDEL RATS.

K.G.KOnig, T.M.Marthalier and H.R. Mühlemann: *Helv. odont. Acta*, 1963, 7, 2-12 (Dent. Inst., Univ., Zürich, Switzerland)

Upon depression of the cariogenic microflora by administration of erythromycin at different ages during lactation, the incidence of lesions in short-period post-weaning caries tests in the young and 4 months later in the young of the following generation was studied as an indicator of re-infection and of die rapidity of re-establishment of the micro biota. In

ODONTOLOGY

spite of the sensitivity to penicillin and erythromycin of die cariogenic micro-organisms, they were found to regain their full caries-inducing potency within a rather short time, especially when depressed animals were caged with non-depressed caries-active control rats.

D.S.Barker

110. SURVEY OF YEAST POPULATION IN SALIVA AND EVALUATION OF PROCEDURES FOR IDENTIFICATION OF CANDIDA ALBICANS. H.A.Bartels and H.Blechman: J. dent. Res., 1962, 41, 1386-1390 (Dept.

Microbiol., N.T. Univ., Coll. Dent., N.Y., U.S.A.) Incidence and no. of yeasts isolated from stim. and unstim. salivas via modified Littman's medium were not significantly different. 40% of saliva specimens contained yeasts or yeast-like organisms of which 75% were *Candida* spp.: 78% of these were *C. albicans*. Cream-of-rice and com-meal agar media were most suitable for chlamydospore production. Modified Pagano-Levin medium aided presumptive identification of *C. albicans* confirmable by slide aggltn. tests. T.H.Melville

111. ORAL NOCARDIA. G.D.Roth and A.N.Thurn: J. dent. Res., 1962, 41, 1279-1292 (Univ. Kansas City,

Sch. Dent., Kansas City, Mo., U.S.A.) Nocardias isolated from carious humap teeth were studied as to their morphol. and ptysiol. prop. Results are discussed in terms of their reproducibility and environment-dependence. Particular points noted are: variability of both colonial and cellular morphology; adaptive nature of catalase enzyme; and unreliability of standard tests for gelatinase activity and carbohydrate breakdown. The relationship of oral nocardias to various other oral bacteria is*considered. T.H.Melville

112. MICROBIOLOGICAL MINERALISATION: CALCIFIABLE CELL-FREE EXTRACT FROM CALCIFIABLE MICRO-ORGANISM. J.Enniger: J. dent. Res., 1962, 41, 1383-1385 (Ivorydale Tech. Center, Procter and Gamble Co., Cincinnati, Ohio, U.S.A.) Washed

cells of *Bacterionema matruchotii* were extracted with acetic acid and a cell-free extract was recovered by water dialysis. This extract suspended in a calcifying solution acquired Ca hydroxyapatite as shown by X-ray diffraction but this prop. was not present in an extract which had been freeze-dried. T.H.Melville

113. INORGANIC CONTENT AND HISTOLOGY OF EARLY DENTAL CALCULUS IN MAN. H.E.Schroeder: Helv. odont. Acta, 1963, 7, 17-30 (Dent. Inst., Univ., Zürich, Switzerland)

The formation rate and composition of early supragingival calculus forming on Mylar strips attached to lower incisor teeth of 11 subjects was studied and compared with plaque from other tooth surfaces. D.S. Barker

114. INFLUENCE OF FLUORIDE AND PHOSPHATE LOZENGES ON EARLY CALCULUS FORMATION. H.E. Schroeder, E.Muller and H.R.Muhlemann: Helv. odont. Acta, 1963, 7, 12-16 (Dent. Inst., Univ., Zurich, Switzerland)

The amount of calculus forming in 7 days on Mylar strips attached to the lower central incisor teeth of 8 students was compared during periods when the students sucked lozenges 6 times a day. The lozenges contained either 200 mg. Na phosphates, 0-442 mg. NaF, or both. An increase of 25% in dry wt. of calculus resulted from sucking the phosphate lozenges. The F" lozenges produced a 10% wt. increase. D.S.Barker

115. PRESENCE OF ANAESTHETIC IN DENTAL PULP IN LOCAL ANAESTHESIA. A.Rost: Stoma Heidel.,

1963, 16, 112-118 (Friedrichstrasse 28, Giessen, Germany) Hostacaine and hydroxyprocaine were present in the pulp of all of 40 teeth extracted 5-15 min. after injn. for infiltration or block anaesthesia. Procaine could not be detected. C.P.Wallis

116. THE EFFECT OF DIFFERENT^f VITAL PULP AND ROOT-FILLING PREPARATIONS ON TISSUE CULTURES.

H.Maizumi and E.Sauerwein: Dtsch. zahnärztl. Z., 1962, 17, 1628-1635 (Pharmacol. Inst., Univ., Bonn, Germany)

The results of testing 8 prep. intended for use on vital pulp tissue (including Calxyl and ZnO-eugenol), and 13 'root filling' medicaments (including chloropercha, •N2 normal^l, and iodoform paste) are reported in detail. The effects of each prep. on tissue cultures of embryo chick heart cells were studied. Calxyl or chloropercha, among others, interfered with cell growth far less than, for instance, ZnO and eugenol or iodoform paste or 'N2 normal'. The authors point out that non-irritation of cells is not the only prop. required of the substances tested.

(German, English summary) J.P.Waterhouse

117. AGE, GONAECTOMY, AND WOUND HEALING IN PALATAL MUCOSA OF RAT. E.O.Butcher and J.Klingsberg: Oral Surg., 1963, 16, 484-493 (Dept. Anat., Coll. Dent., New York Univ., N.Y., U.S.A.)

Wounds ranging in size from 1-2 mm., and involving either the superficial mucosa only, or the whole mucoperosteum, were made in the palates of 200 Long-Evans strain rats, aged from 22-830 days. The gonads of some of these animals had been removed up to 20 months prior to the expt. The superficial wounds healed rapidly, but in the deeper wounds, the epithelium covered the surface only after removal of necrotic tissue and growth of the underlying granulation tissue had occurred. Healing was faster in the younger animals, and ovariectomy, but not orchectomy, gave more rapid healing. D.S.Barker

118. LICHEN RUBER PLANUS OF THE ORAL MUCOUS MEMBRANE. D.Herrman: Dtsch. zahnärztl. Z., 1963, 18, 346-363 (Clin. for Dis. of Teeth, Mouth and Jaws, Free Univ., Berlin, Germany)

A detailed account of the clinical and histol. findings in 60 patient* who had oral lesions of lichen planus ('typical', atropW hypertrophic, bullous, erosive) without skin involvement is given. The group contained 44 women and 16 men: a sex ratio of 2*7. Slightly less than one half of the whole group were aged 50-59 yr., although men and women in all decades of life from 20 to 90 were seen. 93% of the group had lesions on the cheeks. Attempts to influence the course of non-erosive types of lichen plant* by local or systemic administration of steroids, vitamins* arsenic, etc. were unsuccessful.

(German, English summary) J.P.Waterhouse

119. RELATIONSHIP BETWEEN THIRD MOLAR AGENESIS AND REDUCTION IN TOOTH NUMBER. S.Gam and A.D.Lewis: Angle Orthodont., 1962, 32, 14-18 (Fels Res. Inst., Yellow Springs, Ohio, U.S.A.)

A sample consisting of 100 subjects of 14 yr. or older, having one or more third molars missing and a control group of 398 having all 4 third molars present was examined clinically, radiographically and by means of models. When 1 or more third molar teeth were missing, the incidence of other missing teeth increased 13-fold. Third molar agenesis was also associated with a reduction in &* no. of all the other teeth, first molars excluded, whereas the reduction in no. in the control group relate^ only to the second incisor and second premolar teeth. R.D.Howard

CARBOHYDRATES

120. STUDIES ON THE CARBOHYDRATE METABOLISM OF A GRAM NEGATIVE ANAEROBE (BACTERIODES SYMBIOSUS) USED IN THE CULTURE OF ENTA-MOEBA HISTOLYTICA. P.D.Bragg and R.E.Reeves: J. Bact., 1962, 83, 76-84 (Dept. Biochem., Louisiana State Univ. Sch. Med., New Orleans, La., U.S.A.)

Resting cells of B. symbiosus have been shown to utilise glucose and several other monosaccharides. The fermentation of the sugars is mediated by demonstrable kinases except in the case of mannitol. The main end-products of the metabolism of glucose are CO₂, H₂, ethanol and acetic, butyric, succinic and lactic acids. Changes in the thiol used in the growth media produce different enzyme complements in the cells. For example cells grown with cysteine are unable to metabolise glucosamine, whereas those grown with thiomaltate rapidly degrade this amino sugar. Enzyme assays and ¹⁴C-labelled glucose studies suggest that glucose is metabolised by resting cells mainly by the Embden-Meyerhof pathway.

C. Toothill

121. CARBOHYDRATE METABOLISM IN STRAIN L-929 MOUSE FIBROBLAST CELLS. M.K.Johnson and E.J. Johnson: Proc. Soc. exp. Biol., N.Y., 1962, 111, 149-152 (Dept. Microbiol., Univ. Mississippi Sch. Med., Jackson, Miss., U.S.A.)

The cells oxidised glucose, typical tricarboxylic acid substrates and pentose phosphate. Cell extracts contained enzymes of the Embden-Meyerhof pathway, the citric acid cycle and the glucose 6-PO₄ oxidative pathway although no trans-*etolase or transaldolase could be detected.

M.M.Shapland

122. SUBSTANCES OF THE CARBOHYDRATE METABOLISM OF ISOLATED PERFUSED RAT LIVER. H.Schimassek: Biochem. Z., 1963, 336, 460-467 (Physiol. Inst., Univ. Marburg/Lahn, Germany) An apparatus described in which a medium containing bovine r.b.c. & albumin, Tyrode soln. and Terramycin is perfused ¹⁴C-liver. The levels of lactate, pyruvate, Wycerol 1-phosphate, dihydroxyacetone phosphate and lactose 1,6-diphosphate were 50% higher than in vivo, ¹⁴lactate and glucose 6-phosphate had decreased by 40% (German) L.Cohn

123. OXIDATION AND FERMENTATION OF SUGARS BY YEAST PROTOPLASTS. J.W.Millbank: Exp. Cell Res., 1963, 29, 422-429 (Brewing Indust. Res. Fdn., Nuffield, Surrey, England) Glucose, fructose, sucrose and maltose were oxidised by protoplasts of 3 strains of brewing yeasts at rates equal to or greater than those of the corresponding intact cells, as measured using ¹⁴N as a basis for determining the parameters QCO₂ to Q₁₄ and protoplasts of \pm strain nor mally

{** to metabolise maltose, lost this ability after incubation for 2 hr. in media lacking this sugar. The distribution of invertase and its activity were studied in 1 strain.

K.Jones

124. RESPIRATORY ENZYMES OF CHLORELLA. H.-S. Gewitz and W.Volker: Hoppe-Seyleis Z. physiol. Chem., 1962, 330, 124-131 (Max-Planck-Inst. für Physiol., 1 Berlin-Dahlem, Germany) The iso-

¹⁴On of a new enzyme is described. It contains Fe, ⁵⁵Fe, ⁵⁷Cr, ⁵⁹Fe, ⁶³Fe, ⁶⁵Fe, ⁶⁷Fe, ⁶⁹Fe, ⁷¹Fe, ⁷³Fe, ⁷⁵Fe, ⁷⁷Fe, ⁷⁹Fe, ⁸¹Fe, ⁸³Fe, ⁸⁵Fe, ⁸⁷Fe, ⁸⁹Fe, ⁹¹Fe, ⁹³Fe, ⁹⁵Fe, ⁹⁷Fe, ⁹⁹Fe, ¹⁰¹Fe, ¹⁰³Fe, ¹⁰⁵Fe, ¹⁰⁷Fe, ¹⁰⁹Fe, ¹¹¹Fe, ¹¹³Fe, ¹¹⁵Fe, ¹¹⁷Fe, ¹¹⁹Fe, ¹²¹Fe, ¹²³Fe, ¹²⁵Fe, ¹²⁷Fe, ¹²⁹Fe, ¹³¹Fe, ¹³³Fe, ¹³⁵Fe, ¹³⁷Fe, ¹³⁹Fe, ¹⁴¹Fe, ¹⁴³Fe, ¹⁴⁵Fe, ¹⁴⁷Fe, ¹⁴⁹Fe, ¹⁵¹Fe, ¹⁵³Fe, ¹⁵⁵Fe, ¹⁵⁷Fe, ¹⁵⁹Fe, ¹⁶¹Fe, ¹⁶³Fe, ¹⁶⁵Fe, ¹⁶⁷Fe, ¹⁶⁹Fe, ¹⁷¹Fe, ¹⁷³Fe, ¹⁷⁵Fe, ¹⁷⁷Fe, ¹⁷⁹Fe, ¹⁸¹Fe, ¹⁸³Fe, ¹⁸⁵Fe, ¹⁸⁷Fe, ¹⁸⁹Fe, ¹⁹¹Fe, ¹⁹³Fe, ¹⁹⁵Fe, ¹⁹⁷Fe, ¹⁹⁹Fe, ²⁰¹Fe, ²⁰³Fe, ²⁰⁵Fe, ²⁰⁷Fe, ²⁰⁹Fe, ²¹¹Fe, ²¹³Fe, ²¹⁵Fe, ²¹⁷Fe, ²¹⁹Fe, ²²¹Fe, ²²³Fe, ²²⁵Fe, ²²⁷Fe, ²²⁹Fe, ²³¹Fe, ²³³Fe, ²³⁵Fe, ²³⁷Fe, ²³⁹Fe, ²⁴¹Fe, ²⁴³Fe, ²⁴⁵Fe, ²⁴⁷Fe, ²⁴⁹Fe, ²⁵¹Fe, ²⁵³Fe, ²⁵⁵Fe, ²⁵⁷Fe, ²⁵⁹Fe, ²⁶¹Fe, ²⁶³Fe, ²⁶⁵Fe, ²⁶⁷Fe, ²⁶⁹Fe, ²⁷¹Fe, ²⁷³Fe, ²⁷⁵Fe, ²⁷⁷Fe, ²⁷⁹Fe, ²⁸¹Fe, ²⁸³Fe, ²⁸⁵Fe, ²⁸⁷Fe, ²⁸⁹Fe, ²⁹¹Fe, ²⁹³Fe, ²⁹⁵Fe, ²⁹⁷Fe, ²⁹⁹Fe, ³⁰¹Fe, ³⁰³Fe, ³⁰⁵Fe, ³⁰⁷Fe, ³⁰⁹Fe, ³¹¹Fe, ³¹³Fe, ³¹⁵Fe, ³¹⁷Fe, ³¹⁹Fe, ³²¹Fe, ³²³Fe, ³²⁵Fe, ³²⁷Fe, ³²⁹Fe, ³³¹Fe, ³³³Fe, ³³⁵Fe, ³³⁷Fe, BIOCHEMISTRY

C-1 and C-6 with more activity in the latter than in the former. This shows that L-glyceraldehyde presented to the liver and that formed from L-sorbose within the liver follow the same pathways. The distribution of 14C does not differentiate L-glyceraldehyde metabolism by way of the phosphate from that via dihydroxyacetone phosphate.

J.N.Ashley

131. SYNTHETIC CYTOLIPIN H AND OTHER LACTOSIDES. A.C.Schram, E.H.Byers and R.H.Wilson: Nature, Lond., 1963, 197, 1074-1076 (Biochem. Dept., Univ. Texas Southwestern Med. Sch., Dallas, Tex., U.S.A.) A ceramide lactoside has been synthesised from ceramide and a-acetobromolactose. The lactoside was identified as ceramide 3-lactoside. Data from i.r. analytical and immunol. techniques strongly suggest that ceramide 3-lactoside is very similar to, if not identical with, the hapten cytoltipin H. J.R.Sargent

132. STRUCTURE AND CHROMATOGRAPHIC PROPERTIES OF CARBOHYDRATES. II. LIQUID-LIQUID PARTITION MOBILITIES OF ALDONO-y-LACTONES. R.J.Ferrier: J. Chromatography, 1962, 9, 251-252 (Lawrence Rad. Lab., Univ. California, Berkeley, Calif., U.S.A.) Notes. P.D.Dawkins

133. PREPARATION OF SOME NEW DISACCHARIDES AND D-ALLOSE FROM 3-KETOGLYCOSIDES. M.J.Bernaerts, J.Fumelle and J.De Ley: Biochim. biophys. Acta, 1963, 69, 322-330 (Central Lab., Min. Economic Affairs, Brussels, Belgium) Conditions for reducing the 3-keto function much faster than the hemiacetal group with Raney Ni are described. The yield was 85-90%. Lactose and gulosylglucose were obtained from 3-keto lactose. Lactose was eliminated by oxidation with Aerobacter cloacae and gulosylglucose was purified and cryst. as the monohydrate. 3-Ketomaltose gave maltose and allosylglucose. 3-Ketomaltobionate gave better yields. Maltose was eliminated with a Paracolobactrum strain and allosylglucose was obtained as a chromatographically pure syrup. 3-Ketosucrose reduction gave sucrose and allosylfructose, the latter being purified by charcoal chromatography. D-allose was obtained by treating with a Paracolobactrum strain which oxidised glucose and fructose, unchanged D-allose was purified and cryst. B.M.Stevens

134. FUNCTION OF TREHALOSE IN BAKER * S YEAST (SACCHAROMYCES CEREVISIAE). A.Panek: Arch. Biochem., 1963, 100, 422-425 (Biochem. Dept., Nat. Sch. Chem., Rio de Janeiro, Brazil) Trehalose and glycogen were formed in nonproliferating cells in the proportion 5:1. During aerobic starvation trehalose was not utilised but during the initial 'lag' phase of a growth curve approx. 9VJo of the trehalose was rapidly mobilised and degraded, largely to CO₂. * B.M.Stevens

135. OCCURRENCE OF SUGAR PHOSPHATES IN COW'S MILK. N.C.Ganguli and K.K.Iva: Indian J. Chem., 1963, 1, 145-146 (Nat. Dairy Res. Inst., Karnal, Punjab, India) The presence of some sugar phosphates like fructose 6-phosphate, fructose 1,6-phosphate and pentose phosphates in milk has been demonstrated. Their isolation and identification have been established by both chem. and paper chromatographic methods. Apart from these sugars, glucose, galactose and lactose are also present in milk in their phosphorylated forms. I.A.B.S.

136. COLANIC ACID. W.F.Goebel: Proc. nat. Acad. Sci., Wash., 1963, 49, 464-471 (Rockefeller Inst., New York, U.S.A.) Colicinogenic bacillus E. coli

K235 L + O (in) produces a serol. active, nitrogen-free polysaccharide which is named colanic acid. The isolation and prop. of colanic acid are described. The compound is a capsular polysaccharide which confers upon tW bacillus its mucoid characteristics and also certain of its serol. prop.

J.R.Sargeni

137. INFRA-RED SPECTRAL CHARACTERISATION OF COLANIC ACID. H.Jaffe: Proc. nat. Acad. Sci., Wash., 1963, 49, 472-473 (Rockefeller Inst., New York, U.S.A.) A limiting and characteristic i.r. spectrum has been determined for the purified salt and acid forms of colanic acid. The spectra indicate the presence of an amino functional group which may be a constituent part of the polysaccharide structure but which is considered more likely to be due to a strongly absorbed basic contaminant.

J.R.Sargefl

138. THE IN VITRO INCORPORATION OF HEXOSAMIN* INTO RAT COLON MUCOIDS. A.Moretti and G.Wolfi G. Biochim., 1962, 11, 175-180 (Inst. di Chim. BioL Univ. Milan, Italy) It has been shown that rat colon is capable of synthesising hexosamine from glucose 6-P and glutamine, and that once formed it is incorporated into non-dialysable high polymers by enzymes present in colon homogenates. It is concluded that mucoid synthesis has taken place.

B.Pay*

139. DIFFERENTIAL DETERMINATION OF D-GLUCOSAMINE AND D-GALACTOSAMINE. Y.Imanaga: J. Biochem., Tokyo, 1963, 53, 80-83 (Dept. Chem. Fac. Sci., Nara Women's Univ., Nara, Japan).

B.M.Stevens

140. NON-ENZYMIC DEGRADATION OF D-GLUCOSAMINIC ACID. Y.Imanaga, F.Saito and Y.Kusuda: J. Biochem., Tokyo, 1963, 53, 84-85 (Dept. Chem. Fac. Sci., Nara Women's Univ., Nara, Japan) Pyridoxal and Cu mainly decomposed D-glucosaminic acid aldolatically at the C-2 to C-3 bond.

B.M.Stevens

141. EPIMERISATION OF N-ACETYL-D-GALACTOSAMINE TO N-ACETYL-D-TALOSAMINE. S.Fuji *nd H.Kushida: Biochim. biophys. Acta, 1963, 69, 572' 573 (Res. Lab., Kaken-yaku-kako Co. Ltd., Kyoto, Japan) The converted aminosugar was isolated ana characterised.

B.M.Steven*

142. CARBAZOLE METHOD FOR THE DIFFERENTIAL ANALYSIS OF GLUCURONATE, GLUCOSIDURONAT* AND HYALURONATE. H.Yuki and W.H.Fishman: Biochim. biophys. Acta, 1963, 69, 576-578 (Tufts. Univ. Sch. Med., Boston, Mass., U.S.A.) Anaiy*? was based on hypoiodite oxidation and the Dische ²_{fpi} reaction; hyaluronate was differentiated by its copi reaction with HgS from aq. soln.,

B.M.Stevens

143. RHODINOSE, A TRIDESOXYSYHEXOSE. H.BrocW¹¹* and T.Waehneldt: Naturwissenschaften, 1963, 50t, 43 (Org. Chem. Inst. Univ. GGttingen, Germany) Isolation from sol. hydrolysate of y-Rhodomycin IV *hu results of physicochem. analysis are described.

(German) A.J.Wansbrow¹¹

144. CATABOLISM OF GLUCOSE AND GLUCONATE § INTACT RATS. C.H.Wang, L.P.Snipper, O.Bilen ^{ax}, B.Hawthorne: Proc. Soc. exp. Biol., N.Y., 1962, 112, 93-97 (Dept. Chem., Oregon State Univ., Corvallis, Ore., U.S.A.) Glucose administered per os is catabolized mainly via the Embden-Meyerhof-Parnas P^{aff}_{JL}, but a small *jo is routed into the glucuronate and phosi*

BIOCHEMISTRY

is

gluconate pathways. Gluconate is readily utilised via the Utter.

M.M.Shapland

145. OXIDATION OF GLUCOSE TO γ - AND 6-GLUCONOLACTONE BY MICROBIAL ENZYMES. R.Weinberg: *Biochim. biophys. Acta*, 1963, 67, 359-365 (Pioneering Lab. Microbiol. Chem., Northern Reg. Res. Lab., Peoria, 111., U.S.A.) Three particulate enzymes yielded glucose α - γ -lactone whereas 2 sol. enzymes produced glucono-6-lactone. B.M.Stevens

146. GLUCOSE SUPPLY BY THE LIVING HOST AND GLYCOLYSIS OF YOSHIDA ASCITES HEPATOMA IN VIVO. U.Del Monte and C.B.Rossi: *Cancer Res.* 1963, 23, 363-367 (Inst. Gen. Pathol., Univ. Messina, Italy) Glucose penetration into and lactate efflux from ascitic fluid was measured in rats in which the tumour had been replaced by cell free ascitic fluid. Glucose concn. were extremely low in ascitic fluid but lactate levels were higher than in blood. Blood lactate was also above normal in tumour bearing rats. Lactate efflux was of the same order of magnitude as glucose influx. When extra glucose was supplied both glucose utilization and lactate formation increased. B.M.Stevens

147. GLUCOSE AND ACETATE METABOLISM IN ALLIGATOR MISSISSIPPIENSIS. A.L.Black, M.G. Simesen and J.C.Bartley: *Comp. Biochem. Physiol.*, 1963, 8, 299-310 (Dept. Physiol. Sci., Univ. California, Davis, Calif., U.S.A.) Alligators, *Allmississippiensis*, were obtained and kept for a week without food so that expt. animals were in the post-absorptive condition*. The respiratory rates of the gators were studied after injn. of labelled acetate or ^{14}C ucose. The metabolism of acetate was faster than glucose. A range of ^{14}C -containing amino acids was plated. The nature of these was similar to those obtained in mammals inj. with $[14\text{C}]$ acetate or $[14\text{C}]$ glucose. M.S.Laverack

148. ATP DEPENDENT INCORPORATION OF $[14\text{C}]$ GLUCOSE INTO CHARONINSULPHURIC ACIDS BY A CELL FREE EXTRACT OF THE MUCOUS GLAND OF CHARONIA LAMPAS. K.Iida: *J. Biochem. Tokyo*, 1963, 53, 37-42 (Dept. Chem., Fac. Sci., Nagoya Univ., Nagoya, Japan) ATP and Mg were essential. ATP was converted to AMP during the reaction. UTP was required. Addition of SO_4^{2-} had no effect. More glucose was incorporated into the S-poor charoninsulphuric acid than into the S-rich charoninsulphuric acid. Almost all the incorporating activity of the extract was found in a 6000 r.p.m. supernatant. B.M. Stevens

149. GLUCURONIDE FORMATION AND TRANSPORT OF VARIOUS COMPOUNDS BY GUNN RAT INTESTINE IN VITRO. I.M.Arias, M.Furman, D.F.Tapley and J.E. Ross: *Nature, Lond.*, 1963, 197, 1109-1110 (Dept. Einstein Coll. Med., Yeshiva Univ., New York, N.Y., U.S.A.) Prep. from the mucosa of Gunn rats had a markedly reduced ability to form glucuronides of 2-amino-4-methylumbellifero. Transport of triiodothyroacetic acid and testosterone V_{d} in the sacs of the intestine in Gunn rats was less than 50% normal; transport of monoiodotyrosine was less than 50%. The biosynthesis of glucuronides in intestinal tissue appears to be similar to that in the liver. It is suggested that glucuronide formation plays a major part in active transfer of thyroxine analogues and certain steroids by the mucosal cell. G.M.Lewis

150. GLUCOSE METABOLISM OF EUGLENA GRACILIS VAR. BACILLARIS; GROWTH AND ENZYMIC STUDIES. R.E.Hurlbert and S.C.Rittenberg: *J. Protozool.*, 1963, 9, 170-182 (Dept. Bacteriol., Univ. Southern California, Los Angeles, Calif., U.S.A.) CO_2 , certain Krebs cycle acids and certain amino acids stimulate growth and glucose utilisation of a colourless strain of *E. gracilis* in a phthalate-buffered mineral salt medium. Glucose utilisation was initiated within a pH range of 3.0-5.0 which could be extended by the addition of glycine. Cells cultured at pH 4.5 could be adapted to growth at pH 7.0 when a small amount of citrate was present. It is suggested that the citrate acted as a chelator. The major enzymes of the Embden-Meyerhof-Parnas and pentose phosphate pathways were demonstrated in cell-free extracts. The pH optima of a no. of the enzymes was found to be between 7.5-8.6, though the cells from which the enzymes were obtained were grown in acid medium. There was evidence for the operation of a uridine linked pathway in the hexose metabolism.

R.J.Walker

151. [THE] OXIDATIVE ASSIMILATION AND DISTRIBUTION OF GLUCOSE IN *BACILLUS CEREUS*.

C.E.Clifton: *J. Bact.*, 1962, 83, 66-69 (Dept. Med. Microbiol., Stanford Univ. Sch. Med., Stanford, Calif., U.S.A.) Exogenous labelled $[14\text{C}]$ glucose is taken up rapidly by washed cells of *B. cereus* and apparently enters a metabolic pool sol. in cold & J_0 TCA. From this pool the label rapidly passes into other cellular fractions, primarily materials sol. and insol. in hot & J_0 TCA, which may constitute the endogenous reserves of the cells. There is a marked lag in the liberation of $^{14}\text{CO}_2$; little or no lag is observed in the slightly enhanced rate of O_2 consumption noted in the presence of exogenous glucose. Assimilation in part at least, appears to be at the expense of cellular reserves which appear to be replenished or replaced by the assimilated substrate.

C.Toothill

152. 3-(j8-D- GALACTOSIDO)-2-ACETAMIDO-2-DEOXY-D-GALACTOSE. A CRYSTALLINE DISACCHARIDE FROM HUMAN BRAIN GANGLIOSIDES.

E.Klenk, U.W.Hendricks and W.Gielen: *Hoppe-Seylers Z. physiol. Chem.*, 1962, 330, 140-144 (Physiol.-Chem. Inst. Univ., 5 K81n-Lindenthal, Germany) The isolation, separation and identification of the disaccharide is described.

(German) L.Cornish

153. COLORIMETRIC DETERMINATION OF 3,6-ANHYDROGALACTOSE WITH THE INDOLYL-3-ACETIC ACID REAGENT. W.Yaphe: *Nature, Lond.*, 1963, 197, 488-489 (Atlantic Reg. Lab., Nat. Res. Coun., Halifax, Nova Scotia, Canada) The indolyl-3-acetic acid reagent can be used at 23.5° and 37° to determine free 3,6-anhydrogalactose. It shows no advantage, however, over the resorcinol test for the quant. determination of this sugar in a polysaccharide. G.M.Lewis

154. CARBOHYDRATES IN PROTEIN. VEL THE NATURE OF THE CARBOHYDRATE IN OVOMUCOID.

A.Neuberger and H.Papkov: *Biochem. J.*, 1963, 87, 581-585 (Dept. Chem. Path., St. Mary's Hosp. Med. Sch., London, England) Ovomucoid was prep. by a modification of published methods by chromatography on CMcellulose and DEAEcellulose. This protein was digested by the enzyme pronase, and a glycopeptide fraction was obtained by chromatography on Sephadex G-25. Further chromatography on Sephadex G-50 showed considerable retardation, indicating an average

BIOCHEMISTRY

mol. wt. appreciably below 10000, and this was also indicated by quant. dialysis expt. Evidence is produced from the results of dinitrophenylation and fractionation expt., in which different resins were used, indicating the probable presence in ovomucoid of 3 glycopeptide moieties differing in hexose, hexosamine and amino acid composition.

- 155. ENZYMIC DEBRANCHING OF GLYCOGEN. I. A NEW PATHWAY IN RABBIT MUSCLE FOR THE ENZYMIC DEBRANCHING OF GLYCOGEN.** M.Abdullah and W.J.Whelan. **II. COMBINED ACTION OF OLIGO-1,4'1,4-GLUCANTRANSFERASE AND AMYLO-1,6-GLUCOSIDASE IN DEBRANCHING GLYCOGEN.** D.H.Brown, B.Illingworth and C.F.Cori: Nature, Lond.. 1963, 197, 979-980, 980-982 (Lister Inst. Preventive Med., Chelsea Bridge Rd., London, England) I. A new debranching process has been detected during studies of the action of amylo-1,6-glucosidase prep, on amylopectin and glycogen. The debranching process does not require prior phosphorolysis of glycogen but appears to occur by action of a trans-glucosylase (resulting in chain lengthening rather than chain shortening) which exposes 1:6-bonded side chains to the action of glucosidase. II. Non-phosphorolytic debranching of glycogen in the presence of amylo-1,6-glucosidase prep, is shown to occur by exposure of Of-1,6-linked glucose bonds through the action of an oligo-1,4->1,4-glucantransferase. The latter enzyme transfers maltotriosyl and maltosyl but not glucosyl residues. J.R.Sargent

- 156. PORCINE MUSCLE GLYCOGEN STRUCTURE AND ITS ASSOCIATION WITH OTHER MUSCLE PROPERTIES.** R.N.Sayre, E.J.Briskey and W.G.Hoekstra: Proc. Soc. exp. Biol., N.Y., 1963, 112, 223-225 (Depts. Meat and Animal Sci., Univ. Wisconsin, Madison, Wis., U.S.A.) Three different pig breeds were studied to elucidate the changes of structure of glycogen mol. after death. Post-mortem glycolysis accounted for the loss of a glucose residue per average chain length of glycogen. The importance of anaerobic conditions in decreasing the chain length was shown in Chester White pigs and it was found that chain lengthening could be achieved by feeding animals prior to death with sucrose. Thus it is concluded that the nutritional status of the body at death can complicate the pattern of post-mortem changes which are influenced by inherent genetic factors.

D.N.Wheatley

- 157. α -1,4-GLUCOSANS. XVII. THE MOLECULAR STRUCTURE OF SOME GLYCOGENS.** O.Kjellberg, D.J.Manners and A.Wright: Comp. Biochem. Physiol., 1963, 8, 353-365 (Dept. Chem., Univ. Edinburgh, Scotland) Samples of glycogen obtained from chickens, Ascaris, rabbit, Arenicola, Cardium, Mytilus, horse, pig, Oncorhynchus, cod, mouse and skate were examined by means of enzymic degradation, iodine staining, periodate oxidation and concanavalin A reaction. Chain lengths of 12-15 glucose residues were indicated, together with mol. wt. values of $5\cdot10 \times 10^6$ as measured by turbidity techniques. The feeding of D-galactose to starved rabbits or sucrose to pigs does not produce a liver glycogen with low branching values. Similar chain lengths are shown by lyo- and desmo- glycogens obtained from fed and starved rabbits. M.S. Lave rack

- 158. STUDIES IN CELLULOSE CHEMISTRY. PART VH - ASSAY OF REDUCING END GROUPS BY HILLER AND PACSU'S METHOD.** T.S.A.Padmanabhan, T.N.Rawal

and L.R.Sud: Indian J. Technol., 1963, 1, 99-101 (Defence Res. Lab. (Stores), Kanpur, India).

I.A.B.S.

- 159. CONNECTIVE TISSUE METABOLISM. I. HYALURONIC ACID SYNTHESIS BY CELL-FREE EXTRACTS OF HUMAN TISSUES.** C.H.Altshuler, G.Kinsman and J.Bareta: Arch. Path., Chicago, 1963, 75, 206-211 (Dept. Path., St. Joseph's Hosp., Milwaukee, Wis., U.S.A.) A cell free hyaluronic acid synthesising enzyme system has been prep, from several human mesodermal tissue homogenates. The substrates are uridine diphospho-N-acetyl glucosamine and uridine diphosphoglucuronic acid. R.Mitchell

- 160. SOME FACTORS AFFECTING THE INTERACTION OF HYALURONIC ACID WITH BOVINE PLASMA ALBUMIN.** E.Gramling, W.Niedermeier, H.L.Holley and W.Pigman: Biochim. biophys. A eta, 1963, 69, 552-558 (Arthritis and Rheumatic Dis. Lab., Univ. Alabama Med. Center, Birmingham, Ala., U.S.A.)

In soln. with a low albumin/hyaluronic acid concn. ratio all the albumin was bound to hyaluronic acid to give a Pi complex. In soln. where the ratio was higher free albumin could be demonstrated in the mixture. Some hyaluronic acid always remained free even when an excess of albumin was present. Complex formation appeared to be directly related to the intrinsic ν of the hyaluronic acid. The effect of the relative *) of the soln. was also examined.

B.M.Stevens

- 161. PURIFICATION OF HYALURONATE LYASE ON DEAE-SEPHADEX.** E.Som and F.Ionescu-Stoian: Biochim. biophys. Acta, 1963, 69, 538-543 (Dept. Gen. Biochem. and Immunochem., Dr.J.Cantacuzino Inst., Bucarest, Rumania) Testicular hyaluronate lyase was obtained as an electrophoretically homogeneous prep, from the crude prep, which contained 4-5 electro*, phoretic fractions using a DEAE-Sephadex A-50 (mediumV column. Using pH 6*0, 0#02M phosphate buffer with an ionic strength of 0*08 enzymically inactive proteins were adsorbed while the active component passed through

B.M.Stevens ..

- 162. INFRARED DICHROISM OF SODIUM HYALURONATE?*** F.R.Quinn and F.A.Bettelheim: Biochim. biophys. Acta, 1963, 69, 544-551 (Chem. Dept., Adelphi Coll., Garden City, N.Y., U.S.A.) Films of umbilical cord Na hyaluronate swollen in 82% ethanol were elongated and the i.r. absorption spectra of the dn^e films were taken at different elongations with the electrical vector of polarised i.r. radiation parallel and perpendicular to the direction of elongation. Dichroic ratios were calc. as a function of elongation. Orientations of different atomic groups in the polymer mol. with elongation were interpreted to indicate a rather stiff mol. con*figuration of chains in the gel form. Elongation is suggested to be mainly due to turning and orientation 0* mol. aggregates rather than to uncoiling of a random isotropic chain configuration.

B.M. Stevens

- 163. PREPARATION OF HYALURONIC ACID FROM BOVINE SYNOVIAL FLUID.** G.Matsumura, M.De Salegui, A.Herp and W.Pigman: Biochim. biophys. Acta, 1963, 69, 574-576 (Dept. Biochem., New J^r/k Med. Coll., New York, U.S.A.) Hyaluronic acid was isolated as the cetylpyridinium salt, this was then dissociated in NaCl and the cetylpyridinium chloride extracted with ethanol; coprecipitated protein was removed by adsorption on Fuller's earth.

rtC
B.M.Stevens

164. BINDING OF SODIUM AND POTASSIUM IONS BY HEPARIN. S.Salminen and K.Luomanmaki: Biochim. biophys. Acta, 1963, 69, 533-537 (Wihuri Res. Inst., Helsinki, Finland) The effect of heparin on the relative activities of Na and K was calc. from the distribution of small ions between a heparin soln. and its "Urafiltrate. Activities of Na and K were markedly decreased by heparin. K was preferentially bound. The excess of SO₄ over carboxyl groups in heparin is suggested to be responsible for alkali metal ion binding.

B.M.Stevens

165. MACROMOLECULAR PROPERTIES AND BIOLOGICAL ACTIVITY OF HEPARIN. II. FURTHER ELECTROPHORETIC STUDIES. G.H.Barlow and L.J.Coen: Biochim. biophys. Acta, 1963, 69, 569-571 (Phys. Chem. Dept., Res. Div., Abbott Lab., North Chicago, 111., U.S.A.) Data available on the heparin-streptomycin complex were used to attempt further purification of heparin.

B.M.Stevens

166. SULPHURATED MUCOPOLYSACCHARIDES OF METAPHYSIS CARTILAGE OF NEW-BORN PIGS. A.A.Castellani, S.Ronchi, G.Ferri and M.Malcovati: G. Biochim., 1962, 11, 181-186 (Inst. Chim. Biol.. Univ. Pavia, Italy) The Ca salts of mucopolysaccharides extracted after enzymic digestion of new-born pig metaphysis cartilage were fractionated with increasing quantities of ethanol. At 4CP/o alcohol, S&J of mucopolysaccharide were pptd. and this fraction consisted J* chondroitin sulphate A (6 Oft) and chondroitin sulphate A (4%). At higher alcohol concn. keratosulphate was JW. but in smaller amounts, and also yet smaller founts of xylose. All fractions contained peptide ^Purities.

B.Payne

167. LIGHT CHONDROMUCOPROTEIN FROM METAPHYSIS CARTILAGE IN NEW-BORN PIGS.

A.A.Castellani, B.Bonferoni, S.Ronchi, G.Ferry and M.Malcovati: G. Biochim., 1962, 11, 187-195 (Inst. Chim. Biol., Univ. Pavia, Italy) Chondromucoprotein was prep. from metaphysis cartilage of KL^bY Piglets, and its homogeneity was studied by freeze electrophoresis and by ultracentrifuging. Electrophoresis and sedimentation patterns both showed chondromucoprotein to be homogeneous. Hexoses and pentoses were identified after hydrolysis of chondromucoprotein by (48)³chromatography and chondroitin A (57%) and C (4%) content were determined after digestion with hyaluronidase. Protein content was determined by method of Folin and constituted about 6% of the whole. The results of the analysis are tabulated in some detail.

B.Payne

168. PREPARATION OF SIALOMUCOPOLYSACCHARIDES FROM BRAIN MITOCHONDRIAL FRACTIONS.

G.Brunngraber and B.D.Brown: Biochim. biophys. Acta, 1963, 69, 581-582 (Illinois State Psychiat. Inst. Chicago, Ill., U.S.A.) The material purified was rat or dog brain was free of nucleic acid and protein, dialysable and was not pptd. by cetylpyridinium chloride. Prelim, comm.

B.M.Stevens

V. METABOLISM IN VIVO OF CONNECTIVE TISSUE POLYSACCHARIDES. I. CHONDROITIN SULPHATE C AND KERATOSULPHATE OF NUCLEUS POSUS. II. CHONDROITIN SULPHATE B AND GLUCURONIC ACID OF SKIN. III. CHONDROITIN SULPHATE AND KERATOSULPHATE OF CARTILAGE. R.Pavidson and W. Small: Biochim. biophys. Acta, 1963, 69, 445-452, 453-458, 459-463 (Dept.

Biochem., Duke Univ. Med. Center, Durham, N.C., U.S.A.) I. The ratio of keratosulphate to chondroitin sulphate increased uniformly as a function of age in rabbit nucleus pulposus. Several hormones, notably growth hormones, oestrogens and androgens, altered the composition of mature tissue to that typical of a younger age. The metabolic activity of the polysaccharides was examined and their half lives estimated. Keratosulphate appeared to be extremely inert in the mature animal and probably had a half life greater than 120 days.

II. Gross composition and metabolic activity of skin mucopolysaccharides were examined. Chondroitin sulphate and hyaluronic acid fractions appeared to exist in more than 1 physical state and appeared to change their prop. after synthesis de novo. The biol. half lives were in agreement with those previously reported but were accurate only for young animals or for a portion of the total material. Testosterone caused a marked increase in the skin hyaluronic acid content. Effects of other hormones on the composition and metabolic activity of skin polysaccharides are reported.

III. Labelled glucose appeared first in the galactosamine moiety of the light mucoprotein fraction of cartilage. Isotope disappeared rapidly from this fraction with an accompanying appearance in the insol. residue. Chondroitin sulphate made up approx. 80% of the total polysaccharide and appeared to be relatively inert. Isotope appeared in chondroitin sulphate before keratosulphate indicating that the 2 polysaccharides did not represent part of the same macromolecular structure but this was not established. Effects of several hormones on the incorporation and turnover of isotope are reported.

B.M.Stevens

170. VITAMIN A AND MUCOPOLYSACCHARIDE BIO-SYNTHESIS BY CELL-FREE PARTICLE SUSPENSIONS.

G.Wolf, J.G.Bergan and P.R.Sundaresan: Biochim. biophys. Acta, 1963, 69, 524-532 (Radiocarbon Lab., Univ. Illinois, Urbana, 111., U.S.A.) Particles sedimented from colon homogenates at 20000 x g after debris removal at 1000 x f. synthesised mucopolysaccharide-bound hexosamines from glucose 6-phosphate [G-6-P], glutamine, ATP, UTP, NAD and Mg. Whole homogenate required at least ATP, UTP and NAD absolutely, particles required G-6-P and Mg. 2*8 jmoles hexosamine were formed/100 mg. homogenate protein in 3 hr. incubation at 37°. Corresponding amounts for 20000 x g particles and for microsomes plus cell sap were 7*3 pmoles and 0*6 jmmole. The particles were histol. cell-free and showed no bacterial contamination. Hexosamine formation was approx. linearly related to amount of particle protein. Synthesis was lower if UDP-glucuronic acid and UDP-acetylglucosamine replaced G-6-P. Homogenates from vit. A deficient rats produced 0*27 fmole/100 mg. protein and particles less than 0*1 fmole. A metabolite of vit. A acid, but not vit. A, restored.

B.M.Stevens

171. COMPARATIVE STUDIES ON CARTILAGE AMINO-POLYSACCHARIDE SULPHATES. I. POLYSACCHARIDES FROM SHARK, SKATE, DOGFISH AND FIN WHALE.

A.G.Lloyd, K.S.Dodgson and R.G.Price: Biochim. biophys. Acta, 1963, 69, 496-504 (Dept. Biochem., Univ. Wales, Cardiff, Wales) Adult blue shark, skate and dogfish cartilage contained material corresponding to chondroitin sulphate and keratosulphate. Each of the aminopolysaccharides was characterised by the presence of fractions of widely differing SO₄ content. The polysaccharide mixture from fin whale cartilage had chondroitin sulphate A as major constituent and chondroitin

BIOCHEMISTRY

sulphate C and keratosulphate in substantially lower amounts. B.M.Stevens

172. ROLE OF NON-COLLAGEN COMPONENTS IN THE MECHANICAL BEHAVIOUR OF TENDON FIBRES. F.R.Partington and G.C.Wood: *Biochim. biophys. Acta.* 1963, 69, 485-495 (Rheumatism Res. Centre, Univ. Manchester, England) Determination of load-extension curves of rat tail tendon fibres showed that if extension was restricted to 2% the slope of the linear portion of the curves was unchanged in successive tests. Trypsin and pure hyaluronidase had no significant effect on the slope. Less pure prep. of hyaluronidase did not change the slope. Damage to the fibres thus indicated appeared to be due to the presence of enzymic impurities which attacked the non-collagenous protein of the inter-fibrillar matrix. This non-collagenous protein appeared to be important in stabilising the fibres. B.M.Stevens

173. HETEROGENEITY OF URINARY ACID MUCOPOLYSACCHARIDES. W.R.Kelley, I.B.Ponct and N.di Ferrante: *Nature, Lond.*, 1963, 197, 1204-1206 (Dept. Physiol., Coll. Med., Univ. Cincinnati, Ohio, U.S.A.) Human urinary acid mucopolysaccharides were digested with papain and chromatographed on Dowex. The hexuronic acid-containing material was further purified on 'ECTEOLA' cellulose column. The presence of a mucopolysaccharide containing glucosamine and neutral sugars is suggested. A different degree of sulphation was apparent in the hexuronic acid-containing fractions. G.M.Lewis

174. HEXOKINASE OF WHITE ADIPOSE TISSUE. D.L.Dipietro: *Biochim. biophys. Acta*, 1963, 67, 305-312 (Baker Clinic Res. Lab., Dept. Med., Harvard Med. Sch., Boston, Mass., U.S.A.) Apparent Km for glucose and fructose, estimated by determining the rate of hexose C-1 oxidation through the hexose monophosphate shunt with added glucose 6-phosphate dehydrogenase and NADP, were 0.07mM and 3mM respectively. A summation of reaction rates was not observed when both sugars were present. Glucose competitively inhib. fructose phosphorylation, although fructose had little or no effect on glucose phosphorylation. The enzyme required ATP specifically and was activated by Mg and Mn. Glucose phosphorylation rates of 30-60 /imoles/min./g. adipose tissue N were observed. B.M.Stevens

175. GALACTOKINASE FROM E. COLI. J.R.Sherman and J.Adler: *J. biol. Chem.*, 1963, 238, 873-878 (Dept. Biochem., Univ. Wisconsin, Madison, Wis., U.S.A.) The kinase is purified approx. 35-40 fold from sonic extracts of the organism. It requires galactose, ATP, and divalent cations and has optimum pH near 8. Equal amounts of galactose 1-phosphate and ADP are formed in the reaction. Near to equilibrium the reaction is approx. 85% complete under specified conditions. This galactokinase is a small protein similar in size to that from yeast, rat liver, and human cells. Several galactokinaseless mutants of *E. coli* contain less than 0.03% of the activity of the bacteria that contain the enzyme. J.N.Ashley

176. PARTIAL CHARACTERISATION OF HEXOKINASE FROM EUGLENA GRACILIS VAR. BACILLARIS. M.M.Belsky and J.Schultz: *J. Protozool.*, 1962, 9, 195-200 (Dept. Biol., Brooklyn Coll., Brooklyn, N.Y., U.S.A.) The enzyme extract was prep. by the glass bead method. The partially purified hexokinase from *E. gracilis* had the following properties; pH optimum

8.0-8.5; an ab's. requirement for Mg and ATP with Mn, Co, Zn and Ca less active or inactive; an apparent Km (glucose) of 5×10^{-4} M; the enzyme was not inhib. by sulphydryl agents but was 24% inhib. by ADP. The relative rates of phosphorylation by the enzyme were: glucose, 1.0; fructose, 1.19; mannose, 0.56. This enzyme prep. was found to also contain phosphohexose isomerase activity. It is concluded that the enzyme activity is localised in the cytoplasmic or small-particle fraction of the cell. *Euglena* hexokinase appears to resemble yeast rather than muscle hexokinase.

R.J.Walker

177. THE POST-NATAL DEVELOPMENT OF HEPATIC FRUCTOKINASE. D.G.Walker: *Biochem. J.*, 1963, 87, 576-581 (Dept. Biochem., Univ. Birmingham, England) Sp. fructokinase is absent from foetal liveis of rats, rabbits and guinea-pigs, and develops immediately after parturition, reaching adult levels of activity 7-10 days later. Fructose tolerance is greatly lowered in the new-born rabbit. This post-natal appearance of hepatic fructokinase in all spp. examined cannot be the reason for the presence of fructose in foetal fluids of only certain spp. *

178. CONSTITUTIVE ALDOSE DEHYDROGENASE IN PSEUDOMONAS FRAGI. R.Weinberg: *Biochim. biophys. Acta*, 1963, 67, 349-358 (Pioneering Lab. Microbiol. Chem., Northern Reg. Res. Lab., Peoria, Ill., U.S.A.) The enzyme was particulate. All sugar substrates were oxidised by a single enzyme to the γ -lactone of the corresponding aldonic acid. Growth was correlated rather with metabolism of the sugar acid than with the sugar oxidation. The enzymes oxidising sugar acids and D-arabinose had different prop., being sol., formed by induction and highly sp. for their individual substrates. B.M.Stevens

179. CHANGES IN LIVER D-GLUCURONOLACTONE DEHYDROGENASE ACTIVITY. C.A.Marsh and A.J. Cam: *Nature, Lond.*, 1963, 197, 1298-1299 (Rowett Res. Inst., Bucksburn, Aberdeen, Scotland) D-Glucuronolactone dehydrogenase in mouse liver increases with age and pregnancy and decreases in animals bearing expt. tumours. G.M.Lewis

180. RIBITOL 5-PHOSPHATE DEHYDROGENASE FROM LACTOBACILLUS PLANTARUM. L.Glaser: *Biochim. biophys. Acta*, 1963, 67, 525-530 (Dept. Biol. Che¹, Washington Univ. Sch. Med., St. Louis, Mo., U.S.A.) The partial purification of an *L. plantarum* (ATCC 8014; enzyme catalysing the reversible reaction of D-ribitol 5-phosphate with NAD or NADP to give D-ribulose 5-phosphate with NADH₂ or NADPH₂ and H) is described. B.M.Stevens

181. PURIFICATION AND PROPERTIES OF GLUCOSE 6-PHOSPHATE DEHYDROGENASE FROM HUMAN. R.B.C. D.Balinsky and R.E.Bernstein: *Biochim. bio²* Acta, 1963, 67, 313-315 (Electrolyte and Metabolic Res. Unit, South African Inst. for Med. Res., Johanna³, burg, S. Africa) A modification and extension of the method of Marks et al. gave 2000- to 3000-fold purification; on 1 occasion 8300-fold purification was achieved. B.M.Stevens

182. RIBITOL DEHYDROGENASE IN AEROBACTER AEROGENES 1033. S.B.Hulley, S.B.Jorgensen and E.C.C.Lin: *Biochim. biophys. Acta*, 1963, 67, 212-225 (Dept. Biol. Chem., Harvard Med. Sch., Boston Mass., U.S.A.) The enzyme acted only on ribitol but was induced by ribitol or D-arabinol providing that

BIOCHEMISTRY

19

latter was metabolised. A mutant producing ribitol dehydrogenase constitutively was isolated, although catabolite repression still exerted its influence. Ribitol dehydrogenase was obligatory for ribitol utilisation either aerobically or anaerobically. Anaerobically, the growth rate on ribitol was severely limited by inadequate H acceptors. The addition of fumarate stimulated.

B.M.Stevens

183. NEURAMINIDASE IN MAMMALIAN BRAIN.

E.H.Morgan and C.-B.Laurell: Nature, Lond., 1963, 197, 921-922 (Dept. Clin. Chem., Malmo Gen. Hosp., Univ. Lund, Malmo, Sweden) Fresh homogenates of feline-pig, bovine or human brain release sialic acid on incubation at 37°. It is postulated that this release is due to the action of a brain neuraminidase, since it is ^evented by heating to 100°, and has a definite pH optimum between pH 3.5-4.0. G.M.Lewis

184. SEPARATION OF KETOSE AND ALDOSE BY CHROMATOGRAPHY ON AN ION EXCHANGE COLUMN.

S.Adachi and H.Sugawara: Arch. Biochem., 1963, 100, 468-471 (Lab. Animal Products Technol., Coll. Agric., Tohoku Univ., Sendai, Japan) A modification on the Samuelson-Sjöström method for isolating monosaccharides using anion exchanger in HSO₃⁻ form used for the separation of mono- or di-saccharide ketoses and aldoses in preparative amounts. Stepwise elution with 75% n-propanol and water was used.

B.M.Stevens

185. PURIFICATION AND PROPERTIES OF INVERTASE OF NEUROSPORA. R.L.Metzenberg: Arch. Biochem., 1963, 100, 503-511 (Dept. Physiol. Chem., Univ. Wisconsin, Madison, Wis., U.S.A.) Invertase purified from *N. crassa* contained little or no mannose but small amounts of hexosamine were detected. The enzyme had an unusually high extinction at 280 mji. Physical and kinetic prop. are reported. B.M.Stevens

186. ACTIVATION OF α -GLUCAN PHOSPHORYLASE AND RELATED METABOLIC CHANGES IN DOG MYOCARDIUM FOLLOWING ARREST OF BLOOD FLOW. A.Wollenberger and E.-G.Krause: Biochim. biophys. Acta, 1963, 67, 337-340 (Deutsche Akad. der Wissenschaften zu Berlin, Arbeitsstelle für Kreislauforschung, Berlin-Buch, Germany) Prelim. comm. B.M.Stevens

187. ENZYMIC DEGRADATION OF GANGLIOSIDES. S.R.Korey and A.Stein: Life Sci., 1963, No. 3, 198-203 (Dept. Neural., Einstein Coll. Med., New York, U.S.A.) Rat brain n-butanol extracted gangliosidase degraded poly- and mono-sialogangliosides. Gangliosidase present is believed to be impure, although it is known to have independent neuraminidase and glycosidase activities. K.Jones

188. SOLUBILISATION AND ACTIVATION OF LIVER GLUCURONYLTRANSFERASE BY EDTA. E.Halac and E.Bonevardi: Biochim. biophys. Acta, 1963, 67, 498-500 (Dept. Microbiol., New York Univ. Sch. Med., New York, U.S.A.) B.M.Stevens

189. ENZYMIC SYNTHESIS OF SIALYL-LACTOSE. G.Wjourdian, D.M.Carlson and S.Roseman: Biochem. biophys. Res. Comm., 1963, 10, 352 (Rockham Arthritis Res. Unit, and Dept. Biol. Chem., Univ. Michigan, Ann Arbor, Mich., U.S.A.) Results indicated that sialyl-lactose (2-3) was enzymically synthesized when a washed particulate fraction of rat mammary gland was incubated with cytidine monophospho-sialic acid and lactose. B.Ketterer

190. PROTEOLYTIC ACTIVATION OF GLUCOSE 6-PHOSPHATASE IN NORMAL, DIABETIC AND HEPATIC RAT LIVERS. E.Heise and M.Görlich: Nature, Lond., 1963, 197, 1311-1312 (Dept. for Expt. Chemotherapy, Robert Rossle Clinic, Inst. Med. and Biol., German Acad. Sci., Berlin-Buch, Germany)

The activation of glucose 6-phosphatase by trypsin in homogenates and isolated microsomes from rat liver occurs to the same degree in normal and alloxan-diabetic animals. In rats bearing hepatomas induced by dimethylaminoazobenzene, glucose 6-phosphatase activity was very low and not increased by trypsin.

G.M.Lewis

191. GLUCOSAMINE 6-PHOSPHATE DEAMINASE ACTIVITY DURING CONNECTIVE TISSUE GROWTH.

T.N.Sekhara Varma and B.K.Bachhawat: Biochim. biophys. Acta, 1963, 69, 464-471 (Neurochem. Lab., Dept. Neurol. and Neurosurgery, Christian Med. Coll. Hosp., Vellore, India) Glucosamine 6-phosphate deaminase, which reversibly degraded glucosamine 6-phosphate to fructose 6-phosphate and NH₃, was present in connective tissue developed by s.c. implantation of cotton pellets. Some prop. of the enzyme are described. Carrageenin had no effect on the induction of the enzyme during granulomata development. Pharmacol, high doses of cortisone inhib. the enzymic activity both in ordinary granulomata and those induced by carrageenin.

B.M.Stevens

192. ENZYMIC MODIFICATION OF PHENYLAZOBENZOYL-TAKA-AMYLASE A [PhAB-TAA]. I. ISOLATION OF THE PROTEOLYTICALLY MODIFIED PhAB-TAA.

H.Toda and S.Akabori: J. Biochem., Tokyo, 1963, 53, 95-101 (Inst. Protein Res., Univ. Osaka, Japan) Although Taka-amylase A was resistant to proteolytic enzymes PhAB-TAA containing 1 mole of phenylazobenzoyl/mole protein was susceptible to proteases. Changes in sp. optical rotation and reduced *n* also accompanied the introduction of the phenylazobenzoyl group. PhAB-TAA was partially degraded with 'pronase' and the modified material was cryst. and isolated. Chromatographic behaviour and homogeneity were examined using DEAEcellulose.

B.M.Stevens

193. ACTION PATTERN AND SPECIFICITY OF AN AMYLASE FROM BACILLUS SUBTILIS. J.Robyt and D.French: Arch. Biochem., 1963, 100, 451-467

(Dept. Biochem. and Biophys., Iowa State Univ., Ames, Iowa, U.S.A.) The cryst. a-type amylase showed a dual product specificity for the formation of maltotriose and maltohexaose when allowed to act on amylose, amylopectin, glycogen, 3-amylase limit dextrins, pure individual maltodextrins and cyclic Schardinger dextrins. The dual specificity was pronounced with amylopectin. Nature, amounts and sequences of products were determined by qual. and quant. paper chromatography. Distributions of products from the interior segments of amylopectin and glycogen differed completely from the distribution of products from amylose. Reactions of the maltodextrins were highly sp. and dependent on the mol. size.

B.M.Stevens

194. RATE-DETERMINING NATURE OF ALDOLASE IN GLYCOLYSIS BY RAT-BRAIN PREPARATIONS.

E.G.Brunngraber and J.Iannantuoni: Biochem. J., 1963, 87, 624-631 (Illinois State Psychiatric Inst., Chicago, Ill., U.S.A.) Cell sap and mitochondrial prep, from rat-brain homogenates glycolyse without inactivation at low enzyme concn. Published reports of such inactivation could not be confirmed. In the absence of added yeast

BIOCHEMISTRY

hexokinase, the rate-limiting steps in the glycolytic sequence are the hexokinase reaction and the availability of ADP. The addition of cryst. yeast hexokinase stimulates glycolysis two- to five-fold, lowers the ATP-ADP ratio, and aldolase becomes rate-limiting. The accumulation of fructose 1,6-diphosphate, the fructose 1,6-diphosphate:those phosphates ratio, stimn. of glycolysis by added aldolase, and the high rate of the 3-phosphoglycerate \rightarrow pyruvate and the glucose \rightarrow fructose 1,6-diphosphate sequences in glycolysis compared with overall glycolysis are cited as evidence of the rate-limiting nature of the aldolase under conditions in which the glycolytic system of cell-sap or cell-sap plus mitochondria was supplemented with added yeast hexokinase.

195. ENZYMIC SYNTHESIS OF COLOMINIC ACID.
D.Aminoff, F.Dodyk and S.Roseman: J. biol. Chem., 1963, 238, PC1177-1178 (Rackham Arthritis Res. Unit, Univ. Michigan, Ann Arbor, Mich., U.S.A.)

Net synthesis of colominic acid (a homopolymer of N-acetylneuraminic acid) occurs when a cell-free particulate prep, from *E. coli* K235 is incubated with cytidine 5'-monophospho-N-acetylneuraminic acid.

J.N.Ashley

196. GLUCOKINASE AND HEXOKINASE IN LIVER IN RELATION TO GLYCOGEN SYNTHESIS. E.Vfiuela. M.Salas and A.Sob: I. biol. Chem., 1963, 238, PC1175-1177 (Dept. Enzymol., Inst. MarShón, Centro de Investigaciones Biológicas, C.S.I.C., Madrid, Spain) The 2 enzymes in rat liver that phosphorylate glucose are separated. One is a typical animal hexokinase; the other has unique prop, and is best designated as a glucokinase, although it readily phosphorylates mannose. Glucokinase forms glucose 6-phosphate as primary product, which is not inhibitory. Glucokinase disappears in animals deprived of food and is absent from diabetic animals.

J.N.Ashley

LIPIDS AND STEROIDS

197. ISOLATION AND CHARACTERISATION OF SATURATED AND UNSATURATED FATTY ACIDS AND ALCOHOLS OF HUMAN SKIN SURFACE LIPIDS. E.Haahti and E.C.Horning: Scand. J. din. Lab. Invest., 1963, 15, 73-78 (Dept. Med. Chem.. Univ. Turku, Finland) Four types of sat. branched chain and branched monounsat. fatty acids from C3.4 to C18 were found in human skin surface lipid. in addition to acids earlier reported. Correspondingly, at least 4 types of branched chain alcohols were detectable, as well as both straight and branched chain monounsat. alcohols in the regiof of C10 to C24.

K.Jones

198. FATTY ACID METABOLISM IN SERRATIA MARCESCENS. IV. THE EFFECT OF TEMPERATURE ON FATTY ACID COMPOSITION. D.G.Bishop and J.L.StUI: J. lipid Res., 1963, 4, 87-90 (Dept. Biochem., Univ. Sydney, Australia) Three medium-chain hydroxy acids in *S. marcescens* grown at 30° are very much reduced in cells grown at 37°. The content of unsat. and cyclopropane acids is the same at 30° and 37°. As the synthesis of unsat. and cyclopropane acids in micro-organisms requires hydroxy acids as intermediates it is suggested that the temp. sensitive reaction is one which

leads to the trapping of hydroxy acids in a bound form. 12 unidentified acids are present in *S. marcescens* grown at 30°. These acids comprise 36% of the total fatty acids of the free lipids but are not found in cells grown at 37°.

J.R.Sargent

199. COMPLEXITY OF MIXTURE OF FATTY ACIDS FROM TUBERCLE BACILLUS. C16 AND C17 ACIDS FROM VIRULENT STRAINS. J.Cason and W.T.Miller: J. biol. Chem., 1963, 238, 883-887 (Chem. Lab., Univ. California, Berkeley, Calif., U.S.A.)

The n-C16 acid fraction from a virulent strain of tubercle bacillus contains approx. 1% of hexadec-10-enoic acid. The branched chain C17 acid fraction contains approx. 20% of 10-methylhexadec-9-enoic acid. The sat. acids in this branched fraction consist of approx. equal amounts of 8- and 10-methylhexadecanoic acids. These virulent tubercle bacilli seem to have a more complicated bio-genetic pathway than has been found for *Mycobacterium phlei*.

J.N.Ashley

200. BIOSYNTHESIS OF LONG CHAIN SATURATED AND UNSATURATED FATTY ACIDS IN ISOLATED PLANT LEAVES [MAINLY RICINUS COMMUNIS]. A.TJames: Biochim. biophys. Acta, 1963, 70, 9-19 (Nat. Inst. Med. Res., Mill Hill, London, England) Labelled acetic, octanoic, decanoic, dodecanoic, tetradecanoic, 9-octadecenoic, hexadecanoic and octadecanoic acids were incorporated into the sat. and unsat. lipid fatty acids. All except the last 2 were precursors of oleic, linoleic and linolenic acids. No oleic acid was synthesised without O₂. Two separate pools of longer chain fatty acids are suggested to exist. In 1, myristic acid is converted to palmitic and stearic acids which are esterified to galactolipid and phospholipid. In the other, myristic acid is converted to palmitic and stearic acids and finally to oleic acid which alone is available for esterification to combined lipid or conversion to linoleic and linolenic acids.

B.M.Stevens

201. BIOSYNTHESIS OF LONG CHAIN FATTY ACIDS

BY LETTUCE CHLOROPLAST PREPARATIONS.

P.K.Stumpf and A.TJames: Biochim. biophys. Acta# 1963, 70, 20-32 (Nat. Inst. Med. Res., London, England) The major site for biosynthesis of sat. C10*-C18 fatty acids and oleic acid in leaves was the chloroplast. In the presence of light, ATP, CoA, Mg, CO₂ *nd inorg. phosphate were required. In the dark synthesis was greatly diminished. NH₃ or 3(p-chlorophenyl)l, 1-dimethylurea, but not DNP, inhibited. Anaerobically, oleic acid biosynthesis was markedly decreased, but sat. acid biosynthesis was relatively unaffected. Isolated chloroplasts were less effective than intact leaves at utilising C8, C10, C12 and C14 sat. fatty acids for oleic acid biosynthesis. Malonic and a-cetic acids were readily utilised.

B.M.Stevens

202. SYNTHESIS OF FATTY ACIDS BY RAT LIVER

SLICES IN TRITIATED WATER. D.W.Foster and

B.Bloom: J. biol. Chem., 1963, 238, 888-892 (Nat. Inst. Arthritis and Metabol. Dis., Bethesda, Md., U.S.A.)

After rat liver slices are incubated in a medium that contains [³H]water, most of the ³H in the isolated long chain fatty acids is present in stearic and palmitic acids, and more ³H is present in the odd, than in the even, numbered C. An exchange reaction, ^³H is essentially complete, probably occurs between Na⁺³H₂O and water before or during synthesis of fatty acids.

J.N.Ashley

203. BIOSYNTHESIS OF ODD- AND EVEN-NUMBERED CEREBROSIDE FATTY ACIDS: EVIDENCE FOR TWO ROUTES. A.K.Hajra and N.S.Radin: Biochim. biophys. Acta, 1963, 70, 97-99 (Mental Health Res. Inst., Univ. Michigan, Ann Arbor, Mich., U.S.A.)

A similar pair of steps appeared to be involved in the formation of lignoceric and cerebronic acids and their close homologues whilst the C-23 a-OH acid and possibly other OH acids appeared to be made by a $C\pm$ degradation of a longer acid. Prelim, comm. B.M. Stevens

204. CONVERSION OF AROMATIC AMINO ACIDS TO FATTY ACIDS BY ADIPOSE TISSUE. D.D.Feller and E.Feist: Biochim. biophys. Acta, 1963, 70, 85-86 (Radioisotope Service, V.A. Hosp., Seattle, Wash., U.S.A.) B.M.Stevens

205. ENZYMIC FORMATION OF FATTY ACID AMIDES OF ETHANOLAMINE BY RAT LIVER MICROSONES. M.Colodzin, N.R.Bachur, H.Weissbach and S.Udenfriend: Biochem. biophys. Res. Comm., 1963, 10, 165 (Lab. Clin. Biochem., N.H.Inst., Bethesda, Md., U.S.A.) A microsomal fraction from the rat liver catalyses the formation of palmityl ethanolamide and ω -er fatty acid amides. The requirements for this system are given. B.Ketterer

206. FATTY ACID METABOLISM IN SERRATIA MARCESCENS. III. THE CONSTITUENT FATTY ACIDS OF THE CELL. D.G.Bishop and J.L.Still: J. Upid Res., 1963, 4, 81-86 (Dept. Biochem., Univ. Sydney, Australia) An analysis of the lipids of the bacterium *Sunarcescens* has shown that palmitic acid and 9,10-Jtoethyene-hexadecanoic acid constitute about $l\&J_0$ of the ω -tel fatty acids. Monounsat. acids account for only about $J^0\%$ of the total fatty acid and consist predominantly of "10-hexadecenoic acid (palmitoleic acid) and 11,12-Tptadecenoic acid (vaccenic acid). Three hydroxy acids that may function as intermediates in the biosynthesis of unsat. fatty acids have also been isolated and characterised. J.R.Sargent

207. CONVERSION OF GLYCINE TO FATTY ACIDS BY ADIPOSE TISSUE. D.D.Feller and E.Feist: Proc. Soc. exp. Biol., N.Y., 1962, 111, 18-21 (Radioisotope Serv., V.A. Hosp., Univ. Washington, Seattle, Wash., U.S.A.) In vitro synthesis of fatty acids in adipose tissue shows that glycine can be a precursor. M.M.Shapland

208. RELATIVE INCORPORATION OF THE VARIOUS PROPIONATE CARBONS INTO FATTY ACIDS BY UCTATING RAT MAMMARY GLAND. P.Cady, S.Abraham and I.L.Chaikoff: Biochim. biophys. Acta, 1963, 70, 118-131 (Dept. Physiol., Univ. California, Berkeley, Calif., U.S.A.) Without glucose, slices incorporated ^{14}C most rapidly from $[2-14]C$ propionate. Δ^2 glucose, fatty acid synthesis from all 3 C was inhibited and incorporation from te- l^1C propionate became as rapid as that from $[2-14]C$ propionate. Low Δ^2 late conc. to the presence of glucose depressed ^{14}C incorporation from $[1-14]C$ propionate; higher acetate Δ^2 cn. depressed conversion from all the propionate C. Even-chain and odd-chain fatty acids were shown by chromatographic analysis to be synthesised from each the propionate C. B.M.Stevens

209. U-OXIDATION OF FATTY ACIDS IN VITRO. I. OVERALL REACTION AND INTERMEDIATE. Δ^2 Wakabayashi and N.Shimazono: Biochim. biophys.

Acta, 1963, 70, 132-142 (Dept. Biochem., Fac. Med., Univ. Tokyo, Japan) ID-Oxidation of straight chain fatty acids was demonstrated in cell free systems from guinea-pig liver. The 6000 x ℓ supernatant fraction was the most active. Incubation of sorbic acid amide, octatrienoic acid amide or capric acid amide with this fraction. NAD and an NADPH₂ generating system produced the corresponding dicarboxylic acid monoamides which were detected by paper chromatography. Incubation of $[2-14]C$ sorbic acid amide with microsomes yielded Δ^2 hydroxy $[2-14]C$ sorbic acid amide. A 105000 XJJ supernatant oxidised Δ^2 hydroxysorbic acid amide to muconic acid amide. The hydroxylating reaction required NADPH₂ and O₂. Catalase did not inhibit. B.M.Stevens

210. INHIBITION OF FATTY ACID SYNTHESIS DURING STARVATION AND ALLOXAN DIABETES. II. FATTY ACID SYNTHESIS IN THE LIVER OF RATS WITH ALLOXAN DIABETES. O.Wieland, L.Neufeldt, S.Numa and F.Lynen: Biochem. Z., 1963, 336, 455-459 (II Med. Univ., Munchen, Germany) Particle-free extracts from livers of male Sprague-Dawley rats made diabetic by i.v. injn. of alloxan (40 mg./kg. body wt.) showed decreased activities of the total system for fatty acid synthesis (from acetate) and of acetyl carboxylase (from acetyl Co A). (German) L.Cohn

211. IN VITRO PRODUCTION OF NON-ESTERIFIED FATTY ACIDS DURING INCUBATION OF VARIOUS TYPES OF ADIPOSE TISSUE FROM FASTING AND FED RATS. I. MOBILISATION OF FATTY ACIDS FROM EPIDIDYMAL, PERINEPHRIC AND SUBCUTANEOUS ADIPOSE TISSUE. C.Munkner: Scand. J. clin. Lab. Invest., 1963, 15, 83-80 (2nd Clin. Intern. Med., Arhus Univ. Sch. Med., Arhus, Denmark) Three kinds of adipose tissue from fasting and fed rats released const. amount of non-esterified fatty acids [NEFA] in vitro. Under various expt. conditions, a difference was found in this mobilisation or assimilation of fatty acids. In all adipose tissues the liberation of fatty acids was inhib. by feeding, and also by the addition of glucose + insulin or of oleate to the medium. Adrenaline increased the liberation of NEFA considerably. K.Jones

212. SYNTHESIS BY THE RAT OF C20 AND C22 POLYEN-ACIDS FROM A¹, 7,10,13-HEXADECATETRAENOIC ACID. E.Klenk: Hoppe-Seylers Z. Physiol. Chem., 1963, 331, 50-55 (Physiol. Chem. Inst., Univ., 5 Köln-Lindenthal, Germany) With the aid of gas chromatography and u.v. spectroscopy. C20 pentaenoic acid and C22 hexaenoic acid were identified in the liver phosphatides of rats after a feeding period of 28 days. (German) L.Cornish

213. INCORPORATION IN VITRO OF $[14]C$ PALMITATE INTO GLYCEROLIPIDS BY VARIOUS CELL COMPONENTS. R.M.Johnson and L.Kerur: Biochim. biophys. Acta, 1963, 70, 152-156 (Inst. Nutr. and Food Technol., Ohio State Univ., Columbus, Ohio, U.S.A.) ^{14}C incorporation into triglycerides, ethanolamine phosphatides and choline phosphatides varied, depending on whether whole homogenates, mitochondria or microsomes plus cytoplasmic supernatant were used and also depending on whether fractions came from normal or from 3 day * regenerating' rat liver. B.M.Stevens

214. INCORPORATION OF $[1-14]C$ LINOLEIC ACID INTO LIPIDS OF POLYMORPHONUCLEAR LEUCOCYTES. P.Elsbach: Biochim. biophys. Acta, 1963, 70, 157-167 (Dept. Med., New York Univ. Sch. Med.. New

BIOCHEMISTRY

York, U.S.A.) W.b.c. from rabbit peritoneal exudates incorporated [$1-14\text{C}$]linoleic acid when incubated in vitro with linoleic acid bound to albumin. Almost all the ^{14}C appeared in cell lipid in the esterified form, both as phospholipid and as non-phospholipid. 14CO_2 was evolved and amounts of water-sol. radioactivity in water washes of lipid extracts of the w.b.c. increased. Uptake ceased at low temp, and was markedly diminished by inhibn. of anaerobic glycolysis. Interference with oxidative metabolism did not inhibit accumulation.

B.M. Stevens

215. EFFECTS OF PALMITATE ON THE METABOLISM OF W.B.C. FROM GUINEA-PIG EXUDATE. W.H.Evans and P.S.Muellec: *J. lipid Res.*, 1963, 4, 39-45 (Lab. Biochem., Cytochem. Section, Nat. Cancer Inst., Bethesda, Md., U.S.A.) Addition of palmitate to polymorphonuclear w.b.c. in the presence of serum albumin leads to uptake of palmitate and increased O_2 consumption by the cells. These 2 effects were inhib. by fluoride and iodoacetate but not by cyanide or dinitrophenol. Glucose caused a 39% inhibn. in the O_2 uptake by cells (Crabtree effect) in the absence of palmitate; no Crabtree effect occurred in the presence of palmitate. Palmitate had no significant effect on O_2 uptake of guinea-pig circulating blood w.b.c. and no net palmitate uptake was observed with such cells. J.R. Sargent

216. METABOLISM OF GLYCEROLIPIDS. m. REACTIVITY OF VARIOUS ACYL ESTERS OF COENZYME A WITH tt' -ACYLGLYCEROPOHOSPHORYLCHOLINE, AND POSITIONAL SPECIFICITIES IN LECITHIN SYNTHESIS. W.E.M.Lands and I.Merkel. IV. SYNTHESIS OF PHOSPHATIDYLETHANOLAMINE. L.Merkel and W.E.M.Lands: *J. biol. Chem.*, 1963, 238, 898-904, 905-906 (Dept. Biol. Chem., Univ. Michigan, Ann Arbor, Mich., U.S.A.) m. Rat liver microsomes catalyse transfer of acids from their acyl CoA deriv. to the β -hydroxyl group of tt' -acylglycerophosphorylcholine to form lecithin. Unsat. react more rapidly than sat. acyl CoA esters. Hydrolysis of acyl CoA in this system is not due to transfer of the acyl group to water by the acyl transferase, but to a separate hydrolytic enzyme with different kinetic prop. Acyl transfer occurs with preferential esterification of sat. fatty acids with the OL' -hydroxyl group and of unsat. acids with the β -hydroxyl group.

IV. Stereos. labelled diacylglycerophosphorylethanolamirie may be synthesised from either OL' or β -acyl-glycerophosphorylethanolamine [AGPE] by use of a rat liver microsomal prep. Linoleate is a better substrate than stearate for esterification of OL' -AGPE, whilst the reverse is true for the β -AGPE. J.N.Ashley

217. STUDIES ON FATTY LIVER INDUCTION BY 4-AMINOPYRAZOLOPYRIMIDINE. J.F.Henderson: *J. lipid Res.*, 1963, 4, 68-74 (Dept. Pharmacol., George Washington Univ. Sch. Med., Washington, D.C., U.S.A.) Injn. of 4-aminopyrazolopyrimidine (APP) into mice increased total liver lipids. The increase was largely accounted for as neutral lipid. Phospholipid was unchanged. APP inhib. incorporation of [14C]acetate into lipids of liver slices in vitro but oxidation of [^{14}C]acetate or [14C]palmitate by slices in vitro was unaffected. APP decreased total lipid levels in plasma, this being accounted for entirely by clearance in triglycerides and cholesterol. APP markedly inhib. incorporation of [14C]orotic acid into RNA but not of [14C]glycine into proteins of liver and plasma. Hyperlipaemia

elicited by Triton WR-1339 was inhib. by APP.

J.R. Sargent

218. INCORPORATION OF [14C]FORMATE INTO EHRLICH ASCITES TUMOUR LIPIDS. G.V.Marinetti and E.R.M.Kay: *Biochim. biophys. Acta*, 1963, 70, 168-175 (Dept. Biochem., Univ. Rochester Sch. Med. and Dent., Rochester, N.Y., U.S.A.) The time course of incorporation into nuclear and cytoplasmic HP^{id} was examined. Paper chromatography and hydrolysis indicated that phosphatidylserine and, to a lesser extent, phosphatidylethanolamine were the most active phosphatides. However, after 3 hr. incubation ninhydrin-neg.i P-free lipids contained most of the radioactivity. These lipids released fatty acids and ninhydrin-pos., water-sol. labelled compounds only after prolonged hydrolysis, and had paper chromatographic prop, differentiating them from all known neutral lipids and phosphatides. They were tentatively identified as fatty acid amides of amino acids or peptides. Decarboxylation of phosphatidylserine to phosphatidylethanolamine and direct methylation of phosphatidylethanolamine to lecithin were not major metabolic pathways. B.M.Stevens

219. PRESENCE OF ORNITHINE IN BACTERIAL LIPIDS. M.-A.Lanéelle, G.Lanéelle and J.Asselineau: *Biochim. biophys. Acta*, 1963, 70, 99-101 (Lab. Chim. biol., Fac. Sci., Toulouse, France) In *Mycobacterium* No. 1217, ornithine was not a constituent of phospholipid but was found in combination with fatty acids whose prop. of solubility and adsorbability made separation from phospholipid difficult. Prelim, comm.

(French) B.M.Stevens

220. DISTRIBUTION OF INORGANIC PHOSPHATE [Pi] IN A BIPHASIC SYSTEM CONSISTING OF CHLOROFORM-MET HANOL-WATER. H.Bader: *Biochim. biophys. Acta*, 1963, 70, 87-89 (Inst. Chim. Biol.. Fac. Med., Strasbourg, France) The cleaning of Pi from lipids was better the lower the Pi in the extracted material, the higher the pH of the wash water and the lower the % of methanol in the total mixture.

B.M.Stevens

221. A COLORIMETRIC METHOD FOR THE QUANTITATIVE MEASUREMENT OF TOTAL LIPIDS IN TISSUES. R.P.Dales: *Nature*, Lond., 1963, 197, 1120-1121 (Dept. Zool., Bedford Coll., London, England) Consistent results in the quant. estimation of oil in a tissue may be made within an accuracy of 2% down to least 2 mg. oil by satn. of the lipid with Oil Red O dissolved in triethyl phosphate with addition of a few drops of Teepol. The excess colourant is removed by extract^{at} in water and the dye dissolved in the lipid is estimated^{given} colorimetrically. G.M.Lewis

222. MIGRATION OF AN ACYL GROUP IN GLYCEROL DERIVATIVES. IV. MIGRATION OF AN ACYL GROUP UPON BOILING OF GLYCEROL DERIVATIVES WITH A MIXTURE OF ACETIC ANHYDRIDE AND ACETIC ACID. M.A.Hoefnagel, A.van Veen and P.E.Verkaade: *Rec. Trav. chim. Pays-Bas*, 1962, 81, 461-464 (Ost-Chem. Lab., Technical Univ., Delft, Netherlands).

G.C.Barr

223. FACTICE CHROMATOGRAPHY: AN AUTOMATICALLY MONITERED, LIQUID-GEL SYSTEM FOR SEPARATION OF NON-POLAR LIPIDS. J.Hirsch: *J. lipid Res.*, 1963, 4, 1-10 (Rockefeller Inst., New York, U.S.A.) A chromatographic system for separation of cholesterol, esters, triglycerides, diglycerides and monoglycerides is comprised of a liquid gel with factice (a hydrophobic polymer) as stationary phase and aq. acetone as moving

Phase. Cholesterol esters with fatty acid chain lengths from 2-18 C are eluted as individual peaks and similar separations are possible with triglycerides and methyl esters of fatty acids. Elution is performed with a single solvent system and detection of lipid in eluates is achieved by automatic differential refractometry,

J.R.Sargent

224. CHANGES IN THE LIPOLYTIC ACTIVITY OF THE GUINEA-PIG MAMMARY GLAND AT PARTURITION.

D.S.Robinson: *I. lipid Res.*, 1963, 4, 21-23 (External Staff of M.R.C., Dunn Sch. Pathol., Oxford, England)

Clearing factor lipase activity of guinea-pig mammary gland remains const. during pregnancy until immediately before parturition. A marked increase then occurs until at parturition the activity per gland is about 100 times greater than during pregnancy. Activity persists at this high level after parturition provided suckling is continued. Prevention of suckling reduces lipase activity.

J.R.Sargent

225. A SENSITIVE METHOD FOR QUANTITATIVE MICRODETERMINATION OF LIPIDS. A.Karmen, T.Walker and R.L.Bowman: *J. lipid Res.*, 1963, 4, 103-106 (Lab. Tech. Development, N.H.I., Bethesda, Md., U.S.A.)

The method is based on volatility differences between solute and solvent. Soln. is passed into a miniature gas chromatographic column at room temp. Carrier gas is passed through and the effluent assayed in a hydrogen flame ionisation detector. When solvent has been completely volatilised the remaining Materials in the column (solutes) are pyrolysed and assayed in the ionisation detector.

J.R.Sargent

226. GLASS FIBRE PAPER STRIP CHARRING: A RAPID AND SIMPLE METHOD FOR MONITORING COLUMN CHROMATOGRAPHY OF LIPIDS. P.Ways: *J. lipid Res.*, 1963, 4, 101-103 (Dept. Biochem., Univ.

Washington, Seattle, Wash., U.S.A.) Effluent samples are applied to glass fibre, then charred. O.D. of charred spots can be used as a quant. method of estimating phospholipid.

J.R.Sargent

227. PRECURSORS OF METHYL KETONES IN BUTTER.

B.van der Ven, P.H.Begemann and J.C.M.Schogt: *J. lipid Res.*, 1963, 4, 91-95 (Unilever Res. Lab., Vlaardingen, Netherlands) Butterfat, when treated with Girard-T reagent, yields a series of 6 pyrazolones, responding to 6 even numbered p-ketoacids (C₆ to C₁₆). This is in agreement with the formation of 6 odd-numbered methyl ketones (C₅ to C₁₅) on subjecting butterfat to steam-deodorisation. The presence in butterfat of nonvolatile p-ketoacid esters has been proved. If they are glycerides, their amount is estimated at 0.02P%. J.R.Sargent

228. LIPIDS OF HUMAN ADRENALS. C.Riley: *Biochem. J.*, 1963, 87, 500-507 (Stephen Ralli Lab., Royal Sussex County Hosp., Brighton, England) Lipids were extracted from a series of human adrenal glands obtained at autopsies and surgical operations and were fractionated by chromatography on silicic acid. The fatty acids covered from the sterol esters, triglycerides and phospholipids were studied by gas chromatography. Stress or nin. with corticotrophin depleted the sterol esters and increased the phospholipids; the free cholesterol was unacted. Evidence was found of the presence of significant amounts of a sterol diol. The fatty acids of the sterol esters differed appreciably from those found in blood especially in their lower content of linoleic acid and their higher content of oleic acid. The triglycerides resembled those found in human depot fat. It was suggested that the

adrenal may utilise cholesterol linoleate preferentially in the biosynthesis of steroids. *

229. EFFECT OF AGE AND RESTRAINT ON POST-PRANDIAL LIPAEMIA CLEARANCE IN DOGS. H.Sobel and H.V.Thomas: *Proc. Soc. exp. Biol., N.Y.*, 1963, 112, 206-209 (V.A. Hosp., Sepulveda, Calif., U.S.A.)

Dogs divided into 4 groups according to age were fed 1 g. of pure lard/lb. body wt. in a meat diet. The level of blood lipids were investigated. The oldest animals developed a much later peak of lipaemia than the young animals. The expt. was repeated when dogs were restrained in Pavlov rigs. Under stress lipaemia was reduced even though the urine analysis showed corticoids in the excreta. It was thought that there was probably increased clearance under restraint. The concn. of non-esterified fatty acids in the blood was not altered by stress.

D.N.Wheatley

230. CHEMISTRY OF LIPIDS OF POSTHAEMOLYTIC RESIDUE OR STROMA OF R.B.C. XL STRUCTURE OF GLOBOSIDE, THE MAIN MUCOLIPID OF HUMAN R.B.C. T.Yamakawa, S.Yokoyama and N.Handa:

J. Biochem., Tokyo, 1963, 53, 28-36 (Dept. Chem., Inst. Infectious Dis., Univ. Tokyo, Japan) Globoside was purified by repeated silicic acid column chromatography. The component fatty acids were mainly C₂₂-C₂₄ with nervonic acid predominating. N-acetylgalactosaminoyl(l->6)galactose was isolated by mild acid hydrolysis and charcoal chromatography. Several methylated hexoses were obtained by complete methylation and methanolysis and were identified by gas-liquid chromatography. The formula N-acetylgalactosaminoyl(l->6)-galactosyl(l->4)galactosyl(I ->4)glucosyl-ceramide is proposed.

231. LIPID COMPONENTS OF [RUNNER BEAN] LEAVES. HI. ISOLATION AND CHARACTERISATION OF MONO- AND DI-GALACTOSYL DIGLYCERIDES AND LECITHIN [THE MAJOR GLYCOLIPIDS AND PHOSPHOLIPID].

P.S.Sastray and M.Kates: *Biochim. biophys. Acta*, 1963, 70, 214-216 (Div. Appl. Biol., Nat. Res. Council, Ottawa, Canada) Prelim, comm.

B.M.Stevens

232. INHIBITION BY GLUCOSE OF THE ETHIONINE INDUCED FATTY LIVER. L.Campagnari-Visconti, F.Campagnari and D.Koch-Wesen: *Proc. Soc. exp. Biol., N.Y.*, 1962, 111, 479-482 (Dept. Med., Western Res. Univ., Sch. Med., Cleveland, Ohio, U.S.A.) Increase in triglyceride in the liver of rats seems to be due to a blocking of the release, and to fat mobilisation into the liver from the periphery (e.g. during fasting) after i.p. injn. of ethionine. Oral administration of glucose to treated animals seems to inhibit only the mobilisation of fat and so prevents build-up in the liver.

M.M.Shapland

233. LIPID COMPONENTS OF THE RESPIRATORY CHAIN.

J.M.Hafkenscheid, J.Links and E.C. Slater: *Biochim. biophys. Acta*, 1963, 70, 202-204 (Lab. Physiol. Chem., Univ. Amsterdam, Netherlands) Effects of ubiquinol on acetone extracted heart muscle prep, and the possible relationship of ubiquinone to the antimycin- and BAL-sensitive factors were examined.

B.M.Stevens

234. TRANSMETHYLATION REACTIONS IN BACTERIAL LIPIDS. J.H.Law, H.Zalkin and T.Kaneshiro: *Biochim. biophys. Acta*, 1963, 70, 143-151 (Dept. Chem., Harvard Univ., Cambridge, Mass., U.S.A.)

Agrobacterium tumefaciens grown with methyl labelled

BIOCHEMISTRY

methionine produced lipids containing N-methylethanolamine, N,N-dimethylethanolamine and choline with labelled methyl groups and labelled cyclopropane acids. The rate of methylated base formation, but not that of cyclopropane acid formation, paralleled growth. In this organism and in *E. coli* and *Serratia marcescens*, cyclopropane acid formation took place mainly during late logarithmic growth and in the stationary phase. Both H and C of methionine methyl groups were incorporated into cyclopropane rings. A mutant with blocked methionine synthesis formed cyclopropane acids from methionine methyl groups; incorporation was not diluted by a no. of Ci. donors.

B.M.Stevens

235. LIPID COMPOSITION OF HUMAN C.S.F. M.H.Hack and F.M.Helmy: Proc. Soc. exp. Biol., N.Y., 1962, 111, 421-423 (Dept. Med., Tulane Univ. Sch. Med., New Orleans, La., U.S.A.) Lipid extract of human c.s.f. contained phosphatidyl ethanolamine, ethanolamine plasmalogen, sphingomyelin, phosphatidyl choline and a small amount of choline plasmalogen. Neutral lipids were present as triglycerides, cholesterol and cholesterol ester. A plasmalogen resembling cardiolipin was present in low concn. but cerebrosides were not detected.

M.M.Shapland

236. STRUCTURE OF SULPHATIDES. P.Stoffyn and A.Stoffyn: Biochim. biophys. Acta, 1963, 70, 218-220 (McLean Hosp., Res. Lab., Belmont, Mass., U.S.A.) The SO₄²⁻ was shown to be located at C-3 of the galactopyranoside moiety. Prelim, comm.

B.M.Stevens

237. EFFECT OF LIGHT AND STREPTOMYCIN ON THE INCORPORATION OF SULPHATE INTO SULPHOLIPIDS IN EUGLENA GRACILIS. A.Abraham and B.K.Bachhawat: Biochim. biophys. Acta, 1963, 70, 104-106 (Wellcome Res. Unit, Christian Med. Coll. Hosp., Vellore, S. India) Light had no effect on SO₄²⁻ uptake and activation but was required for sulpholipid synthesis; streptomycin inhib. active SO₄²⁻ formation. Prelim, comm. B.M.Stevens

238. DIRECT CONVERSION OF SULPHATIDES INTO CEREBROSIDES [BY TREATMENT WITH A 0.05 N SOLUTION OF ANHYDROUS HYDROGEN CHLORIDE IN METHANOL FOR FOUR HOURS AT ROOM TEMPERATURE]. P.Stoffyn and A.Stoffyn: Biochim. biophys. Acta, 1963, 70, 107-108 (McLean Hosp. Res. Lab., Belmont, Mass., U.S.A.) Prelim, comm.

B.M.Stevens

239. QUANTITATIVE ESTIMATION OF SULPHATES IN LIPID EXTRACTS. E.Martensson: Biochim. biophys. Acta, 1963, 70, 1-8 (Dept. Med. Biochem., Univ. Gothenburg, Sweden) The method was based on a reductive SO₄²⁻ analysis applied directly to the lipid extract. Since a hydrolysis step was unnecessary the method was less complicated and likely to be freer from error than previous methods.

B.M.Stevens

240. ORIGIN OF METHYL KETONES FOUND IN STEAM DISTILLATES OF MILK FAT. R.C.Lawrence and J.C.Hawke: Nature, Lond., 1963, 197, 1276-1277 (Dairy Res. Inst., Palmerston North, New Zealand)

Methyl ketones were prep. from milk fat obtained following injn. of [carboxy-¹⁴C]acetate into a cow. C₉, C₁₁, C₁₃ and C₁₅ methyl ketones had the highest sp. activity. The pattern of labelling of these methyl ketones was markedly similar to the labelling of C₁₀, C₁₂, C₁₄ and C₁₆ fatty acids demonstrated previously. It is suggested that methyl ketones and their corresponding acid with one more C atom have a common precursor in J-keto acids.

J.R.Sargent

241. PHOSPHOLIPID PATTERNS IN SUBCELLULAR FRACTIONS OF ADULT AND IMMATURE RAT ORGAN^{IG} JJ.Biezenski, T.H.Spaet and A.L.Gordon: Biochim. biophys. Acta, 1963, 70, 75-84 (Dept. Haematol., Lab. Div., Montefiore Hosp., New York, U.S.A.)

Phospholipid contents of whole tissue, nuclear, mitochondrial, microsomal and supernatant fractions of immature liver, kidney, uterus and ovary and the distribution of phospholipids in the cytoplasmic fraction were determined. Amounts and % distributions of lipid serine, ethanolamine, choline, N and sphingomyelin in lipid extracts of all fractions of the 4 organs of ad:^{...} and immature rats were also examined. High lipid choline and fairly high ethanolamine with little serine, sphingo^{"#1} myelin or 'other' phospholipids were found in phospholip^P rich mitochondria and microsomes. In phospholipid-poor nuclei and supernatant, choline phospholipids, 'cephalin'^{*} and 'other'^{*} were approx. equally divided. With age, 'cephalins' and 'other'^{*} phospholipids decreased whilst lecithins increased.

B.M.Stevens

242. PHOSPHOLIPID FRACTION FROM OX HEART MUSCLE WHICH ACTIVATES CYTOCHROME $\frac{f}{e}$ OXIDASE. M.Cohen and W.W.Wainio: J. biol. Chem., 1963, 238, 879-882 (Bureau Biol. Res., Rutgers - Stay Univ., New Brunswick, N.J., U.S.A.) A phospholip^{*} fraction is very effective for activation of the partially purified prep. 2-4-1*5 of cytochrome $\frac{f}{e}$ oxidase. Addition of 0.047 mg. of active fraction stimulates the reaction t_{1/2} half-max. rate. This amount of phospholipid correspond* approx. to a 1:1 mol. ratio of phospholipid:cytochrome P. This active fraction is composed mainly of lysophosphatides, of which 65% contain ethanolamine and 21% contain serine. There is a minor inositol-containing component. The fatty acids are 54% stearic, 25% linoleic, 20% palmitic, and a trace of oleic acid.

J.N.Ashley

243. ROLE OF PHOSPHATIDES IN NON-ENZYMIC BROWNING. H.S.Burton and D.J.McWeeny: Nature, Lond., 1963, 197, 1086-1087 (Food Sci. and Plant Hlth. Divn., Min. Agric., London, England)

Aq. dispersions of lecithin from egg yolk were treated with various additives and their affect on the browning reaction studied at 40°. Chromophore development was much more rapid in the presence of glycine than of glucose. Addition of Na metabisulphite retards the re* action while ascorbic acid causes more browning. f_{err}? f sulphate caused an even more rapid browning reaction iⁿ the lecithin/glycine system. Esterification of glycine reduced the browning while phenylglycine reacted w^t lecithin to give a dark solid. The browning reactions of phosphatides and unsat. acids are presumed to be due to carbonyl/amino reaction.

GM^{wis}

244. HYDROLYSIS OF SYNTHETIC MIXED-ACID PH^{SS} PHATIDES BY PHOSPHOLIPASE A FROM HUMAN PANCREAS. L.L.M.van Deenen, G.H.De Haas and C.H.T.Heemskerk: Biochim. biophys. Acta, 1963, 295-304 (Dept. Biochem., Lab. Org. Chem., State Univ., Utrecht, Netherlands) L-a-phosphatidyl

ethanolamines were readily hydrolysed in an aq. *9*^{ex}%/fl⁶ Unlike the animal poison enzymes, the pancreatic enzy did not attack synthetic lecithins unless deoxycholate o* synthetic phosphatidic acid were present. Mixed acid^{co11*} lecithins and phosphatidyl ethanolamines containing binations of stearic and lauric acids, stearic and oleic acids or palmitic and linolenic acids in different ^{rno}/_{he} positions were used to investigate the site of action. A* enzyme always liberated the p-esterified fatty acids.

BIOCHEMISTRY

25

^attached fatty acid constituents being recovered in the tyso compounds. B.M.Stevens

245. LECITHIN-CHOLESTEROL SOLS. L.Saunders: J. Pharm., Lond., 1963, 15, 155-156 (Sch. Pharm., Brunswick Sq., London, England) Further studies were made of these sols, formed by ultrasonic irradiation. J.M.Whitmarsh

246. THIN-LAYER CHROMATOGRAPHIC SEPARATION OF SPHINGOSINE AND RELATED BASES. K.Sambasivarao and R.H.McCluer: J. lipid Res., 1963, 4, 106-108 (Dept. Physiol. Chem., Ohio State Univ., Columbus, Ohio, U.S.A.) A rapid thin-layer chromatographic method for the qual. separation and identification of the free bases of erythrosphingosine, threo-sphingosine, dihydrosphingosine, phytosphingosine and ³*0-methylsphingosine is described. The developing solvent used was CHCl₃:MeOH:2N NH₃ 40:10:1 and the Pots were stained with ninhydrin. J.R.Sargent

^7. BREAKDOWN OF PHOSPHOLIPIDS IN MILD ALKALINE HYDROLYSIS. H.Brockerhoff: J. lipid Res., 1963, 4, 96-99 (Fisheries Res. Board Canada, Technol. Station, P.O.Box 429, Halifax, Nova Scotia, Canada) Deacylation of phospholipids by mild alk. hydrolysis is usually accompanied by some hydrolysis of phosphate ester bonds. This undesired side reaction is ^pressed by polar solvents. Deacylation with lithium Wroxide in chloroform: methanol (2:8) will cause the breakdown of not more than 0¹% of egg lecithin. J.R.Sargent

^8. BIOCHEMISTRY OF PLASMALOGENS. H. HAEMOLYTIC ACTIVITY OF SOME PLASMALOGEN DERIVATIVES. E.L.Gottfried and M.M.Rapport: J. lipid Res., 1963, 4, 57-62 (Dept. Med. and Biochem., Einstein Coll. Med., Yeshiva Univ., New York, U.S.A.) A series of lysophosphatides was prep, from the plasma-³gens phosphatidyl choline and phosphatidyl ethanolamine ^a their haemolytic activity compared with that of ³*Palmitoyl lysolecithin. The nature of the linkage of hydrocarbon chain (acylester, OL -J-unsat. ether, or ³-yl ether) did not affect lytic activity. Unsatn. in the hydrocarbon chain of lysolecithins decreased lytic activity except: in the case of lysocephalins. J.R.Sargent

24% PHOSPHOLIPID INTERRELATIONSHIPS IN RAT EPIDIDYMAL TISSUE AND SPERMATOZOOA. J.W.Scott, R.M.C.Dawson and I.W.Rowlands: Biochem. J., 1963, 87, 507-512 (Agric. Res. Counc. Inst., Animal Physiol., Babraham, Cambridge, England) Phospholipid analyses of spermatozoa-rich exudates obtained from rat epididymal tissue indicated that spermatozoa accumulate choline plasmalogen (or its ¹⁴C analogue) as they pass through the epididymis. The coricn. of lecithin and phosphatidylethanolamine was higher in the spermatozoa-rich exudates from the head than in those from the tail of the epididymis, but it is certain whether this is caused by a change in the ¹⁴C-labeled lipids or by contamination of the exudates by phospholipids arising from the tissue. The epididymal pool rapidly becomes labelled when ³H-¹⁴C-lecithin is inj. and the sp. activity is above that of ³H-¹⁴C-lycer-phosphorylcholine up to 40 hr. after administration of the [32p]phosphate.

V*JHROMBOPLASTIC ACTIVITY OF PHOSPHATIDYL-HANOLAMINE FROM NATURAL AND SYNTHETIC SOURCES. D.L.Turner, R.R.Holburn, M.Desipin, M.J. Tocantis: J. lipid Res., 1963, 4,

52-56 (Cardenza Fndn., Jefferson Med. Coll., Philadelphia, Pa., U.S.A.) Improvements are de-

scribed in the prep. of phosphatidylethanolamine from hen's egg and in die prep. of intermediates used in the synthesis of dioleoyl-phosphatidylethanolamine. Both prep. were potent accelerators in the Hicks-Pitney test and moderately active in the thromboplastin generation test. J.R.Sargent

251. IDENTIFICATION OF A BACTERIAL PHOSPHOLIPID AS AN O-ORNITHINE ESTER OF PHOSPHATIDYL GLYCEROL. U.M.T.Houtsmuller and L.L.M.van Deenen: Biochim. biophys. Acta, 1963, 70, 211-213 (Dept. Biochem., Lab. Org. Chem., State Univ., Utrecht, Netherlands) Prelim, comm.

B.M.Stevens
252. PHOSPHOLIPID AND PLASMALOGEN SYNTHESIS IN RAT BRAIN HOMOGENATES. H.G.Carr, H.Haeber and J.J.Eiler: Biochim. biophys. Acta, 1963, 70, 205-207 (Dept. Pharm. Chem., Univ. California Med. Center, San Francisco, Calif., U.S.A.) Palmitaldehyde was not a precursor of the unsat. ether group of plasmalogens; stearic and palmitic acids were incorporated into unsat. ether groups much less efficiently than into phospholipid acyl ester groups.

B.M.Stevens
253. SYSTEM FOR PRECISE GRADIENT ELUTION CHROMATOGRAPHY: APPLICATION TO THE CHROMATOGRAPHY OF SMALL AMOUNTS OF PHOSPHATIDES ON COLUMNS OF SILICIC ACID. D.F.H.Wallach and G.L.Nordby: Biochim. biophys. Acta, 1963, 70, 188-201 (Dept. Biol. Chem., Harvard Med. Sch., Boston, Mass., U.S.A.) An apparatus using precise and predetermined linear or non-linear eluant gradients and const. flow rates is described. A mathematical treatment of gradient production by differential flow techniques, permitting selection of a wide variety of gradients is given. Examples of elution of phosphatides from silicic acid are described.

B.M.Stevens
254. QUANTITATIVE STUDY OF ERYTHROCYTE-LYSOLECITHIN INTERACTION. C.Klibansky and A.de Vries: Biochim. biophys. Acta, 1963, 70, 176-187 (Rogoff Med. Res. Inst., Dept. Expt. Biol., Tel Aviv Univ., Petah Tikva, Israel) The amount of lysolecithin attached to r.b.c., suspended in plasma enriched in lysolecithin by the action of snake venom phospholipase A, depended on the lysolecithin concn. Amount of lysolecithin attached was correlated with the r.b.c. shape. The amount of lysolecithin attached induced spherling but not haemolysis. Albumin reversed lysolecithin attachment and corresponding shape changes. Attachment of lysolecithin did not cause quant. changes in r.b.c. membrane phospholipids but a loss of cholesterol occurred in some cases.

B.M.Stevens
255. SELECTIVE INCORPORATION OF FATTY ACIDS INTO PHOSPHOLIPIDS OF MATURE RED CELLS. E.Mulder, J.de Gier and L.L.M.van Deenen: Biochim. biophys. Acta, 1963, 70, 94-96 (Dept. Biochem., Lab. Org. Chem., State Univ., Utrecht, Netherlands) Further expt. involving dietary changes demonstrated that the selectivity of fatty acid uptake in phospholipids of circulating r.b.c. was identical with that of labelled fatty acid incorporation in vitro. Prelim, comm.

B.M.Stevens
256. ENZYMIC PATHWAYS OF GLYCERIDE AND PHOSPHOLIPID SYNTHESIS IN AORTIC HOMOGENATES. Y.Stein, O.Stein and B.Shapiro: Biochim. biophys.

BIOCHEMISTRY

Acta, 1963, 70, 33-42 (Dept. Med. B, Hadassah Univ. Hosp., Jerusalem, Israel) Rabbit and dog aortic homogenates incorporated [$1\text{-}^{14}\text{C}$]linoleic acid into neutral lipids and phospholipids in the presence of Mg^{2+} -glycerophosphate, CoA and ATP. Triglycerides and diglycerides contained most of the radioactivity found in the neutral lipids, while lecithin, lyssolecithin and phosphatidyl ethanolamine contained most of the activity of the phospholipid fraction. An alternative pathway for lecithin synthesis in which lyssolecithin was the immediate precursor was present. ATP and CoA were required. When lyssolecithin was the precursor, [$1\text{-}^{14}\text{C}$]linoleic acid was found only in the β -position of the lecithin; with Mg^{2+} -glycerophosphate, both α - and β -positions were labelled. Purified lecithin promoted linoleic acid incorporation into phospholipids.

B.M.Stevens

257. UPTAKE OF LIPIDS BY HUMAN α -LIPOPROTEIN. L.A.E.Ashworth and C.Green: *Biochim. biophys. Acta*, 1963, 70, 68-74 (Dept. Biochem., Univ. Liverpool, England) α -Lipoprotein bound many Celite-dispersed lipids but showed considerable discrimination amongst sterol and vit. A deriv. Plant sterols competed with cholesterol for mol. binding sites but palmitic acid and cholesterol did not compete. A no. of anionic dyes were bound. Methyl Orange, which was bound to the greatest extent, competed with cholesterol but not with palmitic acid. β -Lipoproteins (Sf2-10) were severely damaged by incubation with lipid coated Celite.

B.M.Stevens

258. LIPOPROTEIN LIPASE OF MAMMARY GLAND AND CORRELATION OF ITS ACTIVITY TO LACTATION. O.W.McBride and E.D.Korn: *J. lipid Res.*, 1963, 4, 17-20 (Lab. Cell. Physiol. and Metab., Nat. Heart Inst., Bethesda, Md., U.S.A.) Marked increase in the activity of guinea-pig mammary gland lipoprotein lipase occurs immediately preceding parturition. Max. levels are reached within 2 hr. post-partum, this level persisting until cessation of suckling when the enzyme becomes undetectable within 18 hr. Most of the lipoprotein lipase activity in mammary gland appears to be accounted for as activity in retained milk.

J.R.Sargent

259. NEGATIVELY STAINED LIPOPROTEIN MEMBRANES: THE VALIDITY OF THE IMAGE. J.B.Finean and M.G. Rumsby: *Nature*, Lond., 1963, 197, 1326-1327 (Dept. Med. Biochem., Univ. Birmingham, England)

Unfixed, neg. stained lipoprotein prep. are a multiphase system. Low angle diffraction patterns obtained may be due to lipid, possibly cholesterol, separating from the lipoprotein structure during drying.

G.M.Lewis

260. A WATER-SOLUBLE LIPID COMPLEX OBTAINED IN THE MACROMOLECULAR PHASE BY GEL FILTRATION OF HUMAN BILE. E.Thureborn: *Nature*, Lond., 1963, 197, 1301-1302 (Dept. Surg. II, Univ. Gothenberg, Sweden) By gel filtration of native human bile, all the cholesterol and phospholipids were eluted in an opalescent green water soln. in the macromol. phase, mol. wt. more than 40000-50000; they comprised more than 2/3 of the solids in this phase.

G.M.Lewis

261. MONOGLYCERIDE TRANSACYLASE OF RAT INTESTINAL MUCOSA. B.Clark and G.Hilbscher: *Biochim. biophys. Acta*, 1963, 70, 43-52 (Dept. Med. Biochem. and Pharmacol., Univ. Birmingham, England) The enzyme occurred both as a sol. protein in the cell sap and tightly associated with subcellular structures. A partially purified particulate enzyme prep.

was examined with respect to cofactor requirements, pH optimum and substrate specificity. Palmitic acid, ATP and CoA could be replaced by palmitoyl CoA. The reaction product was identified as diglyceride.

B.M.Stevens

262. PURIFICATION OF Ct - AND J -HYDROXYSTEROI DEHYDROGENASES FROM PSEUDOMONAS TESTOSTERONI BY GEL FILTRATION. S.Delin and J.Pora*: *Biochim. biophys. Acta*, 1963, 67, 197-200 (Inst. Biochem., Univ. Uppsala, Sweden) A simple and efficient method is described. The enzymes appeared to be of small mol. size.

B.M.Stevens

263. BRAIN NADH₂-TETRAAZOLIUM REDUCTASE ACTIVITY, LIPOAMIDE DEHYDROGENASE AND ACTIVATING LIPIDS. A.Giuditta and H.J.Strecker: *Biochim. biophys. Acta*, 1963, 67, 316-318 (Inst. U.G. Genetics and Biophys., Naples, Italy) A large part of the easily sol. NADH₂-2- F -iodophenyl-3,5-nitrophenyl-5-phenyltetraazolium chloride [INT] reductase activity was due to lipoamide dehydrogenase: the slight activity of NADPH₂ oxidoreductase with INT was enhanced by lipids and detergents.

B.M.Stevens

264. APPLICATION OF HUBENERS 200-HYDROXYSTEROID-DEHYDROGENASE [200-SD] ON THE MICROCHEMICAL IDENTIFICATION AND SEPARATE OF STEROIDS. H.D.Henning and J. Zander: *Hoppe**, Seylers Z. physiol. Chem., 1962, 330, 31-37 (Univ. Frauenklin., 5 KClm-Lindenthal, Germany) The stereosp. enzymic reduction-oxidation with 20i8-SD of 12 steroid keto-alcohols is described. Full expt. detail are given.

(German) I.Corniff

265. LIPASE AND ESTERASE ACTIVITIES OF THE PANCREAS AND SMALL INTESTINE OF THE CHICK. B.M.Laws and J.H.Moore: *Biochem. J.*, 1963, 87, 632-638 (N.I.R.D., Shinfield, Reading, England) The lipase activity of the chick pancreas was constant from 1 to 30 days of age, but the esterase activity of the small intestine increased markedly from 1 to 10 days of age. Although lipase activity was confined almost entirely to the pancreas and esterase activity to the small intestine, both enzymes appeared to be present in both tissues. Esterase activity was greatest in the duodena** whereas lipase activity was greatest in the upper small intestine. Certain prop. of the 2 enzymes such as pH optima and substrate specificity are described.

266. DIGLYCERIDE KINASE AND OTHER PATHWAY* FOR PHOSPHATIDIC ACID SYNTHESIS IN THE ERYTHROCYTE MEMBRANE. L.E.Hokin and M.R.Hold: *Biochim. biophys. Acta*, 1963, 67, 470-484 (Dept. Physiol. Chem., Univ. Wisconsin, Madison, Wis., U.S.A.) Synthesis of phosphatidic acid by diglyceride kinase in human r.b.c. ghosts was 10-40 times more active than synthesis by phosphorylation of monoglyceride followed by acylation and 2500 times more active than synthesis by acylation of Of-glycerophosphate. Diglyceride kinase activity was as great or greater than the Na⁺ plus K⁺ dependent, ouabain inhib., ATPase of the r.b.c. membrane. Effects of detergents, state of substrate dispersion, freezing of ghosts, Na and K and ouabain have been examined. The kinetic curve at 37° for phosphatidic acid synthesis from diglyceride showed a rapid initial component, followed after approx. 1 min. by a slower component.

B.M.Stevens

267. PHOSPHATIDIC ACID PHOSPHATASE IN THE ERYTHROCYTE MEMBRANE. L.E.Hokin, M.R.Hokin and D.Mathison: *Biochim. biophys. Acta*, 1963, 67, B5-497 (Dept. Physiol. Chem., Univ. Wisconsin, Madison, Wis., U.S.A.) A Mg dependent P_{t} -phosphatidic acid phosphatase was found in r.b.c. membrane h was stim. by Na and, to a lesser extent, by Li, jyi*. K and Rb. Cs had little effect. No Mg dependent Na stim. activity was observed with p-phosphatidic acid %' lysophosphatidic acid although both were hydrolysed. J*-Glycerophosphate was very feebly hydrolysed. 10^{-4} M Be inhib. the Mg dependent phosphatidic acid phosphatase by 30%; 10^{-3} M Be inhib. completely. Cs and F inhib. the Na stimn. The initial phosphatidic acid phosphatase activity was at least 41 ± 6 micromoles/mg. dry wt. of ghosts/hr. which compared favourably with the activity of the Na plus K dependent, ouabain inhib., ATPase of r.b.c. membrane. B.M.Stevens
268. CHOLESTEROL ESTERS AND THE SYNTHESIS OF MILK FAT. R.D.McCarthy and S.Patton: *Biochim. biophys. Acta*, 1963, 70, 102-103 (Dept. Dairy Sci., Pennsylvania State Univ., University Park, Pa., $\text{H}_2\text{S}^{+}\text{A}^-$) Cholesterol esters of milk were shown to have a remarkably active metabolic history and the mammary gland was shown to be capable of synthesising milk cholesterol esters, glycerides and phosphatides from fatty acids. Prelim. comm. B.M.Stevens
269. CRYSTALLISATION OF TRIHYDROXYCOPROSTANIC ACID FROM HUMAN BILE. J.B.Carey, jun. and G.A.D.Haslewood: *J. biol. Chem.*, 1963, 238, PC855-856 (Dept. Med., Univ. Minnesota Med. Sch., Minneapolis, Minn., U.S.A.) The acid is isolated from the bile of patients with bile fistulae, and is characterised as the methyl ester. This is strong evidence that the acid is a natural constituent of human bile, and is indeed an intermediate in conversion of endogenous cholesterol into cholic acid in man. J.N.Ashley
270. HYDROLYSIS AND UTILISATION OF CHOLESTEROL ESTERS FOR STEROID SYNTHESIS BY CANINE ADRENAL HOMOGENATES. R.E.Dailey, L.Swell and C.R.Treadwell: *Arch. Biochem.*, 1963, 100, 360-363 (UA^A Centre, Martinsburg, W.Va., U.S.A.) ar. H_2O^{+} Cholesterol esters of palmitic, oleic, linoleic and CO_2H^{+} acids were hydrolysed independently of added where NAD^{H}_2 generating system was added. The rate of H_2O^{+} hydrolysis was lower than homologues for unsat. fatty acid esters when compared in a monoglyceride from a single dog. B.M.Stevens
271. TWO-DIMENSIONAL PAPER CHROMATOGRAPHY OF ESTERYL ESTERS. A NEW METHOD FOR THE SEPARATION OF CRITICAL PAIRS. C.Michalec, Z.Kohoutek and M.Sulc and J.Mestan: *J. Chromatography*, 1962, 9, 237-241 (Lab. Protein Met. and Proteosynthesis Charles Univ., Prague, Czechoslovakia) Cholesteryl esters have been satisfactorily separated by combining adsorption chromatography on paper impregnated with H_2O^{+} gel in the first direction, followed by treated phase. Partition chromatography on the silica gel chromatopaper impregnated with paraffin oil. After drying, chromatograms were sprayed with either phosphomolybdic acid or heated for 5 min. at $80-90^\circ$ or with antimony esters in if. R_f values of cholesterol and 19 cholestryl in both systems are tabulated. P.D.Dawkins
272. STEROIDS. CCXI. CENTRIFUGALLY ACCELERATED PAPER PARTITION CHROMATOGRAPHY OF STEROIDS. J.S.Matthews and M.De Los Angeles Cervantes: *J. Chromatography*, 1962, 9, 195-198 (Syntex Res. Labs., Mexico City, Mexico) An apparatus is described for centrifugally accelerated partition chromatography of steroids on Whatman no. 1 paper discs impregnated with the stationary phase. For separations to occur the centrifugal velocity must be low and at velocities above 200-250 r.p.m. the steroids remain on the line of application. R_f values are not independent of the velocity. Using the procedure described, separations are complete within 10-15 min. P.D.Dawkins
273. THIN-LAYER CHROMATOGRAPHY OF STEROLS AND STEROIDS. J.Avigan, D.S.Goodhan and D.Steinberg: *J. lipid Res.*, 1963, 4, 100-101 (Sect. on Metabolism, Lab. Cell Physiol. and Metabolism, N.I.H., Bethesda, Md., U.S.A.) Thin layer chromatographic systems for the separation of cholesterol and its precursors and for separating cholesterol, pregnenolone, androstane-3, 17-dione, progesterone, androstane-3-OH-ol, 17-one, 3-acetate, androstane-17-one are described. J.R. Sargent
274. IDENTIFICATION OF THE D-GLUCOSIDES OF STIGMASTEROL, SITOSTEROL AND CAMPESTEROL IN TOBACCO AND CIGARETTE SMOKE. A.G.Kallianos, F.A.Shelburne, R.E.Means, R.K.Stevens, R.E.Lax and J.D.Mold: *Biochem. J.*, 1963, 87, 586-600 (Liggett and Myers Tobacco Co., Res. Dept., Durham, N.C., U.S.A.) A mixture of the D-glucosides of stigmasterol, sitosterol and campesterol has been isolated from a commercial blend of flue-cured, Burley, Maryland and Turkish tobaccos (0.044% of the dry wt. of tobacco), and the smoke of cigarettes manufactured from the same blend of tobaccos ($1.59\text{ mg./1000 cigarettes}$). After acid hydrolysis of the glucosides the free sterols were separated by gas chromatography and the individual compounds were identified by their i.r. absorption and mass spectra. By using the above techniques, together with catalytic hydrogenation, the relative amounts of the sterols in the mixture was 60% of stigmasterol, 25% of sitosterol and 15% of campesterol. V.M.Wootton
275. NEW ASSAY FOR CHOLESTEROL AND CHOLESTEROL ESTERS IN SERUM WHICH IS NOT AFFECTED BY BILIRUBIN. A.L.Babson, P.A.Shapiro and G.E.Philips: *Clin. chim. Acta*, 1962, 7, 800-804 (Dept. Biochem., Wama-Lambert Res. Inst., Morris Plains, N.J., U.S.A.) The bilirubin is removed from the ethanol-ethylacetate extract by an adsorbent. Cholesterol esters are estimated by adding an excess of solid digitonin and assaying the cholesterol remaining in soln. This method is thought to be the fastest and simplest yet devised for determining cholesterol esters. V.M.Wootton
276. CHOLESTEROL CONTENT OF HUMAN SERUM LIPOPROTEINS OBTAINED BY DEXTRAN SULPHATE PRECIPITATION AND BY PREPARATIVE ULTRACENTRIFUGATION. D.Kritchevsky, S.A.Tepper, P.Alanovic and R.H.Furman: *Proc. Soc. exp. Biol.*, N.Y., 1963, 112, 259-262 (Wistar Inst. of Anat. and Biol., Philadelphia, Pa., U.S.A.) Lipoprotein cholesterol can be removed from serum by pptn. with 0.04 ml. of dextran sulphate (5%) and 0.1 ml. of 11-1% CaCl_2 soln. to 1 ml. of serum. The ppt. is removed by centrifugation. The resultant analysis of Of- and β -lipoprotein cholesterol compares closely with ultracentrifugation analyses. Oxalate has been

BIOCHEMISTRY

shown to be an interference in the colorimetric analysis of β -lipoprotein cholesterol. D.N.Wheatley

277. EFFECT OF EGG YOLK SIZE ON YOLK CHOLESTEROL CONCENTRATION. E.L.Nichols, W.W.Marion and S.L.Balloin: Proc. Soc. exp. Biol., N.Y., 1963, 112, 378-380 (Dept. Poultry Sci., Iowa State Univ. Sci. Technol., Ames, Iowa, U.S.A.) Cholesterol content of egg yolks was found to vary inversely with the yolk size in Rhode Island Red hens. There appeared to be a different rate of deposition of cholesterol into the yolks of 2 strains of White Leghorn hens selected for large yolked egg laying and small yolked egg laying. The solid content of ova increased rapidly until they become 3 g. in wt. and then the solid content increases slowly with the increase in ova size.

D.N.Wheatley

278. PAPER CHROMATOGRAPHY OF SOME CHOLESTEROL DERIVATIVES. C.Michalec: J. lipid Res., 1963, 4, 110-111 (Lab. Proteosynthesis and Protein Metab., Charles Univ., Prague, Czechoslovakia) A method for one-dimensional separation of cholesterol, α -cholesterol, α -coprostanol and β -coprostanol on aluminium hydroxide or silica gel impregnated papers is described. Cholesterol and β -cholesterol are separated by chromatography in a 2nd dimension. J.R. Sargent

279. DETECTION OF KETOSTEROIDS ON CHROMATOGRAMS. R.Stupnicki and E.Stupnicki: J. Chromatography, 1962, 9, 235-237 (Inst. Animal Physiol. and Nutr.; Jablonna, nr. Warsaw, Poland) Ketosteroids were detected on paper chromatograms developed in the Bush system A at 34° on Whatman No. 1 paper by the following series of manipulations at room temp: (1) Dipping in 2,4-dinitrophenylhydrazine in 2N HCl and holding in air for 10 min. (2) washing in aq. Na₂CO₃, (3) washing in alk. KMnO₄ to remove excess hydrazine by oxidation, (4) washing in ascorbic acid soln. to remove MnO₂ formed from (3), and finally washing in tap water and air drying. The ketosteroids give yellow, orange and red spots. P.D.Dawkins

280. DETECTION OF STEROIDS ON CHROMATOPLATES USING A NON-DESTRUCTIVE METHOD. G.S.Boyd and H.R.B.Hutton: Biochim. biophys. Acta, 1963, 69, 419-420 (Dept. Biochem., Univ. Edinburgh, Scotland) Various inorg. phosphors, which fluoresce green under the Hg u.v. lamp, were mixed with the Silica Gel G used; substances absorbing between 240 and 280 mji showed as dark spots on examination in u.v. light. Prelim. comm. B.M.Stevens

281. DEMONSTRATION OF STEROIDAL FUNCTIONAL GROUPS ON PAPER CHROMATOGRAMS. II. α -KETOLS AND GLYCOLS. S.C.Pan: J. Chromatography, 1962, 9, 81-91 (Squibb Inst. Med. Res., New Brunswick, N.J., U.S.A.) Spot tests for steroids which form HCHO, CH₃CHO, a non-volatile aldehyde or non-volatile acid on periodate oxidation on paper chromatograms are described. Certain steroidal glycols can be detected by a borate-phenol red spray, and primary and secondary GK-ketols have been demonstrated and distinguished from each other on paper chromatograms by a modified tetrazolium reduction. P.D.Dawkins

AMINO ACIDS, PEPTIDES AND PROTEINS

282. FREE RADICAL IN MICHAELI COMPLEX OF D-AMINO ACID OXIDASE. K.Yagi and T.Ozawa: Biochim. biophys. Acta, 1963, 67, 635-687 (Dept. Biochem., Sch. Med., Nagoya Univ., Japan) Electron spin resonance studies carried out on the cryst. Michaelis complex and on the mother liquid showed that both contained a free radical. Prelim. comm.

B.M.Stevens

283. CARRIER AMINO ACID STOICHEIOMETRY IN AMINO ACID TRANSPORT IN EHRLICH ASCITES CELLS. J.A.Jacquez: Biochim. biophys. Acta, 1963, 71, 15-33 (Div. Expt. Chemotherapy, Sloan-Ketterini Inst. Cancer Res., New York, U.S.A.) The initial flux of L-tryptophan in 'exchange diffusion' and in 'competition' expt. with other amino acids was significantly increased by certain amino acids. For straight chain amino acids with aliphatic side chains, the stimn. was increased progressively and almost constantly with each additional C in the side chain. In competition expt. branching of the chain decreased the stimn. of initial flux. A model of the transport system in which ratio of arnin^a acid to carrier is 1:1 is shown to predict the stimn. in exchange diffusion expt. but a ratio of 2:1 must be assumed to predict the stimn. in competition expt. also.

B.M.Stevens

284. CHANGE IN THE CHARGE ON FAD BY FORMING MODEL OF THE ENZYME-SUBSTRATE COMPLEX OF D-AMINO ACID OXIDASE. K.Yagi and T.Ozawa: Biochim. biophys. Acta, 1963, 67, 319-320 (Dept. Biochem., Sch. Med., Nagoya Univ., Japan) ^T_{cyst} shoulder at 490 mfi in the absorption spectrum of the apo-enzyme-FAD-benzoate complex was shown to be characteristic for the enzyme-substrate model and not to be a prop. of the holo-enzyme.

M.Stevens

285. AMINO ACIDS IN THE PROTEINS FROM ARAGONITE AND CALCITE IN THE SHELLS OF MYTILUS CALIFORNIANUS. P.E.Hare: Science, 1963, 139, 216²¹⁷ (Div. Geol. Sci., California Inst. Technol., Pasadena^a Calif., U.S.A.) Hydroxylysine and hydroxyproline are absent in the calcified proteins of M. californicus^b. The org. matrices from the calcite layers have a higher ratio of acidic to basic amino acids than the aragonitic shell units. The uncalcified periostracum and outer ligament have very few acidic residues. G.M.Lewis

286. STUDIES ON INTRACELLULAR AMINO ACIDS. ⁰_{PENICILLIUM ROQUEFORTI} E.Meyers and S.G.Knipling: Mycologia, 1961, 53, 115-121 (Squibb Inst. Med. Res., New Brunswick, N.J., U.S.A.) ^P_{roQuefotgi} found to have an intracellular amino acid pool comp⁰ 5 to 15% of the total cell N₂ and containing most coffin amino acids, except proline and hydroxyproline. T⁰ qual. pattern of the pool was similar in both vegetative cells and spores. Evidence is given for an internal po⁰ replenishment mechanism in N₂ depleted cells.

J.G.Brown

287. NEW TECHNIQUES FOR THE CHROMATOGRAPHY OF SULPHUR AMINO ACIDS ON PAPER. J.Fondarai + C.Richert: J. Chromatography, 1962, 9, 261-26²⁶ (Lab. Physique, Fac. Med. Pharm., Marseille, France) (French)

P.D.Dawkins

288. METHOD FOR THE IMPROVED RESOLUTION OF BASIC AMINO ACIDS ON THE AUTOMATIC AMINO ACID ANALYSER. D.R.Kominz: J. Chromatography,

of

1962, 9, 253-254 (Nat. Inst. Arthritis and Met. Dis., Nat. Inst. Hlth., Public Hlth. Service, U.S. Dept. Hlth., Education and Welfare, Bethesda, Md., U.S.A.)

Notes. P.D.Dawkins

289. GAS CHROMATOGRAPHY OF THE AMINO ACID ESTERS IN AMMONIA. H.A.Saroff, A.Karmen and J.W.Healy: I. Chromatography, 1962, 9, 122-123 (Nat. Inst. Arthritis and Met. Dis. and Nat. Heart Inst., N.I.H.. Public Hlth. Service, U.S. Dept. Hlth., Education and Welfare, Bethesda, Md., U.S.A.)

Notes. P.D.Dawkins

290. NOTE ON CONVERSION OF AMINO GROUP OF AMINO ACIDS INTO NITROGUANIDINO GROUP.

N.Heyboer, G.H.Visser and K.E.T.Kerling: Rec. Trav. chim. Pays-Bas, 1962, 81, 69-72 (Org. Chem. Lab., Univ., Leiden, Netherlands) 2-Methyl-L-nitroisourea has been used as a reagent to convert amino groups of fglycine, L-ornithine, D- and L-lysine to the nitro-Buanidino groups. Lysine and ornithine deriv. were obtained in 50% yields. The glycine deriv. under some conditions could be obtained in IAPjo yield. G.C.Barr

291. DECOMPOSITION OF NINE AMINO ACIDS DURING CHROMATOGRAPHY ON PAPER. V.Moses: I. Chromatography, 1962, 9, 241-243 (Bio-org. chem. group, Lawrence Rad. Lab., Univ. California, Berkeley, Calif., U.S.A.) Decomposition of 9 amino acids run ^{li}* Phenol-water and n-butanol-propionic acid-water ^Invents was considerably reduced by pretreatment of Whatman No. 4 paper with oxalic acid. P.D.Dawkins

292. EXAMINATION OF OPTICALLY EXCITED AMINO ACIDS BY ELECTRON SPIN RESONANCE AT VERY LOW TEMPERATURE. P.Douzou, M.Ptak and C.Ropars: Nature, Lond., 1963, 197, 1105-1106 (Lab. Biophys. Museum Nat. d'Histoire Naturelle, Paris, France) ^E*Pt. on the electron spin resonance of phenylalanine and ^{tr}Yptophan at the temp. of liquid N₂ suggested that ^radiations centred on 3650A produce a metastable dynamic [^]figuration. G.M.Lewis

²⁹3. SYNTHESIS OF POLY-tt-AMINO-ACRYLIC ACID. K.Heyns and H.Heinecke: Hoppe-Seylers Z. physiol. Chem., 1963, 331, 45-49 (Chem. Staatinst., Org. Chem., Hamburg, Germany).

(German) LCornish
^ USE OF THE NINHYDRIN REACTION FOR QUANTITATIVE ESTIMATION OF AMINO GROUPS IN INSOLUBLE SPECIMENS. P.A.Kendall: Nature, Lond., 1963, 197, 1305-1306 (Dept. Zool., King's Coll., Univ. London, London, England) Using denatured ^LVsozyme for test material, a technique for satisfactory ^determination of amino groups in insol. proteins is des e d , in which the material is shaken in a boiling water ^{ert}! for 15> min. with the reagent ^Rent» then extracted with [^]anol prior to colorimetry or spectrophotometry. G.M.Lewis

*^{Q:} THE SULPHUR BALANCE IN WOOL. J.C.Fletcher. A.Robson and J.Todd: Biochem. J., 1963, 87, 560-567 (Wool Ind. Res. Assn., Torridon, Leeds, England) ^P difficulties in reaching a satisfactory S balance for [^]o^o1 have been mainly due to incorrect determinations of to? ^cysteine content which provides more than 90#> of the L5¹ S. In the colorimetric methods used previously ^{1/4}lytic losses of cystine were hard to assess. The prob fo? [^] as been reinvestigated by using 3 different methods ^cystine determinations. Out of a total S content of

3*66% for a sample of Australian Merino 64s quality wool, cystine, cysteine and methionine provided 3 •33%. O-IOf and 0*12% respectively. The deficit of 0*11% is within the error of the total S determination, but it is probable that some is present in the form of lanthionine, cysteic acid and sulphate. +

296. THE OCCURRENCE OF BIS-(2-AMINO-2-CARBOXYETHYL) TRISULPHIDE IN HYDROLYSATES OF WOOL AND OTHER PROTEINS. J.CFletcher and A.Robson: Biochem. J., 1963, 87, 553-559 (Wool Ind. Res. Assn., Torridon, Leeds, England)

The S-containing compound formed in highest yield by the decomposition of cystine during the acid hydrolysis of wool and other proteins has been identified as bis-(2-amino-2-carboxyethyl) trisulphide. Its identity was confirmed by synthesis by 2 different methods. The trisulphide may be concerned in certain enzyme reactions involving S. Bis-(2-amino-2-carboxyethyl) tetrasulphide has also been tentatively identified as present in small amounts in wool hydrolysates. *

297. SPECIFIC EFFECTS IN THE INTERACTION BETWEEN IONISED GELS AND AMINO ACIDS. J.FeitelsoiK Biochim. biophys. Acta, 1963, 66, 229-236 (Dept. Phys. Chem.. Hebrew Univ.. Jerusalem, Israel)

Effects sp. for each amino acid in interaction with a highly swollen ion-exchange gel are discussed separately from purely electrostatic interactions of the cationic or dipolar form of the mol. The degree of dissociation in the gel was compared to that in soln. for the different spp. Absorption studies showed that sp. effects for cationic amino acids were much more pronounced than those of similar dipolar mol. The temp. dependence of the sp. interactions showed that they were enthalpy effects.

B.M.Stevns

298. ACYLMINO ACID DEACYLASE FROM KIDNEY. H.Hazama, M.Kitagawa and Y.Yamamura: J. Biochem., Tokyo, 1963, 53, 117-123 (Dept. Neuropsychiatry, Fac. Med.. Kyushu Univ., Fukuoka, Japan) The enzyme catalysed the hydrolysis of long chain N-acyl-amino acids. With valine and phenylalanine, lauroyl or myristoyl groups were the most susceptible to hydrolysis. The effect of pH on the hydrolysis of N-palmitoyl-L-aspartic acid differed from the effect of pH on the hydrolysis of other palmitoyl-amino acids. B.M.Stevens

299. TRYPTOPHAN SYNTHETASE LEVELS IN E. COLI, SHIGELLA DYSENTERIAE AND TRANSDUCTION HYBRIDS. R.B.Eisenstein and C.Yanofsky: J. Bact., 1962, 83, 193-204 (Dept. Microbiol., Western Reserve Univ., Cleveland, Ohio, U.S.A.)

*^{S.} dysenteriae and ^{E.} coli strains K-12 and B were found to produce low levels of tryptophan synthetase. although some hybrids formed by the introduction of the gene cluster concerned with tryptophan synthesis from ^{S.} dysenteriae into ^{E.} coli, produced high levels of this enzyme system. A revertant obtained from a tryptophan-requiring mutant also formed high levels of the enzyme. The gene(s) responsible for the high enzyme production was shown to be linked to the cluster of genes concerned with tryptophan synthesis. Stimn. of growth by tryptophan precursors, sensitivity to inhibn. by 5-methyltryptophan and the repression of the enzyme formation by anthranilic acid suggested that high enzyme production in the strains examined results from a partial block in the tryptophan pathway and not from die resistance to repression by tryptophan. The conversion of shikimic acid 5-phosphate to anthranilic acid appears to be the partially blocked reaction in the strains studied. C.Toothill

BIOCHEMISTRY

- 300. DETECTION OF TRYPTOPHAN SYNTHESISING ENZYME IN RAUWOLFIA SERPENTINA BENTH.**
B.C.Bose and R.Vijayvargiya: J. Pharm., Lond., 1963, 15, 215 (M.G.M. Med. Coll., Indore, India)
The presence of the enzyme in R. serpentina Benth, a higher plant, was demonstrated. J.M.Whitmarsh
- 301. INTERFERENCE BY REACTIONS OF KYNURENINE METABOLISM IN THE ESTIMATION OF TRYPTOPHAN PYRROLASE IN RAT LIVER HOMOGENATE [WHEN A DOUNCE, HAND-OPERATED HOMOGENISER REPLACED A WARING BLENDOR FOR TISSUE DISPERSION],** M.V.Jago, J.F.Nelson and S.Rose: Biochim. biophys. Acta, 1963, 67, 513-516 (Dept. Physiol., Univ. Melbourne, Parkville, Viet., Australia). B.M.Stevens
- 302. MECHANISM OF TYROSINE OXIDATION BY MUSHROOM TYROSINASE.** S.Osaki: Arch. Biochem., 1963, 100, 378-384 (Dept. Chem., Florida State Univ., Tallahassee, Fla., U.S.A.) The mechanism was examined spectrophotometrically and by O₂ uptake studies using an O₂ galvanocell. Results indicated a mechanism in which tyrosine combined reversibly with the tyrosine site on the enzyme and the complex then broke down to yield dopa and enzyme. Dopa reacted reversibly with the dopa site on the enzyme to yield a dopa-enzyme complex. This split, yielding, after probable intermediate nonenzymic steps, dopa-chrome and enzyme. Tyrosine also reacted reversibly at the dopa site giving an unreactive tyrosine-enzyme complex. Km and max. velocities were observed. An equation derived assuming this mechanism gave an adequate explanation of the induction period and other kinetic peculiarities. B.M.Stevens
- 303. STUDIES ON L-TYROSINE O-SULPHATE.**
- I. PREPARATION AND PROPERTIES OF POTASSIUM J₂-HYDROXYPHENYL PYRUVIC ACID [35s]SULPHATE. F.A.Rose and G.M.Powell. II. IDENTIFICATION OF £-HYDROXYPHENYL PYRUVIC ACID [35s]SULPHATE AS A METABOLITE OF L-TYROSINE O[35s]SULPHATE IN THE RAT. G.M.Powell, F.A.Rose and K.S.Dodgson. III. THE METABOLIC FATE OF THE L-TYROSINE O[35s]SULPHATE RESIDUE OF 35s-LABELLED RABBIT FIBRINOPEPTIDE B. J.G.Jones, K.S.Dodgson, G.M. Powell and F.A.Rose: Biochem. J., 1963, 87, 548-553 (Dept. Biochem., Univ. Coll., Cardiff, Wales)
- I. Potassium £-hydroxyphenylpyruvic acid [35s]sulphate has been prep, by the action of [35s]chlorosulphonic acid on j₂-hydroxyphenylpyruvic acid under strictly controlled conditions. The prop, of the ester have been compared with those of the parent phenol. The ester displays keto-enol tautomerism and undergoes spontaneous conversion into jD-hydroxybenzaldehyde [35s]sulphate in soln. above pH 11. Spontaneous conversion into jg-hydroxyphenylacetic acid [35s]sulphate has been observed on paper chromatograms.
- II. £-Hydroxyphenylpyruvic acid [35s]sulphate has been identified as a metabolite of L-tyrosine O[35s]-sulphate in the rat. The metabolite is unstable and undergoes spontaneous conversion into jD-hydroxybenzaldehyde [35s]sulphate at room temp, and alk. pH and into £-hydroxyphenylacetic acid [35s]sulphate in the presence of urine and at neutral pH.
- III. Fibrinopeptide B, prep, from the fibrinogen of rabbits receiving Na235sO₄, contains a L-tyrosine O[35s]sulphate residue. The metabolic fate of this residue, after i.p. or i.v. injn. of the labelled fibrinopeptide into rabbits, has been compared with that of free

potassium L-tyrosine O[35s]sulphate. The latter compound is rapidly eliminated unchanged in the urine together with smaller amounts of j⁺-hydroxyphenylacetic acid [35s]sulphate. Similarly, no significant desulphation of the peptide-bound L-tyrosine O[35s]sulphate residue of fibrinopeptide B occurs in vivo, although the behaviour on Dowex 50 columns of the 35s-labelled material that is eliminated in the urine shows that the 35 S is no longer associated with fibrinopeptide. Labelled metabolites in urine emerge from Dowex 50 (H⁺) columns in 2 peaks, the positions of emergence of these peaks during the elution procedure coinciding approx. with those obtained when the urines of rabbits receiving free L-tyrosine O[35s]sulphate are similarly fractionated. The results suggest that fibrinopeptide B is degraded in vivo with the liberation of free L-tyrosine O[35s]sulphate, some of which is metabolised further to yield jD-hydroxyphenylacetic acid [35s]sulphate. •

- 304. VALINE BIOSYNTHESIS. V. CHARACTERISTICS OF PURIFIED DIHYDROXY ACID DEHYDRATASE FROM SPINACH LEAVES.** M.Kanamori and R.L.Wixom: J. biol. Chem., 1963, 238, 998-1005 (Dept. Biochem. Sch. Med., Univ. Arkansas, Little Rock, Ark., U.S.A.) The dehydratase is purified 120-fold. The optimum pH is 8-0-8-2, and Mg is needed for max. activity, although Mn and Co stimulate to a less extent. The enzyme catalyses conversion of ttiS-dihydroxyisovaleric acid into (2-oxoisovaleric acid, both of which are intermediates in microbial synthesis of valine. OKfi-Dihydroxy-jS-methyl-n-valeric acid is dehydrated into OL-oxo-£-methyl-n-valeric acid which are steps in microbial synthesis of i¹⁰* leucine. The purified enzyme prefers threo to erythro isomers and is distinct from several other known dehydratases. The significance of this dehydratase in plant^{**} is shown by conversion of a-acetolactic acid, O⁺S-di^{*} hydroxyisovaleric acid, and GK-oxoisovaleric acid into valine in presence of a crude extract and suitable co-factors. Similarly a#-dihydroxy-fi-methyl-n-valeric acid has furnished isoleucine. J.N.Ashley

- 305. REACTIONS OF SULPHUR CONTAINING AMINO ACIDS. I. DECOMPOSITION OF CYSTINE, CYSTEINE CYSTINE-DIHYDANTOIN. LANTHIONINE AND LANTHIONINE-DIHYDANTOIN IN AQUEOUS SOLUTIONS.** H.Zahn and E.Golsch: Hoppe-Seylers Z. physiol. Chem., 1962, 330, 38-45 (Techn. Hochschule Aachen, Germany). (German) LCorm*

- 306. ENZYMIC SYNTHESIS OF CYSTEINE FROM PHOSPHOSERINE AND SULPHIDE.** A.Sentenac, F.Chapey and P.Fromageot: Biochim. biophys. Acta, 1963, & 672-673 (Section Autonome Chim. Biol., Dépt. Biologie, Centre d'Etudes Nucléaires de Saclay, Gif-sur-Yvette, Seine et Oise, France). (French) B.M.Steven*

- 307. DEMONSTRATION AND CHARACTERISATION OF CYSTEINE SULPHOXIDE LYASE IN THE CRUCIFERAE.** M.Mazelis: Phytochemistry, 1963, 2, 15-22 (Dept. Food Sci. Technol., Univ. California, Davis, Calif., U.S.A.) An enzyme which degrades cysteine sulphoxides has been purified about 11-fold from ^{b1?c}_{11?1}^{co u} buds, and its prop, examined. The name⁺-alkylsufP^{w1n1y} alanine alkyl sulphenate lyase (deaminating) (cystein^{?es} sulphoxide lyase) has been proposed. B.H.DaVi

- 308. GLUTAMATE OXIDATION IN THE DIFFERENTIATING SLIME MOULD. I. IN VIVO.** B.E.Wright and S.Bard. n. IN VITRO. M.BrUhmtiller and B.E.Wright

Biochim. biophys. Acta. 1963. 71, 45-49. 50-57
 (John Collins Warren Lab., Huntington Mem. Hosp., Sj&ston, Mass., U.S.A.) I. During Dictyostelium discoideum differentiation the conversion of glutamate to CO₂/unit protein increased 7-fold and the concn. of intracellular glutamate increased approx. 10-fold. Alterations in the ratio of concn. of intracellular glutamate: Km of glutamic acid dehydrogenase accounted for the increase in glutamate oxidation.

II. Formation of CO₂ from glutamate was inhib. by anaerobic conditions both in vivo and in extracts in vitro. $\text{t}^2\text{-Oxoglutarate}$ was decarboxylated at the same rate as $\text{L}\text{-Glutamate}$ and competitively diluted out 14CO_2 from $\text{L}\text{-14C}]\text{glutamate}$. The rate of glutamate oxidation in vitro appeared to be substrate controlled throughout differentiation.

B.M.Stevens

³*9. EFFECT OF ANAEROBOSIS ON GLUTAMINE UTILISATION BY EHRLICH ASCITES TUMOUR CELLS. E.Kvamme and G.Svenneby: Cancer Res., 1963, 23, 291-299 (Ullevil Hosp., Central Lab., Oslo, Norway) Glutamine was metabolised faster aerobically than anaerobically. Equiv. amounts of NH₃ were formed in both cases. Aerobically, glutamine was accounted for largely as glutamate, aspartate and alanine, anaerobically only as glutamate. Cells preincubated in air showed higher aerobic glutamine utilisation than cells preincubated in N_2 . The latter increased their utilisation after a lag. Increased utilisation was not due to increased permeability of glutamine nor to effects on glutaminase I, transaminases, glutamine synthetase or L-amino acid oxidase. N^{32}P , malonate, transaconitate or AS2O₃ had little effect. Slutamine disappearance. AS2O₃ markedly reduced P^{32}Ue of O₂ uptake by glutamine. 10-3M Bromothymol blue stim. glutamate and NH₃ production in cells or homogenates aerobically or anaerobically.

B.M.Stevens

³*10. ENZYMIC CYCLISATION OF L-GLUTAMINE AND L-GLUTAMINYL PEPTIDES. M.Messer: Nature, Lond., 1963, 197, 1299 (Gastroenterol. Res. Unit, Royal Children's Hosp., Melbourne, Australia) Crude $\text{L}\text{-Glutaminyl peptidase}$ from papaya latex contains an enzyme which liberates ammonia from L-glutamine between pH 7-12 and forms Pyroglutamyl carboxylic acid, which was identified and chromatographically. D-glutamine was not affected, iodine action was not inhib. by dialysis, treatment with Na^+ -acetate or EDTA. Glutamine deriv. such as L-glutamyl-leucine and L-glutaminy-L-asparagine were N^{14}C -unlabelled and converted to ninhydrin-neg. compounds.

G.M.Lewis

³*11. GLUTAMINE SYNTHETASE. I A COMPARATIVE STUDY OF DISTRIBUTION IN ANIMALS AND ITS INHIBITION BY DL-ALLO-6-HYDROXYLYSINE. C.Wu: Comp. Biochem. Physiol., 1963, 8, 335-351 (Dept. of Med. Univ. Michigan Med. Sch., Ann Arbor, Mich. U.S.A.) A method for estimating the glutamine synthetase activity of tissues relying upon the Wirkung of the enzyme to form glutamylhydroxamate is described. Amongst vertebrates the brain was a constant source and in fact ureotelic reptiles and birds were the only source. Enzymic activity in the higher mammals and birds was obtained from liver, also in the mammal kidney, bird heart and liver of uricotelic animals. DL-Allo-6-hydroxylysine inhibited the synthetase activity; this was non-competitive with respect to glutamate.

M.S.Laverack

³*12. CRYSTALLINE L-ASPARTATE 4-CARBOXY-LYASE. M.Wilson: Biochim. biophys. Acta, 1963. 67. 345-

348 (Dept. Biochem., Univ. Leicester, England) The crystn. of the enzyme from an Achromobacter sp. and some of its prop. are described. Prelim, comm.

B.M.Stevens

313. GUINEA-PIG SERUM L-ASPARAGINASE. PROPERTIES, PURIFICATION AND APPLICATION TO DETERMINATION OF ASPARAGINE IN BIOLOGICAL SAMPLES. D.B.Tower, E.L.Peters and W.C.Curtis: J. biol. Chem., 1963, 238, 983-993 (Lab. Neurochem.. Nat. Inst. Neurol. Dis. and Blindness, Bethesda, Md., U.S.A.)

Asparaginase activity of guinea-pig serum is independent of strain, sex or dietary intake of asparagine, but it is a function of age. Sp. activities of neonatal sera are approx. 10% of the adult level, and there is a progressive rise with increase of age of the animals. The enzyme is purified approx. 200-fold in $IOP\%$ yield from serum. It has a high degree of specificity for L-asparagine and requires no cofactors. The optimum pH is 9*6.

J.N.Ashley

314. FORMATION OF BOUND PHOSPHOHISTIDINE FROM ADENOSINE [32p]TRIPHOSPHATE IN MITOCHONDRIA. J.B.Peter and P.D.Boyer: J. biol. Chem., 1963, 238, PC1180-1182 (Dept. Physiol. Chem., Univ. Minnesota, Minneapolis, Minn., U.S.A.)

AT32P when incubated with rat liver mitochondria forms [32p]phosphohistidine. ATP potentiates the ability of oligomycin and $\text{m}-\text{chlorocarbonyl cyanide phenylhydrazone}$ to inhibit the inorg. phosphate-ATP exchange reactions of mitochondria.

J.N.Ashley

315. BOUND PHOSPHOHISTIDINE AS INTERMEDIATE IN PHOSPHORYLATION REACTION OF OXIDATIVE PHOSPHORYLATION CATALYSED BY MITOCHONDRIAL EXTRACTS. J.B.Peter, D.E.Hultquist, M.DeLuca, G.Kreil and P.D.Boyer: J. biol. Chem., 1963, 238, PC1182-1184 (Dept. Physiol. Chem., Univ. Minnesota, Minneapolis, Minn., U.S.A.) Bound phosphohistidine is formed from AT³²p and from inorg. [32p]_pphosphate by a sol. enzyme system from rat liver. Thus a phosphorylation reaction of oxidative phosphorylation occurs which is independent of electron transport. The significance of the results and possible mechanisms of all of the inorg. P uptake reactions of oxidative phosphorylation are discussed.

J.N.Ashley

316. OCCURRENCE OF γ -HYDROXYARGININE IN PLANTS. E.A.Bell and A.S.L.Tirimanna: Nature, Lond., 1963, 197, 901-902 (Dept. Biochem., King's Coll., London, England) A guanidino compound found in extracts of the seeds of 17 spp. of Vicia was purified by ion exchange chromatography and identified as γ -hydroxyarginine.

G.M.Lewis

317. VARIATION OF ARGINASE IN LUNG TISSUE OF DOMESTIC ANIMALS. K.Lange and K.T.Kossman: Naturwissenschaften, 1963, 50, 21 (Physiol. Chem. Inst., Univ., Mflnster, Germany). AJ.Wansbrough

318. EFFECT OF HYDROXYLYSINE ON ASCITES CELL GROWTH IN VITRO. F.R.Leach: Exp. Cell Res., 1963, 29, 162-165 (Dept. Biochem., Oklahoma State Univ., Stillwater, Okla., U.S.A.) Hydroxylysine could not spare or replace lysine in the growth of ascites H cells in suspension, in contrast to its growth stimulating abilities and lysine-sparing action in micro-organisms. The lack of uptake was not the reason for its failure to replace or spare lysine, as shown by autoradiographic studies.

K.Jones

BIOCHEMISTRY

319. ACTIVITY OF SERUM TRANSAMINASE AFTER CARNITINE ADMINISTRATION. E.Strack, Y.Han, H.Aurich and W.Rotzsch: Hoppe-Seylers Z. physiol. Chem., 1963, 331, 33-40 (Physiol.-Chem. Inst. Univ., Leipzig, Germany) The activities of alanine- and aspartate-transaminase in rat serum increase with small doses of ca mi tine but decrease with larger doses. Other possible factors for these activities have been eliminated. (German) I.Cornish
320. SERINE BIOSYNTHESIS FROM HYDROXYPYRUVATE IN PLANTS. J.E.Willis and H.J.Sallach: Phytochemistry, 1963, 2, 23-28 (Dept. Physiol. Chem., Univ. Wisconsin Med. Sch., Madison, Wis., U.S.A.) Serine is biosynthesised in plant extracts by a transamination reaction between L-alanine and hydroxypyruvate. L-alanine is the most active amino group donor of a no. of amino acids investigated. Green leaves are the richest source in plants of the transaminase enzyme. B.H.Davies
321. NON-ENZYMIC TRANSAMINATION BETWEEN ORNITHINE AND GLYOXYLATE. J.Cabello, C.Basilio, V.Prajoux and M.Plaza: Arch. Biochem., 1963, 100, 512-515 (Inst. Quím. Fisiol. Patol., Esc. Med., Univ. Chile, Santiago, Chile) Ornithine and glyoxylic acid transaminated spontaneously. Heating in the presence of Al markedly increased the reaction rate. The reaction appeared to be an Of-transamination yielding glycine and a-keto-6-aminovaleric acid. The latter was in equilibrium with its cyclic form A⁺-pyrroline-2-carboxylic acid. B.M.Stevens
322. FRACTIONATION OF HISTONES OF WALKER 256 CARCINOSARCOMA BY COMBINED CHEMICAL AND CHROMATOGRAPHIC TECHNIQUES. L.S.Hnilica and rf.Busch: J. biol. Chem., 1963, 238, 918-924 (Dept. Biochem., Baylor Univ. Coll. Med., Houston, Tex., U.S.A.) Four main fractions 2a, 2b, 1 and 3, which migrate with decreasing rates during electrophoresis in starch gel, are obtained from the histones. Arginine and glycine each constitute 12% of the total amino acid residues in fraction 2a. Lysine, serine, and alanine constitute 14, 10 and 10%, respectively, of the total amino acid residues in fraction 2b. This is the purest fraction and proline accounts for 81% of the total amino-terminal amino acids. Lysine and alanine constitute 27 and 18%, respectively, of the amino acid residues in fraction 1, which contains several amino-terminal amino acids. Arginine, alanine, glutamic acid, and leucine each comprise approx. 10% of the total amino acid residues in fraction 3, in which alanine is the main amino-terminal amino acid. There are marked differences in the sp. activities of the different histone fractions 1 hr. after injn. of L-[14c]lysine into tumour-bearing rats; the activities decreased in the order 3, 2a, 2b and 1. Thus the alkali sol. and 'residual' nuclear proteins are a complex mixture of proteins. J.N.Ashley
323. PHYSICO-CHEMICAL STUDIES OF THE PROT-AMINES. I. IRIDINE (FROM SALMO IRIDEUS). M.Gehatia and C.Hashimoto: Biochim. biophys. Acta, 1963, 69, 212-221 (Inst. Phys. Chem. Univ. Frankfurt am Main, Germany) A soln. of iridine from S. irideus in pH 7'3, 0.05M triethanolamine hydrochloride buffer was examined at 20° by ultracentrifugation, pycnometry, refractometry and viscometry. The estimated increment of JI was 1.91 when the concn. of iridine chloride was expressed in g./g. soln. The partial sp. vol. was 0.66 ml./g. jg was 0^b74. The diffusion coeff.. evaluated from the ultracentrifugal diagram by the method of max. gradient, was 13^b0 x 10⁻⁷. The mol. wt. was 4100. The intrinsic 1 was 8^b16. Assuming that the mol. behaved as a flexible rod, a diam. of 0^b76 m/i and a length of 10^b45 m/i were calc.
- (German) B.M.Stevens
324. PROTAMINE-HEPARIN COMPLEX AS A SUBSTRATE FOR PLASMIN. H.B.W.Greig and E.M.Cornelius: Biochim. biophys. Acta, 1963, 67, 658-668 (Coag. Res. Lab., South African Inst. Med. Res., Johannesburg, South Africa) A i. ethod for estimating the proteolytic activity of plasL-L* using a protamine-heparin complex as substrate is described. Optimum conditions of substrate concn., pH and temp, were determined. Digestion by plasminogen-streptokinase mixtures was shown to be biphasic. B.M.Stevens
325. SYNTHESIS OF PROTECTED HEPTAPEPTIDE RELATED TO EVOLIDINE [FROM LEAVES OF EVODIA XANTHOXYLOIDES]. N-BEJNZYLOXYCARBONYL-L-LEUCYL-L-PROLYL-L-VALYL-L-ASPARAGINYL-L-LEUCYL-L-SERYL-L-PHENYLALANINE BENZYL ESTER. H.Nesvadba and G.T.Young: Tetrahedron Letters, 1963, 6, 361-363 (Sanabo Res. Lab., Vienna, Austria) Letter. I.A.B.S.
326. TURNOVER OF LIVER GLUTATHIONE IN TRAUMA. S.C.Kalser and L.V.Beck: Biochem. J., 1963, 87, 618-623 (Dept. Pharmacol., Sch. Med., Univ., Pittsburgh, Pa., U.S.A.) GSH synthesis by the liver was studied in vivo in control and tourniquet-traumatised mice. Liver GSH was isolated, and (a) the rate of entrance of L-[³⁵S]cysteine into liver GSH (I) as well as (b) the rate of disappearance of 35s from liver GSH (II) were followed. In the studies in which (a) was measured* similar turnover times were observed for both groups. Since traumatised mice had lower concn. of liver GSH, the turnover rate for the groups of traumatised mice was only about one-half that of the control groups. Although results from the groups of traumatised mice showed similar turnover times for the controls and the groups of traumatised mice when measured by (a), the turnover times of control groups were much longer than those of the groups of traumatised mice when measured by (b). A possible explanation for this discrepancy is discussed. •
327. EVIDENCE FOR INTERMEDIATE IN SYNTHESIS OF γ -GLUTAMYL-a-AMENOBUTYRYLGLYCINE BY GLUTATHIONE SYNTHETASE. J.S.Nishimura, E.A. Dodd and A.Meister: J. biol. Chem., 1963, 238, PC1179-1180 (Dept. Biochem., Tufts Univ. Sch. Med., Boston, Mass., U.S.A.) In reaction mixtures that contain ATP and glutathione synthetase, γ -glutamyl-tt-aminobutyrate is converted, in absence (but not in presence) of an acceptor (such as NH₂OH, glycine), &^{to} an activated form, which is probably γ -glutamyl-O^{*}" aminobutyryl phosphate. J.N.Ashley
328. ENZYMIC INVESTIGATIONS OF PARTIALLY W*/* FIED HOG KALLIKREIN. D.A.Chambeis, C.Bosser, J.M.Greep and G.L.Nardi: Nature, Lond., 1963, 197, 1300-1301 (Dept. Surg., Harvard Med. Sch., Boston, Mass., U.S.A.) Kallikrein and trypsin can be differentiated by their activity towards synthetic substrates^a benzoyl arginine ethyl ester, benzoyl arginine methyl ester and toluene sulphonyl arginine methyl ester. G.M.^{ewte} A
329. ISOLATION AND STRUCTURE OF FORTUTTINE; * PEPTEDOLIPID OF MYCOBACTERIUM FORTUTTUM.

E.Vilkas, A.Miquel and E.Lederen Biochim. biophys. Acta, 1963, 70, 217-218 (Inst. Chim. des Substances Naturelles, Gif-sur-Yvette, Seine-et-Oise, France) The peptidolipid of M. fortuitum, contained only L-amino acids. Prelim, comm. (French) B.M.Stevens

^{330.} DETECTION OF PEPTIDES ON PAPER WITH PHENYL ISOTHIACONATE. I.Sjöquist and J.Sjöquist: Biochim. biophys. Acta, 1963, 71, 210-212 (Dept. Physiol. Chem., Univ., Lund, Sweden). B.M.Stevens

^{331.} SYNTHESIS OF THE C-TERMINAL TETRAPEPTIDE SEQUENCE DERIVED FROM GLUCAGON. H.C.Beyerman and J.S.Bontekoe: Rec. Trav. chim. Pays-Bas, 1962, 81, 699-709 (Org. Chem. Lab., Technische Hogeschool, Delft, Netherlands) The synthesis has ^{HS?} achieved of ^{*c*} tetrapeptide L-Leu-L-Met-L-Asp ^{H^A-L-Thr}. This has been achieved by the use of a ^{*S2}-butyl ester group to protect the terminal carboxyl F^{up} and by the use of a ^{tert}-butoxy group to protect the ^a-hydroxyl group of threonine. G.C.Barr

^{332.} TRICHLOROACETIC ACID-PRECIPITATED PROTEINS [TO GIVE THREE FRACTIONS] OF SEMINAL PLASMA IN BULL, BUFFALO AND GOAT [BEFORE AND AFTER STORAGE AT ROOM TEMPERATURE]. K.A.Abraham and P.M.Bhargava: J. Reprod. Fertil., p 1%3, 5, 277-280 (Reg. Res. Lab., Hyderabad, India) ^{fr**Um.} comm. H.E.H.Jones

^{333.} EFFECT OF ACID PRECIPITATION ON THE SOLUBILITY AND THE ELECTROPHORETIC CHARACTERISTICS OF PLASMA PROTEINS. K.A.Abraham and P.M.Bhargava: Indian J. Chem., 1963, 1, 124-130 (Reg. Res. Lab., Hyderabad, India). LA.B.S.

^{334.} STARCH-GEL ELECTROPHORESIS OF PIG SERUM PROTEINS. R.K.Scopes: Nature, Lond., 1963, 197, £201-1202 (Low Temp. Res. Sta., Downing St., Cambridge, England) Pig serum proteins may be separated in ^{22°/26°} components during 1 day by starch gel electrophoresis using a discontinuous buffer system in ^{ertical} apparatus; up to 10 samples may be characterized simultaneously. G.M.Lewis

^{335.} HAEMOGLOBIN, X. ANALYSIS OF THE α - AND β -CHAINS OF THE NORMAL HUMAN Hb FROM ITS TRYPSIN CLEAVAGE PRODUCTS. G.Braunitzer, Ph.Rudloff and N.Hilschmann: Hoppe-Seylers Z. physiol. Chem., 1963, 331, 1-32 (Max-Planck-Institut für Biologie, Münster, Germany) Selective enzymic hydrolysis of Pted ^{wi*} modern methods of peptide sequencing determination led to the full elucidation of the α - and β -chains of Hb. Expt. details are given. (German) L.Cornish

^{336.} EFFECT OF NEUTRAL SALTS ON THE LIGHT ABSORPTION AND MAGNETIC SUSCEPTIBILITY OF HEMOGLOBIN AND METHAEMOGLOBIN. bijSt. ^{Hele} H.J.Thiele and L.Scheler: Biochim. biophys. Acta, 1963, 661, 282-284 (Inst. Pharmakol., Univ. Greifswald, Germany) Prelim, comm. B.M.Stevens

^{337.} ULTRIPL P_H OF SOME MEMBERS OF THE HEMOGLOBINE FAMILY [SEPARATED BY STARCH GEL ELECTROPHORESIS]. H.Tsuyuki and R.E.A.Gadd: Biochim. biophys. Acta, 1963, 71, 219-221 (Fisheries Research Board of Canada, Technol. Station, Vancouver, B.C., Canada) Prelim, comm. B.M.Stevens

^{338.} NEW VARIANT OF ABNORMAL METHAEMOGLOBIN: Hb MRadom. K.Murawski, Z.Szymanowska and J.Kozlowska: Biochim. biophys. Acta, 1963, 69, 442-444 (Dept. Biochem., Inst. Haematol., Warsaw, Poland) The variant had different spectrochem. prop. from those of known Hb M types. Prelim, comm. B.M.Stevens

^{339.} ACETYLATED HUMAN Hb. E.Bucci, C.Fronticelli, L.Bellelli, E.Antonini, J.Wymaa and A.R.Fanelli: Arch. Biochem., 1963, 100, 364-368 (Inst. Biol. Chem., Univ. Rome, Italy) Prep. of varying degrees of acetylation were stable and spectroscopically indistinguishable from normal Hb in the visible region. Mol. wt. appeared to be reduced to approx. half the normal at higher degrees of acetylation. Isoelectric points shifted downwards to pH 3*5-5.0 depending on the degree of acetylation. At approx. $SQfJo$ acetylation, the highest achieved, the protein still combined reversibly with 02 but the value of the coeff. n of the Hill equation was reduced and became dependent on pH. The value of the log. of p_f was below normal and tended to be independent of pH. The no. of SH groups titratable with jg-mercuribenzoate was reduced to 0. B.M.Stevens

^{340.} REDUCTION OF HUMAN FERRIHAEMOGLOBIN A IN THE PRESENCE OF Cysteine AND THE EFFECT OF CARBON MONOXIDE. W.R.Holmquist and J.R.Vinograd: Biochim. biophys. Acta, 1963, 69, 337-354 (Gates and Crellin Lab. Chem., Pasadena, Calif., U.S.A.)

The rate of reduction in the presence of cysteine was studied as a function of Hb level, cysteine level, temp., pH, ionic strength, stereospecificity, atm. composition and method of Hb isolation. A mechanism is suggested. CO inhib. the reduction. In the absence of other reductants, ferriHb was reduced by CO, the rate of such reduction being accelerated by u.v. light. Evidence for the formation of a ferriHb-NH₃ complex in aq. soln. is described. Extinction coeff. for several Hb compounds at various X are given. B.M.Stevens

^{341.} PURIFICATION OF γ -GLOBULIN FRAGMENTS BY GEL FILTRATION. M.Tan and W.V.Epstein: Science, 1963, 139, 53-54 (Dept. Med., Univ. California Sch. Med., San Francisco, Calif., U.S.A.) Sephadex was used to separate the 3*5 S univalent fragments of human γ -globulin from 7 J5 bivaTent globulin after digestion with papain. G.M.Lewis

^{342.} SOME PHYSICAL STUDIES ON THE TWO α -GLYCOPROTEINS OF FOETAL CALF SERUM. K.J.Turner: Biochim. biophys. Acta, 1963, 69, 518-523 (Commonwealth Serum Lab., Melbourne, Australia) The major component had an ϵ of 3*4 and a mol. wt. of 47000. The minor component, a macroglobulin, had an ϵ of 20 and a mol. wt. of 990000. It is suggested that the macroglobulin may be an aggregate of die 3*4.3 fraction. B.M.Stevens

^{343.} INTERACTION OF HUMAN PLASMA ALBUMIN AND REDUCED GLUTATHIONE [GSH]. L.Libenson and M.Jena: Arch. Biochem., 1963, 100, 441-450 (Div. Med., Western Pennsylvania Hosp., Pittsburgh, Pa., U.S.A.) Albumin was reduced on incubation with GSH at pH 2*5-4*7 to a product with the electrophoretic mobility of the plasma O_L-globulins. No reaction between albumin S-S and GSH occurred at pH 2*0 or pH 5*0-9*0. Reduction and electrophoretic modification gave similar pH curves with optima at approx. pH 3*6. The curves were similar to those for the activity of intracellular proteinases activated by GSH. Behaviour of albumin

BIOCHEMISTRY

towards GSH at various pH in the presence of urea indicated that the reactivity of GSH and the accessibility of protein S-S were limiting factors in the reaction. Mixed disulphides appeared to be formed during the reduction reaction. These were stable at low pH and readily decomposed in slightly alk. soln. B.M.Stevens

344. SEPARATION OF POLYPEPTIDES BOUND BY ALBUMIN IN HUMAN PLASMA. A.L.Rubin, G.D. Lubash, K.F.Aronson and P.F.Davison: *Nature*, Lond., 1963, 197, 1009-1010 (Dept. Med., Cornell Univ. Med. Coll., New York, U.S.A.) Dialysis of human albumin against 1 N acetic acid caused the release of up to 10% peptide material due, presumably, to exposure of binding sites by change of configuration of the albumin to expanded form. The peptides released had an amino acid composition quite distinct from that of albumin itself, which did not suffer any hydrolytic or proteolytic breakdown. The results support the view that albumin has an important function in the transport of biol. active polypeptides.

G.M.Lewis

345. ISOLATION OF HUMAN THROMBIN [FROM PLASMA FRACTION HO]. K.D.Miller and W.H.Copeland: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 512-514 (Div. Labs, and Res., New York State Dept. Hlth., Buffalo, N.Y., U.S.A.) M.M.Shapland

346. TRANSFORMATION OF FIBRINOGEN INTO FIBRIN. I. KINETICS OF THE pH CHANGE ASSOCIATED WITH THE CLOTTING OF FIBRINOGEN. E.Mihalyi and I.H.Billick: *Biochim. biophys. Acta*, 1963, 71, 97-108 (Lab. Cellular Physiol. and Metab., Nat. Heart Inst., Bethesda, Md., U.S.A.) When the initial pH was 5.5-8*0 the reaction followed first order kinetics. Above pH 8.0 two reactions were apparent, 1 producing and the other absorbing H⁺. This biphasic curve could be analysed in terms of 2 consecutive first order reactions. The rate of the reaction below pH 8 and of the first reaction above were concluded to be equal to the rate of the proteolytic step, whereas the rate of the second reaction above pH 8 is concluded to be equal to the rate of the polymerisation step.

B.M.Stevens

347. PURIFICATION OF HUMAN PLASMINOGEN AND PLASMIN BY GEL FILTRATION ON SEPHADEX AND CHROMATOGRAPHY ON DIETHYLAMINOETHYL-SEPHADEX. K.C.Robbins and L.Summaria: *J. biol. Chem.*, 1963, 238, 952-962 (Biochem. Res. and Development Dept., Michael Reese Res. Foundn., Chicago, IL, U.S.A.) Plasminogen is prep, in very pure form from human plasma Fraction 1112*3 by a modification of Kline's method followed by either gel filtration through Sephadex or chromatography on DEAE-Sephadex. Plasminogen of the same purity can also be prep, by direct chromatography of extracts of the same plasma fraction on DEAE-Sephadex. These methods are simple and reproducible and they give excellent yields. Very pure plasmin, prep, by activation of the proenzyme with a trace of urokinase in glycerol, is isolated by chromatography on DEAE-Sephadex. Plasminogen and plasmin are prep, with sp. activities of 19*5 and 21*4 casein units per mg. of protein, or 123 and 140 casein units per mg. of N, respectively. The proenzyme and enzyme are homogeneous immunochem. and in the ultracentrifuge, but they are heterogeneous electrophoretically.

J.N.Ashley

348. ISOLATION OF PHOSVTIN FROM THE PLASMA OF THE LAYING HEN. P.J.Heald and P.M.McLachlan:

Biochem. J., 1963, 87, 571-576 (Twyford Lab. Ltd., Twyford Abbey Road, London, England) Phosvitin has been isolated from the plasma of the untreated laying hen by a simple procedure. The overall yields vary from 39 to 67% of the phosphoprotein P present in the original plasma samples. The material isolated contains 10*07 P and 11*02% N. The amino acid composition is identical with that of yolk phosvitin. The sedimentation constant, s_{20,w}, of 3*11 agrees with that of authentic

**20, w,

*

yolk phosvitin, and the rate of release of phosphate on acid hydrolysis is also similar to that of phosvitin. It is pointed out that phosvitin in the plasma probably exists in a complex chem. different from that in the yolk.

349. INVESTIGATIONS OF SUINT. I. COMPOSITION OF ORGANIC ACIDS FROM FLEECES OF DIFFERENT ORIGIN. C.Kowala, Z.H.Kranz and K.E.Murray: *Aust. J. Chem.*, 1962, 15, 832-840 (Div. Org. Cheifc C.S.I.R.O. Chem. Res. Labs., Melbourne, Australia)

Procedure for isolating the bulk of water-sol. suint acid⁵ from 7 wool samples is described. These are methylated and when examined by gas chromatography, 23 amino acids were identified. Large qual. and quant. difference were found between samples, and the composition of ay samples was complex.

D.G.Upshaw

350. ELASTASE AND ELASTIN. II. PARTIAL PURIFICATION AND PROPERTIES OF ACTIVATION OF PRO-ELASTASE. F.Lamy and S.Tauber: *J. biol. Chem.*, 1963, 238, 939-944 (Dept. Anat., Univ. Pittsburgh Sch. Med., Pa., U.S.A.) Proelastase of pig pancreas is purified 40-fold; the product is contaminated with chymotrypsinogen but not with trypsinogen. Activate proelastase requires active trypsin; the reaction is rapid and is proportional to concen. of proelastase (with excess of trypsin), and to trypsin (up to 75% of complete activation). Approx. 1*1 fig. of trypsin is needed for each P₁₀ elastolytic unit activated. An assay for proelastase is described; trypsin in large excess, proelastase, and elastin are mixed, and the amount of sol. polypeptid liberator by the action of the newly formed elastase OP₁₀ elastin is determined.

J.N.Askey

351. CHARACTERISATION OF A NEW TYPE OF C₂O⁵⁻ LINKAGE IN RESILIN, A RUBBER-LIKE PROTEIN. S.O.Andersen: *Biochim. biophys. Acta*, 1963, 67, 249-262 (Zoophysiol. Lab. B, Univ. Copenhagen, Denmark) Native resilin showed a bright blue fluorescence due to 2 compounds connected to the P₁₀; but liberated by prolonged acid or alk. hydrolysis. UV-absorption spectra showed max. at 286 and 283 mμ respectively in acid and at 322 and 317 mμ in alkali. The shift occurred near neutrality and was accompanied by increased fluorescence. Spot tests indicated both were α-amino acids with a phenolic group. Tests for diphenols ana maoie nuciei were neg. One compound was a diamine dicarboxylic acid, the other a triaminotricarboxylic acid. In resilin the NH₂ of the compounds did not react with dinitrofluorobenzene. The degree of cross-linking from amounts of the 2 compounds agreed with resilin from physical measurements.

J.N.Ashley

352. EFFECT OF IONS ON THE GLUTAMIC DEHYDRO-GENASE REACTION. A.Péna-Díaz, A.Gómez-Puyou and J.Guzmán-García: *Arch. Biochem.*, 1963, 100, 426-430 (Dept. Bioquím., Fac. Med., Univ. Nac. Autónoma México, Ciudad Universitaria D.F., Mexico) Glutamic dehydrogenase activities of rat liver homogenate

BIOCHEMISTRY

35

and rat liver acetone dried powders or activity of the ^CYst. enzyme were higher in the presence of phosphate and Na than with phosphate and K. A similar but greater effect was apparent when SO₄ replaced phosphate. When Cl⁻ replaced phosphate, activity was slightly higher with K than with Na. Km and results with different substrates indicated that the ions affected the participation of α-oxoglutarate. Na and K had no effect on ^{J*} activities of cryst. lactic and malic dehydrogenases under similar conditions.

B.M.Stevens

35a. LOW MOLECULAR WEIGHT FORMS A TYPE A BOTULINUM TOXIN. II. ACTION OF PEPSIN ON INTACT AND DISSOCIATED TOXIN. J.Wagman: Arch. Biochem., 1963, 100, 414-421 (U.S. Army K Biol. Lab., Fort Detrick, Frederick, Md., U.S.A.) Fwied type A toxin with a mol. wt. of approx. 900000 ^{**\$} irreversibly dissociated at pH 9-2 with little loss in toxicity. The principal component formed had an S ^{???}. No reaggregation was observed on readjustment to pH 3.8. Intact toxin was highly resistant to pepsin but the ⁵-toxin was extensively degraded. A considerable amount of toxicity was retained. In some expt. significant quantities of these toxic fragments diffused through cellulose dialysing membranes.

B.M.Stevens

35b. DETERMINATION OF THE MOLECULAR WEIGHT OF POLY-L-LYSINE. A.Yaron and A.Bergen: Biochim. biophys. Acta, 1963, 69, 397-399 (Dept. Biophys., Weizmann Inst. Sci., Rehovoth, Israel) The poly-lysine was either converted to polycarbobenzoyllysine, ^{2e} intrinsic ^{*?} of which was determined in dimethyl-¹⁴C amide or ^v measurements were made on polylysine ¹⁴C bromide in salt-free aq. soln.

B.M.Stevens

35c. EFFECT OF TRYPSIN ON LIVER MICROSOMES. (Lust and P.Drochmans: J. cell Biol., 1963, 16, 81-^{*2} (Cancer Res. Inst., Univ. California Med. Center, San Francisco, Calif., U.S.A.) Livers of Wistar rats were homogenised in unbuffered 0.25M sucrose PH ⁷ isotonic soln. of NaCl and veronal-acetate-HCl at 7%⁵, and centrifuged. The microsomal fractions were suspended and incubated with 4.0-15.0 mg. trypsin and in 10% tris buffer fixed in OSO₄ and embedded in agarose followed by methacrylate. The trypsin removed ¹⁴C from the ⁸h surfaced vesicles and the total contents of the pellet were decreased. Homogeneous? Particles which occur within the smooth vesicles to ¹⁴C in densely with phosphotungstic acid sediment on ¹⁴C-microsome pellet and remain unchanged by ^{ps}m treatment.

35d. DIFFERENT STRUCTURAL FORMS OF REVERSIBLY DISOCUTED GLUTAMIC DEHYDROGENASE: RELATION BETWEEN ENZYMIC ACTIVITY AND MOLECULAR WEIGHT. C.Frieden: Biochem. biophys. Res. Comm., 1963, 10, 410 (Dept. Biol. Chem., Washington Univ. Sch. Med., St. Louis, Mo., U.S.A.) Compounds which dissociate glutamic dehydrogenase at high enzyme concn. also inhibit enzyme activity. Posed that these compounds cause a change in formation of the sub-units.

B.Ketterer

35e. FRACTIONAL SOLUBILISATION OF HAEMOPROTEINS AND PARTIAL PURIFICATION OF CARBON MONOXIDE BINDING CYTOCHROME FROM [RABBIT] LIVER MICROSOMES. T.Omura and R.Sato: Biochim. biophys. Acta, 1963, 71, 224-226 (Inst. Protein Res., Osaka Univ., Kita-ku, Osaka, Japan) Two haemoproteins were successfully separated. Prelim. comm.

B.M.Stevens

358. ISOLATION AND CHARACTERISATION OF URINARY γ-GLOBULINS. P.Cornillot, R.Bourillon, J.Michon and R.Got: Biochim. biophys. Acta, 1963, 71, 89-96 (Lab. Biochim., Fac. Med., Paris, France)

The γ-globulin fraction obtained by pptn. with 2M (NH₄)₂SO₄ and DEAEcellulose chromatography was separated by chromatography on Sephadex G-100 into several ultracentrifugally homogeneous components of differing mol. wt. Urinary ⁷γ γ-globulin showed the same physico-chem. and immunochem. characteristics as plasmatic γ-globulin. The ^{3.5} JJ globulin differed in immunochem. behaviour and mol. wt. The ^{2.2} γ-globulin was slightly antigenic and contained more glucides than the other 2 fractions. No γ-globulin with j > lower than 2 was found in urine.

(French) B.M.Stevens

359. COMPOSITION OF BOVINE SUBMAXILLARY MUCINS. W.Pigman and Y.Hashimoto: Biochim. biophys. Acta, 1963, 69, 579-580 (Biochem. Dept., New York Med. Coll., New York, U.S.A.)

B.M.Stevens

360. COW'S K-CASEIN. CHARACTERISATION OF THE RENNIN-SENSITIVE LINKAGE. P.Jollès, C.Alais and J.Jollès: Biochim. biophys. Acta, 1963, 69, 511-517 (Lab. Chim. biol., Fac. Sci., Univ. Paris, France)

K -Casein was reduced by LiBH₄. A ppt. and a supernatant containing a substance sol. in 12% TCA and not dialysable were obtained and seemed to be closely related to para-7t-casein and K-caseino-glycopeptide respectively. Phenylalaninol was detected in the ppt. LiBH₄ appeared to reduce the rennin sensitive linkage in Ji -casein. This appeared to be an ester linkage involving the carboxyl group of the C-terminal phenylalanine residue of para-Jt-casein. (French) B.M.Stevens

361. SHAPE AND VOLUME OF THE CRYSTAL OF D-AMINO ACID OXIDASE MICHAELIS COMPLEX.

K.Yagi and T.Ozawa: J. Biochem., Tokyo, 1963, 53, 162-163 (Dept. Biochem., Sch. Med., Nagoya Univ., Japan).

B.M. Stevens

362. PURIFICATION OF CYTOCHROME $\frac{c}{2}$ AND OTHER HAEMOPROTEINS FROM WHEAT GERM.

A.R.Wasserman, J.C.Garver and R.H.Burris: Phytochemistry, 1963, 2, 7-14 (Dept. Biochem., Coll. Agric., Univ. Wisconsin, Madison, Wis., U.S.A.)

A large-scale method has been described for the extraction and purification of cytochrome $\frac{c}{2}$ as well as some other haemoproteins, from wheat germ. The quantities isolated were sufficient for extensive physical and chem. studies.

B.H.Davies

363. DISTINCTION OF CYTOCHROMES A AND $\frac{c}{2}$ BY CHEMICAL REACTIVITY. M.Morrison and S.Horie: Biochim. biophys. Res. Comm., 1963, 10, 160

(Dept. Biochem., Med. Res. Inst., City of Hope Med. Center, Duarte, Calif., U.S.A.) Evidence is presented to show that in a purified cytochrome oxidase prep, there are 2 cytochrome components, one which combines with CO and the other which does not. These correspond to cytochromes $\frac{c}{2}$ and $\frac{a}{2}$ respectively.

B.Ketterer

364. ELECTRON TRANSFER SYSTEM. II. BINDING OF CYTOCHROME $\frac{c}{2}$ BY RECONSTITUTED NADH₂ OXIDASE. S.H.Richardson and L.R.Fowler: Arch. Biochem., 1963, 100, 547-553 (Inst. Enzyme Res., Univ. Wisconsin, Madison, Wis., U.S.A.) A reconstituted NADH₂ oxidase complex bound varying amounts of cytochrome $\frac{c}{2}$. Addition of cytochrome $\frac{c}{2}$ above a

BIOCHEMISTRY

certain const. level did not further increase NADH₂ oxidase activity. Evidence for interaction between the polybasic cytochrome protein and particle bound phospholipid is presented. A bound form of cytochrome c was shown to be necessary for NADH₂ oxidase activity.

B.M.Stevens

365. ACTOMYOSIN-LIKE PROTEIN IN MITOCHONDRIA OF THE MOUSE LIVER. S.A.Nefakh and T.B.Kazakova: Nature, Lond., 1963, 197, 1106-1107 (Lab. Enzymol., Dept. Biochem., Inst. Expt. Med., Kirovski Prospect 69/71, Leningrad, U.S.S.R.) An actomyosin-like

protein could be extracted from mouse liver mitochondria, which polymerised on addition of very small amounts of myosin A and showed ATPase activity. It is considered that this protein, through its contractility, regulates die permeability of the mitochondrial membrane, releasing factors which stimulate cytoplasmic glycolysis when ATP concn. is diminished. The actomyosin-like protein could not be extracted from cancer cells.

G.M.Lewis

366. OPTICAL-ROTATORY DISPERSION OF MYOSIN A. II. EFFECT OF DIOXANE AND JJ-CHLOROMERCURIBENZOATE [PCMB]. Y.Tonomura, K.Sekiya and K.Imamura. m. **EFFECT OF ATP AND INORGANIC PYROPHOSPHATE [PPi].** Y.Tonomura, K.Sekiya, K.Imamura and T.Tokiwa: Biochim. biophys. Acta, 1963, 69, 296-305, 305-312 (Res. Inst. for Catalysis. Fac. Sci., Hokkaido Univ., Sapporo, Japan)

II. Myosin A a-helical content, estimated from bo in the Moffitt-Yang plot, was 57-61%. Addition of 8-10 vol. % dioxane to myosin A in 0.6M KCl at pH 7*0 initially increased the helical content by several % and activated ATPase. Helical content and ATPase activity then decreased gradually. After 2 hr. the helical content had decreased by a few % but ATPase had disappeared. Immediately after dioxane addition, sp. rotatory power at 500*0 mji showed a max. at approx. 10% dioxane as did ATPase activation. The helical content of alk. inactivated myosin remained const. PPi prevented dioxane altering the helical content. 3-4 moles PCMB/105 g. myosin A increased ATPase max. velocity at 20° from 0.22 to 0.44 mmoles inorg. phosphate/min./g. and Km from 1^B3 to 1.5 x 10⁻⁴M. Temp. dependence of max. velocity increased. 8 moles PCMB inhib. ATPase. Helical content rose after 4 moles PCMB and fell after 8. In Spectrophotometric titrations indicated that in 0.5M KCl 'abnormal' tyrosine increased from 3.6-3.7 moles to 6.2-7.0 moles and 5.5 moles/10⁵ g. protein respectively on adding PPi or ATP. EDTA gave no change. In 0.5M NaCl 'normal' and 'abnormal' tyrosine could not be distinguished and adding ATP gave no significant change in the dissociation state of tyrosine. The electrostatic interaction factor of the dissociation of 'normal' tyrosine was measured under various conditions. In 0.6M KCl PPi decreased the helical content while ATP increased it by several %. ADP gave no change. In 0.6M NaCl, ATP increased the helical content by several % with or without Mg and even in the presence of EDTA.

B.M.Stevens

367. POST-MORTEM LABILITY OF SKELETAL MUSCLE PROTEINS. R.K.Scopes and R.A.Lawrie: Nature, Lond., 1963, 197, 1202-1203 (Low Temp. Res. Sta., Cambridge, England) Several protein components of the sarcoplasmic complex in pig and beef muscle are unstable and either denature or are isoelectrically precipitated by the post-mortem pH fall in muscle, both if this is extensive (low ultimate pH) and/or fast. Many of the constituents are stable and show no diminution in starch gel patterns.

G.M.Lewis

368. INTERMOLECULAR DEFECT OF COLLAGEN IN EXPERIMENTAL LATHYRISM. J.Gross: Biochim. biophys. Acta. 1963, 71, 250-252 (Dept. Med.. Harvard Med. Sch.. Massachusetts Gen. Hosp., Boston. Mass., U.S.A.) Extracted lathyritic collagen readily formed striated fibrils in vitro on warming to body temp., but the fibrils did not become insol. with time as did normal collagen. Prelim, comm.

B.M.Stevens

369. ELASTIC COAT OF THE ARTERIAL WALL STUDIED WITH THE AID OF COLLAGENASE. O.Hassler, M.Wiren and S.Herbertsson: Acta path. microbiol., scand., 1963, 57, 15-20 (Histol. Dept., Univ. Uppsala. Sweden) Collagenase digests native collagen at physiol. temp. and pH. This enzyme produces an effective isolation of the elastic component, which suffered less alteration than after treatment with acids or alkali. The only change that could be found by histo-chem. examination was that a pos. but non-sp. SH-reaction was obtained after digestion.

I.Friedmann

370. TROPOCOLLAGEN: SIGNIFICANCE OF PROTEASE-INDUCED ALTERATIONS. A.L.Rubin, D.Pfahl, P.T. Speakman, P.F.Davison and F.O.Schmitt: Science. 1963, 139, 37-38 (Dept. Biol.. M.I.T.. Cambridge. Mass., U.S.A.) Purified tropomyosin from calf or guinea-pig skin was treated with pepsin. Terminal or near terminal covalently bonded peptides were liberated whose amino acid composition was strikingly different from the composition of the pepsin-resistant triple-helix body of the macromol. Pepsin also converted most of the j8- to a-chains, suggesting that the interchain link is a external to the body of the mol. and probably involves peptides. The role of these prop. in bioregulatory mechanisms is briefly discussed.

G.M.Lewis

371. INTERFERENCE BY AMMONIUM SULPHATE WITH THE ESTIMATION OF PROTEINS BY THE BIURET REACTION. P.G.Stanley: Nature, Lond., 1963, 187, 1108 (Wellcome Lab. the Unit Clin. Invest.. Royal North Shore Hosp. of Sydney. Crow's Nest, N.S.W., Australia) A concn. of as little as 0.08M (NH₄)₂S₀* in a sample of egg albumin interferes appreciably with the estimation of protein of the biuret reaction.

GMM

372. EXTENT OF REDUCTION OF WOOL PROTEINS 0* THIOLS. J.A.Maclaren: Aust. J. Chem., 1962, 15, 824-831 (Div. Prot. Chem.. C.S.I.R.O. Wool Res. Labs.. Parkville, Victoria, Australia) Carboxy-methylation of reduced Merino wool and estimation of the residual disulphide was used to measure the reduction of disulphide groups by dil. soln. of ethanethiol, benzenethiol, toluene-CU-thiol, aminoethanethiol, ¹⁴C₆H₅SH and cysteine, in aq. n-propanol, the wool fibres remaining intact throughout the process. Toluene-CU-thiol was the most effective thiol giving 92% reduction in 2 days, increasing to 99% with repeated reduction-carboxymerinylation cycles. Lincoln 36's wool was 100% reduced after 2 cycles.

D.G.Upal

373. BINDING OF CARBOHYDRATE COMPONENTS IN PROTEINS. F.Michael, E.-A.Ostmann and G.W.Müller: Tetrahedron Letters, 1963, 2, 115-119 (Org.-Chem. Inst. Univ., Münster, Westf., Germany) Mild hydrolysis of pure albumin, and also of a glycopeptide, led to the isolation of a peptide of the pepopeptide ¹⁴N-LL-asparagyl-β-D-glucosamine. This linkage is probably of general occurrence in proteins.

(German)

I.A.B.S.

OBSERVATIONS OF THE MECHANISM OF FIBRINOLYSIS IN A TWO PHASE SYSTEM. R.E.Max-Well, V.Lewandowski and V.S.Nickel: Biochem. biophys. Res. Comm., 1963, 10, 150 (Res. Lab., Park Davis and Co., Ann Arbor, Mich., U.S.A.) Lysis of * Preformed clot of fibrin was found to depend on contact time as well as concn. and phase distributions of plasminogen activator and inhibitor.

B.Ketterer

ACTION OF N-BROMOSUCCINIMIDE ON HUMAN Hb AND ITS POSSIBLE BEARING ON HAEM-GLOBIN LINKAGE. G.J.S.Rao and H.R.Cama: Biochim. biophys. Acta, 1963, 71, 139-149 (Dept. Biochem., Indian Inst. Sci., Bangalore, India) Reaction of N-bromosuccinimide with the haem groups of Hb brought about the appearance of the characteristic absorption peaks of Hb and release of inorg. Fe from the haem groups. Urea was necessary for reaction at pH 4.0 but not at pH 7.0. The spectrum showed no peak in the Soret region at pH 7.0 unless urea or sucrose were present. 8M urea produced effect at pH 3.5-4.5. From this and the dependence of the release of inorg. Fe on the urea concn. it is tested that haem groups are 'buried' within the globin B.M. Stevens

INTERACTION OF BROMOTHYMOL BLUE WITH Hb AND ITS EFFECT ON THE OXYGEN EQUILIBRIUM. J.Antonini, J.Wyman, R.Moretti and A.Rossi-Fanelli: Biol. Aim. biophys. Acta, 1963, 71, 124-138 (Inst. Biol. Chem., Univ. Rome, Italy) The affinity of the dye was much greater for the deoxy- than for the oxy-form of human Hb. The dye had a marked effect on O₂ equilibrium. This difference in behaviour was not seen in myoglobin or in those modified forms of Hb which have simple hyperbolic O₂ equilibrium curves. B.M. Stevens

DENATURATION OF PROTEINS. IV. CONALBUMIN AND FERRIC-CONALBUMIN IN UREA SOLUTION, A.N.Blazer and H.A.McKenzie: Biochim. biophys. Acta, 1963, 71, 109-123 (Physico-chem. Unit, Univ., Sydney, Australia) At pH below 4.2 conalbumin undergoes reversible changes in optical rotation, sedimentation and extent depending on ionic strength and concentration, greatly increased by urea. At pH 5.8-7.8, urea produces disorganised conalbumin producing rotation and ν changes. Fe-conalbumin changes pH 8 pI. Fe-conalbumin was also more stable at pH 9.0. Expt. with cysteine indicated S-S stabilised. Acid and urea produced similar rapid changes in the Fe-conalbumin u.v. spectrum tyrosine and tryptophan region; Fe-albumin changes were slower. The absorbancy of Fe-conalbumin at 292 m μ in cone. urea soln. order. At pH 5.9 and 30° apparent order with to urea was 14. Changes in Fe-conalbumin with Hg^{2+} PH 9.6-10.2 were irreversible. Prelim, expt. on min 'renaturation' are described. B.M.Stevens

GENERAL REACTION OF DFP WITH PROTEINS. I. DIRECT EFFECT ON ENZYMIC ACTIVITIES, T. urachi: Biochim. biophys. Acta, 1963, 71, 239-255; ²DePt. Biochem., Nagoya City Univ. Sch. Med., ²ya, Japan) Prelim, comm. B.M.Stevens

EFFECT OF UREA ON BEHAVIOUR OF THE PROTEIN "MOIETY" OF HUMAN SERUM CL-LIPOPROTEINS IN SOLUTION. S.S.Sanbar and P.Alaupovic: Biochim. Biophys. Acta, 1963, 71, 235-236 (Cardiovascular Res. Sta., Oklahoma Med. Res. Inst., Oklahoma City, U.S.A.) The isolated protein appeared to be

a monomer which aggregated in 0.15M NaCl, phosphate buffer or barbital buffer; addition of urea or a pH increase produced a partial dissociation to the monomeric form without denaturation. Prelim, comm.

381. Jb-TYPE CYTOCHROMES FROM MUNG BEAN SEED-LINGS, m. STRUCTURE OF CYTOCHROME b 555. H.Shichi, D.P.Hackett and G.Funatsu. IV. PURIFICATION AND PROPERTIES OF CYTOCHROME J23 (b-559). H.Shichi, H.E.Kasinsky and D.P.Hackett: J.biSl. Chem., 1963, 238, 1156-1161, 1162-1166 (Dept. Biochem.. Univ. California, Berkeley, Calif., U.S.A.) m. The mol. wt. of cytochrome Jb-555 is approx. 13500; 1 mol. of protohaem is present. Hydrolysis gives 122 amino acids and 12 mol. of NH₃ per mole of protein; there are considerably more acidic- than basic-amino acids. Native cytochrome Jb-555 has no free titratable thiol groups, but 6 are present after reduction with NaBH₄. Disulphide linkages are probably involved in maintenance of the tertiary structure of the protein. The amino-terminal amino acid is probably alanine. Alanine, glycine and serine are obtained after hydrazinolysis. The nature of the linkage between protohaem and apocytochrome b-555 is examined by testing the ability of a modified prosthetic group or apoprotein to reconstitute the cytochrome. Protohaem Fe, the carboxyl groups of protohaem, and histidine in the protein are all probably involved in the binding.

IV. A £-type cytochrome, which appears to be identical with cytochrome J₂₃, and which has absorption max. at 559, 529, and 425 m μ in the reduced form, is isolated from the sol. fraction of etiolated mung bean seedlings. Purification of cytochrome J23 from broad bean leaves is effected by chromatography on DEAE- and CM-cellulose. Cytochrome Jb3 is partially sol. in sat. (NH₄)₂SO₄ at pH 5.0. It is readily reduced by Na₂S₂O₄, cysteine and ascorbic acid. It is autoxidisable; the reduced form does not combine with CO. The prosthetic group is protohaem, and the mol. wt. is estimated to be approx. 28000.

J.N.Ashley

382. CROSS-LINKING OF COLLAGEN AND GELATIN DURING ACETYLATION. J.Bello and H.R.Bello: Biochim. biophys. Acta, 1963, 69, 562-564 (Dept. Biophys., Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.)

B.M.Stevens

383. CONSTITUTION OF THE CROSS-LINKAGES IN ELASTIN. S.M.Partridge, D.F.Elsden and J.Thomas: Nature, Lond., 1963, 197, 1297-1298 (Low Temp. Res. Sta., Cambridge, England) A purified yellow fluorescent peptide obtained from elastin after treatment with proteolytic enzymes followed by amino- and carboxy-peptidases was analysed and found to contain glycine, alanine and proline in the ratio 1:1:2 and small quantities of other amino acids. Evidence from titration, end-group assays and formation of DNP deriv. indicated that, in the native protein, 3 or 4 peptide chains spring from 2 carboxyl and 2 amino groups in the chromophore, thus generating the cross-linked structure. A prelim, examination of the products of acid hydrolysis of the coloured peptide has been made.

G.M.Lewis

BIOCHEMISTRY

- 384. PRESENCE OF PHOSPHATE-MEDIATED CROSS-LINKAGES IN HARD TISSUE COLLAGENS.** A.Veis and R.J.Schlueter: *Nature, Lond.*, 1963, 197, 1204 (Dept. Biochem., Northwestern Univ. Med. Sch., Chicago, 111., U.S.A.) Bovine dentine collagen, decalcified with EDTA exhibits markedly different swelling and solubility characteristics in comparison with bovine corium collagen, although resembling it in amino acid and carbohydrate composition. Dentine collagen contained 0*4% residual P, probably in the form of PO₄, though resistant to the action of venom and spleen phosphodiesterases. The unusual prop. of dentine collagen may be ascribed to the presence of cross linkages mediated by PO₄-groups. G.M.Lewis
- 385. RECOVERY OF THE INTACT STRUCTURE OF TAKA-AMYLASE A [TAA] AFTER REDUCTION OF ALL DISULPHIDE LINKAGES IN EIGHT MOLAR UREA.** T.Isemura, T.Takagi, Y.Maeda and K.Yutani: *J. Biochem., Tokyo*, 1963, 53, 155-161 (Div. Phys. Chem., Inst. Protein Res., Univ., Osaka, Japan) TAA was reduced by Na thioglycolate in 8M urea-0*01M EDTA to give a linear polypeptide with 9 SH. Removal of thioglycolate and urea followed by air oxidation under suitable conditions produced a protein with approx. 50% of the enzymic activity of native TAA and prop., approaching those of native TAA. This protein was shown to be a mixture of completely renatured TAA and partly renatured TAA. The completely renatured TAA was isolated by crystn. and its prop. were shown to coincide with those of native TAA. B.M.Stevens
- 386. COMPARATIVE ANTIGENICITY OF NATIVE AND 'DESIALISED' OROSOMUCOID IN RABBITS.** E.Athineos, M.Thornton and R.J.Winzler: *Proc. Soc. exp. Biol., N.Y.*, 1962, 111, 353-356 (Dept. Biol. Chem., Univ. Illinois Coll. Med., Chicago, 111., U.S.A.) Removal of sialic acid, a terminal sugar, from human orosomucoid by neuraminidase treatment resulted in increased antigenicity of the protein, indicating it is not an important determinant antigenic group. M.M.Shapland
- 387. INTERACTION OF AZO-DYES WITH PROTEINS. II. ULTRAVIOLET SPECTRAL CHANGES OCCURRING ON ADDING PROTEIN TO AQUEOUS SOLUTIONS OF METHYL ORANGE.** W.B.Forbes and B.Milligan: *Aust. J. Chem.*, 1962, 15, 841-850 (Div. Prot. Chem., C.S.L.R.O. Wool Res. Labs., Parkville, Victoria, Australia) New theory on the interaction of Methyl Orange and related dyes with proteins in aq. soln. is proposed. D.G.Upshall
- 388. PHYSICO-CHEMICAL PROPERTIES OF OL-CRYSTAL LIN FROM OX LENS.** S.K.Niyogi and V.L.Koenig: *Biochim. biophys. Acta*, 1963, 69, 283-295 (Dept. Biochem., Northwestern Univ. Med. Sch., Chicago, 111., U.S.A.) α -Crystallin was purified by repeated pptn. at its isoelectric point. Electrophoretic analyses in acid and alkali at various ionic strengths indicated 1 component. Sedimentation expt. at pH above 3*0 and various ionic strengths also indicated 1 component. At pH 3*0 and below, depending on ionic strength 2 or 3 components appeared. Sedimentation and v expt. indicated that the dissociation was reversible. Sedimentation, * and light-scattering data at pH 2*0 and various ionic strengths indicated unfolding leading to dissociation. Sedimentation and light-scattering data at pH 9*1 and 6 ionic strengths between 0-1 and 0-6 indicated almost 2-fold aggregation at higher ionic strengths possibly accompanied by a change

in mol. shape. Mol. wt. and dimensions were calc. fr°JJJ sedimentation, * and partial sp. vol. data at pH 9*1 art 6 ionic strengths. B.M.Stevei*

- 389. COUNTER-CURRENT DISTRIBUTIONS OF RENIN-SUBSTRATE AND SERUM PROTEINS IN POLYETHYL GLYCOL-SALT SYSTEMS.** K.E.Lentz, L.T.Skeggs, J.H.Hochstrasser and J.R.Kahn: *Biochim. biophys. Act.**, 1963, 69, 263-270 (Dept. Med. and Surgery, V.A. Hosp., Cleveland, Ohio, U.S.A.) Aq. 2 phase partitioning systems for proteins were prep. from polyethylene glycols and inorg. salt soln. Effects of mol. wt. range of the glycol, relative proportion of water, pH, temp, and nature of inorg. cations and anions on the tot* solubilities and relative phase distributions of albumin, y-globulin, total serum proteins and renin substrate w#* examined. Na₂SO₄, (NH₄)₂SO₄ and Li₂SO₄ systems wej formulated for counter-current distributions of renin sujstrate and unfractionated serum. Purification by batch-wise partitioning preceded distribution of renin substrata Substrate purities up to 24300 Goldblatt units/g. protein were obtained. Serum was resolved into several groups of proteins including y-globulins with widely differing K values. B.M.Stevei*

- 390. ENZYMIC ACTION ACROSS THIN MEMBRANE.** A.Rothen: *J. colloid Sci.*, 1962, 17, 124-135 (Rockefeller Inst., New York, U.S.A.) A protect!^ blanket of plastic with a structure tight enough to P^{rev}*.w the free diffusion of trypsin mol._f lets the enzyme throw when an adequate substrate is located under the blanket This was shown by following the appearance of labeU⁶⁰ trypsin across the blanket and also by measuring the enzymic activity of the material which had crossed tn^c blanket. G.C.Barf

- 391. DENATURATION OF PROTEINS. I. SEDIMENTATION, DIFFUSION, OPTICAL ROTATION, VISCOSITY AND GELATION IN UREA SOLUTIONS OF OVALBUMIN AND BOVINE SERUM ALBUMIN [BSA].** H.A.McKenzie, M.B.Smith and R.G.Wake: *H. ULTRAVIOLET ABSORPTION SPECTRA OF BSA AND OVALBUMIN IN UREA AND IN ACID SOLUTION.* A.N.Glazer, H.A.McKenzie and R.G.Wake: *Biochim. biophys. Acta*, 1963, 69, 222-239, 240-248 (Phys.-Chem. Unit, Univ. Sydney, Australia) I. At pH 3-10, BSA showed a very rapij_p initial increase in laevorotation and t in cone, urea so at 25°. At low pH, ovalbumin behaved similarly, but near neutrality and above the changes were much slow. Kinetics of the optical rotation change for ovalbumin resembled those described by Simpson and Kauzmann *ve with some differences. The proteins appeared to be random coil polymers. 'Unfolded' proteins tended to aggregate slowly in 7M urea especially at neutral and all pH. Ovalbumin aggregated more readily than BSA. Aggregation in BSA appeared to be largely a S-S -SB ^ exchange but this was only partly true for ovalbumin. effects of j>-chloromercuribenzoate were examined. tt. Acid and urea produced similar rapid shifts in BSA spectrum. pH effects on the rate of change of tn^c.el difference spectrum at 287 mfi [A2873 at pH 0-5-4**.el similar to effects on jjj, *> and optical rotation. A cld soir variable effects on the ovalbumin spectrum. In uraf.hei the spectrum changed immediately at low pH. At nif.^ pH the spectrum changed with time. The change in A287 apparently followed first-order kinetics at 25 °J_{on} pH 6-1 and 30° and pH 7-8. Apparent orders of reacu with respect to urea were 7-6 ± 0*5 and 7-8 ± 0^Z. Change with time of optical rotation in 7M urea at P"

$\text{pH } 25^\circ$ was not simple first order. The half-time was inversely proportional to the $13^{*}5$ power of the urea concn.

B.M.Stevens

³⁹² CHROMATOGRAPHY OF POLYLYSINE. J.W.Stewart and M.A.Stahmann: *J. Chromatography*, 1962, 9, 233-235 (Dept. Biochem., Univ. Wisconsin, Madison, Wis., U.S.A.) Partial hydrolysates of polylysine have been fractionated on CM-cellulose columns using an exponential gradient of NaCl. The peak no. in the order of remergence from the column were shown, by paper chromatography with authentic compounds, to be equal with the no. of lysine residues/mol. in the responding peak. The plot of the log. of the peak no. of lysine residues/mol. against NaCl molarity at saturation with a linear gradient, disclosed a simple relationship between mol. wt. and the eluent concn. Samples are produced to suggest this to be a general relationship for the chromatography of other polyelectrolytes on substituted cellulose ion-exchange columns.

P.D.Dawkins

³⁹³ THE DISTRIBUTION OF CERTAIN PROTEINS, POLYPEPTIDES AND POLYAMINES IN AN AQUEOUS-PHENOL SYSTEM. G.R.Shepherd and P.A.Hopkins: *Biochem. biophys. Res. Comm.*, 1963, 10, 103 (Los Alamos Scientific Lab., Univ. California, Los Alamos, N.Mex., U.S.A.) The influence of NaCl concn. in Partitioning of certain proteins, polypeptides and polyamines is described.

B.Ketterer

³⁹⁴ CHARACTERISATION OF THE DIFFERENCE SPECTRUM OF DnSOPROPYLPHOSPHORYL-a-CHYMO-i&YPSIN [DIP-CT] VERSUS a-CHYMOTRYPSIN [CT]. [V. ENVIRONMENT OF TRYPTOPHYL RESIDUES.]

L.Oppenheimer, J.Mercouhoff and G.P.Hess: *Biochim. biophys. Acta*, 1963, 71, 78-88 (Dept. Biochem., Cornell Univ., Ithaca, N.Y., U.S.A.) Comparison of the difference spectra of amino acid deriv. in media varying in polarity. The difference spectrum of ¹⁴N-tryptophan amide in 20% v/v glycerol versus this of ¹⁴N-tryptophan amide in water indicated that 1 or more tryptophyl residues in DIP-CT were in a less polar medium than the analogous Q₁₄-residues. The effect of urea denaturation on the DIP-group sus CT difference spectrum indicated that the DIP group did not become a chromophore. Herskovits and Towinski's solvent perturbation method and sp. Option of CT and DIP-CT tryptophyl residues by ¹⁴C-nosuccinimide indicated that the DIP-CT versus CT ¹⁴C-yield was caused by tryptophyl residues inaccessible to urea and N-bromosuccinimide. • B.M.Stevens

³⁹⁵ HNSTON-OGSTON EFFECT IN THE ULTRACENTRIFUGATION OF SOLUTIONS OF DENATURED COLLAGEN. P.T.Speakman: *Biochim. biophys. Acta*, 1963, 69, 480-484 (Dept. Biol., M.I.T., Cambridge, Mass., U.S.A.) Collacen, denatured by raising the temp. of acid-sol. collagen dissolved in NaCl-acetic acid small. consisted of 2 main protein spp., a and \$ and a ¹⁴C-an? Quantitatively a ¹⁴C-sp. ¹⁴C-collagen. The ratio of the ¹⁴C-peaks of the a- and p-proteins could be calc. from the ¹⁴C-P of ¹⁴C areas of the schlieren a- and jS-peaks and JV S¹⁴SIL¹⁴C peaks. This method of calcn. was checked by comparing the a/p ratios of 2 denatured collagen fractions quant. separated by salt gradient elution from a cellulose column with the ratio in the collagen soln. which was the starting material on the column.

³⁹⁹ PHYSICO-CHEMICAL STUDIES ON BOVINE

y-GLOBULIN. F.H.Chowdhury and P.Johnson:

Biochim. biophys. Acta, 1963, 66, 218-228 (Dept. Colloid Sci., Cambridge, England) Fluorescence depolarisation measurements in neutral soln. yielded rotational relaxation times much lower than expected from the translational dynamic prop. 6M urea produced only a smaller further reduction in relaxation time. From the simple dispersion, the Ac of 213*0 mjj and the low -bo values in the Moffitt and Yang equation, obtained from optical rotation measurements over a range of X, it is suggested that non-polar amino acid residues may be important in controlling internal folding within the mol. core but that much internal flexibility remains outside this core. Low LiBr concn. produced small changes in optical rotatory prop. Higher LiBr concn. produced an opposite trend, probably involving denaturation. Above 5M LiBr solubility was considerably reduced.

NUCLEIC ACIDS, NUCLEOPROTEINS AND NUCLEOTIDES

⁴⁰⁰ REQUIREMENT FOR MULTIPLE FACTORS FOR THE ATP-LINKED REDUCTION OF NAD BY SUCCINATE.

R.L.Prairie, T.E.Conover and E.Racker: *Biochem. biophys. Res. Comm.*, 1963, 10, 422-427 (Dept. Biochem., Public Hlth. Res. Inst., City of New York, Inc., N.Y., U.S.A.) The reduction of NAD by succinate via cytochrome b₅ flavoprotein brought about by sub-mitochondrial particles requires certain sol. factors from mitochondria. B.Ketterer

BIOCHEMISTRY

- 401. FLAVOPROTEIN OXIDISING NADPH₂ ISOLATED FROM LIVER MICROSOMES.** H.Nishibayashi, T.Omura and R.Sato: *Biochim. biophys. Acta.* 1963, 67, 520-522 (Inst. Protein Res., Osaka Univ., Kita-ku, Osaka, Japan) The NADPH₂ oxidase requiring vit. K₃. 1,4-naphthoquinone or 1,2-naphthoquinone was purified and the possibility of its identity with the previously isolated flavoprotein NADPH₂-cytochrome ϵ reductase is discussed. Prelim, comm. B.M.Stevens
- 402. EFFECT OF NAD ON THE FORMATION OF SULPHUR-35 LABELLED SUBSTANCES IN A PARTICLE-FREE SUPERNATANT OF MOUSE [FURTH] MAST-CELL TUMOUR.** L.Spolter, L.I.Rice and W.Maix: *Biochim. biophys. Acta*, 1963, 69, 583-584 (Dept. Biochem., Univ. Southern California Sch. Med., Los Angeles, Calif., U.S.A.) NAD enhanced SQ 4^{2-} incorporation into a low mol. wt. SO 4^{2-} -containing fraction as well as into heparin. Prelim, comm. B.M.Stevens
- 403. SUCCINATE LINKED NAD REDUCTION IN SUB-MITOCHONDRIAL PARTICLES.** H.L.W and I.Vallin: *Biochim. biophys. Acta*, 1963, 69, 361-374 (Wenner-Gren Inst., Univ. Stockholm, Sweden) Reduction of added NAD by succinate catalysed by beef heart particles required ATP specifically. Six NAD analogues tested were reduced at almost the same rate as NAD but NADP was only reduced very slowly. Phosphate and ADP influenced the reduction rate, the effect being pronounced if both were added. The effect of NADH₂ was marked only if the NAOH₂ was present at concn. at least equal to those of NAD. Respiratory inhibitors acting in the flavin region of the respiratory chain blocked the reaction. B.M.Stevens
- 404. NEO-GUANYLIC ACID. A NEW NUCLEOTIDE FROM RNA.** W.J.F.Hemmings: *Biochim. biophys. Acta*, 1963, 68, 284-292 (Arthur Guinness Son. and Co., Dublin, Ireland) Neo-guanylic acid, found in certain prep. of brewers' yeast RNA, appeared to be 1-ribosylguanine (2')^{3'}-phosphate. The changes in u.v. absorption in acid and alk. soln. shown by guanine, neo-guanylic acid and 8-azaguanine ribonucleoside are described. B.M.Stevens
- 405. ISOLATION AND IDENTIFICATION OF 3'-AMINO-3'-DEOXYADENOSINE FROM CORDYCEPS MILITARIS.** A.J.Guarino and N.M.Kredich: *Biochim. biophys. Acta*, 1963, 68, 317-319 (Dept. Biol. Chem., Univ. Michigan, Ann Arbor, Mich., U.S.A.) B.M.Stevens
- 406. BIOSYNTHESIS OF A NEW XANTHINE RIBONUCLEOTIDE BY BEEF ERYTHROCYTES.** D.Hatfield, H.S. Forrest and J.B.Wyngaarden: *Biochim. biophys. Acta*, 1963, 68, 322-324 (Dept. Biochem., Duke Univ. Med. Center, Durham, N.C., U.S.A.) The compound is tentatively identified as (3-ribosylxanthine) 5'-phosphate. Prelim, comm. B.M.Stevens
- 407. FINE STRUCTURE OF CYTOSINE.** D.J.Brown and J.M.Lyall: *Aust. J. Chem.*, 1962, 15, 851-857 (Dept. Med. Chem., John Curtin Sch. Med. Res., Canberra, Australia) 4-amino-1, 2-dihydro-2-oxopyrimidine is found to be the predominant tautomeric form in aq. soln., indicated by study of the ionisation const. and u.v. spectra of cytosine, methylated deriv. and related compounds. D.G.Upshall
- 408. ENZYMIC SYNTHESIS OF CYTIDINE MONOPHOSPHO-2-KETO-3-DEOXY-OCTONATE.** M.A.Ghalambor and E.C.Heath: *Biochem. biophys. Res. Comm.*, 1963, 10, 346 (Rockham Arthritis Res. Unit and Dept.

- Bacterial.. Univ. Michigan, Ann Arbor, Mich., U.S.J A purified enzyme from *E. coli* is described which cata* lyses the formation of cytidine monophospho-2-keto-3* deoxyoctonate from 2-keto-3-deoxyoctonate and CTP. , B.Ketterer
- 409. EFFECT OF OROTIC ACID ON PYRIDINE NUCLEO[TIDES AND CHOLESTEROL SYNTHESIS.** S.Rajalaksh D.S.R.Sarma and P.S.Sarma: *Indian J. exp. Biol.* 1963, 1, 63-66 (Dept/Biochem., Indian Inst. Scu. Bangalore, India) Rats receiving orotic acid have been found to exhibit a significant fall in NAD, recognisable even after as short a period as 3 days. The dec^u" of the level of this adenine containing coenzyme is not due to enhanced NADase activity but to decreased syn* ^ thesis. The reduced synthesis appears to be a manifest** tion of adenine deficiency induced by prolonged feeding of orotic acid to rats kept on a purified diet. Further, these rats show a reduced ability to incorporate [2- \pm 4C* glycine into liver proteins, and synthesise cholesterol from both labelled acetate and mevalonic acid. There is a lowering in the activities of xanthine oxidase, catala* and NADase. These effects due to dietary orotic acid are reversible with an exogenous supply of adenine. The mechanism by which orotic acid seems to act is by creating a disturbance in the metabolic balance betw/e purine and pyrimidine nucleotides. •
- 410. BREAKDOWN OF ATP BY PLANT MITOCHOND^** K.C.Sikka, Y.P.Gupta and N.B.Das: *Indian J. exp. Biol.*, 1963, 1, 111-112 (Div. Soil Sci. and Agric. Chem., Indian Agric. Res. Inst.. New Delhi, India) Mitochondria prep, freshly from germinated berseem (*Trifolium alexandrinum* Linn.) possess ATPase activity. The terminal phosphate is released almost completely during 10 min. and the second labile phosphate in 60 min. Na deoxycholate activates the enzyme. The activity of AMPase in the above prep, is low, while inorg. pyrophatase activity is high, more than 60% of the total phosphate being liberated in 2'5 min. •
- 411. ENDOGENOUS ATP LEVELS IN HUMAN AMNION CELLS DURING APPLICATION OF HIGH HYDROSTAT^ PRESSURE.** J.V.Landau and R.A.Peabody: *Exp. Cell Res.*, 1963, 29, 54-60 (V.A. Hosp., Albany, N.Y., U.S.A.) FL human amnion cells at 35° displayed an increase in ATP during pressure application and a rapid return to normal levels on release of pressure. The rise in ATP was more rapid at 2°, and the lower temp, prevent efficiently the return to the normal values. There was concomitant change in ADP and no AMP was detected. Primary amnion cells showed no increase in ATP on pressure application. KJO*
- 412. UNAVAILABILITY OF CHROMAFFIN GRANULE A FOR METABOLIC REACTIONS.** P.B.Hagen and C.W. Toews: *Biochim. biophys. Acta*, 1963, 71, 201-204 (Dept. Biochem., Univ. Manitoba, Winnipeg, Canada) ATP was stored in a form in which it was unable to participate in enzymic reactions so long as the granule remained intact. B.M.S*
- 413. ABSORPTION SPECTRUM OF FMN SEMIQUINO** S.Nakamura, T.Nakamura and Y.Ogura: *J. Bloc* Tokyo, 1963, 53, 143-146 (Dept. Biophys. Biocnej. Fac. Sci., Univ., Tokyo, Japan) The spectrum partly reduced FMN in HCl soln. was analysed and the value of the 'effective semiquinone formation const.' was estimated graphically. Using this value of K tn*, absorption spectrum of semiquinone was shown to hav.

BIOCHEMISTRY

41

^{max.}, at 350 and 490 mji with extinction coeff. of $10 \cdot 0 \times 10^3$ and $9 \cdot 4 \times 10^3$ respectively. K increased with increasing $[V\dot{T}']$ but the semiquinone spectrum was unchanged within the pH range tested. B.M.Stevens

⁴¹⁴ U. INTERACTION OF METHYL GREEN WITH DNA AS OBSERVED BY A NEW METHOD OF USING HYDROGEN PEROXIDE. T.Kurozumi, K.Kurihara, Y.Hachimori and K.Shibata: J. Biochem.. Tokyo, 1963, 53, 135-142 (Tokugawa Inst. for Biol. Res., Tokyo, Japan) Methyl Green in soln. faded rapidly on addition of H_2O_2 but Methyl Green bound to DNA did not fade. Hence from spectroscopic measurement of the rate of fading of a DNA Methyl Green mixture the concn. of p^A could be calc. The measurement could be made immediately after preparing the mixture. The binding of Methyl Green by native and heat denatured DNA was [^] small. B.M.Stevens

⁴¹⁵ GLUCOSYLATED DNA FROM A TRANSDUCING PHAGE FOR BACILLUS SUBTILIS. L.Takahashi: Biochem. biophys. Res. Comm., 1963, 10, 289 (Graduate Dept. Biochem., Brandeis Univ., Waltham, Mass., U.S.A.) A transducing phage for B. subtilis, ^{ptg} 2, contains a sugar as an integral part of its DNA which has been identified tentatively as glucose. B.Ketterer

⁴¹⁶ DENATURATION AND RENATURATION OF DNA OF POLYOMA VIRUS. R.Weil: Proc. nat. Acad. Sci., Wash., 1963, 49, 480-487 (Div. Biol., Chem., Chem. Eng., California Inst. Technol., Pasadena, Calif., U.S.A.) Thermal denaturation of polyoma DNA followed by rapid cooling resulted in a DNA prep, with increased infectivity. This prep. contained 2 bands when examined by density gradient centrifugation, both bands showing about the same degree of infectivity. One band corresponds to largely renatured DNA, the other to denatured DNA. Polyoma DNA infectivity was not destroyed by formamide treatment, but was destroyed by treatment with formamide together with formaldehyde. JJ^{\wedge} at-denatured DNA renatured readily when incubated in $IOrt$ namide. J.R.Sargent

⁴¹⁷ STABILITY OF DNA IN GLYCOL SOLUTION. [^]Eliasson, E.Hammersten, T.Lindahl, LBjörk and J.C.Laurent: Biochim. biophys. Acta, 1963, 68, 234-239 (Dept. Bacteriol., Karolinska Inst., Stockholm, Sweden) A sharp transition in the secondary structure of DNA in electrolyte containing glycol soln. occurred at $25 \text{ si } A_{260}$ as J^{ud} sed by an increase in absorbancy at 200 mji in V decrease in % and transforming activity. Changes $Ht \cdot anc \cdot absorb \cdot ncy$ at lower temp, were reversible and $LJ^{\wedge}L^{\wedge}$ related with any change in transforming activity. $\bullet 1? \cdot$ scattering expt. suggested that DNA aggregated in yco_1 . B.M.Stevens

⁴¹⁸ FURTHER OBSERVATIONS ON THE CHEMICAL TERMINATION OF DNA IN ANIMAL TISSUES. L.Ovtrup and K.Roos: Biochim. biophys. Acta, 1963, 68, 425-433 (Dept. Histol., Univ. Göteborg, Sweden) On the effects of hot $HClO_4$ as measured by the $4^{\wedge}en$ ylamine reaction were extended to low mol. wt. whose compounds. From the observed absorbancy/absorbance of deoxyribose the absorbancy for DNA extrapolated to zero time is shown to approx. to the value expected for the purine deoxyribose present. Without extrapolation pyrimidine deoxyribose interfered. Results obtained by this chem. method were compared with results obtained from a microbiol. assay for DNA. An analysis of the

sources of errors in the chem. method was made. B.M.Stevens

⁴¹⁹ MECHANISM OF [PHAGE] DNA MELTING. T.I.Tikchonenko, G.A.Perevertajlo and E.Dobrov: Biochim. biophys. Acta, 1963, 68, 500-502 (Oncol. Dept., Inst. Microbiol. and Epidemiol., Acad. Med. Sci., Moscow, U.S.S.R.) Prelim, comm. B.M.Stevens

⁴²⁰ DNA TYPE ATTRIBUTABLE TO A BACTERIAL ENDOSYMBIOTE IN THE PROTOZOAN CRITHIDIA (STRIGOMONAS) ONCOPELTI. J.Marmur, M.E.Cahoon, Y.Shimura and H.J.Vogel: Nature, Lond., 1963, 197, 1228-1229 (Graduate Dept. Biochem., Brandeis Univ., Waltham, Mass., U.S.A.) Examination of DNA samples from C. oncopelti by buoyant density technique revealed the presence of 3 DNA bands. When the endosymbiote was isolated from disrupted cells by differential centrifugation, the banding pattern of its DNA corresponded with the minor band of density $1^{\wedge}691$ g./ml. The calc. base composition resembles that for DNA from various bacteria, pleuropneumonia-like organisms and kappa. G.M.Lewis

⁴²¹ THE DISTRIBUTION OF NUCLEOTIDES IN DEOXYRIBONUCLEIC ACID. G.B.Petersen: Biochem. J., 1963, 87, 495-500 (D.S.I.R., Plant Chem. Div., Palmerston North, New Zealand) A combination of paper chromatography and paper electrophoresis has been used to separate many of the products obtained through the action on DNA of diphenylamine in acid soln. followed by phosphomonoesterase. Thirty-four products, consisting of oligonucleotides containing up to 9 pyrimidine residues, were separated and identified with respect to base composition and chain length. Many of these represent mixtures of isomeric sequences in unknown proportions. The amounts of these components in digests of calf-thymus and herring testis DNA were measured. Although many of the sequences were present in amounts significantly different from those expected on the basis of a random distribution of nucleotides in DNA, the distribution patterns of the DNA from the two sources differed considerably from each other. Products consisting of consecutive sequences of 4 deoxycytidylic acid residues were found in both types of DNA and in DNA of Alcaligenes faecalis and Pseudomonas aeruginosa. Polycytidylic acids of chain length longer than 4 were not detected in any of the 4 DNA digests. It was concluded that, if it is present, the sequence consisting of 5 deoxycytidylic acid residues flanked by purine nucleotides must occur in less than $60P\%$ of the expected random amount in calf-thymus and herring-testis DNA and less than $17f\%$ of the random amount in the 2 bacterial DNA samples. *

⁴²² DETERMINATION OF TOTAL DEOXYRIBOSE OF DNA. P.Schmid, C.Schmid and D.C.Brodie: J. biol. Chem., 1963, 238, 1068-1072 (Dept. Pharm. Chem., Sch. Pharm., Univ. California Med. Center, San Francisco, Calif., U.S.A.) A kinetic analysis of the reactions that give quant. formation of colour from deoxyribosyl compounds and indole gives optimum conditions for the colorimetric determination of DNA. After hydrolysis of DNA, or a nucleoside or ribosyl compound, the hydrolysate is treated with the indole reagent and aq. HCl and the extinction of the colouration produced is determined. J.N.Ashley

⁴²³ DISTRIBUTION OF PROTEIN ANTIGENS AMONG E. COLI RIBOSOMES. G.Quash: Biochim. biophys. Acta, 1963, 68, 330-332 (Service du Dr. Wahl, Inst.

BIOCHEMISTRY

Pasteur, Paris, France) In. E. coli, Ag linked to strain characteristics appeared to be heterogeneously distributed whereas ribosomal common Ag were homogeneously distributed. Prelim, comm. B.M.Stevens

424. ENZYMIC DEGRADATION OF THYMUS NUCLEOPROTEIN. E.Fredericq: Biochim. biophys. Acta, 1963, 68, 167-176 (Inst. Phys. Chem., Univ., Liège, Belgium) Gel forming calf deoxyribonucleoprotein showed a complete loss of rigidity either when the DNA was split into 2 parts (on the average) by DNase II or when a few peptide bonds were split by trypsin or chymotrypsin. In the former case 8% of the deoxyRNP was solubilised, in the latter 50%.* After short exposure to ultrasound had similar effects to DNase II. Recombined histone nucleates were more rapidly hydrolysed by DNase than native deoxyRNP and differences in the solubilisation of DNA and histones were found. Complexes of polynucleotides and protein were characterised by paper electrophoresis after prolonged hydrolysis of deoxyRNP with DNase and trypsin. B.M.Stevens

425. THYMUS DEOXYRIBONUCLEOPROTEIN. III. SEDIMENTATION BEHAVIOUR. G.Giannoni and A.R.Peacocke: Biochim. biophys. Acta, 1963, 68, 157-166 (Dept. Biochem., Univ., Oxford/ England) 5 of fresh soln. of different deoxyRNP prep, in dil. phosphate buffer, examined using u.v. absorption methods, were reproducible to within $Htfo$ and extrapolated to 32 at infinite diln. This, together with light scattering and n measurements, confirmed that the deoxyRNP consisted of discrete mol. with configurations of moderately stiff coils. The shape of the sedimenting boundary was const, at different salt concn. in spite of dissociation. Within any 1 deoxyRNP mol. a range of stability of histone binding to DNA was concluded to exist. Analysis of supernatant fractions showed that histones of smaller arginine and greater lysine content were bound least strongly. B.M.Stevens

426. FINE STRUCTURE OF DEOXYRIBONUCLEOPROTEIN COMPONENT OF NUCLEUS. AN ELECTRON MICROSCOPIC STUDY UTILISING AUTORADIOGRAPHY TO LOCALISE DNA SYNTHESIS. E.D.Hay and J.P.Revel: J. cell. Biol., 1963, 16, 29-51 (Dept. Anat., Harvard Med. Sch., Boston, Mass., U.S.A.) 8-10 day old regenerating forelimbs of Salamander larvae, Ambystoma opacum and A. maculatum previously inj. i.p. with 1 and 5 pc [3H]thymidine were fixed in Bouin's soln. for light microscopy and in OsO₄ for E.M. study. Autoradiographs of 5-10 μ m and 0.05-1.0 p sections treated with alkali to remove the emulsion were prep. A deoxyRNP meshwork of interconnected filaments of 50-75A diam. is dispersed throughout the interphase nucleus during DNA synthesis. Dense chromatin centres were noted in chromosomes and interphase nuclei where DNA was not synthesised. The functional significance of variations in the deoxyRNP structure is discussed. P.Barlow

427. FRACTIONATION AND CHARACTERISATION OF NUCLEAR RNA FROM RAT LIVER. M.B.Sporn and W.Dingman: Biochim. biophys. Acta, 1963, 68, 387-400 (Lab. Neurochem., Nat. Inst. of Neurol. Diseases and Blindness, Bethesda, Md., U.S.A.) Four fractions with j_s of 6, 19, 33 and above 40 were obtained by sucrose gradient centrifugation. Absorption spectra, changes in extinction at 260 m*μ*J and 280 m*μ*J on a K_2 hydrolysis, changes in extinction at 260 m*μ*J on heating and kinetics of RNase digestion were examined for each. Microsomal, supernatant and whole tissue RNA were

similarly examined. The 33 and 19 £ nuclear RNA resembled ribosomal RNA. The 6 J nuclear RNA had physical prop, distinct from those of cytoplasmic supernatant RNA. Nuclei also contained a group of RNA with heterogeneous sedimentation prop. B.M.Stevens

428. ISOLATION AND PROPERTIES OF TOTAL NUCLEIC RIBONUCLEIC ACID OF RAT LIVER. B.Reiner, J.A. Bain and D.P.Groth: J. biol. Chem., 1963, 238, 1085-1090 (Dept. Pharmacol., Emory Univ., Atlanta, Ga., U.S.A.) The isolation in substantially quant. yield and largely free from DNA and protein is described. W& methods, which minimise degradation, include a step that simult. inhibits nuclease activity and increases ease of extraction. Cytoplasmic RNA is quant. isolated. The materials are characterised by chromatography and sealmentation, and a chromatographic elution method that does not need the use of strong alkali is described. The effects of chromatography and storage on dissociation of RNA are reported. The base composition of main chromatographic fractions of nuclear RNA shows a i inverse relationship to rat tissue DNA. * J.N.Ashley

429. DISSOCIATION PROPERTIES OF RNA. I. TITRATION OF RAT LIVER RNA AND MODEL POLYNUCLEOTIDES. R.A.Cox: Biochim. biophys. Acta, 1963, 68, 401-410 (Nat. Inst. for Med. Res., Mill Hill, London, England) The dissociation curve obtained on titrate high mol. wt. RNA at 0.4° from pH 7 to pH 3 differed from that obtained by titration from pH 3 to pH 7. Approx. 50% of the titratable groups dissociated over pH range pH 7-11.6. Calf thymus DNA was titrated at 25°. Few or no titratable groups were ionised at pH 11.4 but ionisation was complete at pH 11.6. A broader dissociation curve was obtained by titrating from pH 11.6 and was reversible from pH 3 upwards. A partly denatured sample had a curve intermediate between the 2. The complex of polytfdenylic [poly-A] and polyuridylic [poly-U] acids was stable at pH 4-10.7 and 20°. At t_{fore} extreme pH, dissociation to polynucleotides occurred. The alk. form of poly-A interacted reversibly with poly-U but hysteresis was found in acidic soln. B.M.Stevens

430. ISOLATION OF NATURALLY OCCURRING POLYADENYLATE FROM CALF THYMUS NUCLEI. M.Edmonds and R^Abrams: J. biol. Chem., 1963, 238, PC1186-1187 (Res. Dept., Montefiore Hosp., Pittsburgh, Pa., U.S.A.) Polyadenylate is isolate by chromatography, from calf thymus nuclei. Of all t₂' RNA present in the nuclei only polyadenylate serves as primer for synthesis of further polyadenylate. With the use of polythymidyl acid-cellulose columns it is possible to detect small amounts of polyadenylate. active as primer in polymerisation of ATP. in RNA prep, from several sources. J.N.Ashley

431. METHOD FOR ISOLATION OF 2'-O-METHYL RIBONUCLEOSIDES AND Ni-METHYLADENOSE FROM RNA. R.H.Hall: Biochim. biophys. Acta, 1963, 68, 278-283 (Dept. Expt. Therapeutics, Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.) A nucleosid mixture obtained by enzymic hydrolysis of yeast sol. RNA was resolved into major fractions by partition chromatography. Minor components were then isolate by paper chromatography. 1 g. RNA yielded 1-2 mg. 2'-O-methylated deriv. and 3-0 mg. Ni-methyladenine. The ratios of 2'-O-methyladenosine to 2'-O-methyluridine and of 2'-O-methylguanosine to 2'-O-methylcytidine may be close to 1. B.M.Stevens

432. POLARISABILITY THEORIES OF POLYNUCLEOTIDE HYPOCHROMISM. I. H.DeVoc. II. JJ.Weiss: Nature. Lond. 1963, 197. 1295-1296. 1296 (Section on Rhys. Chem., Natl. Inst. of Mental Hlth.. Bethesda. Md., U.S.A. and King's Coll., Univ. of Durham, Newcastle-on-Tyne, England). G.M.Lewis

433. FATE OF NUCLEI, DNA AND DNase IN THE COURSE OF AUTOLYSIS. J.L.van Lancker and R.L. Holtzer: Lab. Invest., 1963, 12, 102-105 (Pathol. Dept.. Wisconsin Univ. Med. Sch., Madison, Wis.. U.S.A.) DNA and DNase estimations and nuclear counts of mouse liver undergoing autoysis for varying time revealed an unaltered DNA and nuclear count up to 6 hr. although most of DNase is released after 1 hr. A.M.Mackay

434. HAEMAGGLUTINATION INDUCED BY NUCLEIC ACIDS. Ushiyama: Nature. Lond. 1963, 197, 912 (Dept. Legal Med. Univ. Tokyo, Hongo, Tokyo, Japan) R.b.c. of human, sheep, guinea-pig and J²bit after treatment with trypsin can be agglutinated by yeast RNA and sperm DNA, the effect being inhib. by a and human albumin. G.M.Lewis

435. EFFECTS OF DEUTERIUM ON THE THERMAL TRANSITION OF NUCLEIC ACIDS. H.R.Mahler. G.Dutton and B.D.Mehrotra: Biochim. biophys. Acta, 1963, 68, 199-210 (Chem. Lab.. Indiana Univ.. Bloomington, Ind.. U.S.A.) No significant differences in total hyperchromicity or in midpoint or width of transition were found when die thermal helix to coil transitions of 3 DNA and 4 RNA were examined, by means of absorption-temp. profiles, after extensive high temp, incubation in water or in deuterium oxide. Base composition varied from 32*5 to 65 and 40 to 64 mole % guanine plus cytosine for DNA and RNA respectively. In a medium containing $1\cdot5 \times 10^{-3}$ M NaCl, $1\cdot5 \times 10^{-4}$ M Na citrate and $1\cdot0 \times 10^{-3}$ M MgCl₂, transition temp. for alanine, tyrosine and valine transfer RNA were 73°, 5*5° and 49*5° respectively. B.M.Stevens

436. INTERACTION OF NUCLEIC ACIDS WITH PIAMINES. H.R.Mahler and B.D.Mehrotra: Biochim. biophys. Acta, 1963, 68, 211-233 (Chem. Lab.. Indiana Univ.. Bloomington, Ind.. U.S.A.) Aliphatic diamines increased the helix to coil transition midpoint (T_m) as determined by absorbancy-temp. profiles in double stranded DNA. A decrease in ionic strength induced the rise in T_m [ATm3 and the strength of interaction]. ATm was proportional to amine concn. when ionic strength was low but reached a limiting value at high concn. When saturated with diaminopentane was reached at 10^{-2} M at 10^{-4} M at low ionic strength. ATm was highest with the C₅ amine. Single stranded DNA. RNA acid polyadenylic acid did not show the effect. Related to the mole % adenine plus thymine or $\text{G} + \text{T}$ was proportional to T_m . Proportionality were 13 and -0*477° at high and low ionic strengths respectively. B.M.Stevens

437. NUCLEIC ACID CHANGES IN THE STORAGE TISSUE OF SEEDS DURING GERMINATION. J.H.Cherry: Biochim. biophys. Acta, 1963, 68, 193-198 (Seed Pioneering Res. Lab.. Southern Utilisation Res. Development Div.. Agric. Res. Service, U.S. Dept. Agric.. New Orleans, La., U.S.A.) During germination die RNA content increased to a 2-fold max. in the first 2-6 days and thereafter decreased. The pattern was similar for 4 varieties

of mature and immature seed and for the same variety produced in 2 locations. In corn scutellum the RNA content increased 20% on the first day of germination and decreased thereafter. The DNA content of peanut cotyledons and corn scutella did not change significantly during germination. B.M.Stevens

438. BIOCHEMICAL CHANGES IN PROGRESSIVE MUSCULAR DYSTROPHY. I. NUCLEIC ACID METABOLISM IN NORMAL AND DYSTROPHIC RABBIT AND MOUSE LIVER, BRAIN AND MUSCLE. U.Srivastava, A.Devi and N.Sarkar: Expt. Cell Res., 1963, 29. 289-297 (Dept. Biochem.. Fac. Med.. Laval Univ.. Quebec, Canada) In muscles, livers and brains of rabbits and mice with progressive nutritional and hereditary muscular dystrophy, the concn. of DNA and RNA increased while that of free nucleotides steadily decreased. Protein concn. also declined, decreasing by 28% of tile control in acute stage of dystrophy. The changes were more marked in rabbits, and DNA only increased in guinea-pigs. These changes in all tissues could be reversed by supplying vit. E, and DNA changes could be considered as an index of the degree of progression of the disease. K.Jones

439. CHROMATOGRAPHIC SEPARATION OF RNases IN CORN. CM.Wilson: Biochim. biophys. Acta, 1963, 68, 177-184 (Crops Res. Div., Agric. Res. Service, U.S. Dept. Agric.. Urbana, Ill.. U.S.A.) RNase A secreted from the scutella and found in seedling root supernatant soln. was eluted from CM-cellulose by pH 6*0 buffer. RNase B was eluted by pH 8-0 buffer. RNase B was adsorbed on to mitochondria but could be removed with 0-5M KCl. pH optima were 5-0 for RNase A and 6*2 for RNase B. Both were stim. by KCl at die optimum pH. Mg d2 stim. RNase A at pH 5*0 and inhib. it at pH 5*8 whereas RNase B was stim. at pH 5*8. A third RNase resembling RNase A in chromatographic behaviour and RNase B in pH optimum was isolated but may have been an artifact. B.M.Stevens

440. DISTRIBUTION OF RNASE IN CORN, CUCUMBER AND SOYABEAN SEEDLINGS. EFFECTS OF ISOLATION MEDIA. C.M.Wilson and J.C.Shannon: Biochim. biophys. Acta, 1963, 68, 311-313 (Crops Res. Div., Agric. Res. Service, U.S. Dept. Agric., Urbana, Ill., U.S.A.) B.M.Stevens

441. CONCENTRATION AND DESALTING OF RIBONUCLEASE. G.W.Rushizky, A.E.Greco, R.W.Hartley, jun. and H.A.Sober: Biochem. biophys. Res. Comm., 1963, 10, 311 (Lab. Biochem., Nat. Cancer Inst.. Nat. Inst. Hlth.. Public Hlth. Service, U.S. Dept. Hlth., Education and Welfare, Bethesda, Md., U.S.A.) Various ribonucleases were extractable into phenol without loss of activity; this finding was the basis of a desalting technique. B.Ketterer

442. INHIBITION OF SUCCINOADENYLATE KINASE SYNTHETASE OF E. COLI BY ADENOSINE AND GUANOSINE-5'-MONOPHOSPHATES. J.B.Wyngaarden and R.A.Greenland: J. biol. Chem., 1963, 238, 1054-1057 (Dept. Med.. Duke Univ. Med. Center, Durham, N.C., U.S.A.) The enzyme, from *E.coli*, is inhib. by various purine nucleoside 5'-monophosphates and GDP. AMP, succino-AMP, guanosine 5'-phosphate and deoxyguanosine 5'-phosphate are competitive inhibitors of inosine 5'-phosphate. Inhib. by AMP may play an important part in physio 1. modulation of activity of the

BIOCHEMISTRY

kinosynthetase reaction. GDP is a competitive inhibitor of GTP in this reaction. The enzyme has greater affinity for GDP than for GTP, and intracellular levels of these 2 compounds are such that GDP may also function actively in regulation of the kinosynthetase.

J.N.Ashley

443. ADENOSINE TRIPHOSPHATE-CREATINE PHOSPHOTRANSFERASE FROM OX BRAIN: PURIFICATION AND ISOLATION. T.Wood: Biochem. J. 1963, 87, 453-462 (Dept. Biochem., Maudsley Hosp., London, England) ATPase-creatine phosphotransferase

(EC 2.7.3.2) has been isolated in a pure form from ox brain, via the following steps: (a) extraction with KC1 soln.; (b) removal of inert protein with acetone; (c) pptn. with Mg acetate; (d) acetone fractionation; (e) (NH4)2SO4 fractionation; (f) chromatography on DEAE-Sephadex. Three peaks of enzyme activity were obtained: two due to interconvertible forms of the pure enzyme produced on the column, and a third minor peak due to association with other proteins. The pure enzyme had prop. similar to those of the enzyme from muscle but was markedly activated by thiols. The enzyme content of ox brain was calc.

444. PURINE RIBONUCLEOSIDE AND DEOXYRIBONUCLEOSIDE PHOSPHORYLASE IN HUMAN ERYTHROCYTES. C.-H.De Verdier and B.J.Gould: Biochim. biophys. Acta, 1963, 68, 333-341 (Dept. Clin. Chem., Univ. Hosp., Uppsala, Sweden) The enzymes were purified by chromatography on DEAEcellulose and CM-Sephadex columns. Characteristics are described. The 2 activities could not be separated but inactivation expt. and kinetic studies in which ribonucleoside and deoxyribonucleoside acted alternatively as inhibitor and substrate indicated that 2 separate enzymes existed.

B.M.Stevens

BIOSYNTHESIS OF PROTEINS AND NUCLEIC ACIDS

445. THE INCORPORATION OF AMINO ACIDS INTO 'METHYLM POOR' AMINO ACID TRANSFER RIBONUCLEIC ACID. J.L.Starr: Biochem. biophys. Res. Comm., 1963, 10, 181 (Dept. Med., North Western Univ. Sch. Med., Wesley Mem. Hosp., Chicago, 111, U.S.A.) 'Methyl poor' s-RNA obtained from methionine-starved *E. coli* incorporated amino acids comparably with normally methylated s-RNA, except for arginine.

B.Ketterer

446. THERMAL DENATURATION AND AMINO ACID BINDING ABILITY OF SOLUBLE RNA. M.Arca, C.Calvori, L.Frontali and G.Tecce: Biochem. biophys. Res. Comm., 1963, 10, 117 (Inst. di Fisiol. Generale, Univ. Roma, Italy) The incorporation of isoleucine into sol. RNA by extracts of *B. stearothermophilus* stopped abruptly at 80° although amino acid activating enzymes from this organism are active at this temp.

B.Ketterer

447. INCORPORATION OF METHYL GROUPS INTO AMINO ACID TRANSFER RIBONUCLEIC ACID. J.L.Starr: Biochem. biophys. Res. Comm., 1963, 10, 428 (Dept. Med., Northwestern Univ. Sch. Med., Wesley Mem. Hosp., Chicago, 111, U.S.A.) Evidence is given consistent with the suggestion that methylated bases found in

trace amounts in s-RNA are native to this fraction.

B.Ketterer

448. ON THE STABILITY OF TRANSFER-RNA TERMINAL NUCLEOTIDE SEQUENCE IN YEAST. R.Rosset and R.Monier: Biochem. biophys. Res. Comm., 1963, 10, 195 (Inst. Chim. Biol., Fac. Sci., Marseille, France)

A small turnover of terminal AMP, but no turnover in terminal CMP was demonstrated in transfer-RNA from exponentially growing yeast.

B.Ketterer

449. KINETICS OF TRANSFER RNA SYNTHESIS. IN E. COLL J.E.M.Midgley: Biochim. biophys. Acta, 1963, 68, 354-364 (Carnegie Inst. of Washington, Dept. of Terrestrial Magnetism, Washington, D.C., U.S.A.) In exponentially growing cells [¹⁴C]uracil was incorporated into transfer RNA [s-RNA] bypassing the intracellular nucleotide pool. Uridine and pseudouridine nucleoside phosphate residues were labelled at the same rate. s-RNA labelling was delayed by approx. 1.5 min. compared to other RNA components. With [³²P]orthophosphate, labelling of s-RNA uridine and pseudouridine 5'-phosphate residues suffered a greater kinetic delay than the uridine 5'-phosphate residues of the remaining newly formed RNA. The large intracellular pool delayed 32P entry into all RNA fractions. Incubation in chloramphenicol greatly reduced kinetic delay in [¹⁴C]uracil entry into s-RNA uridine and pseudouridine phosphates.

When newly formed RNA synthesised with chloramphenicol was incubated with homologous DNA-agar more hybridisable RNA was found than in controls.

B.M.Stevens*

450. INTERACTION BETWEEN RAT LIVER RIBOSOMES AND SOLUBLE RNA. W.S.Bont, L.Bosch, H.Bloemendaal, H.Hilders and F.Huizinga: Biochim. biophys. Acta, 1963, 68, 487-490 (Dept. Biochem., Antoni van Leeuwenhoek-Huis, Amsterdam, Netherlands) The fractionation of ribosomes derived from microsomes which had been incubated with sol. [³²P]RNA, GTP and sol. enzymes is described. Prelim. comm.

B.M.Stevens*

451. NUCLEOTIDE SEQUENCES ADJACENT TO THE 5'-TERMINI OF YEAST SOLUBLE RIBONUCLEIC ACIDS. D.Bell, R.V.Tomlinson and G.M.Tener: Biochem. biophys. Res. Comm., 1963, 10, 304 (Univ. British Columbia, Vancouver, B.C., Canada) Expt. are described demonstrating the existence of GMP, UMP, AMP and CMP as 5'-terminal groups in s-RNA.

B.Ketterer

452. PAPER CHROMATOGRAPHY OF TRANSFER RNA ON DIETHYLAMINOETHYL-CELLULOSE. K.B.Jacobson and S.Nishimura: Biochim. biophys. Acta, 1963, 68, 490-493 (Biol. Div., Oak Ridge Nat. Lab., Oak Ridge, Tenn., U.S.A.) Transfer RNA was resolved into several amino acid sp. types. Prelim. comm.

B.M.Stevens

453. SPECIFIC PARTIAL HYDROLYSIS PROCEDURE FOR SOLUBLE RNA. D.W.Veiwoerd and W.Zillig: Biochim. biophys. Acta, 1963, 68, 484-486 (Max-Planck Inst. fur Biochem., Mtinchen, Germany) A sp. partial hydrolysis at the 5-ribosyl uridylic acid sites and at the 3-ribosyl uridylic acid sites was obtained although the resulting oligonucleotides were not separated.

B.M.Stevens

454. FRACTIONATION OF SOLUBLE RNA BY CHROMATOGRAPHY ON DEAE ION EXCHANGERS. Y.Kawade, T.Okamoto and Y.Yamamoto: Biochim. biophys. Res. Comm., 1963, 10, 200 (Inst. for Virus Res., Kyoto Univ., Kyoto, Japan) Some fractionation of s-RNA

from yeast has been obtained using DEAE ion exchangers and an NaCl gradient at pH 5. B.Ketterer

⁴⁵ 5. LARGE SCALE PREPARATION OF YEAST 'SOLUBLE' RIBONUCLEIC ACID. R.W.Holley: Biochem. biophys. Res. Comm., 1963, 10, 186 (U.S. Plant, Soil and Nutrition Lab., Soil and Water Conservation Res. Div., Agric. Res. Service, U.S. Dept. Agric. and Dept. Biochem., Cornell Univ., Ithaca, N.Y., U.S.A.) An earlier procedure has been modified to simplify handling large quantities of yeast for s-RNA prep.

B.Ketterer

*⁵ 6. THE UTILISATION IN VIVO OF MOUSE NUCLEIC ACID METABOLITES LABELLED WITH RADIOACTIVE PRECURSOR SUBSTANCES. M.R.Schwarz and W.O. Rieke: Lab. Invest., 1963, 12, 92-101 (Anat. Dept., Washington Univ. Med. Sch., Seattle, Wash., U.S.A.) ⁷ ⁸ s.c. or i.p. [3H]uridine injn. was given to adult mice, few hr. later, sarcoma cells were transplanted i.p. freely, or inside a dialysis bag. Lymphoid cells from a mouse receiving [3H]uridine over several days were also inj. i.P. to a non-labelled sarcoma bearing mouse. In some expt. [3H]adenine or cultured bone marrow-cells were used. Autoradiographs of the transplanted cells removed at various times were prep. Nucleic acid labelling was noted in all the expt., even at a time when only traces of administered nucleoside are present.

A.M.Mackay

457. NUCLEOTIDE INTERCONVERSIONS. VIII. THYMINE-SPARING EFFECT ON THE UTILISATION OF DEOXYCYTIDINE BY CHICK-EMBRYO MINCE. G.F.Maley and F.Maley: Biochim. biophys. Acta, 1963, 68, 293-301 (Div. Lab. and Res., New York State Dept. Hlth., Albany, N.Y., U.S.A.) Almost ² ³ ⁴ ⁵ ⁶ ⁷ ⁸ C2-14C]deoxycytidine or [2-14c]deoxy-^j ⁹ ¹⁰ ¹¹ ¹² ¹³ ¹⁴ ¹⁵ ¹⁶ ¹⁷ ¹⁸ ¹⁹ ²⁰ ²¹ ²² ²³ ²⁴ ²⁵ ²⁶ ²⁷ ²⁸ ²⁹ ³⁰ ³¹ ³² ³³ ³⁴ ³⁵ ³⁶ ³⁷ ³⁸ ³⁹ ⁴⁰ ⁴¹ ⁴² ⁴³ ⁴⁴ ⁴⁵ ⁴⁶ ⁴⁷ ⁴⁸ ⁴⁹ ⁵⁰ ⁵¹ ⁵² ⁵³ ⁵⁴ ⁵⁵ ⁵⁶ ⁵⁷ ⁵⁸ ⁵⁹ ⁶⁰ ⁶¹ ⁶² ⁶³ ⁶⁴ ⁶⁵ ⁶⁶ ⁶⁷ ⁶⁸ ⁶⁹ ⁷⁰ ⁷¹ ⁷² ⁷³ ⁷⁴ ⁷⁵ ⁷⁶ ⁷⁷ ⁷⁸ ⁷⁹ ⁸⁰ ⁸¹ ⁸² ⁸³ ⁸⁴ ⁸⁵ ⁸⁶ ⁸⁷ ⁸⁸ ⁸⁹ ⁹⁰ ⁹¹ ⁹² ⁹³ ⁹⁴ ⁹⁵ ⁹⁶ ⁹⁷ ⁹⁸ ⁹⁹ ¹⁰⁰ ¹⁰¹ ¹⁰² ¹⁰³ ¹⁰⁴ ¹⁰⁵ ¹⁰⁶ ¹⁰⁷ ¹⁰⁸ ¹⁰⁹ ¹¹⁰ ¹¹¹ ¹¹² ¹¹³ ¹¹⁴ ¹¹⁵ ¹¹⁶ ¹¹⁷ ¹¹⁸ ¹¹⁹ ¹²⁰ ¹²¹ ¹²² ¹²³ ¹²⁴ ¹²⁵ ¹²⁶ ¹²⁷ ¹²⁸ ¹²⁹ ¹³⁰ ¹³¹ ¹³² ¹³³ ¹³⁴ ¹³⁵ ¹³⁶ ¹³⁷ ¹³⁸ ¹³⁹ ¹⁴⁰ ¹⁴¹ ¹⁴² ¹⁴³ ¹⁴⁴ ¹⁴⁵ ¹⁴⁶ ¹⁴⁷ ¹⁴⁸ ¹⁴⁹ ¹⁵⁰ ¹⁵¹ ¹⁵² ¹⁵³ ¹⁵⁴ ¹⁵⁵ ¹⁵⁶ ¹⁵⁷ ¹⁵⁸ ¹⁵⁹ ¹⁶⁰ ¹⁶¹ ¹⁶² ¹⁶³ ¹⁶⁴ ¹⁶⁵ ¹⁶⁶ ¹⁶⁷ ¹⁶⁸ ¹⁶⁹ ¹⁷⁰ ¹⁷¹ ¹⁷² ¹⁷³ ¹⁷⁴ ¹⁷⁵ ¹⁷⁶ ¹⁷⁷ ¹⁷⁸ ¹⁷⁹ ¹⁸⁰ ¹⁸¹ ¹⁸² ¹⁸³ ¹⁸⁴ ¹⁸⁵ ¹⁸⁶ ¹⁸⁷ ¹⁸⁸ ¹⁸⁹ ¹⁹⁰ ¹⁹¹ ¹⁹² ¹⁹³ ¹⁹⁴ ¹⁹⁵ ¹⁹⁶ ¹⁹⁷ ¹⁹⁸ ¹⁹⁹ ²⁰⁰ ²⁰¹ ²⁰² ²⁰³ ²⁰⁴ ²⁰⁵ ²⁰⁶ ²⁰⁷ ²⁰⁸ ²⁰⁹ ²¹⁰ ²¹¹ ²¹² ²¹³ ²¹⁴ ²¹⁵ ²¹⁶ ²¹⁷ ²¹⁸ ²¹⁹ ²²⁰ ²²¹ ²²² ²²³ ²²⁴ ²²⁵ ²²⁶ ²²⁷ ²²⁸ ²²⁹ ²³⁰ ²³¹ ²³² ²³³ ²³⁴ ²³⁵ ²³⁶ ²³⁷ ²³⁸ ²³⁹ ²⁴⁰ ²⁴¹ ²⁴² ²⁴³ ²⁴⁴ ²⁴⁵ ²⁴⁶ ²⁴⁷ ²⁴⁸ ²⁴⁹ ²⁵⁰ ²⁵¹ ²⁵² ²⁵³ ²⁵⁴ ²⁵⁵ ²⁵⁶ ²⁵⁷ ²⁵⁸ ²⁵⁹ ²⁶⁰ ²⁶¹ ²⁶² ²⁶³ ²⁶⁴ ²⁶⁵ ²⁶⁶ ²⁶⁷ ²⁶⁸ ²⁶⁹ ²⁷⁰ ²⁷¹ ²⁷² ²⁷³ ²⁷⁴ ²⁷⁵ ²⁷⁶ ²⁷⁷ ²⁷⁸ ²⁷⁹ ²⁸⁰ ²⁸¹ ²⁸² ²⁸³ ²⁸⁴ ²⁸⁵ ²⁸⁶ ²⁸⁷ ²⁸⁸ ²⁸⁹ ²⁹⁰ ²⁹¹ ²⁹² ²⁹³ ²⁹⁴ ²⁹⁵ ²⁹⁶ ²⁹⁷ ²⁹⁸ ²⁹⁹ ³⁰⁰ ³⁰¹ ³⁰² ³⁰³ ³⁰⁴ ³⁰⁵ ³⁰⁶ ³⁰⁷ ³⁰⁸ ³⁰⁹ ³¹⁰ ³¹¹ ³¹² ³¹³ ³¹⁴ ³¹⁵ ³¹⁶ ³¹⁷ ³¹⁸ ³¹⁹ ³²⁰ ³²¹ ³²² ³²³ ³²⁴ ³²⁵ ³²⁶ ³²⁷ ³²⁸ ³²⁹ ³³⁰ ³³¹ ³³² ³³³ ³³⁴ ³³⁵ ³³⁶ ³³⁷ ³³⁸ ³³⁹ ³⁴⁰ ³⁴¹ ³⁴² ³⁴³ ³⁴⁴ ³⁴⁵ ³⁴⁶ ³⁴⁷ ³⁴⁸ ³⁴⁹ ³⁵⁰ ³⁵¹ ³⁵² ³⁵³ ³⁵⁴ ³⁵⁵ ³⁵⁶ ³⁵⁷ ³⁵⁸ ³⁵⁹ ³⁶⁰ ³⁶¹ ³⁶² ³⁶³ ³⁶⁴ ³⁶⁵ ³⁶⁶ ³⁶⁷ ³⁶⁸ ³⁶⁹ ³⁷⁰ ³⁷¹ ³⁷² ³⁷³ ³⁷⁴ ³⁷⁵ ³⁷⁶ ³⁷⁷ ³⁷⁸ ³⁷⁹ ³⁸⁰ ³⁸¹ ³⁸² ³⁸³ ³⁸⁴ ³⁸⁵ ³⁸⁶ ³⁸⁷ ³⁸⁸ ³⁸⁹ ³⁹⁰ ³⁹¹ ³⁹² ³⁹³ ³⁹⁴ ³⁹⁵ ³⁹⁶ ³⁹⁷ ³⁹⁸ ³⁹⁹ ⁴⁰⁰ ⁴⁰¹ ⁴⁰² ⁴⁰³ ⁴⁰⁴ ⁴⁰⁵ ⁴⁰⁶ ⁴⁰⁷ ⁴⁰⁸ ⁴⁰⁹ ⁴¹⁰ ⁴¹¹ ⁴¹² ⁴¹³ ⁴¹⁴ ⁴¹⁵ ⁴¹⁶ ⁴¹⁷ ⁴¹⁸ ⁴¹⁹ ⁴²⁰ ⁴²¹ ⁴²² ⁴²³ ⁴²⁴ ⁴²⁵ ⁴²⁶ ⁴²⁷ ⁴²⁸ ⁴²⁹ ⁴³⁰ ⁴³¹ ⁴³² ⁴³³ ⁴³⁴ ⁴³⁵ ⁴³⁶ ⁴³⁷ ⁴³⁸ ⁴³⁹ ⁴⁴⁰ ⁴⁴¹ ⁴⁴² ⁴⁴³ ⁴⁴⁴ ⁴⁴⁵ ⁴⁴⁶ ⁴⁴⁷ ⁴⁴⁸ ⁴⁴⁹ ⁴⁵⁰ ⁴⁵¹ ⁴⁵² ⁴⁵³ ⁴⁵⁴ ⁴⁵⁵ ⁴⁵⁶ ⁴⁵⁷ ⁴⁵⁸ ⁴⁵⁹ ⁴⁶⁰ ⁴⁶¹ ⁴⁶² ⁴⁶³ ⁴⁶⁴ ⁴⁶⁵ ⁴⁶⁶ ⁴⁶⁷ ⁴⁶⁸ ⁴⁶⁹ ⁴⁷⁰ ⁴⁷¹ ⁴⁷² ⁴⁷³ ⁴⁷⁴ ⁴⁷⁵ ⁴⁷⁶ ⁴⁷⁷ ⁴⁷⁸ ⁴⁷⁹ ⁴⁸⁰ ⁴⁸¹ ⁴⁸² ⁴⁸³ ⁴⁸⁴ ⁴⁸⁵ ⁴⁸⁶ ⁴⁸⁷ ⁴⁸⁸ ⁴⁸⁹ ⁴⁹⁰ ⁴⁹¹ ⁴⁹² ⁴⁹³ ⁴⁹⁴ ⁴⁹⁵ ⁴⁹⁶ ⁴⁹⁷ ⁴⁹⁸ ⁴⁹⁹ ⁵⁰⁰ ⁵⁰¹ ⁵⁰² ⁵⁰³ ⁵⁰⁴ ⁵⁰⁵ ⁵⁰⁶ ⁵⁰⁷ ⁵⁰⁸ ⁵⁰⁹ ⁵¹⁰ ⁵¹¹ ⁵¹² ⁵¹³ ⁵¹⁴ ⁵¹⁵ ⁵¹⁶ ⁵¹⁷ ⁵¹⁸ ⁵¹⁹ ⁵²⁰ ⁵²¹ ⁵²² ⁵²³ ⁵²⁴ ⁵²⁵ ⁵²⁶ ⁵²⁷ ⁵²⁸ ⁵²⁹ ⁵³⁰ ⁵³¹ ⁵³² ⁵³³ ⁵³⁴ ⁵³⁵ ⁵³⁶ ⁵³⁷ ⁵³⁸ ⁵³⁹ ⁵⁴⁰ ⁵⁴¹ ⁵⁴² ⁵⁴³ ⁵⁴⁴ ⁵⁴⁵ ⁵⁴⁶ ⁵⁴⁷ ⁵⁴⁸ ⁵⁴⁹ ⁵⁵⁰ ⁵⁵¹ ⁵⁵² ⁵⁵³ ⁵⁵⁴ ⁵⁵⁵ ⁵⁵⁶ ⁵⁵⁷ ⁵⁵⁸ ⁵⁵⁹ ⁵⁶⁰ ⁵⁶¹ ⁵⁶² ⁵⁶³ ⁵⁶⁴ ⁵⁶⁵ ⁵⁶⁶ ⁵⁶⁷ ⁵⁶⁸ ⁵⁶⁹ ⁵⁷⁰ ⁵⁷¹ ⁵⁷² ⁵⁷³ ⁵⁷⁴ ⁵⁷⁵ ⁵⁷⁶ ⁵⁷⁷ ⁵⁷⁸ ⁵⁷⁹ ⁵⁸⁰ ⁵⁸¹ ⁵⁸² ⁵⁸³ ⁵⁸⁴ ⁵⁸⁵ ⁵⁸⁶ ⁵⁸⁷ ⁵⁸⁸ ⁵⁸⁹ ⁵⁹⁰ ⁵⁹¹ ⁵⁹² ⁵⁹³ ⁵⁹⁴ ⁵⁹⁵ ⁵⁹⁶ ⁵⁹⁷ ⁵⁹⁸ ⁵⁹⁹ ⁶⁰⁰ ⁶⁰¹ ⁶⁰² ⁶⁰³ ⁶⁰⁴ ⁶⁰⁵ ⁶⁰⁶ ⁶⁰⁷ ⁶⁰⁸ ⁶⁰⁹ ⁶¹⁰ ⁶¹¹ ⁶¹² ⁶¹³ ⁶¹⁴ ⁶¹⁵ ⁶¹⁶ ⁶¹⁷ ⁶¹⁸ ⁶¹⁹ ⁶²⁰ ⁶²¹ ⁶²² ⁶²³ ⁶²⁴ ⁶²⁵ ⁶²⁶ ⁶²⁷ ⁶²⁸ ⁶²⁹ ⁶³⁰ ⁶³¹ ⁶³² ⁶³³ ⁶³⁴ ⁶³⁵ ⁶³⁶ ⁶³⁷ ⁶³⁸ ⁶³⁹ ⁶⁴⁰ ⁶⁴¹ ⁶⁴² ⁶⁴³ ⁶⁴⁴ ⁶⁴⁵ ⁶⁴⁶ ⁶⁴⁷ ⁶⁴⁸ ⁶⁴⁹ ⁶⁵⁰ ⁶⁵¹ ⁶⁵² ⁶⁵³ ⁶⁵⁴ ⁶⁵⁵ ⁶⁵⁶ ⁶⁵⁷ ⁶⁵⁸ ⁶⁵⁹ ⁶⁶⁰ ⁶⁶¹ ⁶⁶² ⁶⁶³ ⁶⁶⁴ ⁶⁶⁵ ⁶⁶⁶ ⁶⁶⁷ ⁶⁶⁸ ⁶⁶⁹ ⁶⁷⁰ ⁶⁷¹ ⁶⁷² ⁶⁷³ ⁶⁷⁴ ⁶⁷⁵ ⁶⁷⁶ ⁶⁷⁷ ⁶⁷⁸ ⁶⁷⁹ ⁶⁸⁰ ⁶⁸¹ ⁶⁸² ⁶⁸³ ⁶⁸⁴ ⁶⁸⁵ ⁶⁸⁶ ⁶⁸⁷ ⁶⁸⁸ ⁶⁸⁹ ⁶⁹⁰ ⁶⁹¹ ⁶⁹² ⁶⁹³ ⁶⁹⁴ ⁶⁹⁵ ⁶⁹⁶ ⁶⁹⁷ ⁶⁹⁸ ⁶⁹⁹ ⁷⁰⁰ ⁷⁰¹ ⁷⁰² ⁷⁰³ ⁷⁰⁴ ⁷⁰⁵ ⁷⁰⁶ ⁷⁰⁷ ⁷⁰⁸ ⁷⁰⁹ ⁷¹⁰ ⁷¹¹ ⁷¹² ⁷¹³ ⁷¹⁴ ⁷¹⁵ ⁷¹⁶ ⁷¹⁷ ⁷¹⁸ ⁷¹⁹ ⁷²⁰ ⁷²¹ ⁷²² ⁷²³ ⁷²⁴ ⁷²⁵ ⁷²⁶ ⁷²⁷ ⁷²⁸ ⁷²⁹ ⁷³⁰ ⁷³¹ ⁷³² ⁷³³ ⁷³⁴ ⁷³⁵ ⁷³⁶ ⁷³⁷ ⁷³⁸ ⁷³⁹ ⁷⁴⁰ ⁷⁴¹ ⁷⁴² ⁷⁴³ ⁷⁴⁴ ⁷⁴⁵ ⁷⁴⁶ ⁷⁴⁷ ⁷⁴⁸ ⁷⁴⁹ ⁷⁵⁰ ⁷⁵¹ ⁷⁵² ⁷⁵³ ⁷⁵⁴ ⁷⁵⁵ ⁷⁵⁶ ⁷⁵⁷ ⁷⁵⁸ ⁷⁵⁹ ⁷⁶⁰ ⁷⁶¹ ⁷⁶² ⁷⁶³ ⁷⁶⁴ ⁷⁶⁵ ⁷⁶⁶ ⁷⁶⁷ ⁷⁶⁸ ⁷⁶⁹ ⁷⁷⁰ ⁷⁷¹ ⁷⁷² ⁷⁷³ ⁷⁷⁴ ⁷⁷⁵ ⁷⁷⁶ ⁷⁷⁷ ⁷⁷⁸ ⁷⁷⁹ ⁷⁸⁰ ⁷⁸¹ ⁷⁸² ⁷⁸³ ⁷⁸⁴ ⁷⁸⁵ ⁷⁸⁶ ⁷⁸⁷ ⁷⁸⁸ ⁷⁸⁹ ⁷⁹⁰ ⁷⁹¹ ⁷⁹² ⁷⁹³ ⁷⁹⁴ ⁷⁹⁵ ⁷⁹⁶ ⁷⁹⁷ ⁷⁹⁸ ⁷⁹⁹ ⁸⁰⁰ ⁸⁰¹ ⁸⁰² ⁸⁰³ ⁸⁰⁴ ⁸⁰⁵ ⁸⁰⁶ ⁸⁰⁷ ⁸⁰⁸ ⁸⁰⁹ ⁸¹⁰ ⁸¹¹ ⁸¹² ⁸¹³ ⁸¹⁴ ⁸¹⁵ ⁸¹⁶ ⁸¹⁷ ⁸¹⁸ ⁸¹⁹ ⁸²⁰ ⁸²¹ ⁸²² ⁸²³ ⁸²⁴ ⁸²⁵ ⁸²⁶ ⁸²⁷ ⁸²⁸ ⁸²⁹ ⁸³⁰ ⁸³¹ ⁸³² ⁸³³ ⁸³⁴ ⁸³⁵ ⁸³⁶ ⁸³⁷ ⁸³⁸ ⁸³⁹ ⁸⁴⁰ ⁸⁴¹ ⁸⁴² ⁸⁴³ ⁸⁴⁴ ⁸⁴⁵ ⁸⁴⁶ ⁸⁴⁷ ⁸⁴⁸ ⁸⁴⁹ ⁸⁵⁰ ⁸⁵¹ ⁸⁵² ⁸⁵³ ⁸⁵⁴ ⁸⁵⁵ ⁸⁵⁶ ⁸⁵⁷ ⁸⁵⁸ ⁸⁵⁹ ⁸⁶⁰ ⁸⁶¹ ⁸⁶² ⁸⁶³ ⁸⁶⁴ ⁸⁶⁵ ⁸⁶⁶ ⁸⁶⁷ ⁸⁶⁸ ⁸⁶⁹ ⁸⁷⁰ ⁸⁷¹ ⁸⁷² ⁸⁷³ ⁸⁷⁴ ⁸⁷⁵ ⁸⁷⁶ ⁸⁷⁷ ⁸⁷⁸ ⁸⁷⁹ ⁸⁸⁰ ⁸⁸¹ ⁸⁸² ⁸⁸³ ⁸⁸⁴ ⁸⁸⁵ ⁸⁸⁶ ⁸⁸⁷ ⁸⁸⁸ ⁸⁸⁹ ⁸⁹⁰ ⁸⁹¹ ⁸⁹² ⁸⁹³ ⁸⁹⁴ ⁸⁹⁵ ⁸⁹⁶ ⁸⁹⁷ ⁸⁹⁸ ⁸⁹⁹ ⁹⁰⁰ ⁹⁰¹ ⁹⁰² ⁹⁰³ ⁹⁰⁴ ⁹⁰⁵ ⁹⁰⁶ ⁹⁰⁷ ⁹⁰⁸ ⁹⁰⁹ ⁹¹⁰ ⁹¹¹ ⁹¹² ⁹¹³ ⁹¹⁴ ⁹¹⁵ ⁹¹⁶ ⁹¹⁷ ⁹¹⁸ ⁹¹⁹ ⁹²⁰ ⁹²¹ ⁹²² ⁹²³ ⁹²⁴ ⁹²⁵ ⁹²⁶ ⁹²⁷ ⁹²⁸ ⁹²⁹ ⁹³⁰ ⁹³¹ ⁹³² ⁹³³ ⁹³⁴ ⁹³⁵ ⁹³⁶ ⁹³⁷ ⁹³⁸ ⁹³⁹ ⁹⁴⁰ ⁹⁴¹ ⁹⁴² ⁹⁴³ ⁹⁴⁴ ⁹⁴⁵ ⁹⁴⁶ ⁹⁴⁷ ⁹⁴⁸ ⁹⁴⁹ ⁹⁵⁰ ⁹⁵¹ ⁹⁵² ⁹⁵³ ⁹⁵⁴ ⁹⁵⁵ ⁹⁵⁶ ⁹⁵⁷ ⁹⁵⁸ ⁹⁵⁹ ⁹⁶⁰ ⁹⁶¹ ⁹⁶² ⁹⁶³ ⁹⁶⁴ ⁹⁶⁵ ⁹⁶⁶ ⁹⁶⁷ ⁹⁶⁸ ⁹⁶⁹ ⁹⁷⁰ ⁹⁷¹ ⁹⁷² ⁹⁷³ ⁹⁷⁴ ⁹⁷⁵ ⁹⁷⁶ ⁹⁷⁷ ⁹⁷⁸ ⁹⁷⁹ ⁹⁸⁰ ⁹⁸¹ ⁹⁸² ⁹⁸³ ⁹⁸⁴ ⁹⁸⁵ ⁹⁸⁶ ⁹⁸⁷ ⁹⁸⁸ ⁹⁸⁹ ⁹⁹⁰ ⁹⁹¹ ⁹⁹² ⁹⁹³ ⁹⁹⁴ ⁹⁹⁵ ⁹⁹⁶ ⁹⁹⁷ ⁹⁹⁸ ⁹⁹⁹ ¹⁰⁰⁰ ¹⁰⁰¹ ¹⁰⁰² ¹⁰⁰³ ¹⁰⁰⁴ ¹⁰⁰⁵ ¹⁰⁰⁶ ¹⁰⁰⁷ ¹⁰⁰⁸ ¹⁰⁰⁹ ¹⁰¹⁰ ¹⁰¹¹ ¹⁰¹² ¹⁰¹³ ¹⁰¹⁴ ¹⁰¹⁵ ¹⁰¹⁶ ¹⁰¹⁷ ¹⁰¹⁸ ¹⁰¹⁹ ¹⁰²⁰ ¹⁰²¹ ¹⁰²² ¹⁰²³ ¹⁰²⁴ ¹⁰²⁵ ¹⁰²⁶ ¹⁰²⁷ ¹⁰²⁸ ¹⁰²⁹ ¹⁰³⁰ ¹⁰³¹ ¹⁰³² ¹⁰³³ ¹⁰³⁴ ¹⁰³⁵ ¹⁰³⁶ ¹⁰³⁷ ¹⁰³⁸ ¹⁰³⁹ ¹⁰⁴⁰ ¹⁰⁴¹ ¹⁰⁴² ¹⁰⁴³ ¹⁰⁴⁴ ¹⁰⁴⁵ ¹⁰⁴⁶ ¹⁰⁴⁷ ¹⁰⁴⁸ ¹⁰⁴⁹ ¹⁰⁵⁰ ¹⁰⁵¹ ¹⁰⁵² ¹⁰⁵³ ¹⁰⁵⁴ ¹⁰⁵⁵ ¹⁰⁵⁶ ¹⁰⁵⁷ ¹⁰⁵⁸ ¹⁰⁵⁹ ¹⁰⁶⁰ ¹⁰⁶¹ ¹⁰⁶² ¹⁰⁶³ ¹⁰⁶⁴ ¹⁰⁶⁵ ¹⁰⁶⁶ ¹⁰⁶⁷ ¹⁰⁶⁸ ¹⁰⁶⁹ ¹⁰⁷⁰ ¹⁰⁷¹ ¹⁰⁷² ¹⁰⁷³ ¹⁰⁷⁴ ¹⁰⁷⁵ ¹⁰⁷⁶ ¹⁰⁷⁷ ¹⁰⁷⁸ ¹⁰⁷⁹ ¹⁰⁸⁰ ¹⁰⁸¹ ¹⁰⁸² ¹⁰⁸³ ¹⁰⁸⁴ ¹⁰⁸⁵ ¹⁰⁸⁶ ¹⁰⁸⁷ ¹⁰⁸⁸ ¹⁰⁸⁹ ¹⁰⁹⁰ ¹⁰⁹¹ ¹⁰⁹² ¹⁰⁹³ ¹⁰⁹⁴ ¹⁰⁹⁵ ¹⁰⁹⁶ ¹⁰⁹⁷ ¹⁰⁹⁸ ¹⁰⁹⁹ ¹¹⁰⁰ ¹¹⁰¹ ¹¹⁰² ¹¹⁰³ ¹¹⁰⁴ ¹¹⁰⁵ ¹¹⁰⁶ ¹¹⁰⁷ ¹¹⁰⁸ ¹¹⁰⁹ ¹¹¹⁰ ¹¹¹¹ ¹¹¹² ¹¹¹³ ¹¹¹⁴ ¹¹¹⁵ ¹¹¹⁶ ¹¹¹⁷ ¹¹¹⁸ ¹¹¹⁹ ¹¹²⁰ ¹¹²¹ ¹¹²² ¹¹²³ ¹¹²⁴ ¹¹²⁵ ¹¹²⁶ ¹¹²⁷ ¹¹²⁸ ¹¹²⁹ ¹¹³⁰ ¹¹³¹ ¹¹³² ¹¹³³ ¹¹³⁴ ¹¹³⁵ ¹¹³⁶ ¹¹³⁷ ¹¹³⁸ ¹¹³⁹ ¹¹⁴⁰ ¹¹⁴¹ ¹¹⁴² ¹¹⁴³ ¹¹⁴⁴ ¹¹⁴⁵ ¹¹⁴⁶ ¹¹⁴⁷ ¹¹⁴⁸ ¹¹⁴⁹ ¹¹⁵⁰ ¹¹⁵¹ ¹¹⁵² ¹¹⁵³ ¹¹⁵⁴ ¹¹⁵⁵ ¹¹⁵⁶ ¹¹⁵⁷ ¹¹⁵⁸ ¹¹⁵⁹ ¹¹⁶⁰ ¹¹⁶¹ ¹¹⁶² ¹¹⁶³ ¹¹⁶⁴ ¹¹⁶⁵ ¹¹⁶⁶ ¹¹⁶⁷ ¹¹⁶⁸ ^{1169</}

BIOCHEMISTRY

balanced or unbalanced growth. A normal correlation of RNA:protein with growth rate was found in most media. RNA accumulation was halted during adjustment to a poorer medium. Under some conditions of cultivation, however, regulation of RNA synthesis broke down and unusual amounts of RNA accumulated. All such conditions appeared to impose an amino acid restriction on the cells.

B.M. Stevens

465. CHARACTERISATION OF THE RNA FORMED UNDER CONDITIONS OF RELAXED AMINO ACID CONTROL IN E. COLI F.C.Neidhardt and L.Eidelic: *Biochim. biophys. Acta.* 1963. 68. 380-388 (Dept. Biol. Sci., Purdue Univ., Lafayette, Ind., U.S.A.) The RNA contained 23 μ , 16 JS and 4-8 S components. When RNA overproduction occurred in the absence of protein synthesis, as when cells were transferred from amino acids to minimal medium, the accumulation pattern resembled that of normal cells inhib. by chloramphenicol. 23 μ and 16 S RNA were present as abnormal ribosomes and proportionately less of these were formed than of sol. RNA. At least part of the sol. RNA had amino acid accepting activity. When RNA overproduction occurred with some concomitant protein synthesis, as during adenosine inhib., the accumulated RNA appeared as apparently normal 50 μ , 30 μ and sol. RNA in normal proportions.

B.M.Stevens

466. NATURE OF A DEOXYNUCLEOTIDE POLYMERASE-DNA COMPLEX. D.Billen: *Biochim. biophys. Acta.* 1963, 68, 342-353 (Section of Rad. Biol., Dept. Biol. Univ. Texas M.D.Anderson Hosp., Houston, Tex., U.S.A.) All the polymerase was associated with DNA after sucrose gradient centrifugation of *E. coli* strain 15 A IT extracts. Variable quantities of thymidine and deoxynucleotide monophosphate phosphorylating enzymes were associated with the complex. Ribosomal contamination complicated. Extracts obtained using the pressure cell showed a different distribution pattern for the complex from that shown by extract obtained by alumina grinding. Association of polymerase with DNA was similar in extracts from cells showing extremes of DNA synthesising ability in vivo. X-radiation of cells had no effect. *E. coli* polymerase complexed with calf thymus or bacterial DNA on mixing and showed sucrose gradient sedimentation patterns like that of the extracted complex.

B.M.Stevens

467. SIZE OF NUCLEUS AS A MEASURE OF SYNTHESISING ACTIVITY (AUTORADIOGRAPHIC STUDIES WITH [3H]CYTIDINE AND [3H]PHENYL ALA NINE). E.StBcker: *Naturwissenschaften* 1963, 50, 2. 44-45 (Pathol. Inst., Univ., Wttrzburg, Germany) Good correlation between RNA and protein synthesis and nuclear size was obtained using the method described, in the liver epithelium of normal and thioacetamide-stimulated rats. Nuclear vacuoles present in active cells also, appeared to be labelled in relation to synthetic activity.

(German) AJ.Wansbrough

468. AUTORADIOGRAPHIC STUDIES ON NUCLEIC ACID TURNOVER IN ASCITES TUMOURS. M.EDA. H.Wrba and H.H.Muth: *Naturwissenschaften*. 1963. 50. 2. 46 (Pathol. Inst., Univ., Munich, Germany)

[3H]thymidine was used to observe the difference in activity between inner and outer zones of solid s.c. implanted tumours. Activity in the outer zone was greatest during the first 24 hr. after implantation, but even greater in the inner zone from 24-48 hr. The labelling index was compared with that of the free ascites tumour cells.

(German) AJ.Wansbrough

469. EFFECT OF DEUTERIUM OXIDE ON INCORPORATION OF PHOSPHOROUS-32 INTO RAT LIVER DNA. D.A.Bray and J.F.Thomson: *Proc. Soc. exp. Biol., N.Y.* 1962, 111. 380-383 (Div. Biol. and Med. Res. Argonne Nat. Lab., 111. U.S.A.) With increasing concn. of D₂O, there was a progressive decrease in DNA synthesis. In rats in which 30% of body H₂O was replaced by D₂O the incorporation of 32P into DNA was reduced about 1/5 of normal.

M.M.S.12 p a

470. DISTINCT CISTRONS FOR THE TWO RIBOSOMAL RNA COMPONENTS. S.A.Yankofsky and S.Spiegelmaier: *Proc. nat. Acad. Sci., Wash.* 1963. 49. 538-544 (Dept. Microbiol., Univ. Illinois, Urbana, IL, U.S.A.) Specific hybrid formation was used to determine whether 16S and 23S ribosomes are derived from the same or different complementary sequences of DNA. The data establish that (a) max. amounts of RNA hybridising per unit of DNA differs for the 2 ribosome spp., (b) at satn. concn. of RNA the amount of hybrid formed is additive when 16S and 23S RNA are present together, (c) competitive action of the 2 RNA spp. for the same DNA site is absent. It is concluded that 16S and 23S ribosomal RNA are derived from DNA sequences unique to each.

J.R.Sargeant

471. RNA POLYMERASE OF AZOTOBACTER VINELANDII II. FORMATION OF DNA-RNA HYBRIDS WITH SINGLE-STRANDED DNA AS PRIMER. R.C.Warner, H.H.Samuel, M.T.Abbott and J.S.Krakow: *Proc. nat. Acad. Sci., Wash.* 1963. 49. 533-538 (Dept. Biochem., New York Univ. Sch. Med., New York, U.S.A.) A DNA hybrid is formed during synthesis of RNA by highly purified *A. vinelandii* RNA polymerase. The hybrid was detected by density gradient centrifugation in Cs₂SO₄, where its buoyancy is intermediate between DNA and RNA. The hybrid is resistant to RNase and can be thermally denatured to yield single-stranded DNA and RNA.

J.F.Sargent

472. SPECIES VARIATION OF RNA METHYLASE. P.R.Srinivasan and E.Borek: *Proc. nat. Acad. Sci., Wash.* 1963. 49. 529-533 (Dept. Biochem., Columbia Univ., New York, U.S.A.) From studies of patterns of methylation of transfer RNA by RNA methylases from different spp. it is concluded that methylation is highly ordered within a sp. and varies inter-spp. RNA from a given source while fully methylated, with respect to its homologous methylating enzymes, can be further methylated by enzymes from different sources.

J.R.Sargeant

473. COMPETITION BETWEEN TRITIATED THYMIDYLIC ACID AND 5-METHYLDEOXYCYTIDINE INCORPORATE INTO BONE MARROW DEOXYRIBONUCLEIC ACID. L.Beneš and J.Soška: *Folia Biol., Praha* 1963. 9. 75-76 (Inst. Biophysics, Czech. Acad. Sci., Brno, Czechoslovakia). << M.S.Laverack

474. SYNTHESIS OF DNA DURING THE CYCLE OF DIVISION OF TRYPARASOMA MEGA. M.Steinert: *Protistolog.* 1962. 9. 203-211 (Lab. Parasit., Inst. Sci. and Appl. Res. Katanga, B.P. 2922 Elisabethville, Katanga, Congo) [3H]Thymidine autoradiographic methods were used to investigate the cycle of DNA synthesis during division in *T. mega* of mean generation time of 18.9 hr. for this sp. *consists* of 4 stages: G₁, S, G₂, D. The S stage is the phase of DNA synthesis of both the nucleus and the kinetochore. The cell divides during stage D, beginning with the first division of the kinetochore. The close time relationship between the 2 DNA synthesising bodies suggests the v

Genetic function of the kinetonudeus.

(French) R.J.Walker
475. KINETICS OF MEGACARYOCYTE PROLIFERATION.

L.E.Feinendegen, N.Odarchenko, H.Cottier and V.P.Bond: Proc. Soc. exp. Biol., N.Y., 1962, 111, 177-182 (Med. Res. Center, Brookhaven Nat. Lab., Upton, L.I., U.S.A.) [3H]Thymidine was used as a ³²P marker. The transit time for the most immature recognisable stage of megacaryocytic development to Vifgacaryocytic disintegration was found to be approx. 10 hr. Evidence was obtained that the elements of the earlier stage originate from precursors which continuously synthesise DNA 1-3 days prior to development.

M.M.Shapland
476. HOMOLOGY TEST BETWEEN THE NUCLEIC ACID OF AN RNA VIRUS AND THE DNA IN THE HOST CELL. R.H.Doi and S.Spiegelman: Science, 1962, 138, 1270-1272 (Dept. Microbiol., Univ. Illinois, Urbana, 111, W.A.S.A.). The RNA of bacteriophage MS02 labelled with ³²P did not form hybrids with DNA from its host, Nsail, whereas 3H-labelled ribosomal RNA did form hybrids. It is therefore evident that there are no differences in the DNA complementary to the viral RNA. Implications of the results for replication and transition of RNA are discussed. G.M.Lewis

477. RNA METABOLISM IN THE PLASMA CELL SEQUENCE. J.Mitchell and G.J.V.Nossal: Nature, Lond., 1963, 197, 1121-1122 (Walter and Eliza Hall Inst., Univ. - Melbourne, Australia). Popliteal lymph node cells from rats immunised with Salmonella typhimurium flagella were treated with [3H]uridine. While blast cells incorporated uridine rapidly, mature plasma cells showed little RNA turnover. Most, if not all, RNA synthesis occurred in the nucleus, some moving later to cytoplasm. When [3H]uridine was inj. into the foot of a mature plasma cell did not become labelled. Synt? ³²P leucine incorporation to estimate protein synthesis# it was shown * a blast cells turn over 30 times as much RNA as mature cells for each mol. leucine taken. G.M.Lewis

478. INTERACTION BETWEEN POLYURIDYLIC ACID AND ISOLATED MICROSONES FROM EHRLICH ASCITES TUMOUR CELLS. S.Pedersen and T.Hultin: Biochim. biophys. Acta, 1963, 68, 328-330 (Wenner-Gren Inst., Stockholm, Sweden). Polyuridylic acid sol. added to microsomes without the participation of enzymes or P³²P-linked energy firmly enough to prevent pairing with subsequently added polyadenylic acid. Prelim, comm. B.M.Stevens

479. A CHARACTERISTIC MESSENGER RNA IN THE STEM OF INDUCED FORMATION OF CATECHOL IDISING ENZYMES IN PSEUDOMONAS EFFUSA. M.Mamato, H.Yamagishi and K.Nozu: Biochem. Phys. Res. Comm., 1963, 10, 379 (Dept. Applied Radiation Centre of Osaka Prefecture, Sakai, & Japaⁿ). Induced enzyme formation in ³²P³²P³² was found to be associated with an increase in tyrosine and a new component sedimenting somewhat faster than 16S. B.Ketterer

480. INTERACTION OF RIBOSOMES AND SOME SYNTHETIC POLYRIBONUCLEOTIDES. T.Okamoto and M.Takami: Biochim. biophys. Acta, 1963, 68, 325-327 (Res. Inst. for Nuclear Med. and Biol., Hiroshima Univ., Hiroshima, Japan). Polyuridylic acid, but not polyadenylic acid or polycytidyllic acid, was shown to interact with ribosomes. Prelim, comm. B.M.Stevens

481. OBSERVATIONS ON THE POSSIBLE NATURE OF THE GENETIC CODE. T.H.Jukes: Biochem. biophys. Res. Comm., 1963, 10, 155 (American Cyanamid Co., Agricultural Div., Princeton, NJ., U.S.A.)

A triplet code is postulated in which each triplet contains a 'pivotal' base which may be subject to change without altering the coding function. B.Ketterer

482. ORIGIN AND BIOLOGICAL INDIVIDUALITY OF THE GENETIC DICTIONARY. D.Giacomoni and S.Spiegelman: Science, 1962, 138, 1328-1331 (Dept. Microbiol., Univ. Illinois, Urbana, 111, U.S.A.). Sol. RNA in extracts of E.coli does not form hybrids with DNA at the temp. range (30-55°) suitable for complex formation with informational or ribosomal RNA, but does so between 70-75° under ionic conditions that allow formation of hydrogen bonds. The hybrids formed are specific, resistant to RNase, and indicate that only a small proportion of the DNA is complementary to sol.-RNA mol. It is suggested that sol.-RNA is formed on a DNA template; it saturates DNA at about 0.02%, which is consistent with a degenerate genetic code. G.M.Lewis

483. E.M. STUDIES OF RIBOSOMAL CLUSTERS SYNTHESISING Hb. J.R. Warner, A.Rich and C.E.Hall: Science, 1962, 138, 1399-1403 (Biol. Dept., M.I.T., Cambridge, Mass., U.S.A.). Reticulocytes incubated with [14C]amino acids were lysed and fractionated by a sucrose density gradient method. The protein synthesising fraction was found to consist of clusters of 5 ribosomes, which sedimented at 170 S compared with 76 S for the single ribosome units. E.M. examination revealed threads holding the ribosomal units together; these are thought to be single strands of RNA. possibly the messenger RNA in control of the synthesis of Hb. G.M.Lewis

484. CELL FREE SYSTEM FOR PROLINE INCORPORATION INTO PROTEIN CLEAVED BY COLLAGENASE. M.Urivetsky, V.Kranz and E.Meilman: Arch. Biochem., 1963, 100, 478-485 (Med. Res. Dept., Long Island Jewish Hosp., New Hyde Park, New York, U.S.A.). A system containing skin microsomes incorporated [14C]proline into ribosomal protein with a low collagen content. Conversion of proline to hydroxyproline could not be demonstrated. The ribosomal protein acted as substrate for purified bacterial collagenase, dialysable peptides being released. Two of these were shown to be Gly.Pro.Hydro. and Gly.Pro.Ala. Both contained 14C. B.M.Stevens

485. A SOLUBLE AMINO ACID INCORPORATING SYSTEM. A.Kaji, H.Kaji and G.D.Novelli: Biochem. biophys. Res. Comm., 1963, 10, 406 (Biol. Div., Oak Ridge Nat. Lab., Oak Ridge, Tenn., U.S.A.)

An RNA polymerase prep. from E.coli has been found to stimulate the incorporation of amino acids in the presence of ATP generator, GTP and s-RNA. This incorporation is not accountable for by ribosome contamination.

B.Ketterer
486. CELL-FREE PROTEIN SYNTHESIS: ASSOCIATION OF VIRAL RNA AND E. COLI RIBOSOMES. R.Haselkorn, V.A.Fried and J.E.Dahlberg: Proc. nat. Acad. Sci., Wash., 1963, 49, 511-517 (Committee on Biophysics, Univ. Chicago, IL, U.S.A.). Tobacco yellow mosaic virus [TYMV] RNA associates with JL-³²P ribosomes in the absence of cofactors other than Mg. The complex formed consists of 1 mol. of viral RNA and one 70S ribosome and is capable of incorporating amino acids into protein in a suitable system. ³²P of the ribosomes bind viral RNA, the same fraction functioning in the amino acid incorporating

BIOCHEMISTRY

system. Binding of viral RNA to ribosomes is reversed in 10^{-4} M Mg. Both 30S and 50S ribosomes also appear to contain sites for viral RNA attachment. J.R.Sargent

- 487. INCORPORATION OF [^{14}C]LEUCINE INTO RAT LIVER RIBOSOMES: EFFECT OF SOLUBLE FRACTION FROM MUSCLE OF NORMAL DIABETIC AND INSULIN TREATED RATS.** I.G.Woo: *Biochim. biophys. Acta.* 1963, 68, 411-417 (Dept. Biochem., Univ., Cambridge, England) Sol. fraction from skeletal muscle would substitute for sol. fraction from liver in catalysing [^{14}C]leucine incorporation. No differences between muscle sol. fractions from normal, insulin treated and alloxan diabetic rats were found. B.M.Stevens
- 488. EFFECT OF HYDROXYLAMINE ON RABBIT RETICULOCYTE RIBOSOMES.** D.W.Allen: *Biochim. biophys. Acta.* 1963, 68, 418-424 (John Collins Warren Lab., Huntington Mem. Hosp., Boston, Mass., U.S.A.) Salt free NH₂OH released labelled polypeptides from ribosomes labelled by prior incubation with [^{14}C]amino acids, without disintegrating the ribosomes. Incubation of labelled ribosomes in a cell free system in which labelled polypeptide was released as Hb produced a proportional decrease in the fraction released by NH₂OH. Treatment with either NH₂OH or puromycin rendered the microsomal label unsusceptible to further release by the other. Electrophoretic patterns of material released were similar but unlike Hb. Max. release occurred with 3M NH₂OH after 8-10 min. B.M.Stevens

- 489. BIOSYNTHESIS OF dopa Hb.** F.Chapeville, G.Cartouzou and S.Lissitzky: *Biochim. biophys. Acta.* 1963, 68, 496-499 (Dépt. Biol., Centre d'Etudes Nucléaires, Gif-sur-Yvette, Seine-et-Oise, France) When dopa combined with the sol. RNA sp. for tyrosine was added to an in vitro Hb synthesising system dopa was incorporated into the positions normally occupied by tyrosine. Prelim, comm. (French) B.M.Stevens

- 490. FORMATION OF Hb IN THE PRESENCE OF [ISO-TOPIC] HYDROGEN-3-L-VALYL-L-LEUCINE.** J.P.Burnett, jun. and F.Haurowitz: *Hoppe-Seylers Z. physiol. Chem.*, 1963, 331, 67-76 (Dept. Chem., Indiana Univ., Bloomington, Ind., U.S.A.) In the synthesis of Hb in chicken r.b.c. free Val and Leu are incorporated after activation. Although the N-terminal sequence is Val-Leu, no direct incorporation of [^3H]Val-Leu was observed. It is suggested that the dipeptide is hydrolysed to the labelled amino acids, which are then randomly incorporated. Possible mechanisms are also discussed. LCornish

- 491. THE [^{2-14}C]GLYCINE INCORPORATION IN VITRO INTO DUCK HAEMOGLOBIN FRACTIONATED BY CHROMATOGRAPHY.** L.Bianco and E.Lazzarini: *G.Biochim.*, 1962, 11, 157-161 (Centro Studi Nucleari E.Fermi, Politecnico di Milano, Italy) [^{2-14}C]Glycine was incorporated by incubation into duck Hb, and the resultant material was fractionated on an alumina column. It was found that the haem and globin incorporated [^{2-14}C]glycine at the same rate but to a different extent. B.Payne

- 492. INCORPORATION OF [^{14}C]GLYCINE INTO THE SUBUNITS OF COLLAGENS FROM NORMAL AND LATHYRITIC ANIMALS.** G.R.Martin, K.A.Piez and M.S.Lewis: *Biochim. biophys. Acta.* 1963, 69, 472-479 (Nat. Inst. Dental Res., Bethesda, Md., U.S.A.)

14c appeared first in the primary subunits O₁ and Q₂ and later in p₁ and p₂. O₁ and O₂ were labelled at the sp^{c} rates. In lathyritic animals the formation of p₁ and p₂ was markedly reduced although collagen synthesis proceeded. This defect was apparent long before gross lathyritic symptoms appeared. B.M.Steven!

- 493. COLLAGEN METABOLISM WITH OXYGEN-18 AS A TRACER.** D.Fujimoto and N.Tamiya: *Biochim. biophys. Acta.* 1963, 69, 559-561 (Med. Sch., Tokyo Med. and Dental Univ., Bunkyo-ku, Tokyo, Japan) ^{18}O incorporation from air into the hydroxyproline of various chick embryo fractions is described. B.M.Steven!

- 494. ACTION OF AMINOACETONITRILE ON BONE COLLAGEN IN TISSUE CULTURE.** G.R.Martin and P.Goldhaber: *Biochim. biophys. Acta.* 1963, 69, 508-519 (Nat. Inst. Dental Res., Bethesda, Md., U.S.A.) Aminoacetonitrile increased the amount of collagen extractable with 1M NaCl from 5 day mouse calvaria grown under conditions which led to new osteoid format¹⁰ within 2 weeks; when uniformly labelled L-[^{14}C]prolin¹⁰ was present in the culture fluid aminoacetonitrile depressed the sp. activity of hydroxyproline in the residue but not in the salt extract. B.M.Steven!

- 495. PROTEIN SYNTHESIS IN REGENERATING LIVERS - OF RATS INVESTIGATED WITH ^3H -LABELLED AMINO ACIDS.** W.Busanny-Caspari and M.Deimel: *Z. Ges. exp. Med.*, 1963, 136, 456-465 (Inst. Med. Isotope Res., Univ. Cologne, Germany) Previously partial hepatectomised rats were killed 3 hr. to 14 days after operation and 1 hr. after i.p. injn. of 3-7 me [^3H]phenylalanine or 4 me [^3H]lysine. The sp. radioactivity of proteins of the liver remnant showed a well marked ini¹¹rise after hepatectomy, with a max. after 9 hr.; sp. radioactivity then declined to a min. at 16 hr. followed by a subsequent rise to a 2nd max. 28 hr. after operation. The wt. of the liver remnant increased in linear fashion after operation. Liver proteins showed virtually no in¹¹crease for the first 16 hr. after hepatectomy and only slight¹¹increased at the same rate as liver wt. The possible significance of these observations is discussed.

- (German) P.F.Meyer

- 496. UTILISATION OF EXOGENOUS PROLINE BY THE YEAST CANDIDA UTILIS.** J.H.Miller and E.S.Kemp: *Science*, 1963, 139, 105-106 (Nat. Inst. Arthritis and Metab. Dis., N.I.H., Bethesda, Md., U.S.A.)

- Exponentially growing *C. utilis* cells incorporate [^{14}C]proline into protein. Studies of the kinetic flow of the labelled mol. indicated that 2 pools of proline may be present. Most of the exogenous proline is converted to other amino acids in the glutamic acid family when t_{1/2} concn. is 10^{-5} M or greater. The great variation in P₁ and P₂ concn. and sp. activity of these precursors leads to a distribution of radioactivity in protein which is cone, in P₁ although most of the exogenous material was converted to other compounds. G.M.^{et al}

- 497. SERUM PROTEIN SYNTHESIS BY EMBRYONIC AND NEONATAL CHICKS.** R.Asofsky, Z.Trnka and G.J.Thorbecke: *Proc. Soc. exp. Biol., N.Y.* 1962, 117, 497-499 (Dept. Path., New York Univ. Sch. Med., New York, U.S.A.) Embryonic and neonatal chicks produce, in addition to albumin and several O₁ and P₁-globulins, at least 3 proteins of y-globulin-like elect¹² phoretic mobility but distinct from y-globulin. Formation of y-globulin and /fe-macroglobulin could not be shown. MMShapland

498. SYNTHESIS OF α -ACID GLYCOPROTEIN BY THE ISOLATED PERFUSED RAT LIVER. E.J.Sarcione: Arch. Biochem., 1963, 100, 516-519 (Div. Med., Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.) ^{14}C from ^{14}C glucose was incorporated into the galactose, $^{\text{N}}$ annose and glucosamine and [^{14}C]leucine into the Protein of plasma α -acid glycoprotein. Only negligible amounts of ^{14}C were incorporated in the absence of the Uver. [^{14}C]Leucine was incorporated into the protein of α -acid glycoprotein 2 \times 2 times more rapidly than into albumin of the perfusing blood. B.M.Stevens

499. MAINTENANCE OF THE ACCURACY OF PROTEIN SYNTHESIS AND ITS RELEVANCE TO AGEING.

L.E.Orgel: Proc. nat. Acad. Sci., Wash., 1963, 49, 517-521 (Univ. Chem. Lab., Cambridge, England) Sources of error in the protein synthetic mechanism are discussed. Sources of error which lead to errors in the protein synthetic mechanism itself are considered to be cumulative. It is demonstrated that if the freq. of error Production bears a slight linear dependence on the concn. of errors already present then the error freq. increases exponentially with time. The possible significance of these considerations is discussed in relation to the ageing Mechanism. J.R.Sargent

500. CHEMICAL REACTIVITY OF A MACROMOLECULE AS A FUNCTION OF ITS AGE. H.Walter: Biochim. biophys. Acta, 1963, 69, 410-411 (Med. Res. Programmes, V.A. Hosp., Long Beach, Calif., U.S.A.) Young Hb bound more 51cr than old Hb. B.M.Stevens

501. NUCLEAR PROTEIN SYNTHESIS IN Vicia faba. Sister Augustine Mattingly: Exp. Cell Res., 1963, 29, 314-326 (Dept. Biol., Brescia Coll., Owensboro, Ky., U.S.A.) By using a newly developed technique for isolating cytoplasm-free prep. of *V. faba* nuclei and autobiography, differences in rate and pattern of nuclear incorporation of [^3H]lysine, arginine and tryptophan in meristematic cells were studied. Lysine was incorporated most rapidly, and tryptophan, least. A comparison of nuclear prep. and root tip smears indicated that lysine utilisation occurred in all stages of the cell cycle in varying degrees. K.Jones

502. BIOSYNTHESIS OF PROTEINS. V. FUNCTION OF NUCLEIC ACIDS IN THE INCORPORATION OF AMINO ACIDS IN PROTEINS, IN A CELL FREE SYSTEM OF *E. COLI*. W.Doerfler, W.Zillig, E.Fuchs and M.Albers: Hoppe-Seylers Z. physiol. Chem., 1962, 330, 96-123 In Max-Planck-Inst. Biochem., Munich, Germany) Incorporation requires enzymes, ATP, sol. RNA, ribosomes and high mol. wt. nucleic acids. The effects of nucleic acids are discussed in detail. DNA prep. acts in the biosynthesis of messenger RNA; the rate is increased by spermine. Actinomycin C3 and proflavine inhibits the synthesis of RNA; enzymic degradations are discussed. (German) I.Coraish

ACTION OF PROTEINS SYNTHESISED BY SUBCELLULAR FRACTION FROM PSEUDOMONAS-P. T.Tohida, H.Takahashi and B.Marao: J. Biochem., Tokyo, 1963, 53, 124-134 (Div. Enzymol., Inst. te Miciobiol., Univ. Tokyo, Japan) Proteins fractionated on DEAE-cellulose columns and by $\text{Li}_{\text{N}}\text{O}_4$ fraction. Amino acid incorporation expt. indicated SO_4^{2-} protein synthesis in exponentially growing cells. Mg^{2+} Produced by incubating a cell suspension with uramide, EDTA and KCl at pH 8.0 and centri-

fuging at 15000 $\times \text{g}$ for 5 min.. were homogenised with chilled Tris(hydroxymethyl)aminomethane-HCl buffer containing DNase and MgCl₂ and centrifuged at 15000 $\times \text{g}$ for 20 min. The ppt. resuspended in 0.005M MgCl₂ was again centrifuged at 15000 $\times \text{g}$ for 20 min. The resulting ppt. [MgP] showed heterogeneous protein synthesis. MgP synthesised 2 types of proteins eluted from DEAE-cellulose with low NaCl concn. and 0.5N KOH respectively. The bulk of free proteins found in intact cells were absent from MgP products. Nascent proteins were loosely attached to MgP ribosomes, being released by lowering Mg concn. or DEAE-cellulose treatment. B.M.Stevens

504. FEEDBACK INHIBITION OF ACETYLGLUTAMINE SYNTHETASE BY ARGinine IN *E. COLI*. S.Vyas and W.K.Maas: Arch. Biochem., 1963, 100, 542-546 (Dept. Microbiol., New York Univ. Sch. Med., New York, U.S.A.) A method for measuring N-acetylglutamate formation in resting suspensions of *E. coli* K-12 is described. Dependence on substrate concn., concn. of cells and pH were examined. Evidence is presented for inhibn. by arginine of the enzyme catalysing the reaction, viz. acetylglutamate synthetase. The formation of this enzyme was also shown to be repressed by arginine. B.M.Stevens

505. REGULATION OF BIOSYNTHESIS OF A HEAT SENSITIVE β -D-GALACTOSIDASE IN [BACTERIA] *SHIGELLA DYSENTERIAE*. S.Sarkar and S.E.Luria: Biochim. biophys. Acta, 1963, 68, 506-508 (Dept. of Biol., M.I.T., Cambridge, Mass., U.S.A.) Prelim. comm. B.M.Stevens

506. QUANTITATIVE STUDIES ON ENZYME REPRESSION IN DEVELOPING CHICK EMBRYO AND NEWLY HATCHED CHICK. J.B.Walker: Proc. Soc. exp. Biol. N.Y., 1963, 112, 245-247 (Dept. Biochem., Baylor Univ. Med. Coll., Houston, Tex., U.S.A.) The enzyme repression (neg. feedback control) of the arginine-glycine transaminase system has been achieved with creatine (very effective), guanidinoacetate (highly effective) and to a lesser extent by citrulline in chick embryo livers when eggs received these substances. It was found that glycine and citrulline administered together could reduce the enzyme level even further. The enzyme system could be induced in newly hatched chicks given creatine before hatching by feeding them a complete diet. The enzyme rose to normal levels in 6 days. D.N.Wheatley

507. MECHANISM OF D-GLUTAMYLTRANSFERASE REPRESSION IN [CULTURED] MAMMALIAN CELLS [VIZ. MOUSE SUBCUTANEOUS-STRAIN L]. J.Paul and P.F.Fottrell: Biochim. biophys. Acta, 1963, 67, 334-336 (Biochem. Dept., Univ. of Glasgow, Scotland). B.M.Stevens

508. REPRESSION OF ARGINOSUCCINASE IN *CHLAMYDOMONAS REINHARDTII*. G.A.Hudock: Biochem. biophys. Res. Comm., 1963, 10, 133 (Biol. Lab., Harvard Univ., Cambridge, Mass., U.S.A.) It is demonstrated that arginosuccinase is repressible by arginine in the unicellular green alga *C. reinhardtii* and there is an indication that repression by endogenous arginine may occur. B.Ketterer

509. IN VITRO COMPLEMENTATION IN THE TRYPTOPHAN SYNTHETASE SYSTEM OF *NEUROSPORA*. Y.Sufama: Biochem. biophys. Res. Comm., 1963, 10, 144 (Dept. Biol., U.C.S.D., La Jolla, Calif., U.S.A.) When extracts of 2 strains of *Neurospora*, each producing

BIOCHEMISTRY

defective tryptophan synthetases, were mixed together higher activity was obtained than would be expected from the individual activities of the 2 extracts. B.Ketterer

- 510. CONTROL BY URACIL OF CARBAMYL PHOSPHATE SYNTHESIS IN E. COLI.** L.Gorini and S.M.Kalman: *Biochim. biophys. Acta.* 1963, 69, 355-360 (Dept. Bacteriol. and Immunol., Harvard Med. Sch^{ff}, Boston, Mass., U.S.A.) Uracil inhib. arginine synthesis slightly in wild type. W and K12 strains. A mutant in which uracil produced an abs. requirement for arginine was selected. Evidence that uracil repressed the formation of enzymes producing carbamyl phosphate is presented. NH₄ carbamate counteracted inhibn. of mutant growth by uracil. B.M.Stevens

MINERAL METABOLISM

- 511. EFFECTS OF pH AND INHIBITORS ON SOME PROPERTIES RELATED TO METAL BINDING IN BOVINE CARBONIC ANHYDRASE.** S.Lindskog: *J. biol. Chem.* 1963, 238, 945-951 (Enzyme Chem. Group, Inst. Biochem., Univ. Uppsala, Sweden) The visible absorption spectrum of the enzymically active Co deriv. of bovine Carbonic anhydrase suffers a reversible change with change of pH. Only 2 spp. are involved in the neutral pH region. Another spectral change, reversible by sufficient increase in pH, is caused by inhibitors - either 'metal-poison' type or sulphonamides. Although both the native enzyme and the Co-enzyme bind acetazolamide strongly, the metal free enzyme binds virtually no inhibitor. The no. of protons liberated per chelating site when Zn is bound to the apoenzyme increases by approx. one as the pH is increased from 6 to 9. If methazolamide (a sulphonamide-type inhibitor) is included at pH 9, one proton less is liberated. One proton is taken up on binding of the inhibitor by the native enzyme at the same pH. The results show that one of the ligand groups probably becomes uncoupled from the metal at neutral or weakly acid pH, and inhibitors compete with this group or another ligand for a coordination site of the metal ion. J.N.Ashley

- 512. METAL CHELATES OF ADENOSIDE TRIPHOSPHATES.** M.M.T.Khan and A.E.Martell: *J. phys. Chem.* 1962, 66, 10-15 (Chem. Dept., Clark Univ., Worcester, Mass., U.S.A.) The stability constants of the 1:1 chelates of ATP with divalent ions of biol. occurrence are reported. It is found that the stabilities increase in the sequence: Ba < Sr < Ca < Mg < Co < Mn < Zn < Ni < Cu. Structures for these chelates are suggested. G.C.Barr

- 513. MITOCHONDRIAL FORMATION AND HYDROLYSIS OF ATP IN THE PRESENCE OF SOME RARE-EARTH IONS.** D.Neubert: *Biochim. biophys. Acta.* 1963, 69, 399-402 (Dept. Physiol. Chem., Johns Hopkins Univ. Sch. Med., Baltimore, Md., U.S.A.) Ions of La, Pr, Nd and Sm did not appear to have direct toxic effect on ATP synthesis or breakdown. B.M.Stevens

- 514. PHOSPHOPROTEINS AND ION TRANSPORT OF CEREBRAL CORTEX SLICES.** K.Ahmed, J.D.Judah and

H.Wallgren: *Biochim. biophys. Acta.* 1963, 69, 428-430 (Wistar Inst. Anat. Biol., Philadelphia, Pa., U.S.A.) Phosphoprotein turnover and Na transport appeared to be related. Prelim, comm. B.M.Stevens

- 515. CATION REQUIREMENTS FOR THE FORMATION OF ATP FROM A HIGH ENERGY INTERMEDIATE OF OXIDATIVE PHOSPHORYLATION.** J.J. Scocca and G.B.Pinchot: *Biochim. biophys. Acta.* 1963, 71, 193-195 (McCollum-Pratt Inst., Johns Hopkins Univ., Baltimore, Md., U.S.A.) Mg was required. B.M.Stevens

- 516. EFFECTS OF METALLIC IONS AND REDUCING AGENTS ON THE INCORPORATION OF AMINO ACIDS INTO SOLUBLE RNA AND MICROSOMAL PROTEIN.** A.Devi and N.Sarkar: *Biochim. biophys. Acta.* 1963, 68, 254-262 (Dept. Biochem., Fac. Med., Laval Univ., Quebec, Canada) [14c]Leucine incorporation into sol. RNA, catalysed by activating enzyme in rat liver high speed supernatant, increased 2-3 fold when Co was added as well as Mg. No other metal replaced Co⁺. Ni, cysteine, glutathione and EDTA and, to a lesser extent, ascorbic acid inhib. this activation. Cystine and methionine were ineffective. Rat Walker tumour or Sarcoma 180 supernatants also showed Co activation. Dialysing any of the supernatants gave a further 3-fold activation. ATP was not needed for Co activation; hydroxamic acid was formed when liver supernatant was incubated with leucine, Co and NH₂OH. RNA and albumin did not replace supernatant. In vivo [14c]leucine incorporation into rat protein was increased 25-35% if was administered with the [14c]leucine. B.M.Stevens

- 517. UPTAKE, DISTRIBUTION AND EXCRETION OF FOUR RADIONUCLIDES IN AUSTRALORBIS GLABRAT^A (PLANORBIDAE).** C.R.Johnson, C.R.Angel and B.G. Erickson: *Amer. J. trop. Med. Hyg.*, 1962, 11, 855-860 (U.S. Army Trop. Res. Med. Lab., New York, U.S.A.) ⁸⁵Sr, ⁵⁹Fe, ⁸⁶Rb and ²²Na were incorporated into media in which the snail *A. glabratus* was growing. The uptake, distribution, and degradation of each of the nuclides was studied. This snail takes up ⁸⁵Sr, concentrates Sr > Fe > Rb > Na. ⁵⁹Fe was the only isotope transferred to the egg in appreciable quantities. The snail may serve as a biol. indicator of low level radioactivity. The application of radioactive isotopes to studies of the ecology and population dynamics of snail intermediate hosts of parasitic diseases is proposed. A.A.Zimmernai

- 518. RADIOACTIVITY OF BIOLOGICAL MATERIALS FROM BRAZILIAN AREAS RICH IN THORIUM COMPOUNDS.** E.Penna-Franca and O.G.de Freitas: *Nature*, Lond., 1963, 197, 1062-1063 (Inst. de Biofis., & Janeiro, Brazil) A variety of plant and animal materials obtained from areas in Brazil where the ²²⁸Ra content of the soil is high were analysed for content of ²²⁸Ra and γ -activity. Prelim, results indicate that internal irradiation of plants and animals due to radio active contaminants should be relatively unimportant. G.M.J.

- 519. EFFECT OF FLUOROACETATE ON UPTAKE OF YTTRIUM-91 IN RABBITS.** J.Dearnaley: *Nature*, Lond., 1963, 197, 1218-1219 (M.R.C. Bone Isotopes Res. Unit, Churchill Hosp., Oxford, England) I.p. inj. of fluoroacetate into rabbits increased the citrate content of the heart 6-fold. After subsequent injn. of ⁹¹yttrium chloride, the yttrium content of the heart and other soft tissues was not increased above the level of control rabbits. G.M.J.

520. ELECTRON PARAMAGNETIC RESONANCE OF MANGANESE ION AND CUPRIC ION IN SPORES. U.Windle and L.E.Sacks: *Biochim. biophys. Acta.* 1963, 66, 173-179 (Western Reg. Res. Lab., Albany, Calif., U.S.A.) The Mn spectra observed in a no. of different bacterial spores were different from those of responding vegetative cells and most other frlant materials, having a single broad curve 460-510 Gauss ^{1/2}le with a sextet hyperfine pattern superimposed, ruminant or autodaving of *Bacillus megaterium* spores ^{1/2}e and most of the Mn and the residual cellular matter ^{1/2}hibited only the small sextet hyperfine spectrum. The spectrum for Cu in spores was consistent with bonding to ^{1/2}tein^{1/2} y ^{1/2}hilised clean spores did not exhibit a free radical spectrum on prolonged storage in air. So, . B.M.Stevens

^{1/2} 1. MICRODETERMINATION OF Mg IN BIOLOGICAL FLUIDS. C.Bohuon: *Clin. chim. Acta.* 1962, 7, 811-17 (Lab. Leon Grimbert, Groupe Hosp., Necker des Infants Malades, Paris, France) A simple, precise rapid micromethod for the estimation of Mg in some fluids is described. Mg metabolism can be studied, this method, in babies or small animals such as rats mice. V.M.Wootton

^{1/2} 1. SENSITIVE METHOD FOR THE DETERMINATION OF SERUM COPPER. D.Mikac-Dević: *Clin. chim. Acta.* 1962, 7, 788-793 (Med. Fac., Univ. Zagreb ne^{1/2}o³p^{1/2}f Cr^{1/2}* Sto^{1/2}janović, Zagreb, Yugoslavia) This method for serum Cu needs only 0.5 or 0.25 ml. of serum. The proteins are ptdt. with TCA. The centrifuging e s made alk. with aq. NH₄OH and buffered with chaelis buffer. Then the 1,5-diphenylcarbohydrazide ^{1/2}gent was added, and the complex formed was extracted with CHCl₃. Precision and accuracy of the method were statistically tested. V.M.Wootton

^{1/2} 2. DETERMINATION OF SMALL AMOUNTS OF COPPER IN ORGANIC MATTER. Analytical Methods Committee: *Analyst.* 1963, 88, 253-258. I.A.B.S.

524. DITHIZONE METHOD FOR DETERMINING ZINC IN ORGANIC MATERIAL. G.Westoo: *Analyst.* 1963, 88, 287-291 (Dept. Nutr. Food Hyg., Nat. Inst. Publ. Hlth., Stockholm, Sweden). L.A.B.S.

525. MICROESTIMATION OF ZINC IN HUMAN BLOOD ^{1/2}UM. M.fernková and B.Konrád: *Biochim. ^{1/2}I^{1/2}ys. Acta*, 1963, 71, 190-192 (Lab. Dermatol. Coll-chem., J.E.Purkyne's Univ., Brno, Czechoslovakia) entry was combined with chromatographic Zn ^{1/2}ration so that masking reagents need not be used. B.M.Stevens

^{1/2} 26. ANTAGONISTIC RELATIONSHIP BETWEEN DIETARY CADMIUM AND ZINC. W.C.Supplee: *Science*, 1963, 139, 119-120 (Dept. Poultry Sci., Coll. Agric., Univ. Maryland, College Park, Md., U.S.A.) The growth of chicks decreased and sp. abnormalities of hocks and feathers increased when Cd was added to a Zn^{1/2}deficient diet. Bleaching and ulceration of the gizzard lining was also observed. All these changes were partially prevented by increase in the Zn G.M.Lewis

^{1/2} 27. DEHYDROGENASE OF YEAST. In ^{1/2}-LACTIC CYTOCHROME C REDUCTASE, A MN-C-FLAynDprytGTYL, nom. *Azymur-VPAQT*. Gregolin and T.P.Singer: *Biochim. biophys. Acta*, 1963, 67, 201-218 (Ford Inst. Med. Res., Henry Ford

Hosp., Detroit, Mich., U.S.A.) The D-lactic cytochrome reductase of the respiratory particles was solubilised and isolated in an apparently homogeneous form. Only D-lactate and D-Gt-hydroxybutyrate were oxidised at appreciable rates and only phenazine methosulphate and cytochrome f served as electron carriers. Enzyme action appeared to be irreversible. The reductase contained 1 mole FAD/50000 ± 5000 g. protein and 1 g. atom Zn²⁺/2000-27000 g. protein. Partial reversible removal of the flavin was possible but the Zn was very tightly bound. B.M.Stevens

528. EFFECT OF TRIVALENT CHROMIUM ON GALACTOSE ENTRY IN RAT EPIDIDYMAL FAT TISSUE.

W.Mertz and E.E.Roginski: *J. biol. Chem.*, 1963, 238, 868-872 (Section Exp. Liver Dis., Nat. Inst. Arthritis and Metabol. Dis., Bethesda, Md., U.S.A.) Cr³⁺, which is the active ingredient of the glucose tolerance factor [GTF], potentiates the effect of insulin on uptake of glucose by fat tissue GTF deficient rats. The effect of Cr and insulin on penetration of the poorly metabolised sugar, D-[1-14C]galactose, in epididymal fat tissue is studied. Addition of 0-01 jgg. of Cr in vitro, which is ineffective by itself, increased the rates of entry in presence of one milli-unit of insulin by 3*8 times after incubation for 15 min. This amount of insulin did not increase rates of entry in GTF deficient animals, and 0.01 fig. of Cr is needed to show an effect of insulin in vitro. These effects are observed in GTF-deficient animals only, in which the impaired function is restored nearly to the level found in rats-on the GTF-sufficient wheat-casein diet. Thus the site of action of Cr is on the sugar transport mechanism. Cr may be an esseftial cofactor for insulin. J.N.Ashley

529. THE INTERACTION OF MERCURIC CHLORIDE WITH RIBONUCLEIC ACIDS AND POLYRIBONUCLEOTIDES. Y.Kawade: *Biochem. biophys. Res. Comm.*, 1963, 10, 204 (Inst. Virus Res., Univ., Kyoto, Japan) The effect of interaction of mercuric chloride with yeast s-RNA, poly-A, poly-U and poly-A-poly-U on u.v. absorption spectrum and f is described. B.Ketterer

530. REVERSIBLE REACTION OF MERCURIC ION AND DOUBLE-STRANDED POLYNUCLEOTIDES. STEP-FUNCTION THEORY AND ITS SIGNIFICANCE.

S.Katz: *Biochim. biophys. Acta.* 1963, 68, 240-253 (Dept. Biophys., Univ., Buffalo, N.Y., U.S.A.) The theory specifies 2:1 base:Hg complexes which bridge the double helix as the sites of reaction when the ratio concn. of Hg added:concn. of base [r] is not greater than 0.5. Hg-thymidine complexes appear to be most readily formed. Necessarily the Watson-Crick helix is perturbed. The min. perturbation is taken to be an axial chain shift by 1 base spacing. When combined with stoicheiometric data on complexing of Hg and nudesides, the chain-shift mechanism enables a quant. evaluation of the average no. of H⁺released by double stranded polynucleotide in the interval between r being 0 and 0.5. The mercurimetric pH-stat titration curve of highly ordered adenylic-thymidylic polymer as compared to DNA is largely explained. B.M.Stevens

531. CHANGES IN BONE MASS AND DENSITY IN LIVING RATS DURING THE MANIPULATION OF CALCIUM INTAKE. H.Schraer, W.J.Siar and R.Schraer: *Arch. Biochem.*, 1963, 100, 393-398 (Biophys. Lab., Dept. Phys., Pennsylvania State Univ., University Park, Pa., U.S.A.) 28 5-week-old males were divided into

BIOCHEMISTRY

4 groups receiving a low Ca diet with 0.025% Ca_f , 0.17% Ca, 0.91% Ca and 1.49% Ca added as CaHPO_4 and CaCO_3 respectively. Standardised radiographs taken after 10, 17, 38, 45, 52 and 59 days were photodensitometrically analysed at 2 femoral sites and across the seventh caudal vertebra. Changing from the 0.67% Ca pre-expt. diet to the 0.02% Ca diet produced a decrease in femoral mass in 24 hr. Density and mass values were the same in the 2 groups receiving most Ca throughout. Ca balances were run from days 10-17, 38-45 and 52-59. Retention levels were reflected by changes in bone mass. When rats fed 0.025% Ca for 52 days were placed on the 0.91% Ca diet, femoral density rose rapidly but vertebral density was unchanged.

B.M.Stevens

532. CALCIUM AND STRONTIUM UPTAKE BY RAT LIVER AND KIDNEY MITOCHONDRIA. F.R.Mraz: Proc. Soc. exp. Biol., N.Y., 1962, 111, 429-431 (Biol. Lab., Hanford Labs., Gen. Elect. Co., Richland, Wash., U.S.A.) Uptake of ^{85}Sr by mitochondria was reduced to a greater degree by added Ca than was the uptake of ^{45}Ca and increased to a greater degree than $^{45}\text{Ca}^y *^c$ addition of Sr.

M.M.Shapland

533. COMPARATIVE STUDIES OF THE METABOLISM OF STRONTIUM AND BARIUM IN THE RAT. P.H.Blight and D.M.Taylor: Biochem. J., 1963, 87, 612-618 (Dept. Physics, Inst. Cancer Res., Royal Cancer Hosp., London, England) The comparative metabolism of ^{85}Sr and ^{140}Ba has been studied in the ends and shaft of the femur, in molar and incisor teeth, and in soft tissues of 6-8 week-old and 13-month-old rats. The uptake of both ^{85}Sr and ^{140}Ba in bone decreases with age and more ^{140}Ba than ^{85}Sr is retained. Both ^{85}Sr and ^{140}Ba are taken up continuously by the incisor teeth of young and old animals, uptake being greater in the old rat. Concn. of both ^{85}Sr and ^{140}Ba in the soft tissues are generally similar to those in blood. Both ^{85}Sr and ^{140}Ba are cone, by the submaxillary gland. The possible mechanisms of deposition of ^{140}Ba in bones and teeth are discussed.

534. TIME-DEPENDENT EFFECT OF POTASSIUM ION ON L-THREONINE DEHYDROGENASE. M.L.Green: Biochim. biophys. Acta, 1963, 67, 682-685 (Dept. Biochem., John Curtin Sch. Med. Res., Australian Nat. Univ., Canberra, A.C.T., Australia) Prelim. comm.

B.M.Stevens

535. A SODIUM ION PLUS POTASSIUM ION STIMULATED ATPase IN 'MICROSOMAL' FRACTIONS FROM RAT LIVER. A.Schwartz: Biochim. biophys. Acta, 1963, 67, 329-331 (Dept. Pharmacol., Baylor Univ. Coll. Med., Houston, Tex., U.S.A.) Fractions having a Na plus K stim. ATPase, which was inhib. by ouabain, consisted essentially of endoplasmic reticulum.

B.M.Stevens

536. APPARENT UNCOUPLING OF THE SODIUM ION AND POTASSIUM ION ACTIVATION OF THE HUMAN ERYTHROCYTE MEMBRANE ATPase. A.Askari and J.C.Fratantoni: Biochim. biophys. Acta, 1963, 71, 232-234 (Dept. Pharmacol., Cornell Univ. Med. Coll., New York, U.S.A.) The prep. and prop. of an ATPase associated with r.b.c. membrane fragments which was activated by Na or K are described. Prelim. comm.

B.M.Stevens

537. ROLE OF PHOSPHOPROTEINS IN ION TRANSPORT* INTERACTIONS OF SODIUM WITH CALCIUM AND POTASSIUM IN LIVER SLICES. J.D.Judah and K.Ahmed: Biochim. biophys. Acta, 1963, 71, 34-44 (Wistar

Inst. Anat. Biol., Philadelphia, Pa., U.S.A.) Changes in ATP and phosphoprotein turnover observed in low Na media were in part due to Ca influx. Addition of Na reversed the changes, the amount of Na required depending on the external Ca concn. Smaller amounts of Na were required to stimulate ATP turnover than for phosphoprotein. Li did not stimulate phosphoprotein turnover although ATP activity was increased. Na, Ca, ouabain and promethazine competed for phosphoprotein groups. K appeared to be necessary for a dephosphorylating reaction of the phosphoproteins observed within 30 sec. of K addition. This was blocked by ouabain and promethazine.

Stevens

538. IRON METABOLISM IN AVIAN ERYTHROBLASTOS C.le Q.Darcel, S.Dziubalo and R.Bather: Nature, Lond., 1963, 197, 1299-1300 (Animal Pathol. Lab., Canada Dept. Agric., Animal Dis. Res. Inst. (Western Lethbridge, Alberta, Canada) Combined electro-phoretic and autoradiographic studies in normal and leukaemic chickens inj. with ^{59}Fe showed that in leukaemic blood, marked radioactivity occurred in a compound migrating with the speed of ferritin and little appeared in Hb. Non-haem Fe in the liver was markedly elevated, but no free Fe was detected in mature or primitive blood cells. Possible explanations of these findings are considered.

G.M.Lewis

539. INACTIVATION DURING FUNCTIONING OF 3-HYDROXYANTHRANILATE OXIDASE RESULTING FROM OXIDATION OF BOUND FERROUS IRON. R.A.Mitchell, H.H.Kang and L.M.Henderson: I. biol. Chem., 1963, 238, 1151-1155 (Dept. Biochem.. Agric. Exp. Station, Oklahoma State Univ., Stillwater, Okla., U.S.A.) The oxidase, which cleaves S-br hydroxyanthranilate between C-3 and C-4, rapidly becomes inactive when stored at low temp., in absence of Fe. Removal of Fe by dialysis causes inactivation. Gel filtration through a Sephadex G-25 column gives a fully active enzyme free of unbound Fe. This desalted enzyme is rather unstable when stored and is rapidly inactivated during catalysis. This inactivation is directly related to the amount of product formed. Various reducing agents retard inactivation, which is due to oxidation of enzyme bound Fe by 'active' or bound O. The enzyme is not highly sensitive to chelating agents. This agrees with the view that in phenolytic oxygenases the function of the enzyme-bound Fe is to bind and activate O rather than the org. substrate.

J.N.Ashie

540. CHELATION OF IRON BY SUGARS. PJ.Charley, B.Sarkar, CF.Stitt and P.Saltman: Biochim. biophys. Acta, 1963, 69, 313-321 (Dept. Biochem., Sch. M* Univ. S. California, Los Angeles, Calif., U.S.A.) Reducing sugars and polyols formed sol. stable com V^f with metal ions at alk. pH. The sp. pH conditions and concn. of Fe and fructose necessary for complex forma $^{\text{io}}$ are described. The existence of the complex was evi c^{lo} by its solubility at alk. pH, its characteristic spectral prop., titration and redox measurements and direct titr i^{lo} . The Fe-fructose was pptd. from aq. soln. with ethanol or other org. solvents. At pH 9.0 the complex contained 2 Fe:2 fructose:1 Na. The complex dissolved rapidly through a Visking sac. It was isoionic at pH 4-4.7.

B.M.Stevens

541. DECREASE OF HAEM & CONTENT IN THE HEART MUSCLE OF COPPER-DEFICIENT SWINE. R.Lemberg, N.Newton and L.Clarke: Aust. J. exp. Biol. med. sci.

1962, 40, 367-372 (Inst. Med. Res., Royal North Shore Hosp., Sydney, N.S.W. Australia) Two samples of heart muscle from Cu-deficient pigs and a control sample from a normal pig were analysed for haem and protohaem. The haem content was greatly reduced in Cu deficiency. The low haem content could be due either to a role of Cu in haem synthesis (distinct from synthesis of the whole enzyme) or to a lack of Cu in the biosynthesis of the holoenzyme at an early stage. Loss of cytochrome oxidase activity in Cu deficiency appears to be entirely due to this factor and this loss cannot therefore prove that Cu is necessary for cytochrome oxidase activity, although it does not exclude this possibility.

B.A.Stone

OTHER BODY CONSTITUENTS

542. ENZYMIC ANALYSIS OF CoA. G.Michal and H.-U.Bergmeyer: Biochim. biophys. Acta, 1963, 67, 599-616 (G.F.Boehringer und Soehne GmbH, Mannheim, Biochem. Abteilung Tutzing/Obb., Germany) Our methods were checked for reproducibility, specificity and applicability to pure substances and crude extracts. The method using β -hydroxyacyl-CoA dehydrogenase was applicable to all materials and allowed differentiation between reduced and total CoA but specificity was low. The thiokinase method gave erroneous results at first but after modification gave a sp. assay for reduced CoA in both crude and pure prep. Phosphotrans-Q^{Ac}Vlase was highly sp. for CoA and assayed reduced γ well in pure prep., but was unreliable in crude extracts. The titratable cleavage enzyme was very sp. for reduced CoA and could be used in both crude and pure prep. but was too unstable for routine work.
543. INCREASE IN LIVER ACETYL COENZYME A DURING KETOSIS. O.Wieland and L.Weiss: Biochem. biophys. Res. Comm., 1963, 10, 333 (Lab. fur Klinische Biochem., II Med. Klinik, Univ. Munchen, Germany) The level of acetyl-CoA in the livers of non-diabetic rats rendered ketotic by withdrawal of insulin and administration of corticoids and of rats made ketotic by fat feeding is 2.5-3.0 times that of controls.
544. PREPARATION OF MALONYL-CoA BY THIOESTER CHANGE. R.A.Kloss and J.E.Dickinson: Biochim. Biophys. Acta. 1963, 70, 90-91 (Chem. Dept., Northern Illinois Univ., DeKalb, Ill., U.S.A.) Prelim. comm.
545. ¹⁴CO₂ FIXATION AND ACCUMULATION OF MALONIC ACID IN AMPHIBIAN HYBRIDS (RANA PIPIENS FEMALE x R. SYLVATICA. MALE). S.Cohen: Exp. Cell Res., 1963, 29, 207-211 (Dept. Biochem., Vanderbilt Univ. Sch. Med., Nashville, Tenn., U.S.A.) Radioactive malonic acid accumulated in the hybrid (R. pipiens x R. sylvatica) embryos grown in medium containing ¹⁴CO₂. However, the results did not show clearly whether this accumulation was the primary event in the initiation of the development of the embryo. Other radioactive metabolites derived from ¹⁴CO₂ in both the normal and hybrid embryos were also identified.

K.Jones

546. HAEMATIN PROSTHETIC GROUPS OF SOME ANIMAL PEROXIDASES. I. PREPARATION AND PROPERTIES OF AN ETHER-SOLUBLE HAEMATIN FROM MILK PEROXIDASE. D.B.Morell and P.S.Clezy: Biochim. biophys. Acta, 1963, 71, 157-164 (Inst. Med. Res., Royal North Shore Hosp., Sydney, Australia) The prosthetic haematin group of milk peroxidase was shown to contain a strongly electrophilic substituent conjugated to the porphyrin ring. This substituent was labile to strong alkali and to certain adsorbents. The haematin was covalently bound to the apoenzyme through ester or amide bonds. The linkage could be broken by alkali and by HI or HBr in acetic acid. The latter reagent yielded a haematin retaining the characteristic electrophilic group.

B.M.Stevens

547. SPECTROSCOPIC STUDY OF HAEMATIN COMPOUNDS IN THE SORET REGION. P.S.Clezy and D.B.Morell: Biochim. biophys. Acta, 1963, 71, 165-171 (Sch. Chem., Univ. New South Wales, Sydney, Australia) Absorption spectra of substituted haemin chlorides and alk. haemamins in the 350-430 mμ region are given. Alk. haemamins in ether showed a single band. Haemin chlorides in benzene or diethyl ether exhibited 2 max. but in acetic acid only a single band was observed. For haemin chlorides in ether, the position of 1 band depended on the electrophilic character of the substituents conjugated to the porphyrin ring. This band was major when the substituents were highly electrophilic. The other band of shorter λ predominated where substituents were weakly electrophilic or non-electrophilic, and showed no correlation with the nature of the substituents.

B.M.Stevens

548. ACTION OF DIAZOMETHANE ON HAEMIN CHLORIDES. P.S.Clezy and D.B.Morell: Biochim. biophys. Acta, 1963, 71, 150-156 (Sch. Chem., Univ. New South Wales, Sydney, Australia) Reaction in ethereal soln. gave a spectroscopically identifiable sp. with an absorption max. near 600 mp. This compound was decomposed by acid to give the porphyrin corresponding to the original haemin chloride. Alk. haemamins or porphyrin-Cu complexes were unaffected by diazomethane.

B.M.Stevens

549. FORMATION IN VITRO OF (i)-STERCOBILIN FROM BILIRUBIN. I.T.Kay, M.Weimer and C.J.Watson: J. biol. Chem., 1963, 238, 1122-1123 (Dept. Med., Univ. Minnesota, Minneapolis, Minn., U.S.A.) Bilirubin is smoothly hydrogenated to give (db)-stercobilinogen (isolated as stercobilin in 15-20% overall yield by oxidation in air in presence of CuSO₄) in presence of a large amount of 10% Pd-C in acetic acid at 60° and 1 atm. of H₂.

J.N.Ashley

550. ACCUMULATION OF HAEMATINS BY POLYCHAETES. R.P.Dales: Nature, Lond., 1963, 197, 1302 (Dept. Zool., Bedford Coll., London, England) Darkening of many polychaete annelids with age is due to accumulation of haematin, possibly due to normal Hb breakdown.

G.M.Lewis

551. ISOLATION AND IDENTIFICATION OF THE SEX ATTRACTANT OF THE AMERICAN COCKROACH. M.Jacobson, M.Beroza and R.T.Yamamoto: Science, 1963, 139, 48-49 (Entomol. Res. Divn., U.S. Dept. Agric., Beltsville, Md., U.S.A.) The sex attractant of Periplaneta americana was collected from many females over which air was passed and condensed in cooled vessels containing a little dil. HCl. The material was

BIOCHEMISTRY

extracted with hexane and chromatographed on silicic acid. The pure compound was identified as 2, 2- dimethyl- 3-isopropylidene-cyclopropyl propionate, and the hydrogenated form synthesised. It elicits a response in males at levels below 10-14 μg . G.M.Lewis

552. ISOLATION AND IDENTIFICATION OF CANTHAXANTHIN IN THE LESSER FLAMINGO (PHOENICON-AIAS MINOR). H.Thommen and H.Wackernagel: *Biochim. bioiis. Acta.* 1963, 69, 387-396

(Abteilung für Vitamin- und Ernährungsforschung der Fa. F.Hoffmann-La Roche und Co. A.G., Basel, Switzerland) Canthaxanthin was the main pigment in the feathers and skin. A surprisingly high concn. of carotenoid was found in liver and small amounts in heart and kidney. Smaller amounts of esterified astaxanthin and traces of β -carotene were also found. Carotenoids were isolated by column and thin layer chromatography and identified by u.v. absorption max.

(German) B.M.Stevens

553. FLAVONOID PIGMENTS IN MARBLED WHITE BUTTERFLY (MELANARGIA GALATHEA SEITZ). S.J.Morris and R.H.Thomson: *Tetrahedron Letters.* 1963, 2, 101-104 (Chem. Dept., The Univ.. Aberdeen, Scotland) Letter. I.A.B.S.

554. PURINE BASES OF THE WHITE BODIES OF OCTOPUS VULGARIS. E.Farina, B.Farina and E.Leone: *G. Biochim..* 1962, 11, 141-145 (Inst. Biochim. Applicata. Univ. Sassari, Sardinia, Italy)

Deproteinised AgNO_3 extracts of white body homogenates of *O.vulgaris* were examined by chromatography for purine bases. The following bases were found in quantities expressed as mg. purine base/100 g. white body: guanine 360, adenine 780, and hypoxanthine 426. D.Payne

555. COMPARATIVE STUDY OF TRIMETHYLAMINE N-OXIDE BIOSYNTHESIS. J.R.Baker, A.Struempler and S.Chaykin: *Biochim. biophys. Acta,* 1963, 71, 58-64 (Dept. Biochem. Biophys., Univ. California, Davis, Calif., U.S.A.) In animals, synthesis from trimethylamine appeared to be restricted to vertebrates, at least 1 example of each class having been shown to be competent to carry out the reaction. At least some elasmobranchs and fresh and salt water teleosts synthesised trimethylamine N-oxide, but many spp. did not produce detectable amounts under present assay conditions. No synthesis of trimethylamine N-oxide by plants was demonstrated in vitro but there was some evidence that certain plants carried out the synthesis in vivo.

B.M.Stevens

556. ENZYMIC OXIDATION OF CYSTEAMINE TO HYPOTAURINE IN THE PRESENCE OF SULPHUR DONORS. D.Cavallini, C.De Marco and R.Scandurra: *G. Biochim.,* 1962, 11, 196-207 (Inst. Chim. Biol., Univ. Modena, Italy) An enzyme capable of oxidising cysteamine to thiotaurine and hypotaurine in presence of elementary S (or thiopyruvate or Na sulphide) was extracted from horse kidney. The mechanism of the reaction was studied. Hypotaurine was the primary product, but this was transsulphurated to thiotaurine when suitable quantities of polysulphides were present.

B.Payne

557. PRE-LUMIRHODOPSIN AND THE BLEACHING OF VISUAL PIGMENTS. T.Yoshizawa and G.Wald: *Nature, Lond.*, 1963, 197, 1279-1286 (Biol. Lab., Harvard Univ., Cambridge, Mass., U.S.A.) Direct spectrophotometry at liquid N_2 temp, of the product of irradiation of rhodopsin confirms the existence of pre-

lumirhodopsin. The status of this compound in the chain of intermediates involved in the bleaching of rhodopsin and iso-rhodopsin is evaluated. G.M.Lewrt

558. OXIDATION OF 4(5)-IMIDAZOLONE-5(4)-PROPIONIC ACID TO HYDANTOIN-5-PROPIONIC ACID BY [A COMMERCIAL PREPARATION OF MILK] OXIDASE. H.Hassall and D.M.Greenberg: *Biochim. biophys. Acta.* 1963, 67, 507-510 (Dept. Biochem.. Univ. California, San Francisco, Calif., U.S.A.)

B.M.Stevens

559. ABSORPTION SPECTRA OF RETINAL OIL GLOBULE IN TURKEY, TURTLE AND PIGEON. G.K.Strother: *Exp. Cell Res..* 1963, 29, 349-355 (Phys. Dept., Pennsylvania State Univ., University Park, Pa., U.S.A.)

There was no important difference between absorption spectra of globules of the same colour in the spp. studied. All the coloured globules studied acted as sharp cut-off filters for visible light, with some decrease in absorption for wavelengths shorter than 400 m(i). The coloured oil globules of the pigeon retina are suggested to be responsible for the red shift in the spectral response of this animal as compared with the frog. Kjones

560. SEPARATION OF 2-AMINO-4-HYDROXY-PTERINES THROUGH ION EXCHANGE CHROMATOGRAPHY. H.Rembold and L.Buschmann: *Hoppe-Seylers Z. physiol. Chem.,* 1962, 330, 132-139 (Max-Planck-Inst. Biochem., Munich, Germany)

Dowex 1X8 gives a good separation, but this can be further improved by re-chromatography on a cellulose column. Full expt. details are given.

(German) LCornish

ENZYMES

561. KINETICS OF ENZYME CATALYSED REACTION* WITH TWO OR MORE SUBSTRATES OR PRODUCTS, n. INHIBITION: NOMENCLATURE AND THEORY.

IE. PREDICTION OF INITIAL VELOCITY AND INHIBITION PATTERNS BY INSPECTION.

W.W.Cleland: *Biochim. biophys. Acta.* 1963, 67, 173-187. 188-196

(Dept. Biochem., Coll. Agric., Univ. Wisconsin, Madison, Wis., U.S.A.)

n. A nomenclature to describe different types of inhibn. is proposed. Rate equations for inhibn. and methods for distinguishing between various types of inhibn. and for obtaining inhibn. and kinetic const. from expt. data are discussed. Examples of the type of information obtainable from inhibn. studies are given.

III. A general method for predicting initial velocity and dead end and product inhibn. patterns by inspection of the mechanism is presented. The method is applicable to any non-random mechanism without alternate react* sequences. Several examples of the application of to C₁₀ method are given.

B.M.Stevens

562. REACTION KINETICS OF RESPIRATORY ENZYMES STUDIED BY ELECTRON SPIN RESONANCE ABSORPTION.

Y.Imai, A.Hirai and R.Kado: *Biochim.,* 1963, 67, 687-690 (Dept. Physio¹;

Fac. Med., Univ., Kyoto, Japan) Fungal glucose oxidase and pig heart succinate dehydrogenase were examined. Prelim. comm.

--
B.M.Stevens

563. TIME COURSE OF CONSECUTIVE REACTIONS CATALYSED BY EXO-ENZYMES. K.Hiromi and S.Ono: I. Biochem.. Tokyo. 1963. 53. 164-166 (Lab. Biophys. Chem., Coll. Agric., Univ. Osaka Prefecture, Sakai. Japan) The time courses of exo-enzyme catalysed degradation of substrates having 2 attackable bonds and of linear substrates of a high degree of polymerisation are discussed theoretically. Prelim, comm. B.M.Stevens

564. ISOELECTRIC POINT OF NATIVE AND SIALIDASE TREATED HUMAN SERUM CHOLINESTERASE. O.Svensmark and P.Kristensen: Biochim. biophys. Acta. 1963, 67. 441-452 (Inst. Neurophysiol.. Univ. Copenhagen. Denmark) Electrophoretic mobility determined by paper electrophoresis at pH 2*8-9*6 with corrections for electro-osmosis, evaporation, paper structure and adsorption of protein to paper. Orosomucoid and caeruloplasmin were used as control proteins. The electric point of native cholinesterase was 2*9-3-0, that of sialidase treated cholinesterase was 6*7-7*0. At pH 8*6 native cholinesterase had a mobility of -3-1 * 10*5 sq. cm./V/sec. and sialidase treated cholinesterase of -0.2 x 10*5 sq. cm./V/sec. At pH 4-9-6 the ability of sialidase treated cholinesterase was 2-9 * 10*5 units above that of native cholinesterase; at pH 2*8 this difference was decreased to approx. 2 x 10*5 units. B.M.Stevens

565. DEVELOPMENT OF ENZYMIC FERMENTATION. I YEAST ENZYMES. II MUSCLE ENZYMES. P.Ohlmeyer, W.Kutscha and W.Russman. II. MUSCLE ENZYMES. P.Ohlmeyer and K.Grill: Hoppe-Seylers Z. physiol. Chem., 1962, 330, 1-ii. 12-20 (Leibniz-Kolleg Univ., 74 Tübingen, Germany) I. After cytolysis of baker's yeast, 6% of total alcohol dehydrogenase [ADH] activity was in the sediment and 23% was solubilised by enzyme development or incubation. On homogenisation 90% of ADH, ructokinase [PFK] and aldolase were in the supernatant; ADH activity decreased on aerobic termination. PFK was found in the supernatant of homo-S₂1⁶⁸ of Peas. The fermentation potential of a homologate of baker's yeast was 5% of that of the intact cells. A homogenate of bovine muscle contained no PFK in the presence of AMP, lactic acid was produced via D-fructose diphosphate. The muscle enzymes and the S₂1⁶⁸ enzymes show similar relationships to cell structure, decreases during storage, for both frog muscle and K₆muscle» latter contained equal amounts of soluble bound lactate dehydrogenase. B.M.Stevens (German) I.Cornish

V CHROMATOGRAPHY OF TAKA-AMYLASE A [TAA] ON DIETHYLAMINOETHYL-CELLULOSE COLUMN. H.Toda and S.Akabori: J. Biochem., Tokyo, 1963, 53, 102-110 (Inst. for Protein Res., TAA U.S.A.) Chromatography of crystalline TAA showed the presence of small amounts of inactive ¹⁴C-Takadiastase column. A procedure for a simplified chromatographic preparation of homogeneous enzyme is described. 'Takadiastase' extract was chromatographed on cellulose thereby separating alk. protease, Takadiastase and TAA directly. B.M.Stevens

L-L-MALATE: NADP OXIDOREDUCTASE (DECARBOXYLATING) FROM GERMINATING FLAX-RUST DROSOPHILES. M.A.Johnson and D.S.Frear: Phytochemistry, 1963, 2, 75-83 (Dept. Agric. Biochem., North Dakota State Univ., Fargo, N.Dak., U.S.A.) The enzyme was purified more than 20-fold and partially

characterised. The prep, catalysed the oxidative decarboxylation of L-malic acid to pyruvic acid, optimally in the presence of NADP and Mn and at pH 7*6. Oxaloacetic acid was decarboxylated at pH 5. Other enzymic studies on the prep, were carried out. B.H.Davies

568. ENZYMIC ACTIVATION AND CLEAVAGE OF D- AND L-MALATE. J.R.Stem: Biochim. biophys. Acta, 1963, 69, 435-437 (Dept. Pharmacol., Sch. Med., Western Reserve Univ., Cleveland, Ohio. U.S.A.)

Two separate enzymes catalysed formation of malyl-CoA and of acetyl-CoA and glyoxylate from malate; free malyl-CoA was not the substrate of the malate cleavage reaction. Prelim, comm. B.M.Stevens

569. PROSTHETIC GROUP OF SUCCINIC DEHYDROGENASE. I. FLUORESCENCE AND ENZYMIC HYDROLYSIS OF THE FLAVIN PEPTIDE. R.Strom and P.Cerletti: G. Biochim.. 1962. 11. 208-220 (Inst. Chim. Biol. Univ., Rome, Italy) The prosthetic group of succinic dehydrogenase obtained from beef heart mitochondria, which has been split from protein and purified by gel filtration, was fluorescent only in acid media with max. at pH 2-6-2-8. Max. fluorescence of mononucleotide was 85% of equimol. amount of riboflavin. Fluorescence of the dinucleotide was 10% less than the mononucleotide. Fluorescence of the mononucleotide was quenched 20% at pH 2*8 by 0-05M adenosine. By using different proteolytic enzymes the prosthetic group was shown to be bound to different peptides, but all the compounds had similar fluorimetric characteristics. B.Payne

570. MECHANISM OF THE SUCCINIC DEHYDROGENASE CATALYSED REACTION. O.Gawron, AJ.Glaid, J.Francisco and T.P.Fondy: Nature, Lond., 1963, 197, 1270-1272 (Dept. Chem., Duquesne Univ., Pittsburgh, Pa., U.S.A.) Studies of the succinic dehydrogenase catalysed exchange reaction between protons present in the medium and chlorosuccinate or succinate indicate that one of the 2 H atoms removed from a trans pair on the substrate is removed at a much faster rate than the other. A mechanism for succinic dehydrogenase action is proposed whereby one of the substrate H is removed as a protein (fast exchange) and the other is initially removed as a hydride ion (slow exchange). J.R.Sargent

571. COENZYME Q AND SUCCINATE-TETRAZOLIUM REDUCTASE ACTIVITY OF NEONATAL RAT KIDNEY. Proc. Soc. exp. Biol., N.Y., 1962, 111, 230-233 (Dept. Path., Univ. Minnesota Sch. Med., Minneapolis, Minn., U.S.A.) Low succinate-tetrazolium reductase activity of tubular elements of neonatal rat kidney cortex is due to low activity of die primary dehydrogenase and a lack of coenzyme Q. M.M.Shapland

572. NEW NAD-DEPENDENT SPECTRAL SPECIES OF LIPOAMIDE DEHYDROGENASE. C.Veeger and V.Massey: Biochim. biophys. Acta, 1963, 67, 679-681 (Lab. Physiol. Chem., Univ., Amsterdam, Netherlands) Prelim, comm. B.M.Stevens

573. STARCH GEL ELECTROPHORESIS OF CITRATE CONDENSING ENZYME FROM PIG HEART. L.Broder and P.A.Srere: Biochim. biophys. Acta, 1963, 67, 626-632 (Dept. Biol. Chem., Univ. Michigan, Ann Arbor, Mich., U.S.A.) The enzyme existed in vitro as 2 distinct spp. separable by electrophoresis. Several mild treatments interconverted, suggesting that separate forms arose during purification. It is suggested that the 2

BIOCHEMISTRY

differed only in the state of reduction of their thiol groups.

B.M.Stevens

574. IMMUNOCHEMICAL STUDIES WITH CITRATE CONDENSING ENZYME. L.Broder and P.A.Srere: *Biochim. biophys. Acta*, 1963, 67, 617-625 (Dept. Biol. Chem., Univ. Michigan, Ann Arbor, Mich., U.S.A.) Antisera to pig heart enzyme was prep, in rabbits. Interaction of enzyme and anti-enzyme was independent of pH between 6-3 and 8*9 and of temp, at 0° and 37°. Reaction was complete within 10 min. of mixing. Heat inactivated enzyme, acetyl CoA, CoA or citrate had no effect. Enzyme inactivated by acetylation retained some reactivity towards anti-enzyme. j>-Mercuribenzoate treated enzyme reacted normally. Pig liver and kidney and pigeon heart and breast muscle enzymes reacted with the Ab in the same way as the pig heart enzyme. Pigeon liver and dog heart, liver and kidney enzymes reacted partially; moth flight muscle and rabbit heart enzymes remained completely uninhib.

B.M.Stevens

575. PHYSICOCHEMICAL STUDIES ON CITRATE OXALOACETATE LYASE FROM AEROBACTER AERogenes. T.J.Bowen and L.J.Rogers: *Biochim. biophys. Acta*, 1963, 67, 633-640 (Dept. of Biochem., Univ. of Leeds, Leeds, England) The prep, from A. aerogenes, was homogeneous in the analytical ultracentrifuge and on free boundary electrophoresis. Effects of temp., protein concn., cysteine and urea on stability were examined. The diffusion coeff. was $4*16 \times 10^{-7}$ sq. cm./sec. with $4*3-6^B 4$ mg. protein/ml. JS was 16*2. The mol. wt. was 3^A.8000 by the sedimentation-diffusion method and 314000 by a Trautmann plot derived from approach to equilibrium expt.

576. CRYSTALLINE PSEUDOMONAS CYTOCHROME OXIDASE. I. ENZYMIC PROPERTIES WITH SPECIAL REFERENCE TO THE BIOLOGICAL SPECIFICITY.
II. SPECTRAL PROPERTIES OF THE ENZYME.
m. PROPERTIES OF THE PROSTHETIC GROUPS.
T.Yamanaka and K.Okunuki: *Biochim. biophys. Acta*, 1963, 67, 379-393, 394-406, 407-416 (Dept. Biol., Fac. Sci., Univ. Osaka, Nakanoshima, Osaka, Japan)
I. One mole enzyme aerobic ally oxidised 154 moles and 600 moles of reduced cytochrome fi-551/min. at 16° and 27° respectively. Anerobically 250 moles were oxidised/min./mole enzyme in the presence of NO₂" at 19°. The absorption spectrum indicated the presence of haem A2 and a ξ -type haem. Very little activity was shown towards reduced beef cytochrome ξ but reduced tunny fish cytochrome ξ was oxidised more rapidly. Reduced Physarum polyccephalum cytochrome c was not oxidised by the enzyme but was oxidised by cytochrome ξ . Reduced wheat cytochrome ξ was oxidised faster by cytochrome a than by the Pseudomonas oxidase. Reduced Porphyra tenera cytochrome-553 was oxidised by the Pseudomonas oxidase but not by cytochrome a.

II. The haem $\xi 2$ 0C-band was at 655 mp, 629 and 652 mfi and 625 mji at pH 7[#]6, 7*0 and 5'6 respectively in Na₂S₂O₄ reduced enzyme. The absorbancy also varied with pH. The y-band, which had a much lower absorbancy, remained at 460 mji at all pH. In ascorbate reduced enzyme the (X-band did not vary with pH. With cyanide the haem $\xi 2$ (X-band was at 617 mji and the y-band had max. at 443 and 472 mji. With CO the absorbancy of the haem $\xi 2$ CX-band was greatly reduced and the y-band disappeared. NO₂" or NO added to Na₂S₂O₄ reduced enzyme produced a max. at 665 mfi and abolished the y-band. With ascorbate reduced enzyme NO₂" or NO

produced a bump at 570 mji. Hydroxylamine produced complicated effects. None of the reagents appreciably affected the haem ξ spectrum.

III. Haem ξ was easily cleaved from the protein with HCl-acetone. Haematin $\xi 2$ was insol. in acetone and hence easily removed. Haematin $\xi 2$ and haem $\xi 2$ h^A a-bands at 684 mjj and 626 mfi respectively. Pyridine, cyanide, NO and CO deriv. of haem $\xi 2$ had a-bands at 620 mji, 632 mfi, 625 mji and 644 mji respectively. T^A y-bands of haematin 1/2 and its deriv. contained 2 or 3 peaks. The ratio y-band absorbancy/a-band absorbancy was very much lower for haematin 22 and its deriv. than for other haems. The haem remaining on the protein after HCl-acetone treatment was removed by Ag₂SO₄ treatment and shown to be haematohaem. The absorpti spectra of haem $\xi 2$ and the Pseudomonas oxidase are co&pared.

B.M.Stevens

577. MULTIPLE ENZYME CHANGES IN PLASMA OF NORMAL AND TUMOUR-BEARING MICE FOLLOWING INFECTION WITH LACTIC DEHYDROGENASE [LDH] AGENT. A.L.Notkins, R.E.Greenfield, D.Marshall^A L.Bane: *J. exp. Med.*, 1963, 117, 185-195 (Microbe Lab., Natl. Inst. Dental Res., N.I.H., Bethesda, Md., U.S.A.) Within 72 hr. of the injn. of LDH agent W^{*} normal mice 5 (LDH, isocitric and malic dehydrogenase^{si} phosphohexose isomerase and GOT) of the 7 enzymes studied in the plasma were raised. There was a marked increase in enzyme activity of the plasma of mice bearing tumours and infected with LDH. Activities of the tumour-bearing mice were not raised if they were not infected, but did show a late increase which appeared to be related to tumour growth. The results suggest that contamination with LDH agent may have been responsible for raised enzyme activities previously attributed to the tumour.

H.E.H.jones

578. LOCALISATION OF A LACTIC DEHYDROGENASE [LDH] ISOZYME IN NUCLEI OF YOUNG CELLS IN THE ERYTHROCYTE SERIES. E.S.Vessell and A.G.Bearn: *Proc. Soc. exp. Biol., N.Y.*, 1962, 111, 100-104 (Rockefeller Inst., New York, U.S.A.) LDH is o z^A 5 is absent in the anucleated mature r.b.c. of man and guinea-pig but is present in the earlier forms which are nucleated or contain primary nuclear products.

M.M.Shap^{inf}

579. MODIFIED TECHNIQUE FOR DIRECT STAINING WITH NITRO-BLUE TETRAZOLIUM OF LACTATE DEHYDROGENASE [LDH] ISO-ENZYMES ON AGAR ELECTROPHORESIS. R.J.Wieme, M.van Sande, D.Karcher, A.Lowenthal and H.J.Van der Helm: *Clin. chim. Acta*, 1962, 7, 750-754 (Lab. Med. Clin., Univ. Ghent, Belgium) A new procedure for the detection of LDH iso-enzymes by the tetrazolium method is described. The substrate soln. is stabilised by agar 0-9%, and poured directly on top of the electrophoresis plate and left to set; this is then incubated at 37°. This method is useful in a clinical laboratory, as many samples can be run in parallel. It is also more accurate for calculating relative activities since neither enzyme nor substrate is lost in the incubating fluid. Plotting the area of the scanned peaks against enzyme activity yields an S-shaped response curve.

V.M.Wooff

580. VISUALISATION OF DIFFERENT NAD AND NADH DEHYDROGENASE ISOENZYMES ON AN AGAR-GEL PLATE. G.Broun and S.Avrameas: *Nature*, Lond., 1963, 197, 1208 (Inst. de Recherches Sci. sur le Cancer, Villejuif (Seine), France) A tetrazolium

BIOCHEMISTRY

574.

Method is described for the visualisation of dehydrogenase enzymes separated by electrophoresis in agar gel. The technique has been applied to lactic, malic, isocitric, glutamic, β -hydroxybutyric, and glucose 6-phosphate dehydrogenases in rat liver. G.M.Lewis

581. BIOCHEMICAL INVESTIGATIONS OF CRYSTAL-LINE ISO-ENZYMES OF LACTATE DEHYDROGENASE FROM HUMAN ORGANS. E.D.Wachsmuth and G.Pfleiderer: Biochem. Z., 1963, 336, 545-556 (Inst. Biochem., Univ. Frankfurt/Main, Germany)

H_2O_2 extracts of human brain, heart and kidney obtained post mortem were treated with Ca phosphate gel. Iso-enzymes of lactate dehydrogenase could be cryst. with $(\text{NH}_4)_2\text{SO}_4$ at 50-60% satn. and eluted as distinct fractions by applying a NaCl gradient to a column of DEAE sephadex. The five iso-enzymes behaved differently under various conditions of activity.

582. MOLECULAR HETEROGENEITY OF LACTIC DEHYDROGENASE DURING DEVELOPMENT OF THE SNAIL ARGOBUCCINUM OREGONENSE REDFIELD.

Goldberg and J.N.Cather: J. cell. comp. Physiol., 1963, 61, 31-37 (Dept. Zool., North Dakota St. Univ., Fargo, N. Dak., U.S.A.) In the uncleaved egg, 5° *U. oregonense*, 5 distinct lactic dehydrogenases were detected by disc electrophoresis of the homogenate 1% acrylamide gel. During development of the egg, these disappeared, possibly contributions of gonadal tissue to the oocyte, while 2 others appeared, probably associated with differentiation of appropriate synthetic mechanisms. Indian Botanic Garden G.M.Lewis

583. PURIFICATION, KINETIC AND IMMUNOCHEMICAL STUDIES OF MAJOR VARIANTS OF LACTIC DEHYDROGENASE FROM HUMAN LIVER, HEPATOMA, AND

LYTHROCYTES; COMPARISON WITH MAJOR VARIANT OF HUMAN HEART LACTIC DEHYDROGENASE. J.S.Nisselbaum and O.Bodansky: J. biol. Chem., 1963, 238, 969-974 (Div. Enzymol. and Metabol., Sloan-Kettering Inst. Cancer Res., New York, U.S.A.) Purification of the various variants is described. Km values for NAD and its analogues, pyruvate, and lactate are determined for these variants. Km values for nicotinamide inosine dinucleotide, lactate, and pyruvate differentiate the liver and hepatoma variants from the r.b.c. and heart variants. The ratios of rates of reduction of thio-NAD, 3-acetylpyridine dinucleotide, and 3-acetylpyridine inosine dinucleotide to NAD differentiate between the same 2 groups of variants. Inhib. studies with sp. antisera also with this classification of variants. J.N.Ashley

584. CRYSTALLISATION OF BINARY AND TERNARY COMPLEXES OF HORSE LIVER ALCOHOL DEHYDROGENASE WITH NADH₂ AND WITH NADH₂ AND ISOBUTYRAMIDE. T.Yonetani and H.Theorell: Arch. & ther., 1963, 100, 554-556 (Nobel Med. Inst., Helsingborg, Sweden) Crystals suitable for X-ray crystallography were prepared. B.M.Stevens

585. TETRAHIAZOTETE REDUCTASE OF A FACULTATIVE ANAEROBIC BACTERIUM. F.Pichinoty and P.Vliardi-Rouvier: Biochim. biophys. Acta, 1963, 59, 366-378 (Lab. Chim. Bact., Centre Nat. Rech. Sci., Paris, France) The tetrathionate reductase activity of extracts was measured using benzyl viologen as the reductase to hydrogenase and measuring H₂

consumption in Warburg manometers. Km and activation energy were measured. The pH optimum was also determined. Cyanide and N₃⁻ inhib. Aerobic cultures did not reduce tetrathionate. Atm. O₂ reversibly inhib. the reductase. In anaerobic cultures enzyme synthesis was induced by tetrathionate; in aerobic cultures O₂ completely repressed its formation.

(French) B.M.Stevens

586. PURIFICATION OF NITRATE REDUCTASE OF ACHROMOBACTER FISCHERI. J.C.Sadana, R.Rama Rao and M.D.Joshi: Biochim. biophys. Acta, 1963, 67, 340-342 (Nat. Chem. Lab., Poona, India) The sp. activity of the enzyme from *A. fischeri* was increased 2.5-fold to 210 jimoles NO₂⁻ formed/mg. protein/hr. and the absorption bands observed previously were shown to be due to cytochrome impurities. Prelim, comm.

B.M.Stevens

587. HYDROGENASE SYSTEM OF CLOSTRIDIUM

PASTEURIANUM. R.C.Valentine, L.E.Mortenson and J.E.Carnahan: J. biol. Chem., 1963, 238, 1141-1144 (Central Res. Dept., E.I.du Pont de Nemours and Co., Wilmington, Dela., U.S.A.) The enzyme system of *C. pasteurianum* responsible for liberation of H from aq. Na dithionite is separated into 2 components. One of these, ferredoxin, is purified 60-fold; it is an electron-transferring protein which couples hydrogenase with various electron donors and acceptors. Its prop. and role in the H-evolving system are discussed. J.N.Ashley

588. PURIFICATION AND SOME PROPERTIES OF DIFFERENT FORMS OF HYDROGEN DEHYDROGENASE.

D.H.Bone, S.Bernstein and W.Vishniac: Biochim. biophys. Acta, 1963, 67, 581-588 (Dept. Microbiol., Yale Univ., New Haven, Conn., U.S.A.) The enzyme was purified 300-fold using MnCl₂ to stabilise. The product was heat stable and showed diminished sensitivity to $\text{J}(\text{J})$ -chloromercuribenzoate and smaller Km. The reaction of MnCl₂ with the enzyme protein was rapid and reversible. High concn. of NaCl and tris(hydroxymethyl)aminomethane buffer denatured irreversibly. The enzymic reaction could be reversed to produce H₂ from NADH₂. B.M.Stevens

589. INHIBITOR, ISOTOPIC AND KINETIC STUDIES ON HYDROGEN DEHYDROGENASE. D.H.Bone: Biochim. biophys. Acta, 1963, 67, 589-598 (Dept. Microbiol., Yale Univ., New Haven, Conn., U.S.A.) The

oxidised form of the *Hydrogenomonas ruhlandii* enzyme was inhib. by 2,3-dimercaptopropanol, cyanide, S₂O₄²⁻, S²⁻, SO₃²⁻ and thioglycolate. Reduction of the enzyme with NADH₂ or H₂ diminished the effectiveness of these inhibitors but made the enzyme sensitive to $\text{J}(\text{J})$ -chloromercuribenzoate inhibn. Kinetic analysis and inhibitor expt. indicated that the enzyme was reduced with H₂ to give a proton and that the reduced enzyme was then oxidised with NAD giving NADH₂. Exchanges between H₂ and [3H]water and between [3H]water and NADH₂ were catalysed. Analysis of NAD enzymically reduced with 3H₂ showed that the 3H was in the β -position of NADH₂. The enzyme action had a lag phase which was eliminated by preincubation with H₂ or NADH₂.

B.M.Stevens

590. COMPARATIVE STUDY OF PEROXIDASE ACTIVITY OF Hb. METHAEMOGLOBIN AND Hb-HAPTOGLOBIN COMPLEX. M.Waks, J.Yqn, J.Moretti and M.F.Jayle: Biochim. biophys. Acta, 1963, 67, 417-424 (Lab. Chim. Biol., Fac. Méd., Paris, France) Kinetic const. for Hb and metHb were determined using oxygenated water as oxidising substrate and guaiacol as

BIOCHEMISTRY

- electron donor. K_m and k_s for the Hb catalysed reaction did not differ significantly from the values for the Hb-haptoglobin complex. The character of the inhibn. produced by high guaiacol concn., however, differed.
 (F rench) B.M. Stevens
591. PEROXIDASE AS OXIDASE: REACTION BETWEEN OXYGEN-18 AND DIHYDROXYFUMARATE. F.K.Anan and H.S.Mason: Biochim. biophys. Acta. 1963. 67. 321-323 (Dept. Biochem., Univ. Oregon Med. Sch., Portland, Ore., U.S.A.) B.M.Stevens
592. OXIDATION OF HOMOGENTISIC ACID CATALYSED BY HORSE RADISH PEROXIDASE. B.N.La Du and V.G. Zannoni: Biochim. biophys. Acta. 1963. 67. 281-287 (Nat. Inst. Arthritis and Metab. Dis., Bethesda, Md., U.S.A.) In the presence of SH compounds products similar to those obtained by spontaneous reaction of benzoquinoneacetic acid with SH agents were obtained. Catalase, cytochromejg, Hb and metHb did not catalyse the reaction. A no. of aromatic compounds containing disubstituted OH or NH₂ in the α -position were oxidised. B.M.Stevens
593. PURIFICATION AND PROPERTIES OF MONO-AMINEOXIDASE. L.M.Barbato and L.G.Abood: Biochim. biophys. Acta, 1963, 67, 531-541 (Dept. Psychiatry, Univ. Illinois Coll. Med., Chicago, Ill., U.S.A.) Beef liver mitochondrial MAO was purified 20-fold. Phenanthroline inhibn., apparently noncompetitively by Lineweaver-Burk criteria. Phenylcyclopropylamine gave a strictly competitive and irreversible inhibn.; effects of pH on activity suggested the presence of two MAO. Phenylcyclopropylamine inhibn. was independent^a O₂ or K cyanide. The differential action of O₂ and K cyanide on iproniazid inhibn. was also examined. B.M.Stevens
594. OXIDATIONS AND TRANSHYDROGENATIONS INVOLVING PYRIDINE-DINUCLEOTIDES CATALYSED BY BOVINE MILK XANTHINE OXIDASE. D.A.Gilbert: Nature, Lond., 1963, 197. 1066-1068 (Chester Beatty Res. Inst., Royal Cancer Hosp., Fulham Rd., London, England) Xanthine oxidase present in milk catalyses the oxidation of added NADH₂; the flavin prosthetic group of the enzyme is the catalytic activity involved in the oxidation. Milk xanthine oxidase also catalyses transhydrogenation reactions using NADH₂ as substrate and various pyridine nucleotides as acceptors. The latter include 3-acetylpyridine, and 3-formylpyridine nucleotides and their corresponding hypoxanthine deriv. J.R.Sargent
595. SPECIFICITY OF RAT BRAIN ACETYLCHOLINESTERASE FOR N-ALKYL ANALOGUES OF ACETYLCHOLINE. K.N.Mehotra and W.C.Dauterman: J. Neurochem., 1963, 10, 119-123 (Dept. Entomol., Cornell Univ., Ithaca, N.Y., U.S.A.) A freeze-dried powder of whole rat brain homogenised in water was used to study AChase activity toward 17 compounds of the general structure CH₃COOCH₂.CH₂N⁺[(CH₂)_nCH₃](CH₂)_nCH₃] [(CH₂)_{n'}CH₃]I⁻. Activity tended to decrease as the values of n and n' increased but substitution of the ethylene group between COO and N⁺ by butylene or propylene resulted in almost complete loss of activity. R.Woodman
596. THERMAL INACTIVATION OF ACETYLCHOLINESTERASE. M.H.Coleman and D.D.Eley: Biochim. biophys. Acta, 1963, 67, 646-657 (Univ.. Nottingham, England) Thermal inactivation of the mammalian r.b.c. enzyme was accompanied by a decrease in K_m although the substrate inhibn. const. was unchanged. The time course involved 2 first order processes. These data would be explained if a second, less active enzyme, differing in the spacing of anionic and esteratic sites, formed from the native enzyme and was inactivated independently. Salt stabilised the enzyme soln. The V for optimum thermal inactivation was 6* 5-7* 5. Energy and entropies of inactivation were determined from $t_{1/2}$ C*eff. of the rate const. B.M.Steven
597. SIMPLIFIED AND IMPROVED METHOD OF PRE^wTION OF ACETYLCHOLINESTERASE OF THE EEL S-ELECTRIC ORGAN. A.B.Hargreaves, A.G.Wanderley^wF.Hargreaves and H.S.Goncalves: Biochim. biophys. Acta. 1963, 67. 641-646 (Inst. Biofis.. Univ. Brasília de Janeiro, Brazil) The enzyme was pptd.* pH 5-1, adsorbed on tricalcium phosphate gel, eluted with 2&lo sat. MgSO₄, pptd. with 6570 sat. MgSO₄ and chromatographed and rechromatographed on DEAE-cellulose. The product was almost homogeneous on ultracentrifugation and paper electrophoresis. S was 4. Bia Stevog
598. PEROXIDASE AND ACID PHOSPHATASE ACTIVITIES IN PIG THYROID [CYTOPLASMIC FRACTIONS]. T.Hosoya: J. Biochem., Tokyo, 1963, 53, 86-87. (Inst. Endocrinol., Gunma Univ., Maebashi, Japan)*. B.M.S.ve*
599. REPRESSION OF ALKALINE PHOSPHATASE IN HUMAN CELL CULTURES BY CYSTINE AND CYSTEINE. R.P.Cox and C.M.Macleod: Proc. nat. Acad. Sci. Wash., 1963, 49, 504-510 (Dept. Med., New York Univ. Sch. Med., N.Y., U.S.A.) Alk. phosphatase in established human cell cultures is repressed by cystine and cysteine. 40 hr. are required for substantial repression of alk. phosphatase by these amino acids. Observations described suggest that repression is caused by interference with enzyme synthesis or activation rather than by sulphhydryl inhibn. of alk. phosphatase. J.R. Sargent
600. PERIODIC ACTIVATION OF LYSOSOMAL ENZYMES DURING REGENERATION OF THE LIVER. R.L.P.Adams: Biochem. J., 1963, 87, 532-536 (Dept. Biochem., Univ., Oxford, England) Liver acid DNase and acid phosphatase show marked increases in total activity after partial hepatectomy in the rat. For the first 20 hr. the increase in free activity is proportionally less. However, the total activity is reduced by 70% the free activity, and it is suggested that this is due to cessation of lysosome synthesis before cell division. β -Glucuronidase and, to a lesser extent, arylsulphatase show increased free activities at 14 hr. after hepatectomy which may be related to increased microsomal acivity at this time. • J.R. Sargent
601. ACID PHOSPHATASE ACTIVITY DURING GROWTH AND SYNCHRONOUS DIVISION OF TETRAHYMENAL PYRIFORMIS. B.Klamer and R.A.Fennell: ^wRes., 1963, 29, 166-175 (Res. Div., Parke Davis and Co., Ann Arbor, Mich., U.S.A.) The acid phosphatases of T. pyriformis were localised cytochemically, studied quant. and separated by starch-gel electrophoresis procedures. From the expt. data, it is suggested that these phosphatases are involved in catabolic processes; there is an increased synthesis of enzyme in cells under adverse physiol. conditions. B. G.
602. PURIFICATION AND IDENTIFICATION OF KIDNEY HISTAMINASE. R.Kapeller-Adlerand^wH.Macfarlane: Biochim. biophys. Acta, 1963, 67, 542-565 (Dept. Clin. Chem., Univ. Edinburgh, Scotland) A rather stable, apparently homogenous

prep. was purified from cortex extracts by chromatography and electrophoresis. In a large no. of expt., histaminase travelled towards the anode as 1 band at pH above 5² and was located between CC-and p-globulins of Iowan serum. No histaminase migration occurred at pH 3⁰ and 5-15. The prep. contained no diamine oxidase. J* acted specifically on histamine and its ring-N substituted deriv. such as 1-methyl-4-(j8-aminoethyl)imidazole (1-methylhistamine) and 1-methyl-5-(p-aminoethyl)imidazole (1, 5-methylhistamine). Spectrophotometric and chem. expt. indicated that the enzyme contained FAD and pyridoxal phosphate. B.M.Stevens

603. HYDRAZIDASE. I. PURIFICATION AND SPECIFICITY. II. INHIBITION BY FLUORIDE. I.Toida: J. Biochem.. Tokyo. 1963, 53, 14-17, 18-22 (Dept. Biochem., Res. Inst. Tuberculosis, Japan Anti-tuberculosis Association, Kiyose-machi, Tokyo, Japan) I. The mycobacterial enzyme decomposing hydrazides to hydrazine was purified 200-500 fold. Prep. had no proteolytic activity and was sp. for acid hydrazides. II. Inhib. was reversible and competitive and did not require phosphate. The inhibiting action was fairly rapid. Ac²⁺ ions includin^g M²⁺ and Fe did not relieve the inhib. on benzoyl hydrazide was less inhib. than action on other substrates. B.M.Stevens

604. RECOVERY OF THE INTACT STRUCTURE OF MURAMIDASE (LYSOZYME) AFTER REDUCTION OF L DISULPHIDE LINKAGES IN EIGHT MOLAR UREA, ^frmai, T.Takagi and T.Isemura: J. Biochem., Tokyo. 1963, 53, 1-6 (Dept. Biol., Fac. Sci., Osaka Univ.) Hen's egg white muramidase was H₂O₂ and air oxidation under appropriate conditions bduCed a good yield of completely renatured enzyme which was isolated by crystn. The prop. of the renatured enzyme coincided well with those of native muramidase. B.M.Stevens

605. ENZYME REACTIONS WITH PHENOLIC COMPOUNDS: EFFECT OF o-METHYLTRANSFERASE ON A SUBSTRATE OF FRUIT POLYPHENOL IDASE [PPO]. B.J.Finkle and R.F.Nelson: 'Nature. Lond.' 1963, 197, 902-903 (Western Reg. Res. Lab., Agric. Res. Service, U.S.Dept. Agric., Albany, Calif., U.S.A.) Caffeic acid and chlorogenic acid were then treated with o-methyltransferase; they could not be oxidised by PPO extracted from peach or apple although the parent compounds were rapidly oxidised to products. G.M.Lewis

J²ETABOLISM OF THIOPYRIMIDINES AND THIOMIKJES. S-METHYLATION WITH S-ADENOSYL-HIONINE TRANSMETHYLASE AND CATABOLISM AMMALIAN TISSUES. C.N.Remy: J. biol. Chem., V7/238, 1078-1084 (Gen. Med. Res. Programme, V1v-J?os-P- Syracuse, N.Y.. U.S.A.) Tissues, parti^{lly} of various mammalian species, contain a system that catalyses S-methylation of S²Vs³ substituted Pyrimidines and 6-thio-substituted oNcV. The system is inhib. by the methylated reaction series of substrates and by a wide variety of no² substituted purines and pyrimidines, and by physiol. fN³N⁴-thiols. This system, which is the supernatant fraction of the cell, is different from other thiol transmethylases in mammalian tissues. J.N.Ashley

607. N-ALKYL GROUP SPECIFICITY OF CHOLINE ACETYLASE [CA] FROM RAT BRAIN. W.C.Dauerman and K.N.Mehotra: J. Neurochem., 1963, 10, 113-117 (Dept. Entomol., Cornell Univ., Ithaca, N.Y., U.S.A.) Of 17 N-alkyl substituted analogues of choline, crude CA (as a cysteine-treated acetone powder of whole brain) acetylated only 4 as follows: R(CH₃)₃-34 units activity; R(CH₃)₂C₂H₅¹² 24 units; R(CH₃)₂-n-C₃H₇-20 units; R(CH₃)₂-n-C₄H₉-15 units, where R ≈ OHCH₂.CH₂N+. Tert. alcohols and those analogues containing more than 2 C atoms between the N and OH positions in R were inactive. With the 4 active compounds Km increases as the alkyl chain lengthens. R. Woodman

608. FACTORS AFFECTING LEVELS OF UREA CYCLE ENZYMES IN RAT LIVER. R.T.Schimke: J. biol. Chem., 1963, 238, 1012-1018 (Nat. Inst. Arthritis and Metabol. Dis., Bethesda, Md., U.S.A.) All conditions that cause breakdown of protein and increased excretion of urea, such as feeding a protein-rich diet, starvation, or administration of corticosteroids are associated with increases in all 5 urea cycle enzymes proportional to the increase in synthesis of urea. Intact adrenals are not needed for increase in enzyme levels produced by a high protein diet. No individual amino acid or urea, given in the diet, or a sp. urea cycle substrate, causes any alteration in the levels of the urea cycle enzymes. The steady state, free, intracellular concn. of arginine, citrulline, and ornithine are const, under various conditions that cause alterations in excretion of urea and enzyme levels. Adrenalectomy causes 70-80% decrease in activity of arginase, whereas the other 4 enzymes are decreased by, at the most, 30%. Arginase activity is unchanged when rats are fed an arginine-free diet, whereas the activities of the other 4 enzymes are increased up to 2-fold. Simult. administration of L-ethionine abolishes the increased levels of arginase and ornithine transcarbamylase produced by administration of cortisone acetate. J.N.Ashley

609. CARBONIC ANHYDRASE ACTIVITY OF MAMMARY TISSUES. D.W.C.Brown and G.Bialy: Endocrinology, 1963, 72, 662-663 (Worcester Found. Exp. Biol., Shrewsbury, Mass., U.S.A.) High carbonic anhydrase activity was observed in lactating post partum mammary tissue of rats and mice. That of cows and rabbits was less active, and rat mammary tumour tissue had low activity. H.C.Jones

610. COMPARISON OF VIRULENCE AND ACTIVITY OF SOME ENZYMES OF LISTEMA MONOCYTOGENES. F.Stricker, J.Fisera, V.Krcmery and M.Ferencik: Folia Microbiol., 1963, 2, 89-92 (State Vet. Inst., Bratislava, Czechoslovakia) Virulence of L. monocytogenes was closely correlated with catalase activity in cells. Significant correlation also existed between virulence and the activities of glucose and lactic acid dehydrogenases and GOT. I.R.Sargent

611. RHODANESE-CATALYSED REDUCTION OF THIOSULPHATE BY REDUCED LIPOID ACID. M.Villarejo and J.Westley: J. biol. Chem., 1963, 238, PC1185-1186 (Dept. Biochem.. Univ. Chicago, Ill., U.S.A.) Cryst. ox liver rhodanese catalyses reduction of S₂O₃²⁻ to SH⁻ and SO₃²⁻. NaBH₄ or Na dithionite functions as substrate for the enzymic reaction. But in the range of physiol. accessible oxidation-reduction potentials only reduced lipoate and lipoamide are reactive. The enzyme does not utilise NADH₂, NADPH₂, cysteine, reduced glutathione, or formaldehyde for reduction of S₂O₃²⁻.

BIOCHEMISTRY

The reaction with lipoate or lipoamide is stereosp. The cryst. enzyme contains no bound lipoic acid.

J.N.Ashley

612. DESULPHURATION OF THIOUREA BY SALIVA. T.H.Shepard, A.E.Lorincz and S.M.Gartler: Proc. Soc. exp. Biol., N.Y.. 1963. 112. 38-42 (Dept. Anat. Pediatrics, Med. Coll., Univ. Florida, Gainesville, Fla., U.S.A.) There is an enzyme system in saliva which is capable of desulphuration of thiourea which is stable after 15 min. at 70°. inactivated by 100° in a min.. and destroyed by TCA at a final concn. of 4%. Its activity is slightly lost after dialysis and lyophilisation. It is dependent on the presence of thiocyanate and ascorbic acid and its behaviour is temp, and pH dependent. The activity of saliva of various mammalian spp. has shown that it is not possessed by all. There was no correlation between the presence of this enzyme system and the ability of people to taste phenylthiocarbamide. Many S containing substances such as propylthiouracil, thiosulphate and reduced glutathione were potent inhibitors perhaps acting competitively with thiourea.

D.N.Wheatley

The ratio of the prealbumin-albumin complex to globulins was 0.47 in this group and 0.59 in ducklings receiving 0.05% choline chloride in the diet. In ducklings receiving a protein deficient diet the prealbumin to globulin ratio increased. Of the 8 amino acids tested tryptophan, methionine and leucine increased the pre-albumin-albumin ratio. (French) MAPfc*

618. TRANSAMIDINASE ACTIVITIES IN VITRO OF TISSUES FROM VARIOUS MAMMALS AND FROM RAT-FED PROTEIN-FREE, CREATINE-SUPPLEMENTED AND NORMAL DIETS. J.F.Van Pilsum, B.Olsen, D.Taylor, T.Rozycki and J.C.Pierce: Arch. Biochem.. 1963, 100. 520-524 (Dept. Physiol. Chem., Univ. Minnesota Med. Sch., Minneapolis, Minn., U.S.A.). Spleen, skeletal muscle, heart muscle, lung, brain and testes had measurable transamidinase activities, although per unit wt. of tissue these were only a fraction of activities found in kidney and pancreas. In rats fed creatine-supplemented or protein-free diets only pancreas and kidney transamidinase levels fell. B.M.Stevens

619. EFFECT OF LYSINE AND GLYCINE UPON ARGININE REQUIREMENT OF GUINEA-PIGS. B.L.O'Dell and W.O.Regan: Proc. Soc. exp. Biol., N.Y.. 1963. 121. 336-337 (Dept. Agric. Chem., Univ. Missouri, Columbia, Mo., U.S.A.) The growth rate measured by average daily increase in wt. over 4 weeks in guinea pigs fed a diet of 30% casein is compared with diets supplemented with 2% lysine HCl and 2% glycine. TB¹⁰⁰ supplemented diets significantly reduced the growth rate. An addition of 0.5% arginine to the diet significantly increased the growth rate. D.N.Wheatley

620. COMPARATIVE EFFECTS OF PECTIN N.F. ADMINISTRATION ON THE CHOLESTEROL-FED RABBIT, GUINEA-PIG, HAMSTER AND RAT. A.F.Wells and B.H.Ershoff: Proc. Soc. exp. Biol., N.Y.. 1962, 111. 147-149 (Western Biol. Lab., Culver City, Calif., U.S.A.) Increase in plasma and liver cholesterol in the rat fed on 1% cholesterol counteracted by inclusion of citrus pectin, containing 10% methyl, in the diet. No significant effect was observed in rabbit, guinea-pig and hamster. Ian J M.M.Shapelfg

621. DIET AND CHOLESTEROLAEMIA: VII. EFFECT OF METHIONINE, ETHIONINE, AND β -FLUOROPHENYLALANINE. J.C.Seidel and A.E.Harper: J. lipid Res., 1963, 4, 75-80 (Dept. Biochem., Wisconsin, Madison, Wis., U.S.A.) Concn. 0.1% serum cholesterol in rats fed a diet containing cholic acid and hydrogenated coconut oil was significantly lower than those of rats supplemented with ethionine alone. The addition of methionine also very largely prevented the depression of growth caused by ethionine. Administration of β -fluorophenylalanine lowered the concn. of cholesterol in the serum but β -thiophenylalanine had little effect. J^

622. TURNOVER OF ADIPOSE TISSUE TRIGLYCERIDES [TG] MEASURED BY THE RATES OF SYNTHESIS AND RELEASE OF TRIGLYCERIDE-GLYCEROL. E. Shafrir: Biochim. biophys. Acta, 1963. 70. 19-24 (Dept. Biochem., Hebrew Univ., Jerusalem, Israel) Amounts of glycerol released by endogenous TCJ

NUTRITION

613. ADAPTATION OF THE EXOCRINE SECRETION OF RAT PANCREAS TO THE COMPOSITION OF THE DIET. A.Bep Abdeljilil, A.M.Visani and P.Desnuelle: Biochem. biophys. Res. Comm., 1963. 10, 112 (Inst. Chim. Biol. Fac. Sci., Marseille, France) Increased levels of amylase in pancreas homogenates and pancreatic juices from rats fed a starch-rich diet were apparent after 1 day and max. within 3-5 days. A similar effect on some pancreatic proteinases was shown when a casein rich diet was administered. B.Ketterer

614. EFFECT OF DILUTION OF THE DIET WITH AN INDIGESTIBLE FILLER ON FOOD INTAKE IN THE MOUSE. D.C.Dalton: Nature, Lond., 1963, 197. 909-910 (Dept. Agric., Univ. Leeds, England) Diln. of the diet of the mouse with indigestible cellulose filler is an effective means of lowering nutrient intake despite attempts by the animal to compensate for the lowered nutrient intake by increased food consumption. G.M.Lewis

615. COLORIMETRIC DETERMINATION OF LOW CONCENTRATIONS OF 2,2-DICHLOROVINYL DIMETHYL PHOSPHATE IN THE ATMOSPHERE. J.T.Hughes: Analyst, 1963, 88. 318-319 (Glasshouse Crops Res. Inst., Rustington, Littlehampton, England). I.A.B.S.

616. PROTEIN MALNUTRITION. J.B.Allison: Trans. N.Y. Acad. Sci., 1963. 25, 293 (Bureau Biol. Res., Rutgers State Univ., New Brunswick, N.J., U.S.A.) Review. The relationship of protein intake to the synthesis and catabolism of proteins is discussed with special reference to protein malnutrition. K.Brew

617. ELECTROPHORETIC SEPARATION OF SERUM PROTEINS OF DUCKLING DURING PROTEIN MALNUTRITION OR CHOLINE DEFICIENCY. J.M.Demers, R.Carbonneau and N.Platonow: C.R. Soc. Biol., Paris, 1962, 156. 1390-1394. There was a decrease in the albumin and prealbumin fraction of serum proteins of ducklings kept on a choline deficient diet for 21 days.

BIOCHEMISTRY

61

in epididymal fat pads of fed rats were balanced by de novo glycerol synthesis. Approx. 1-7% of glyceride ester bonds were split and resynthesised/24 hr. indicating a $\frac{1}{2}$ day TG half life. Fatty acid [FA] release was lower. The ratio FA outflow:glycerol release increased on testing and decreased on refeeding or addition of glucose during incubation. During refeeding the surplus of Steyerol synthesised over glycerol released was utilised \approx external FA deposition. Glucose reduced FA outflow by promoting glycerol synthesis. With adrenaline glycerol please greatly outbalanced synthesis despite enhancement of synthesis but high glucose concn. raised esterification rates to equal lipolysis.

B.M.Stevens

623. BIOASSAY OF ESSENTIAL FATTY ACIDS [EFA]. COMPARISON OF EFFECTS OF TRIGLYCERIDES, METHYL AND ETHYL ESTERS. H.J.Thomasson and U.Gottenbos: Proc. Soc. exp. Biol., N.Y., 1962, 136, 261-262 (Unilever Res. Lab., Vlaardingen, Netherlands) Comparison of activities of fatty acids in EFA bioassay are correct only when the acids administered are in a comparable form such as esters and triglycerides. The latter was preferred because of causing low death rate and const. body wt. level in deficient animals.

M.M.Shapland

624. EFFECT OF CORN OIL FEEDING ON THE LIPIDS OF DOG BILE. U.K.Misra: Indian J. exp. Biol., 1963, 1, 87-90 (Vallabhbhai Patel Chest Inst., Delhi Univ., Delhi, India) The effect of dietary corn oil, an \approx 1% fat (40jfc wt./wt.), on dog bile lipids was studied. Using silicic acid column chromatography, bile lipids of tritium and test diet fed dogs have been fractionated into glycerides, free fatty acids, free cholesterol, mono- and diglycerides, cephalin, lecithin, sphingomyelin, lyssolecithin. On corn oil feeding, the amount of fatty acids, free cholesterol and monoglycerides increases, whereas that of phospholipids decreases.

625. EFFECT OF CHOLESTEROL-FAT FEEDING ON ACTIVITY OF RABBIT AORTA DEHYDROGENASE SYSTEMS. M.Rhova, T.Zemplenyi and Z.Lojda: Quart. J. w.p. Physiol., 1963, 48, 61-66 (Inst. C. H. C. Res. Prague-Kre, Prague, Czechoslovakia) Sucrose feeding to rabbits resulted in a decrease in hydrogenase activity in aortic tissue. Lactic acid decreases were seen in (X-glycerophosphate-, acid- and malic acid dehydrogenase activity).

626. INCORPORATION OF Cl^{14}C PALMITATE INTO SERUM TRIGLYCERIDES OF CHOLINE DEFICIENT RATS. B.Lombardi and M.C.Schotz: Proc. Path. exp. Biol., N.Y., 1963, 142, 400-401 (Dept. U.S.A. X Univ. Pittsburgh Med. Sch., Pittsburgh, Pa., U.S.A.) The accumulation of labelled palmitate in plasma triglycerides in rats fed on choline deficient diets was shown to be a different mechanism from that observed with hepatotoxic substances such as CCl_4 since there is no change in the liver to plasma triglycerides in the former case.

D.N.Wheatley

T.A.Andeison, R.E.Taylor, R.H.Diven, F.Hubbert jun. and W.H.Hale: J. anim. Sci., 1962, 21, 369-372 (Univ. Arizona, Tucson, Ariz., U.S.A.)

Samples were taken from different sites (dorsal, ventral and caudal lobes) of livers (cattle and sheep) having a wide range of vit. A levels. Samples were obtained by the aspiration technique and showed a confidence interval of $\pm 62\%$ of the estimated value when the observed vit. A was $< 30 \mu\text{g}/\text{g}$. of fresh tissue. For larger amounts (40-160 $\mu\text{g}/\text{g}$) the confidence interval did not exceed $\pm 21\%$ but widened again at still higher values.

A.G.Pollard

628. METABOLISM OF RETINA, m. ROLE OF NADPH₂ IN VISUAL CYCLE. S.Futterman: J. biol. Chem., 1963, 238, 1145-1150 (Howe Lab. Ophthalmol., Massachusetts Eye and Ear Inf., Boston, Mass., U.S.A.)

Aldehydes stimulate oxidation of C-1 of glucose in retina. Visual cell outer segment prep, metabolise glucose by glycolytic and hexose monophosphate oxidation routes; the latter is stim. by pyruvate and aldehydes. Retinal visual cell alcohol dehydrogenase can use NADPH₂ for reduction of retinene to vit. A. The quant. relationship between oxidation of C-1 of glucose and reduction of vit. A aldehyde to vit. A in dark-adapted visual cell outer segment prep, exposed to light shows that NADPH₂ is the main reducing agent for this aldehyde in the visual cycle.

629. EFFICIENCY OF ANTIBIOTICS IN SUPPLEMENTING THE GROWTH EFFECT OF 5-CAROTENE IN VITAMIN A-DEPLETED RATS. N.B.Guerrant: Proc. Soc. exp. Biol., N.Y., 1962, 111, 34-37 (Dept. Agric. and Biol. Chem., Pennsylvania State Univ., University Park, Pa., U.S.A.) Tetracyclines appear to be the most effective antibiotics in the stimm. of additional growth in rats receiving sub-optimum intake of vit. A.

M.M.Shapland

630. THIAMINASE ACTION: HAMMETT'S p- σ -TREATMENT. J.A.Mazrimas, Pill-Soo Song, L.L.Ingraham and R.D.Draper: Arch. Biochem., 1963, 100, 409-413 (Dept. Biochem., Univ. California, Davis, Calif., U.S.A.) Thiaminase was isolated from carp and reaction rates were studied as a function of the basicity of a series of substituted anilines. The rate increased as Hammett's σ const., which measures the availability of the electron pair on the N, became smaller until it reached 0. The rate then decreased with increasing neg. values of σ . Two possible explanations are offered.

B.M.Stevens

631. EFFECT OF PREVENTION OF COPROPHAGY ON THIAMINE-SPARING ACTION OF HYDROLYSED GLUCOSE CYCLOACETOACETATE [GCA] IN RATS. S.K.Meghal and M.C.Nath: Indian J. exp. Biol., 1963, 1, 107-108 (Dept. Biochem., Nagpur Univ., Nagpur, India) The thiamine-sparing action of hydrolysed glucose cycloacetoacetate is abolished when coprophagy is prevented. Rats when fed hydrolysed GCA along with their faeces record highest growth during 6 weeks of expt. period, and their thiamine contents in heart, liver and caecum are appreciably increased. The rats kept on thiamine-low diet (control) have been found to die due to thiamine deficiency during the expt. even though coprophagy is allowed while those fed their faeces along with thiamine-low diet do not show any increase in their body wt. This shows that thiamine synthesis depends upon the dietary constituents and coprophagy is essential in order to make available flora-synthesised thiamine.

VITAMINS

FOR THE LIVER BIOPSY TECHNIQUE
ESTIMATING HEPATIC VITAMIN A.

BIOCHEMISTRY

632. EFFECT OF THIAZIDES ON THIAMINE EXCRETION AND ON PYRIDOXINE METABOLISM. S.J.Dubel and L.A.Soloff: Amer. J. med. Sci., 1963, 245, 58-62 (Div. Cardiology, Temple Univ. Med. Center, Philadelphia, Pa., U.S.A.) Thiazides do not increase the urinary excretion of thiamine or pyridoxine, as judged by the excretion of xanthurenic acid. E.E.Hobbiger
633. PANTOTHENIC ACID DEFICIENCY IN RATS. M.Hatano: J. Vitaminol., 1962, 8, 143-159 (Dept. Internal Med., Kyoto Univ., Sakyo, Kyoto, Japan) The effect of pantothenic acid deficiency on the histol. of various organs was investigated. Changes in the endocrine organs were evident and it is probable that through them become manifested the changes seen during expt. deficiency. G.C.Barr
634. MODE OF INTERACTION OF THE ISONICOTINOYL HYDRAZONE OF PYRIDOXAL PHOSPHATE WITH ASPARTATE-GLUTAMATE APOTRANSAMINASE. Y.M.Torchinsky: Biochem. biophys. Res. Comm., 1963, 10, 401 (Inst. Radiobiol. and Physico-Chem. Biol., Acad. Sci. of the U.S.S.R.. Moscow, U.S.S.R.) Data are given showing that the activation of aspartate-glutamate apotransaminase by the isonicotinoyl hydrazone of pyridoxal phosphate is due to the liberation of pyridoxal phosphate. B.Ketterer
635. SERINE TRANSHYDROXYMETHYLASE. PROPERTIES OF HOMOGENEOUS ENZYME PREPARATION AND NATURE OF ITS INTERACTION WITH SUBSTRATES AND PYRIDOXAL 5-PHOSPHATE. LaV.G.Schirch and M.Mason: J. biol. Chem., 1963, 238, 1032-1037 (Dept. Biol. Chem., Univ. Michigan, Ann Arbor, Mich., U.S.A.) The enzyme from rat liver is obtained more than 95% pure by starch gel electrophoresis and ultracentrifugation. The mol. wt. is 331000 ± 8000 . Reduction with NaBH₄ causes a shift of the 430 mji peak to 340 mji. Acid hydrolysis of the reduced enzyme gives G-pyridoxyllysine. Four mol. of pyridoxal phosphate are bound to each mol. of the enzyme by Schiff base formation to lysyl residues. The enzyme cleaves a-methyl-serine into N¹NIO-methylenetetrahydrofolate and D-alanine which shows the C-H bond on the (X-C of serine is not broken in the enzymic reaction. The spectrum of the enzyme is modified by addition of substrates because complexes with new absorption peaks are formed. J.N.Ashley
636. FREEDOM OF HYDROXYPROLINE-2-EPIMERASE FROM PYRIDOXAL PHOSPHATE. E.Adams: Biochem. biophys. Res. Comm., 1963, 10, 327 (Dept. Pharmacol., St. Louis Univ. Sch. Med., St. Louis, Mo., U.S.A.) An inducible hydroxyproline-2-epimerase from Pseudomonas striata gave no evidence of requiring pyridoxal phosphate as a cofactor. B.Ketterer
637. BIOTIN- AND ATP-DEPENDENT ACTIVATION OF PROPIONYL APOCARBOXYLASE. J.L.Foote, J.E. Christner and M.J.Coon: Biochim. biophys. Acta, 1963, 67, 676-678 (Dept. Biol. Chem., Med. Sch., Univ. Michigan, Ann Arbor, Mich., U.S.A.) At least 2 sol. enzyme fractions were required, the apoenzyme itself and an apoenzyme activating system. B.M.Stevens
638. BIOCHEMICAL FUNCTION OF BIOTIN. IV. BIO-SYNTHESIS OF BIOTIN. A.Lezius, E.Ringelmann and F.Lynen: Biochem. Z., 1963, 336, 510-525 (Max-Planck-Inst. Zellchemie, Munchen, Germany)

Achromobacter IV S was grown in a medium containing isovaleric acid to which [3-14C]cysteine or ¹⁴CO₂ were added. Biotin was isolated by first heating an acidified suspension (3% H₂SO₄) of bacteria, then separating biotin from amino acids and peptides on Dowex 50 and finally subjecting the avidin-biotin complex to gel filtration on Sephadex G25. The [3-14C] atom of cysteine was converted into the C-5 of biotin, whereas incubation with ¹⁴CO₂ led to the carbonyl (C-2) and the carboxyl group (C-10) becoming labelled. (German) L.Conn

639. BACTERIAL BIOTINIDASE. M.Koivusalo, C.Elorriaga, Y.Kaziro and S.Ochoa: J. biol. Chern., 1963, 238, 1038-1042 (Dept. Biochem., New York Univ. Sch. Med., N.Y., U.S.A.) Biotinidase is purified 700-fold from extracts of Streptococcus faecalis. The enzyme hydrolyses all biotin deriv. tested, and it is sp. for the biotin moiety of simple biotin esters and amides. The enzyme liberates equimol. amounts of biotin and lysine from biocytin. It is widely distributed. Besides liver and plasma, it is also present in kidney, heart, brain, spleen and intestine among animal tissues. It is also present in yeast and in Propionibacterium shermanii. There is little or no activity in Lactobacillus arabinosus 17-5 which utilises only free biotin.

J.N.Ashley

640. INCORPORATION OF PIMELIC ACID AS VUNIT IN THE BIOSYNTHESIS OF BIOTIN. H.L.Elford and L.D.Wright: Biochem. biophys. Res. Comm., 1963, 10, 373 (Dept. Biochem. and Graduate Sch. Nutr., Cornell Univ., Ithaca, N.Y., U.S.A.) Evidence is submitted that both carboxyl groups of pimelic acid participate in the biosynthesis of biotin and that only 1 mole of pimelic acid is involved in the biosynthesis of 1 mole of biotin. B.Ketterer

641. ENZYMIC CONVERSION OF TETRAHYDROPT¹⁴IP GLUTAMIC ACID [THPGA] TO CITROVORUM FA¹⁴ OF IN BACILLUS SUBTILIS. M.A.Netrawali, V.M. and A.Sreenivasan: Indian J. exp. Biol., 1963, 1, 70 (Cent. Food Technol. Res. Inst., Mysore, fr?) Optimum conditions for the enzymic synthesis of citrovorum factor [CF] from THPGA in whole cells of a strain of B. subtilis NRRL B644 have been studied. Max. synthesis of CF is observed when incubations are performed under anaerobic conditions at pH 7.2 for 2 hr. Increase in the amount of CF formed is observed on heating the incubated mixture in a water-bath for 30 min. P¹⁴Sap¹⁴ due to non-enzymic mechanism. Replacement of ¹⁴CF by pteroyl glutamic acid considerably lowers CF synthesis. Serine is a better Ci donor than formate. Ascorbic acid has a sp. function other than a reducing agent, and is not replaceable by homocysteine and glutathione (reduced) in the system. The system shows no requirement for ATP, DPN and Mg²⁺ as cofactors. Inclusion of Ci acceptors in the system inhibits CF synthesis.

642. ENZYMIC SYNTHESIS OF METHYL GROLFF^FTION METHIONINE. IV. ISOLATION, CHARACTER AND ROLE OF 5-METHYLtetrahydrofolate. R.Larrabee, S.Rosenthal, R.E.Cathou and J. Buchanan: J. biol. Chem., 1963, 238, 10 & 31 (Div. Biochem., Dept. Biol., M.I.T., Cambridge, Mass., U.S.A.) Synthesis de novo of methionine from 5,10-methylene tetrahydrofolate and homocysteine is studied with enzymes isolated from a mutant of E.coli 113-3 grown on vit. B₁₂ and limiting folic acid. 5-Methyltetrahydrofolate [5MTF], which is 1-dm-

BIOCHEMISTRY

63

5'-deoxy-5-methyl-5,6-dihydrofolate. A. a major folate component of liver and serum. Isolated as an intermediate of these reactions. Although relatively stable to 0 at pH 8-7, it may be converted in presence of O into 5-methyl-5,6-dihydrofolate. It is formed by reaction of 5,10-methylene tetrahydrofolate with NADH₂ in presence of methylene tetrahydrofolate reductase, which is present in the *E. coli* mutant, but is absent from the methionine-requiring mutant 205-2. It is converted into methionine and tetrahydrofolic acid by an enzyme system consisting of NADH₂, *S. faecalis* S_{Mg f h} mocoysteine, and an enzyme that converts a deriv. of vit. B¹² as prosthetic group.

^L PRODUCTION OF A VITAMIN B12 COMPOUND BY TETRAHYMENIDS. J.A.Erwin and G.G.Holz, jun.: J., Protozool., 1962, 9, 211-214 (Dept. Chem., Harvard Univ., Conn., U.S.A.) By means of micro-OrF assay paper chromatography, and paper electrophoresis it was shown that *Tetrahymena pyriformis* mating variety I, and 3 other tetrahymenids produce a heme compound. The compound produced by *T. pyriformis* was nutritionally active for *E. coli* and *Lactobacillus leichmannii* and inert for *Ochromonas malhamensis* and *Euglena gracilis*. It is present in 1 part in 30 million by dry wt. R.J.Walker

F.W. STRUCURE OF COBAMIDE-COENZYME. F.Wagner and P.Renz: Tetrahedron Letters, 1963, 4. StT²⁶⁷ (Lehrstuhl fur Biochem. Tech. Hochschule ^{lu} «gart. Germany) Letter. (German) I.A.B.S.

AMFFECT OF VIT AMIN B12 ON THE RATE OF AMMONIA OXIDATION BY NITRIFYING BACTERIA, R. Rewari and V.B.Sundara Rao: Indian J. Microbiol., 1962, 2f, 75-78 <Ind-Agric. Res. Inst., New Delhi, India) Three pure strains of nitrifying bacteria were isolated by enrichment culture medium. The oxidation of NH₃ to nitrite was significantly enhanced in the presence of vit. B12. G.M.Lewis

646 SEPARATION OF BOUND AND FREE VITAMIN B₁₂ C COLUMN. M.Kalei and BJ.Glass: (GasL Soc. - P. Biol., N.Y., 1962, 111, 270-274) Separation of free vit. B12 from that in normal gastric juice is obtained using Sephadex G-25. This method may be of value in the assay of Vit. B₁₂ binding capacity of biol. vit. B12 binders and factor materials from human and animal sources.

ISOLATION OF VITAMIN B12 BY RATS WITH JHENIC ACID DEFICIENCY. K.Ikuda, E.B. Hsu and B.F.Chow: Proc. Soc. exp. Biol. Med., 1962, 111, 300-304 (Dept. Biochem., Johns Hopkins Univ., Baltimore, Md., U.S.A.) Vit. B₁₂ content of rats exhibited an increased rate of survival. Large increase rate of survival. Absorption of [60Co]vit. B12 were not impaired.

M.M.Shapland
OF MUTATION AND AUXOTROPHY IN THE STUDY OF VITAMIN B12 BIOSYNTHESIS IN NOCARDIA RUGOSA. A-Marco and C.Spalla: G. Microbiol., 1961, 3, 237-248 ('Farmitalia', Milano, Italy) Intermediates in the biosynthesis of vit. B12 have been constructed from the unknown intermediates that accumulate in metabolically blocked strains. A common precursor for vit. B12 and ascorbic acid has been confirmed and is probably D-amino-acid. (ItaUan) G.N.Godson

649. HYDROXOCOBALAMIN: ITS EXAMINATION AND DETERMINATION IN PARENTERAL INJECTION SOLUTIONS BY PAPER CHROMATOGRAPHY. J.L.Martin and W.H.C.Shaw: Analyst, 1963, 88, 292-296 (Glaxo Labs. Ltd., Greenford, Middx., England). I.A.B.S.

650. PURIFICATION OF INTRINSIC FACTOR AND VITAMIN B12 BINDERS FROM HUMAN GASTRIC JUICE. R.GrSsbeck, K.Simons and I.Sinkkonen: Ann. Med. exp. Fenn., 1962, 40, Supp. 6. 1-24. With the aim of purifying intrinsic factor [IF], gastric juice was sat. with cyanocobalamin and fractionated using ion exchange celluloses and cross linked dextrans (Sephadex) and Pevikon electrophoresis. Bound radioactive vit. B12 was used as a guide to locate IF. Three protein-vit. B12 complexes S, I and R were found and fraction S was prep. in a high state of purity. Ultracentrifugal analysis of fraction S indicated an original mol. wt. of approx. 93000. IF activity was assayed throughout the whole purification procedure with a few explained exceptions. Clear cut activity was found only in the binding fractions S and I. The latter may be a digestion product of the former. The binder R and almost all the non-binding fractions lacked IF activity. G.Faulkner

651. TISSUE DISTRIBUTION AND STORAGE FORMS OF VITAMIN B12 INJECTED AND ORALLY ADMINISTERED TO THE DOG. C.Rosenblurru P.G.Reizenstein, E.P. Cronkite and H.T.Meriwether: Proc. Soc. exp. Biol., N.Y., 1963, 112, 262-266 (Merck Sharp and Dohme Res. Labs., Rahway, N.J., U.S.A.) Two mongrel dogs received concurrent administrations of both 57Ca and ⁵⁸Co labelled vit. B12, the former orally, the latter i.v. After 4 weeks the distribution of labelled vit. was studied in 50 different regions of the body. The ratio of the 2 isotopes was const, and therefore there was a common pool of vit. to which both types of vit. contributed regardless of mode of administration. It was also shown by reverse isotope diln. analysis of the liver that the vit. B12 was converted to the noncyano form. This and other chem. changes occurring during storage in the liver may account for there being a complex mode of excretion of vit. B12 products. D.N.Wheatley

652. ELECTRON SPIN RESONANCE STUDY OF COENZYME B12. H.P.C.Hogenkamp, H.A.Barker and H.S.Mason: Arch. Biochem., 1963, 100, 353-359 (Dept. Biochem., Univ. California, Berkeley, Calif., U.S.A.) Three different samples of coenzyme B12 showed no electron spin resonance spectra either in the cryst. state or in aq. soln., indicating that coenzyme B12 is diamagnetic. Electron spin resonance spectra of coenzyme B12 photolysed anaerobically were identical with the spectrum for vit. Bi2rt indicating a paramagnetic photolysis product containing bivalent Co. Exposure of the photolysis product or of vit. Bi2r to O₂ completely abolished the electron spin resonance spectra.

B.M. Stevens

653. BIOSYNTHESIS OF ASCORBIC ACID BY RATS FED A HIGH LEVEL OF DIETARY TYROSINE UNDER TOXIC AND ADAPTED CONDITIONS. S.Ghosh and B.C.Guha-Biochim. biophys. Acta, 1963, 69, 440-442 (Dept. App. Chem., Univ. Coll. Sci., Calcutta, India) Tyrosine toxicosis appeared to be related to reduced ascorbic acid synthesis by liver; ascorbic acid biosynthesis played a part in adaptation to a high tyrosine intake Prelim. comm. B.M. Stevens

BIOCHEMISTRY

- 654. PERMEABILITY OF DERMAL CONNECTIVE TISSUE IN NORMAL AND SCORBUTIC GUINEA-PIGS.** J.Fabianek, A.Herp and W.Pigman: *Nature, Lond., 1963, 197, 906-907* (Dept. Biochem., New York Med. Coll., New York, U.S.A.) The permeability of dermal and s.c. tissue of normal and scorbutic guinea-pigs was increased by ascorbic acid to the same extent when estimated by the Duran-Reynal's spreading test or by a const. pressure infusion test. G.M.Lewis
- 655. DEVELOPMENTAL PATTERN OF ADRENAL ASCORBIC ACID IN THE RAT.** S.Levine and G.W. Lewis: *Science, 1963, 139, 118-119* (Dept. Psychiatry, Stanford Univ., Calif., U.S.A.) The maturational pattern of adrenal ascorbic acid in non-stressed newborn rats consists of high resting levels early in development, a marked decrease during a period between 8 and 12 days, and a subsequent return to high levels. The onset of the maturational pattern is accelerated by about 2 days by previous daily manipulation of the newborn rats. G.M.Lewis
- 656. SHORTENING THE INCUBATION PERIOD FOR THE DETERMINATION OF ASCORBIC ACID BY THE 2,4-DINITROPHENYLHYDRAZINE METHOD.** K.K.G.Nair, C.P.Tewari and P.S.Krishnan: *Indian J. Chem., 1963, 1, 131-134* (Div. Biochem., Lucknow Univ., Lucknow, India). L.A.B.S.
- 657. EFFECT OF TYROSINE AND SOME OF ITS METABOLITES ON THE BIOSYNTHESIS OF ASCORBIC ACID BY RAT LIVER TISSUES [IN VITRO].** S.Ghosh and B.C.Guha: *Biochim. biophys. Acta, 1963, 71, 213-214* (Dept. Applied Chem., Univ. Coll. Sci., Calcutta, India) *j*-Hydroxyphenylpyruvic acid and homogentisic acid inhibited ascorbate synthesis. Prelim, comm. B.M.Stevens
- 658. BACTERIAL ASCORBIC ACID OXIDASE.** W.A.Volk and J.L.Larsen: *Biochim. biophys. Acta, 1963, 67, 576-580* (Dept. Microbiol., Sch. Med., Univ. Virginia, Charlottesville, Va., U.S.A.) An Aerobacter aerogenes strain contained an enzyme which oxidised L-ascorbate and D-isoascorbate but not catechol, phenol, p-cresol, pyrogallol, cysteine, reduced glutathione, hydroquinone or *p*-phenylenediamine. 50*Jo CO* did not inhibit. The pH optimum was 6.3. Km for L-ascorbic acid was 2.36 x 10⁻² M. B.M.Stevens
- 659. EFFECT OF LIVER NECROSIS AND THYROTOXICOSIS ON THE SYNTHESIS OF L-ASCORBIC ACID BY RAT-LIVER MICROSOMES.** N.C.Ghosh and N.C.Kar: *Biochem. J., 1963, 87, 536* (Dept. Appl. Chem., Univ. Coll. Sci. Technol., Calcutta, India) The activity of the enzyme system catalysing the conversion of D-glucuronolactone and L-gulonolactone into L-ascorbic acid by rat liver microsomes is greatly decreased after the injn. of CCI4 and the administration of vit. B12 does not prevent the inhibn. of synthesis. The microsomal conv J-sion of L-gulonolactone into L-ascorbic acid is also significantly decreased in the liver tissues of rats given a necrogenic yeast diet free from vit. E. Supplementation of the necrogenic diet with DL-methionine and L-cystine completely restores the enzyme activity. The synthesis is, however, pyrophosphate-dependent. The administration of (X-tocopherol together with amino acids abolishes this requirement for pyrophosphate. The synthesis of L-ascorbic acid is markedly depressed in the liver microsomes of thyrotoxic rats. Supplementation with vit. B12 restores the synthesis partially.

- 660. SPECTROPHOTOMETRIC ASSAY OF ASCORBIC ACID OXIDASE.** M.F.Oberbacher and H.M.Vines: *Nature, Lond., 1963, 197, 1203-1204* (Florida Citrus Expt. Sta., Lake Alfred, Fla., U.S.A.) The activity of an ascorbic acid oxidase prep, from oranges was estimated quant. by spectrophotometric determination of the diminution of the ascorbic acid absorption peak at 265 fflr Results agreed well with the manometric assay method. G.M.Lewis
- 661. OPERATION OF ¹T_{EXOSE MONOPHOSPHATE OXIDATIVE PATHWAY OF GLUCOSE METABOLISM IN SCORBUTIC GUINEA-PIGS.}** S.Banerjee and W.K. Kawishwar: *Indian J. exp. Biol., 1963, 1, 105-107* (Dept. Physiol. and Biochem., Sardar Patel Med. COM Bikaner, India) Glucose 6-phosphate dehydrogenase and 6-phosphogluconic dehydrogenase activities have been determined by the triphenyl tetrazolium chloride reduction method in the tissues of normal, scorbutic and insulin-treated scorbutic guinea-pigs and in guinea-pigs after recovery from scurvy. The activities of both the enzymes increases in the brain and no changes are observed in the liver and kidney of the scorbutic animals. While insulin treatment of the scorbutic animals does not diminish enhanced activities of these enzymes in the brain, supplementation of the scorbutic animals with ascorbic acid brings back these activities to normal. *
- 662. RELATION OF TOCOPHEROL TO ENZYME SULPHYDRYL SITES.** L.M.Corwin and K.Schwarz: *Arch. Biochem., 1963, 100, 385-392* (Section Expt. Liver Diseases, LNE, Nat. Inst. of Arthritis Metab. Dis., Bethesda, Md., U.S.A.) Tocopherol affected neither cytochrome oxidase nor antimycin A sensitivity of a-tocopherol deficient rat liver homogenates. The decline in (X-ketoglutarate oxidation by such homogenates was prevented by glutathione and 2,3-dimercaptopropyl mercaptan. The decline in free SH with time was prevented by all reagents preventing oxidative decline. Tocopherol lowered the sensitivity of cell fraction (X-ketoglutarate oxidation to AsO₂ and Cd and prevented inhibn. of glutamate and p-hydroxybutyrate oxidation by *j*-hydroxymercuribenzoate. Protecting agents were required at the beginning of incubation; the presence of NAD extended the critical period for the addition of such agents. B.M.Stevens
- 663. CONVERSION OF TOCOPHEROLS IN ANIMALS.** C.Martius and E.Furer: *Biochem. Z., 1963, 336, 488* (Eidgenossische Tech. Hochschule, Zurich, Switzerland) OC-Tocopherol became converted to 2,5,6-trimethyl-3(farnesyl-farnesyl-geranyl-geranyl)-benzoquinone after a-tocopherol labelled with ¹⁴C and ³H had been inj. into chickens, rabbits, rats and earthworms. It is suggested that the vit. activity of a-tocopherol is not connected with its property of being an anti-oxidant. (German) L.
- 664. ACTION OF ARYLSULPHATASE ON VITAMIN DISULPHATE.** F.C.G.Hoskin and C.Von Eschen: *Biochim. biophys. Acta, 1963, 67, 669-671* (Dept. Neurol., Coll. Physn. and Surgn., Columbia Univ.t New York, U.S.A.) B.U.-steve

HORMONES

- 665. INSULIN-LIKE ACTIVITY OF SERUM FROM NORMAL AND HYPOPHYSECTOMISED MONKEYS.** E.G.Bali

E.Knobil: Endocrinology, 1963, 72, 658-661 (Dept. Biol. Chem., Harvard Med. Sch., Boston, Mass., U.S.A.) Sera from hypophysectomised monkeys showed a lower insulin-like activity than that from normal monkeys, and also failed to show the increase in activity seen on diln. of serum from normal animals, ca* H.C.Jones

⁶⁶ PROPERTIES OF HEPATIC GLUTATHIONE-INSULIN TRANSDEHYDROGENASE. H.M.Katzen, F.Tietze and DeW.Stetten, jun.: J. biol. Chem., 1963, 238, 1006-1011 (Nat. Inst. Arthritis and Metabol. Dis., Bethesda, Md., U.S.A.) When the products obtained by reduction of the disulphide bonds of insulin are reoxidised by reduced glutathione in presence or absence of the trans-^N-Varogenase approx. 20 times as much insulin-like activity (as determined by the effect on metabolism of adipose tissue) is recovered in presence, as in absence, of shydrogenase. Approx. 5 times as much immunological activity corresponding to insulin is recovered when the enzyme is present. The results show that presence of glutathione-insulin transhydrogenase favours reconstitution of naturally occurring disulphide bonds of insulin.

J.N.Ashley

⁶⁷ APPARENT MOL. WT. OF INSULIN IN DILUTE ACID SOLUTION. P.D.Jeffrey and J.H.Coates: Nature, ^{nd.}, 1963, 197, 1104-1105 (Dept. Chem., Univ. of ^{elaide}, Australia) The apparent mol. wt. of insulin in acidic soln. was measured over a range of concn. of 0.8-0.02 g./100 ml. using the technique of sedimentation equilibrium. Values varied from 16000 at the highest concn. to 7500 at the lowest. The results are in stent with view that under these conditions insulin exists in a state of dynamic association, the dimer having mol. wt. of 6000. G.M.Lewis

⁶⁸ INSULIN. V. STRUCTURE OF THE GLYCYL CHAIN 2^F BONITO INSULIN II. A.Kotaki: J. Biochem., ^{kyo}, 1963, 53, 61-70 (Dept. Chem., Fac. Sci., ^{to}kyo Metropolitan Univ., Tokyo, Japan) Peptide fragments obtained by chymotryptic, peptic and acid hydrolyses were purified by paper electrophoresis and chromatography and analysed by paper chromatography. The Tyr-Cys linkage at positions 19-20 was Tinned by Witkop's N-bromosuccinimide method. The structure thus determined was H-Gly-Ileu-Glu-Glu-CySO₃H-(CySO₃H,Lys,Pro,His), CySO₃H. Asp[Leu]-Phe-Glu-Leu-Glu-Asp-Tyr-CySO₃H-Asp(NH₂)-OH. B.M.Stevens

⁶⁹ STIMULATION BY INSULIN OF INCORPORATION OF [³²P]PHOSPHATE AND CARBON-14 FROM ACETATE INTO LIPID AND PROTEIN OF ISOLATED RAT DIAPHRAGM. K.L.Manchester: Biochim. biophys. Acta, 1963, 70, 208-210 (Dept. Biochem., Univ. Cambridge, England). B.M.Stevens

⁷⁰ AMINO ACID INCORPORATION INTO PROTEIN OF DIABETIC RAT LIVER SLICES AFTER ACUTE INSULIN DEPRIVATION. A.Kraemer and M.E.Krahf: Proc. Soc. exp. Biol., N.Y., 1962, 111, 482-484 (Dept. Physiol., Univ. Chicago, 111, U.S.A.) Incorporation of [¹⁻¹⁴C]leucine into protein of liver slices decreased progressively up to 48 hr. after insulin withdrawal from all ^{an}-diabetic rats. Addition of both glucose and insulin to reaction medium stim. this incorporation at 24 hr. after insulin withdrawal from donor animals, addition of insulin or glucose alone had no effect on incorporation. M.M.Shapland

⁷¹ STIMULATION OF INSULIN SECRETION IN VITRO BY ATP. J.I.R-Candela, D.M-Hernandez and T.C-Cortazar: Nature, Lond., 1963, 197, 1304 (Inst. G.Maranon, Velazquez 138, Madrid, Spain)

10⁻³M ATP causes a significant increase in the release of insulin from fragments of rabbit pancreas in vitro. G.M.Lewis

⁷² SEPARATION OF 13I-LABELLED PROTEIN-BOUND INSULIN FROM 'FREE' INSULIN BY GEL-FILTRATION. V.Manipol and H.Spitz: Int. J. appl. Radiat., 1962, 13, 647-648 (Radioisotope Lab., Univ. Philippines, Manila, Philippines) A column method is described for separation of free and protein bound [¹³I]insulin. Sephadex G-75 was allowed to swell in 0.85% aq. NaCl for 24 hr. and was then packed into a column 11 mm. diam. by 65 cm. long. The serum sample was applied and eluted with 0.85% NaCl and the effluent collected and counted in 1 ml. samples. The separation obtained was distinct, quant. (95% recovery) and reproducible. The protein bound insulin was eluted at a peak at 10 ml. and free insulin at a peak at 40 ml. effluent. B.Payne

⁷³ SUBCELLULAR FRACTIONATION OF BOVINE PITUITARY GLANDS BY CENTRIFUGATION.

F.S.LaBella, R.J.Reiffenstein and G.Beaulieu: Arch. Biochem., 1963, 100, 399-408 (Dept. Pharmacol. Therapeutics, Univ. Manitoba Fac. Med., Winnipeg, Manitoba, Canada) Sucrose homogenates were

separated into nuclear, mitochondrial, light mitochondrial, microsomal and supernatant fractions which were characterised chem. and enzymically. All particulate fractions contained vasopressin and oxytocin but total hormone activity was greatest in the light mitochondrial fraction. Supernatant fraction contained up to 50% of total hormone but more oxytocin than vasopressin. Sol. hormone was dialysable. Density gradient centrifugation of combined light mitochondrial and microsomal fractions produced fractions with vasopressin oxytocin of 0.2-0.8. One of these subfractions appeared to be primarily neurosecretory material rich in hormone activity and protein but with negligible lipid. Granule fractions containing up to 10 units vasopressin plus 13 units oxytocin/mg. protein were isolated. B.M.Stevens

⁷⁴ PREPARATION OF SHEEP GROWTH HORMONE.

A.L.C.Wallace and K.A.Ferguson: J. Endocr., 1963, 26, 259-263 (C.S.I.R.O., Div. Animal Physiol., Ian Clunies Ross Animal Res. Lab., Prospect, N.S.W., Australia) A prep, free from contamination with other anterior pituitary hormones was obtained by chromatography of a buffer extract of sheep pituitary on DEAE cellulose. This prep. showed 2 components on electrophoresis and was equiv. in potency to purified ox growth hormone. G.F.Blane

⁷⁵ PURIFICATION OF HUMAN GROWTH HORMONE ON SEPHADEX G-200. R.A.Reisfeld, B.G.Hallows,

D.E.Williams, N.G.Brink and S.L.Stelman: Nature, Lond., 1963, 197, 1206-1207 (Merck Sharp and Dohme Res. Lab., Rahway, N.J., U.S.A.) Human growth hormone from acetone powders of pituitary glands may be further purified by fractionation on Sephadex G-200 to yield a growth hormone prep, of greatly increased sp. activity, free of serum proteins when assayed by immunol. techniques although not homogeneous as shown by disc electrophoresis and ultracentrifugation. A further fraction, contaminated by serum proteins, contained LH activity.

G.M.Lewis

BIOCHEMISTRY

- 676. SEPARATION OF ACTH AND MSH FRACTIONS FROM PITUITARIES OF DIFFERENT SPECIES.** F.G.Sulman, Z.Ashair, B.Eckstein, N.Khazan and Y.Pfeifer: Proc. Soc. exp. Biol., N.Y., 1963, 112, 202-205 (Dept. Appl. Pharm., Sch. Pharmacy, Hebrew Univ., Jerusalem, Israel) Oxen, sheep and pig pituitaries were homogenised and the extract fractionated into melanophore stimulating and ACTH fractions. Their activity (ACTH, 0,-MSH and /3-MSH) was determined by their melanosis initiating effect on *Hyla* spp., their O.D. at 280 m/i, and their ascorbic acid T⁻ depleting effect on the adrenals respectively. The effects of ACTH and (X-MSH were similar and their O.D. alike; /3-MSH was different since it only caused melanosis. It is suggested that ACTH and (X-MSH have similar effects because their amino acid sequence to position 14 is identical. 1. D. N. Whea tley
- 677. SYNTHESIS AND BIOLOGICAL PROPERTIES OF L-ACETYL-8-LYSINE-VASOPRESSIN.** W.D.Cash and B.L.Smith: J. biol. Chem., 1963, 238, 994-997 (Dept. Biochem., Cornell Univ. Med. Coll., New York U.S.A.) The synthesis is described. Introduction of the acetyl group into the terminal amino group of 8-lysine-vasopressin markedly reduces the biol. activity, and the rat pressor and avian depressor effects are eliminated completely. The rat antidiuretic, rat oxytocic, and rabbit milk-ejecting activities are reduced to less than 0*5% of the corresponding activities of 8-lysine vasopressin. The acetylated hormone inhibits the rat pressor and avian depressor effects of the U.S.P. Posterior Pituitary, Reference Standard, but does not inhibit the antidiuretic, oxytocic, or milk-ejecting effects of the standard. J.N.Ashley
- 678. BIOLOGICAL AND CHROMATOGRAPHIC CHARACTERISATION OF A POLYPEPTIDE WITH PRESSOR AND OXYTOCIC ACTIVITIES ISOLATED FROM BOVINE PINEAL GLAND.** S.M.Mileu, S.Pavel and C.Neacsu: Endocrinology, 1963, 72, 563-566 (Inst. Endoc., Bucharest, Rumania) A polypeptide similar to arginine vasotocin with pressor and oxytocic activity has been isolated from the bovine pineal gland. H.C.Jones
- 679. INFLUENCE OF ARGinine VASOPRESSIN UPON THE PRODUCTION OF ADENOSINE 3|5'-MONOPHOSPHATE BY ADENYL CYCLASE FROM THE [DOG] KIDNEY.** W.A.Anderson, jun. and E.Brown: Biochim. biophys. Acta, 1963, 67, 674-676 (Dept. Biochem., Howard Univ. Coll. Med., Washington, D.C., U.S.A.) B.M.Stevens
- 680. INTRATHYROIDAL IODINE METABOLISM IN THE RAT. THE IODOTYROSINES.** L.G.Plaskett, C.F. Barnaby and G.I.Lloyd: Biochem. J., 1963, 87, 473-480 (Dept. Biochem., Univ. Edinburgh, Scotland) Estimations were made of the ¹¹¹I incorporated into monoiodotyrosine, di-iodotyrosine and iodothyronines in the rat thyroid gland at intervals from 1 min. to 24 hr. after injn. of [¹²⁵I]iodide. The radioactivity in the iodothyronines increased from less than 1% of the total radioactivity of the gland at 1 min. to about 20% at 24 hr. The ratio of labelled monoiodotyrosine to labelled di-iodotyrosine remained almost const. during this period. Administering NaI or thiouracil altered the value of this ratio but did not cause it to change with time. A possible revision of the current views on thyroid-hormone bio-synthesis is discussed. *

- 681. IN VITRO BIOSYNTHESIS OF THYROID HORMONE* FROM L-[3H]TYROSINE [BY THYROID SLICES].** J.Nunez, J.Mauchamp and J.Roche: Biochim. biophys. Acta, 1963, 71, 241-243 (Lab. Biochim. gén. et comparée, Coll. France, Paris, France) Prelim. comm. (French) . B.M.Stevens
- 682. PREPARATION OF TRITIATED PHENOLS. II. SYNTHESIS OF THYROID HORMONES LABELLED WITH 3H (DL-TYRQXINE AND IODO-3,5,3' DL-THYRO' NINE).** J.Nunez, CJacquemin and J.Roche: Int. J. appl. Radiat., 1962, 13, 611-616 (College de France, Paris, France) By means of a general tritiating method using ³H, thyroxine and 3,5,3'-triiodothyronin* were labelled in the OCJ positions of the side chain. ¹³¹I labelling of tritiated 3,5-diiodothyronine gives rise to double labelled thyroxine and triiodothyronine. (French) B.Payn⁶
- 683. BINDING OF THYROXINE TO HUMAN SERUM PROTEINS.** K.Levin and S.Linde: Scand. J. clin. Invest., 1963, 15, Supp. 69. 139-151 (Central Lab... Central Hosp., VSsteras, Sweden) The ratio between thyroxine bound to serum proteins and free thyroxine was consistent with the assumption that the binding is a simple reversible process, the apparent dissociation const. being about 200 IJM and the average total binding capacity for thyroxine 1-5 g./ml. serum = 1950 IJM. The main part of this was bound to the albumin. The dissociation const. for the binding between thyroxine and thyroxine-binding globulin or thyroxine-binding prealbumin were much smaller than for the binding to albumin. K.Jones
- 684. CONDITIONS FOR THE FORMATION OF AN IODINATED AND TRITIATED PROTEIN COMBINATION DURING THE DEIODINATION OF DOUBLY LABELLED (1311 AND 3H) THYROID HORMONES.** J.Roche, J.Nunez and CJacquemin: Biochim. biophys. Acta, 1963, 69, 271-283 (Lab. Biochim. gén. compare, Coll. France, Paris, France) DL-Thyroxine and 3,5,3'-triiodo-DL-thyronine, labelled OCJ with ¹³¹I, ³H or ³I with ¹³¹I. were deiodinated by mitochondrial salt extracts of slices or mitochondria and purified prep# of thyroxine deiodinase. ¹³¹I and a protein comply* [PX] containing ¹³¹I and ³H were the only labelled cW pounds produced. The ratio of the sp. activities of ¹³¹I and ³H isotopes in chromatographic areas containing residue DL-thyroxine or 3,5,3'-triiodo-DL-thyronine was identical with the blank after incubation with thyroXII⁵ deiodinase but not the other prep. The ¹³¹I concn. PX decreased during incubation in 2 stages. (French) B.M.Stevens
- 685. EFFECT OF THYROID HORMONE ON THE BACTERIOLYTIC ACTION OF [CRYSTALLINE EGG WHITE OR HOMOGENEOUS RAT KIDNEY] MURAMIDASE (LYSOZYME) IN VITRO.** G.Litwack: Biochim. biophys. Acta, 1963, 67, 501-504 (Biochem. Lab., Div. Cardiol., Philadelphia Gen. Hosp., Philadelphia, Pa., U.S.A.) B.M.Stevens
- 686. EFFECT OF D- AND L-TRIIODOTHYRONINE ON BILE ACID EXCRETION OF RATS.** T.H.Lin, R.Rubinstein and W.L.Holmes: J. lipid Res., 1963, 4, 63-67 (Biochem. Section, Res. and Development Div., A.I. Kline and French Labs., Philadelphia, Pa., U.S.A.) Treatment of rats with either D- or L-triiodothyro** caused a relative decrease of cholate and a relative increase of chenodeoxycholate as shown by gas-liquid chromatography studies. Relative increased lev.f. ? of bile acid component, suspected to be a metabolic

BIOCHEMISTRY

67

chenodeoxycholic acid were also shown. Prelim, data indicated to indicate that intestinal absorption of cholesterol was poorer in D-triiodothyronine-treated rats than in control animals.

J.R.Sargent

687. EFFECTS OF THYROPROPIONIC ACID AND 3,3',5-TRIIODOTHYROPROPIONIC ACID ON OXYGEN CONSUMPTION, GOITRE PREVENTION AND CHOLESTEROL BIOSYNTHESIS IN RAT. C.H.Eades, jun. and N.R.Stasilli: *Endocrinology*, 1963, 72, 509-513 (Biochem. Dept., Warner Lambert Res. Inst., Morris Plains, N.J., U.S.A.) Rats fed on a diet containing small amounts of 3,3',5-triiodothyropropionic acid showed a lowering of serum cholesterol and an inhibn. in incorporation of [14c]acetate into liver cholesterol. Tyropropionic acid in large amounts only, inhib. the incorporation of acetate. No increase in O₂ consumption was seen in either case.

H.C. Jones

688. EFFECT OF THYROPROPIONIC ACID AND ITS IODINATED ANALOGUES ON INCORPORATION OF U-[14c]ACETATE INTO CHOLESTEROL BY RAT LIVER HOMOGENATES. C.H.Eades, jun. and G.E.Phillips: *Endocrinology*, 1963, 72, 514-517 (Biochem. Dept., Warner-Lambert Res. Inst., Morris Plains, N.J., U.S.A.) Tyropropionic acid and some of its iodinated analogues were found to inhibit the incorporation of acetate into non-saponifiable lipid fraction of rat liver homogenates. A tetra-iodinated compound stim. acetate incorporation.

H.C.Jones

689. EFFECT OF THYROID HORMONES ON OXYGEN CONSUMPTION OF ISOLATED HORSE LEUCOCYTES. W.Hamolsky, R.Michel, H.Camicero and J.Roche: *Biophys. Acta*, 1963, 69, 420-422 (Lab. de chim. et Comparée, Coll. France, Paris, France) Addition of L-triiodothyroacetic acid produced a ProraPt increase in O₂ consumption, L-thyroxine and triiodothyronine produced lesser and delayed increases. Prelim, comm.

B.M.Stevens

690. UBIQUINONE (COENZYME Q) AND THE REGULATION OF BASAL METABOLIC RATE BY THYROID HORMONES. S.Pedersen, J.R.Tata and L.Ernster: *Biophys. Acta*, 1963, 69, 407-409 (Wenner-Gren Inst. of Univ. Stockholm, Sweden) No change in one concn. in livers of thyrotoxic rats in acute increasing time when was increasing indicating that changes in ubiquinone concn. are adaptations rather than causes of, increased metabolic rate.

B.M.Stevens

691. INFLUENCE OF THYROXINE ON OXIDATIVE SPHORYLATION AND RELATED REACTIONS. R. Biochim. biophys. Acta. 1963, 69, 375-381 (Dept. Zool., Columbia Univ., New York.) The rate of ATP-[32P]inorg. phosphate transfer in submitochondrial particles was reduced by thyroxine. This inhibn. was doubled by adding the inhibitor after the particles. The increased inhibn. was associated with decreased P/O and loss of stimn. of substrate oxidation. Previously reported improvement in presence of thyroxine was largely due to particle ATPase. Stimn. of substrate oxidation was more pronounced at lower particle concentration. At 12° the stimn. was masked by the slow rate of phosphate transferring reactions unless DNP was present. Thyroxine increased the absorbancy of the suspensions.

B.M.Stevens

692. MAMMARY GLAND ENZYME SYSTEMS CONCERNED WITH SYNTHESIS OF MONOIODOTYROSINE. E.P.Reineke: *Proc. Soc. exp. Biol., N.Y.*, 1963, 112, 122-125 (Dept. Physiol. Pharmacol., State Univ.

Michigan, East Lansing, Mich., U.S.A.) A study has been made of the incorporation of 131I into homogenates of mammary glands of CFN strain rats. About 50% of the 131I incorporated was in the form of monoiodotyrosine after 6 hr. incubation. The effect of the inhibitors, heat, thiouracil and KSCN was to block monoiodotyrosine incorporation. Monoiodotyrosine production was catalysed by Cu especially with Mn present. The microsomal fraction from lactating mammary glands could form monoiodotyrosine without the addition of tyrosine as a substrate or metal catalysts but is bound here. Thus the mammary gland homogenates contain all the requirements for the formation of monoiodotyrosine and therefore it is a system which compares in many ways with the thyroid and salivary gland systems for concentrating and producing I-containing substances. It has not been proved that it is in fact the same system.

D.N.Wheatley

693. BRADYKININ ANTAGONISM FOLLOWING ORAL PROTEASE THERAPY. LInnerfield, R.E.Bundy and R.Hochberg: *Proc. Soc. exp. Biol., N.Y.*, 1963, 112, 295-297 (Dept. Biochem., Fairleigh Dickinson Univ., Teaneck, N.J., U.S.A.) It has been shown by hypotensive studies in dogs, smooth muscle contractions in rats and s.c. blueing responses in rabbits treated with bradykinin that orally introduced proteases had an antagonistic effect to bradykinin. They may not however be antagonistic to bradykinin but only to the inflammatory effects the latter produces.

D.N.Wheatley

694. EFFECT OF PHENYLALANINE AND ITS METABOLITES ON THE BRAIN 5HT LEVEL OF THE RAT. W.J.Culley, R.N.Saunders, E.T.Mertz and D.H.Jolly: *Proc. Soc. exp. Biol., N.Y.*, 1962, 111, 444-446 (Mental Retardation Res. Lab., Muscatatuck State Sch., Butlerville, Ind., U.S.A.) Rat brain 5HT was significantly reduced after supplementation of diet with phenylalanine and less so with phenylpyruvic acid. Phenylacetic acid and α -hydroxyphenylacetic had no effect.

M.M. Shapland

695. ISOLATION OF 1-METHYLMIDAZOLE-4-ACETIC ACID, A METABOLIC PRODUCT OF HISTAMINE FROM HUMAN URINE. E.A.Ham and R.W.Schayer: *Biochim. biophys. Acta*, 1963, 71, 208-209 (Merck Sharp and Dohme Res. Lab., Rahway, N.J., U.S.A.)

B.M.Stevens

696. PURIFICATION AND ELECTROPHORETIC PROPERTIES OF RELAXIN PREPARATIONS. E.H.Frieden: *Trans. N.Y. Acad. Sci.*, 1963, 25, 331 (Boston Dispensary and Dept. Biol. Chem., Tufts Univ. Sch. Med., U.S.A.) Relaxin of high sp. biol. activity was obtained by solvent partition in butanol-TCA-water systems but the material was found to be heterogeneous by starch gel electrophoresis. Relaxin prep. were fractionated on several ion exchangers and Sephadex G-50 and the distribution of biol. activity determined after electrophoresis on starch gel. The results indicate that relaxin activity is shared by a no. of substances with different mobilities at pH 8[±]2.

K.Brew

697. RELAXIN: STUDIES DEALING WITH ISOLATION, PURIFICATION AND CHARACTERISATION. H.Cohen: *Trans. N.Y. Acad. Sci.*, 1963, 25, 313 (Princeton Lab. Inc., Princeton, N.J., U.S.A.) A progress report

BIOCHEMISTRY

of attempts to isolate and characterise pure relaxin is described. Material of high biol. activity but manifesting some electrophoretic heterogeneity was isolated and physicochem. studies indicate a mol. wt. of 8000-10000. The amino acid composition of the material was determined and indicates a high content of basic amino acids which is in accordance with the high isoelectric point of the substance. Prelim, results of an attempt to develop an immunol. assay for the hormone using the haemagglutination inhibn. procedure are presented. K.Brew

698. FORMATION OF STEROID SULPHATES BY EXTRACTS OF HUMAN ADRENALS. J.B.Adams: *Biochim. biophys. Acta.* 1963, 71, 243-245 (New South Wales State Cancer Council, Special Unit, Prince of Wales Hosp., Sydney, Australia) Cell free extracts formed steroid sulphates from adenosine 3'-phosphate 5'-phosphosulphate and oestrogens or androgens, but not corticosteroids. Prelim, comm. B.M.Stevens

699. INTERACTIONS OF STEROIDS WITH HUMAN PLASMA PROTEINS. W.R.Slaunwhite, jun., H.Rosenthal and A.A.Sandberg: *Arch. Biochem.*, 1963, 100, 486-492 (Roswell Park Mem. Inst., Buffalo, N.Y.. U.S.A.) The binding of oestrone, oestradiol, testosterone, progesterone, corticosterone and cortisol to plasma proteins was determined by equilibrium dialyses and, occasionally, by ultrafiltration at 5°. The solubilities and bindings of 18 steroids with serum albumin were also examined. Albumin was responsible for most binding of unconjugated steroids except for cortisol and corticosterone since it was the most abundant protein in plasma, binding was decreased at 25° but irregularly depending on the individual steroid. Corticosterone had 1 site on serum albumin with an association const. 30 times that of the other 20 sites. Evidence of competition was found only between corticosterone and cortisol and amongst a group of androgens. B.M.Stevens

700. EFFECT OF CORTISOL AND SALICYLATE UPON CONNECTIVE TISSUE. J.C.Houck: *Amer. J. Path.*, 1962, 41, 365-371 (Biochem. Lab., Children's Hosp., Washington, D.C., U.S.A.) The dermal chem. changes following the administration of cortisol (0⁰65 mg./day) or salicylates (25 mg. acetylsalicylate daily) were studied. Salicylate increased the concn. of galactosamine in the 0⁰5M saline sol. fraction of rat skin but was without affect upon the concn. of collagen or ground substance. Cortisol brought about a decrease in the concn. of ground substance and insol. collagen and an increase in the dermal concn. of a non-collagenous hexosamine poor scleroprotein. D.G.Scott

701. EFFECT OF DEOXYCORTICOSTERONE ON SOLUBLE BEEF HEART MITOCHONDRIAL ATPase. M.Blecher: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 529-531 (Dept. Biochem., Sch. Med. and Den., Georgetown Univ., Washington, D.C., U.S.A.) Mitochondrial ATPase activity was decreased by over 35% in the presence of DOC as measured spectrophotometrically and by release of inorg. PO₄ from ATP. M.M.Shapland

702. MICROBIOLOGICAL OXIDATION OF REICHSTEIN'S COMPOUND S BY CUNNINGHAMELIA BLAKESLEEANA LENDNER. C.Spalla, A.Amici and M.Bianchi: *G.Microbiol.*, 1961, 9, 255-265 (Farmitalia Milano, Italy) *C. blakesleeana* transformed Reichstein's compound S into cortisol, cortisone, 14C-OH and 60-OH-compound S. Zn is required for the synthesis of

the enzymes that oxidise at the 6jS- and 14CC-positions and the state of growth and aeration of the medium affected the activity of these enzymes. It is suggested that there are 2 groups of enzymes, one for the 11p-oxidation and one for the 14a- and 6p-positions and these differ in structure and mechanism of action.

G.N.GodsoD

703. MECHANISM OF REGULATION BY CORTISONE OF METABOLISM OF LIVER PURINE AND RNA. P.Feigelson and M.Feigelson: *J. biol. Chem.*, 1963, 238, 1073-1077 (Dept. Biochem., Columbia Univ. Coll. Physic. Surg., New York, U.S.A.) Cortisone rapidly increases incorporation of [2-14c]glycine into acid-sol. adenine nucleotides as well as into rat liver RNA. Administration (i.p.) of various L- and D-amino acids, NH₄T, and glutamine into adrenalectomised rats also stimulates this absorption. Although cortisone increases the ATP level in liver, such alterations in ATP by themselves do not affect the rate of incorporation of precursor into protein or RNA. Probably increased deamination of amino acids, implicit in the gluconeogenic action of glucocorticoids, causes liberation of OC-amino N moieties that mediate the cortisone-inducco increases in hepatic purine biosynthetic rates. Cortisone also increases the amount of, and incorporation of [14c]orotic acid into, liver RNA. J.N.Ashley

704. PODOPHYLLIN AND COLCHICINE CHANGES IN THE VAGINAL MUCOSA OF THE VIRGINAL, &&*[†] AND OVARIECTOMISED RAT. COMPARATIVE STUDY. T.S.Kline: *Amer. J. Path.*, 1962, 41, 477-482 (Dept. Pathol., Michael Reese Hosp., Chicago, Ill., U.S.A.) D.G.Scott

705. INTERACTION OF OESTROGENS LABELLED WITH CARBON-14 WITH NICOTINAMIDE NUCLEOTIDE D* THE PRESENCE OF PEROXIDASE. P.H.Jellinck and L.Irwin: *Nature, Lond.*, 1963, 197, 1107-1108 (Cancer Res. Centre, Univ. Brit. Columbia, Vancouver, Canada) Horseradish peroxidase in the presence of NAD or NADP converts oestrone, and other phenolic oestrogens, into water-sol., ether-insol. compounds in relatively high yields. No reaction occurred under anaerobic conditions or in the presence of catalase, indicating that hydrogen peroxide is involved. The peroxidase of oestrogen-stimulated rat uteri did not form water-sol. products from oestrone. G.U.Lewis

706. PRESENCE OF OESTROGEN SULPHOKINASE IN CHICK EMBRYONIC CARTILAGE. J.B.Adams: *Nat.*, Lond., 1963, 197, 1007-1009 (New South Wales St. Cancer Council, Special Unit, Prince of Wales Hospt., Sydney, Australia) In a study of 35SO₄ metabolism in cartilage from chick embryos using chromatographic techniques, it was found that an enzyme which sulphates oestrogenic steroids was present in the condyles of femurs, tibias and sternum of 15-day old chick embryo. Cartilage from calf embryo and human chondrosarcoma was inactive. Oestrone, CL-oestradiol and oestriol were sulphated, while pregnan-30C.20a-diol, dehydroisoandrosterone, androsterone, testosterone and cortisone were not affected. G.M.Lewis

707. INHIBITION BY NADH₂ OF THE TRANSFORMATION OF PREGNENOLONE TO PROGESTERONE BY A ¹⁴C-Labeled ADRENAL PREPARATION. S.B.Koritz: *Arch. Biochem.*, 1963, 100, 349-352 (Biochem. Dept., Univ. Pittsburgh Sch. Med., Pittsburgh, Pa., U.S.A.) NADH₂ inhib. the transformation of pregnenolone to

BIOCHEMISTRY

69

^corticoids in a supernatant fraction from an adrenal homone. NAD reversed the inhibn. Some other prop. of system are described. B.M.Stevens

708. COMPETITIVE INHIBITION OF CORTICOID SYNTHESIS BY OESTROGENS. K.W.McKerns: Biochim. biophys. Acta, 1963, 69, 425-427 (Dept. Obstet. Gynec., Coll. Med., Univ. Florida, Gainesville, U.S.A.) The competitive inhibn. by oestrogens J* the rate of added NADP reduction in adrenal homoneates was correlated with the competitive inhibn. of corticoid synthesis. Prelim, comm. B.M.Stevens

709. MODE OF CONJUGATION OF PREGNA-5-ENE, 3^β-DIOL AND PREGNA-5-ENE, 3^β,17^α,21-TRIOL-20-ONE IN MAN. IDENTIFICATION OF THE CORRESPONDING SULPHATE ESTERS. J.R.Pasqualini, P.Dutter and M.F.Jayle: Biochim. biophys. Acta, 1963, 69, 331-336 (Lab. Chim. biol. Fac. Méd., Paris, France) 270 mS. of 21-hydroxypregnénolone 300 mg. of 17^α,21-dihydroxypregnénolone were administered to a normal man and the forms found in blood and urine were examined. In both, 21-hydroxy-8nenolone was found only in the 3^βS, 21-disulphate form. 21-dihydroxypregnénolone was found in the 3^β-monosulphate form. Excretion of the former was more rapid than that of the latter. (French) B.M.Stevens

710. OESTROGENIC AND ANTI-OESTROGENIC EFFECTS OF SOME OESTROGEN DERIVATIVES IN VIVO AND IN VITRO. E.Hecker and G.Farhofer: Biochim. biophys. Acta, 1963, 71, 196-198 (Max-Planck Inst. Biochem., Munich, Germany) 3-Substituted and other oestrogenes were tested on the oestrogen dependent transhydrogenase of human placenta in vitro and by the Allen-Doisy test ^a vivo. (German) B.M.Stevens

711. ROLE OF 2-HYDROXYOESTRONE IN OESTROGEN METABOLISM. J.Fishman: J. clin. Endocrin., 1963, 207-210 (Sloan-Kettering Inst. for Cancer Res., New York, U.S.A.) The importance of 2-hydroxyoestrone as a product of the metabolism of oestradiol in man is discussed, and its substantial losses in the various stages of isolation from urine are estimated. K.Jones

712. KACEMIC PROGESTERONE. W.S.Johnson, J.F.W. Kna and W.S.Johnson: Tetrahedron Letters, 1963, 4, 193-196 (Dept. Chem., Stanford Univ., Calif., U.S.A.) A stereoselective total synthesis yields DL-progesterone indistinguishable for the natural hormone. I.A.B.S.

713. METABOLISM OF [4-¹⁴C]TESTOSTERONE IN NORMAL HUMAN ADRENAL HOMOGENATE. E.Chang, A.Mittelman and T.L.Dao: J. biol. Chem., 1963, 238, 915-917 (Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.) Androst-4-ene-3,17-dione, adrenosterone, 4-hydroxyandrost-4-ene-3,17-dione, and 11β-hydroxy-17^α-ene are isolated after incubation of [4-¹⁴C]testosterone with homogenised normal human adrenal gland. A named metabolite is the main conversion product. A highly polar metabolite is also isolated, compounds with reduced ring A are detected. J.N.Ashley

714. ALTERATION OF STEROID DEHYDROGENASE SYNTHESIS IN A MUTANT OF PSEUDOMONAS TESTOSTERONI. I.D.Teller and A.M.Bongiovanni: Nature, Lond., 1963, 197, 1112-1113 (Worthington Biochem. Corp., Freehold, N.J., U.S.A.) A culture of ^cPseudomonas stored for about 18 months in the presence

of testosterone, gave rise to a mutant which had lost the dehydrogenase active with testosterone, although androsterone activity remained intact. The mutant was also active against dehydroepiandrosterone. G.M.Lewis

715. AROMATISATION IN VIVO OF 30,170-BIS-ACETOXY-17^α-ETHYNYL-19-NOR-ANDROST-4-ENE (SC-11 800). P.K.Besch, D.J.Watson, N.Vorys and R.D.Barry: Biochim. biophys. Acta, 1963, 69, 417-418 (Dept. Obstet. Gynec., Ohio State Univ. Coll. Med., Columbus, Ohio, U.S.A.) The 3^β,17^α-bis-acetoxy group was removed and ring A aromatised to form 17^α-ethynyl oestradiol. Prelim, comm. B.M.Stevens

716. ISOLATION OF [¹⁴C]DEHYDROEPIANDROSTERONE [DHEA] FROM DOGS INFUSED WITH [4-¹⁴C]CHOLESTEROL BY THE SPERMATIC ARTERY. K.B.Eik-Nes and P.F.Hall: Proc. Soc. exp. Biol., N.Y., 1962, 111, 280-282 (Dept. Biol. Chem., Univ. Utah Coll. Med., Salt Lake City, U.S.A.) Isolation of [¹⁴C]DHEA from the spermatic vein blood after spermatic artery infusion of [¹⁴C]cholesterol lends additional support to the view that it is an intermediate in the synthesis of testicular androgens. M.M.Shapland

717. MEASUREMENT OF RATES OF SECRETION AND OF PERIPHERAL METABOLISM OF TWO INTERCONVERTIBLE COMPOUNDS; DEHYDROISOANDROSTERONE-DEHYDROISOANDROSTERONE SULPHATE. E.Gurpide, P.C. MacDonald, R.L.V.Wiele and S.Lieberman: J. din. Endocr., 1963, 23, 346-354 (Dept. Biochem., Coll. Physns. Surgn., Columbia Univ., New York, U.S.A.) K.Jones

718. STEROID METABOLISM. XV. RAPID DETERMINATION OF URINARY PREGNANEDIOL BY GAS CHROMATOGRAPHY [OF CRUDE URINE EXTRACTS]. H.H.Wotiz: Biochim. biophys. Acta, 1963, 69, 415-416 (Boston Univ. Sch. Med., Dept. Biochem., Boston, Mass., U.S.A.) Prelim, comm. B.M.Stevens

719. COLUMN CHROMATOGRAPHY OF 17-KETO-STEROIDS AFTER BISMUTHATE OXIDATION. G.Copinschi, A.Cornil and J.R.M.Franckson: Clin. chim. Acta, 1962, 7, 817-822 (Lab. Méd. Exp., Univ. Libre Bruxelles, Belgium) The 17-KS obtained by bismuthate oxidation of cortisone, cortisol, and tetrahydrocortisone were studied by column chromatography, using Dingemanse's method. V.M.Wootton

720. GAS-LIQUID CHROMATOGRAPHY IN QUANTITATIVE ANALYSIS OF URINARY 11-DEOXY-17-KETO-STEROIDS. M.A.Kirschner and M.B.Lipsett: J. clin. Endocrin., 1963, 23, 255-260 (Endocr. Branch, Natl. Cancer Inst., N.L.H., Bethesda, Md., U.S.A.) The ketosteroids were chromatographed on thin-layer silica gel, following hydrolysis of the urinary conjugates. After elution, the trimethylsilyl ethers were formed, separated and quantitated by gas-liquid chromatography. The method described is accurate, reproducible, rapid and simple. K.Jones

METABOLIC INHIBITORS AND CARCINOGENS

721. STRUCTURAL TRANSITIONS OF SOYABEAN TRYPSIN INHIBITOR. I. NATIVE PROTEIN IN WATER.

BIOCHEMISTRY

R.F.Steiner and H.Edelhoch. II. DENATURED STATE IN UREA. H.Edelhoch and R.F.Steiner: J. biol.Chem.. 1963. 238. 925-930, 931-938 (Naval Med. Res. Inst.. Nat. Naval Med. Center, Bethesda, Md., U.S.A.)

I. Fluorescence polarisation. u.v. fluorescence, difference spectra, and optical rotation of soya bean trypsin inhibitor are studied. At acid pH there are small changes in difference spectra and optical rotation, and somewhat larger changes in fluorescence polarisation and intensity of fluorescence which suggest a minor structural change. Above pH 12 there is a time-dependent structural alteration.

II. There is only a relatively small change in the mol. shape of the inhibitor of 9M urea as shown by Q and polarisation of fluorescence measurements. Increasing concn. of urea up to 9M cause only a red shift in the difference spectrum and a uniform increase in fluorescence intensity. At high temp. or alk. pH there is a change to a largely unorganised structure. Denaturation follows first order kinetics for all methods of determination under a given set of conditions. The rate is probably determined by a single process between an initial and a final state.

J.N.Ashley

722. EFFECT OF DNP ON CARBON DIOXIDE FIXATION BY A THIOBACILLUS. D.P.Kelly and PJ.Syrett:

Nature. Lond.. 1963. 197, 1087-1089 (Dept. Bot.. Univ. Coll. London, England) T. thiorarus in the presence of Hg^{2+} fixed CO_2 when thiosulphate was added; sulphide was also rapidly oxidised but less CO_2 was fixed per mol. substrate oxidised, and the reaction was more sensitive to DNP. It is suggested that both oxidative and substrate phosphorylations are coupled to the oxidation of thiosulphate by Thiobacillus.

G.M.Lewis

723. THERMOSTABLE HAEMOLYTIC FACTOR IN SOYA-BEANS. Y.Birk. A.Bondi. B.Gestetner and I.Ishaaya:

Nature. Lond.. 1963, 197. 1089-1090 (Fac. Agric.. Hebrew Univ.. Rehovot, Israel) Soyabean saponin extract was prep. from ether-extracted soyabean flour, and separated by paper chromatography into 4 components. 3 of which were haemolytic and inhib. the proteolytic activity of Tribolium castaneum larval midgut enzyme and OC-chymotrypsin. The haemolytic activity was not affected by autoclaving the soyabean meal.

G.M.Lewis

724. INTERACTION OF CHLORAMBUCIL WITH CELL SURFACES. J.H.Linford. A.Froese and L.G.Israels:

Nature. Lond.. 1963, 197, 1068-1070 (Dept. Biochem.. Univ. Manitoba, Winnipeg, Canada) In the presence of r.b.c. or ascites cells, chlorambucil (sol. in benzene or ethyl acetate) is partially converted to its hydroxyl form (sol. in ethylacetate alone) or to a water-sol. form. All the added chlorambucil can be recovered from the extracellular phase as a mixture of these 3 components. A similar phenomenon occurs on addition of chlorambucil to r.b.c. ghosts. It is concluded that the chloro groups of chlorambucil are replaced by hydroxyl or other groups by reaction with the cell surface.

J.R.Sargent

725. METABOLIC DEFICIENCIES IN PROTOZOA INDUCED BY THALIDOMIDE. O.Frank. H.Baker, H.Ziffer, S.Aaronson, S.H.Hutner and C.M.Levey:

Science, 1963, 139, 110-111 (Seton Hall Coll. Med.. Jersey City, N.J., U.S.A.) Thalidomide at 2-6 mg./ml. inhib. growth of Euglena gracilis, Ochromonas malhamensis, O. danica and Tetrahymena pyriformis. The toxicity was not altered by purines, pyrimidines, amino acids or metals, but was counteracted by nicotinic acid, nicotinamide, NAD and vit. K1. The mechanism of

toxicity may be an interference with cellular oxidation. It is suggested that a protozoan test system may be useful in screening drugs.

G.M.Lewis*

726. SPINACH ENZYME FUNCTIONING TO REVERSE THE INHIBITION OF CYCLIC ELECTRON FLOW BY $\text{f}-\text{CHLOROPHENYL-L-1-DIMETHYLUREA}$ [CMU] AT HIGH CONCENTRATIONS. T.Asahi and A.T.Jageirdorf: Arch. Biochem.. 1963, 100, 531-541 (McCollum-Pratt Inst., Johns Hopkins Univ.. Baltimore, Md.. U.S.A.) Higher concn. of CMU were needed to inhibit cyclic electron flow in photosynthetic phosphorylation than were needed to inhibit O_2 evolution. The inhibition of cyclic electron flow usually occurred only with low concn. of broken aged chloroplasts and was reversed by adding back fairly large amounts of supernatant soln. after breaking the chloroplasts. The factor responsible for reversal was partially purified and appeared to be associated with diaphorase activity capable of oxidising NADH_2 and NADPH_2 . The higher CMU concn. is suggested to inhibit at a site on the reducing side of cytochrome c. the enzyme added back providing an alternative CMU resistant pathway for electron flow.

B.M.Stevens*

727. SEPARATION OF A TRIBOLIUM-PROTEASE INHIBITOR FROM SOYBEANS ON A CALCIUM PHOSPHATE COLUMN. Y.Birk. A.Gertler and S.Khalef: Biochim. biophys. Acta. 1963, 67, 326-328 (Fac. Agric., Hebrew Univ., Rehovoth, Israel) The Tribolium inhibitor was obtained free from trypsin inhibitor and amylase.

B.M.Stevens*

728. MODE OF ACTION OF 3-(4-CHLOROPHENYL) k , 1-DIMETHYLUREA [CMU] ON PHOTOSYNTHESIS [$\text{f}-\text{CHLORELLA PYRENOIDOSA}$]. G.Gingras, C.Lemasson and D.C.Fork: Biochim. biophys. Acta, 1963, 69, 438-440 (Lab. de Photosynthese du C.N.R.S., Gif-sur-Yvette, Seine et Oise, France) $5 \times 10^{-8}\text{M}$ - 10^{-10}M CMU inhib. the 'short A' light reaction acting on or close to the photochem. step; at higher concn. a rate limiting dark step was also affected. Prelim. comm.

B.M.Stevens*

729. INHIBITION OF SQUALENE AND CHOLESTEROL BIOSYNTHESIS BY HEPATOCATALASE (CAPERASH).

J.Caravaca, M.D.May and E.G.Dimond: Biochem. biophys. Res. Comm.. 1963. 10. 189 (Inst. Cardio-pulmonary Dis.. Scripps Clinic and Res. Fndn.. La Jolla, Calif.. U.S.A.) A dialysable substance in a hepatocatalase prep. was found to inhibit cholesterol formation. Inhib. occurred between mevalonic acid and squalene on the biosynthetic pathway.

K.Bitter*

730. EFFECT OF RAISED O_2 PRESSURE AND OF L-METHIONINE SULPHOXIMINE [MS] ON GLUTAMINE SYNTHETASE ACTIVITY [GSA] OF RAT BRAIN.

Z.S.Gershovich, A.A.Krichevskaya and J.Kolousek: J. Neurochem., 1963, 10, 79-82 (Biochem. Dept. State Univ.. Rostov-on-Don, U.S.S.R.) GSA fr. 7°C acetone powders was measured at pH 7 $^{\circ}\text{4}$ at 37°. Snosy were 40 μM hydroxylamine HCl, 100 μM glutamic acid, 40 μM MgCl_2 , 20 μM cysteine and 10 μM dibarium A. Incubation was performed either in a pressure chamber at 6 atm. pressure of O_2 or MS added to the reaction mixture. With O_2 pressure alone GSA was inhib. 35%-55%; with 0.3 and 1.7 mg. MS/ml. reaction mixture 16% and 4% respectively; and with MS under O_2 pressure 97% inhibition occurred, the effects being additive.

^{732.} HYPERCHROMIC EFFECT OF ORGANIC DENATURING REAGENTS ON DNA. K.Kurihara, Y.Hachimori and K.Shibata: Biochim. biophys. Acta, 1963, 68, 434-445 (Tokugawa Inst. Biol. Res., Tokyo, Japan)

^{733.} N-Dimethylformamide and N-methylpyrrolidone proceed hyperchromic shifts in u.v. absorption of calf thymus and herring sperm DNA at room temp, and neutral or alk. pH. Formic, acetic and propionic acids caused a shift at acidic pH; isopropylamine and ethylamine caused a shift at alk. pH. Δ increments of absorbance at 260 m/i were 49-54% whereas heat produced 48-52% and inorg. acid or alkali 27-31%. Denaturation appeared to be partially reversible. Absorbancy-concn. curves of native DNA showed an abrupt absorbancy change over a narrow reagent concn. range. A slowly cooled heat denatured DNA showed a linear and gradual increase at low reagent concn. and an abrupt change at higher concn. A quickly cooled sample showed only the latter. B.M.Stevens

^{734.} SELECTIVE REACTION OF O-METHYLHYDROXYL AMINE WITH THE CYTIDINE NUCLEUS.

N.K.Kochetkov, E.I.Budowsky and R.P.Shibaeva: Biochim. biophys. Acta, 1963, 68, 493-496 (Inst. Chem. Natural Products, Acad. Sci., Moscow, U.S.S.R.) Prelim, comm. B.M.Stevens

^{735.} ACTION OF HOMOLOGUES AND ANALOGUES OF TRYPTOPHAN [TRY] COMPOUNDS ON TRYPTOPHAN BIOSYNTHESIS. F.Lingens: Hoppe-Seylers Z. physiol. Chem., 1963, 331, 56-63 (Chem. Inst.

^{736.} Biochem. Div. Univ., 74 Tübingen, Germany) Inhib. of indole formation, due to alkyl substitution in 1, 4 or 5 position of Try, or homo-Try, nor-Try analogues of Try, and a no. of substituted amino acids is discussed. (German) LCornish

^{737.} MICROANALYTICAL DETERMINATION OF ACETYL PYRIDINE-ADENINE-DINUCLEOTIDE[APAD] (WD ACETYL PYRIDINE-ADENINE-DINUCLEOTIDE-PHOSPHATE [APADP] IN BRAIN. H.Herken and J.Neuhoff: Hoppe-Seylers Z. physiol. Chem., 1963, 354, 85-94 (Pharm. Inst. Free Univ., Berlin-Dahlem, West Germany) A fluorimetric method was developed to investigate the neurol. symptoms following acetylpyridine poisoning. This permits the differentiation of NAD and NADP from APAD and APADP in 1 mg. of organ.

(German) I.Cornish

^{738.} ACTIVITY OF VARIOUS TRANSAMINASES ON OXYLAMINE. d-CYCLOSERINE AND dl-CYCLOCERINE. P.Oehme: Naturwissenschaften, 1963, 50, 21 (Inst. Pharmacol. Toxicol., Humboldt Univ., Berlin, Germany). (German) AJ.Wansbrough

^{739.} THE STRUCTURE OF 6-RHODOMYCINONE.

Brockmann and H.Brockmann, jun.: Naturwissenschaften, 1963, 50, 19 (Org. Chem. Inst., Univ. Göttingen, Germany). (German) AJ.Wansbrough

^{740.} INHIBITION OF HEXOKINASE BY DISULPHIDES.

Esbakken and L.Eldjarn: Biochem. J., 1963, 87, 525-529 (Inst. Clin. Biochem., Rikshospitalet, Univ.

Oslo, Norway) Disulphides inhibit glucose utilisation in various rat tissues in vitro, whereas the production of lactic acid from endogenous substrates is not inhib. Crude calf-brain hexokinase is inhib. by disulphides to a similar extent as is the utilisation of glucose in brain-tissue slices. Glucose and to a limited extent the ATP-Mg complex protect the isolated brain enzyme against the inhibn. The inhibn. is ascribed to mixed disulphide formation on essential -SH groups of hexokinase. •

^{741.} AMINOMALONATE AS AN ENZYME INHIBITOR.

M.Matthew and A.Neuberger: Biochem. J., 1963, 87, 601-612 (Dept. Chem. Path., St. Mary's Hosp. Med. Sch., London, England) Aminomalonate was a

powerful competitive inhibitor of 6-aminolacuvulate synthetase. This inhibn. was studied and compared with that exerted by some deriv. of aminomalonate and by other compounds. The effect of aminomalonate on serine hydroxymethyltransferase and enzymes requiring glycine as substrate or pyridoxal PO₄ as coenzyme was investigated. Pyridoxal PO₄ catalyses the condensation of aminomalonate with aldehydes under mild conditions to form ultimately (X-amino-p-hydroxy acids). •

^{742.} INHIBITION OF PROTEOLYTIC ACTIVITY BY ETHYL CARBAMATE [URETHANE]. A.M.Kaye and G.Temes: Biochim. biophys. Acta, 1963, 67, 435-440

(Dept. Expt. Biol., Weizmann Inst. Sci., Rehovoth, Israel) 20-150mM urethane inhib. the clotting of dil. sheep plasma. 8-60mM urethane inhib. the action of cryst. (X-chymotrypsin on N-acetyl-L-tyrosine ethyl ester. n-Propyl carbamate inhib. chymotrypsin activity to the same degree as urethane. B.M.Stevens

^{743.} INHIBITION BY PYRIMIDINES OF ASPARTATE TRANSCARBAMYLASE PARTIALLY PURIFIED FROM RAT LIVER. E.Bresnick: Biochim. biophys. Acta, 1963, 67, 425-434 (Dept. Biochem., Baylor Univ. Coll. Med., Houston, Tex., U.S.A.) The enzyme

was purified 56-fold by 30% satn. with (NH₄)₂SO₄, absorption and elution from Ca phosphate gel and fractionation on DEAEcellulose columns. The pH optimum was 9.2. Km was 5.3 x 10⁻³ M for aspartate and 2.5 x 10⁻⁴ M for carbamyl phosphate. Mercaptoethanol was necessary for stabilisation. Equiv. concn. of carbamyl-aspartate and inorg. phosphate were released. Ag, Hg, Cu and Cd inhib.; EDTA reversed. A crude supernatant prep. of rat liver was inhib. by β -hydroxymercuribenzoate. Uridine, cytidine and their nucleosides and nucleotides inhib. Deoxyribose deriv. inhib. more than ribose deriv. and thymidine was the best inhibitor of all. Thymidine and deoxycytidine inhib. were reversible and competitive when examined by the methods of Ackermann and Potter and Lineweaver and Burk. Inhibn. const. were 4.1 x 10⁻⁴ M and 7.0 x 10⁻⁴ M respectively. B.M.Stevens

^{744.} BIOLOGICAL ACTIVITY OF NICOTINYLALANINE.

ANALOGUE OF KYNURENINE. R.H.Decker, R.R.Brown and J.M.Price: J. biol. Chem., 1963, 238, 1049-1053 (Cancer Res. Div., Dept. Surg., Univ. Wisconsin Med. Sch., Madison, Wis., U.S.A.) Administration i.p. of

nicotinylalanine [γ -3-pyridyl- γ -oxo-a-aminobutyric acid] to rats causes a 4-fold increase in urinary N-methyl-nicotinamide. and incubation of nicotinylalanine with rat liver homogenate produces a linear increase in nicotinic acid with time. Nicotinylalanine is not a metabolite of tryptophan; it is an antimetabolite of kynurenine and inhibits kynureinase and kynureine hydroxylase in vitro. Inhibn. also occurs in vivo and this causes a sequential

BIOCHEMISTRY

- block of the main route of kynurenine degradation. J.N.Ashley
- 743. HETEROGENEITY AND METACHROMASY OF SOME COMMERCIAL ANIONIC DYES.** C.Singh: Stain Technol., 1963, 38, 103-110 (Central Drug Res. Inst., Lucknow, India) The multicomponent character of some commercial anionic dyes has been demonstrated using paper chromatography. The metachromatic response of certain fractionated components of the dyes was ascertained by filter paper reactions between dye components and a no. of chromotropes. M.J.Bell
- 744. PANCREATIC HYPERSTROPHY AND CHICK GROWTH INHIBITION BY SOYBEAN FRACTIONS DEVOID OF TRYPSIN INHIBITOR.** H.C.Saxena, L.S.Jensen and J.McGinnis: Proc. Soc. exp. Biol. N.Y., 1963, 112, 101-105 (Dept. Poultry Sci., Washington St. Univ., Pullman, D.C., U.S.A.) Soybean brew flakes have been treated to extract the water sol. proteins not pptd. at pH 4⁴* but pptd. with sat. ammonium sulphate treatment after this. The protein pptd. then has no anti-trypsin activity and was a potent inhibitor of chick growth. The other fractions had high anti-trypsin activity and little growth inhibitory effect. In all cases where growth inhibn. occurred there was pancreatic hypertrophy suggesting that the action might be mediated through the pancreas. D.N.Wheatley
- 745. EFFECTS OF TWO QUATERNARY AMMONIUM COMPOUNDS ON CITRIC ACID AND STEROL SYNTHESIS IN ASPERGILLUS NIGER.** T.S.Raman and E.R.B.Shanmugam: J. gen. Microbiol., 1963, 31, 23-29 (Univ. Biochem. Lab., Madras, India) The action of cetyltrimethylammonium bromide (Cetrimide) and triclobisonium chloride (Triburon) on *A. niger* was examined. 1.28 mg. Triburon/ml. caused greater inhibn. of growth than 30 fig. Cetrimide per ml. 20 fig./ml. of Cetrimide inhib. citric acid accumulation but 160 fig. Triburon/ml. increased citric acid production and caused inhibn. at higher concn. Both compounds produced an initial increase in sterol concn. followed by a decrease at higher concn. K.Brew
- 746. HAEMAGGLUTINATION INHIBITOR IN EDIBLE BIRDS-NEST: ITS BIOLOGICAL AND PHYSICAL PROPERTIES.** F.Biddle and G.Belyavin: J. gen. Microbiol., 1963, 31, 31-34 (Bacteriol. Dept.. Univ. Coll. Hosp. Med. Sch., London, England) The degree of homogeneity and ability to neutralise infectivity of influenza virus of colocalia mucoid from edible birds-nest were investigated. Three compounds differing in mol. size and biol. activity and partially separable by preparative ultracentrifugation were contained in the crude material obtained by simple extraction. The slowest moving compound was lower in inhibitor activity than the others. K.Brew
- 747. INTERMEDIARY CARBOHYDRATE METABOLISM IN TRIATOMA INFESTANS (INSECTA; HEMIPTERA). II. THE METABOLISM OF [14C]GLUCOSE IN TRIATOMA INFESTANS NYMPHS AND THE EFFECT OF DDT.** M.Agosin, N.Scaramelli, M.L.Dinamarca and L.Aravena: Comp. Biochem. Physiol., 1963, 8, 311-320 (Dept. Parasit., Univ. Chile, Santiago, Chile) Reared nymphs of *T. infestans* were treated with DDT or DDE [2,2-bis(2-chlorophenyl)-1, 1-dichloroethylene] which were applied to the ventral abdomen by pipette. A day later 3*0 fil. of aq. [14C]glucose was inj. into the abdomen at a dose of 30 fig. glucose/g. wet wt.

Immediately after this the animals were placed in a respiratory set-up and the amount of labelled CO₂ produced determined. DDT has the effect of increasing the rate of incorporation of label from glucose into CO₂, glycogen and fatty acids (but not protein); DDE has no such effect. The pentose phosphate pathway is stim. by DDT, accounting for 22% of glucose oxidation in normal insects, and 77% in treated animals. DDE depresses this pathway. DDT also increases the total NADP present without affecting the ratio NADP/NADPH2.

M.S.LaveracK
748. STRUCTURAL REQUIREMENTS FOR PUROMYCIN INHIBITION OF PROTEIN SYNTHESIS. D.Nathans at* A.Neidle: Nature, Lond., 1963, 197, 1076-1077 (Rockefeller Inst., New York, U.S.A.) Inhibitory

effects of various analogues of puromycin were studied using a ribosomal amino acid incorporating system. Both the amino nucleoside and amino acid moieties of puromycin are required for inhibn. Amino nucleoside must be substituted at the 3'-position and amino acid must be of L-configuration. Aromatic amino acid deriv. are particularly potent. Analogues with a dipeptide chain are ineffective.

J.R.Sargei*,

749. INTERRUPTION OF POLIOVIRUS RNA SYNTHESIS BY β -FLUOROPHENYLALANINE AND PUROMYCIN. M.D.Scharff, M.M.Thorén, N.F.McElvain and L.Levintow: Biochem. biophys. Res. Comm., 1963, 10, 127 (Nat. Inst. Allergy and Infectious Dis., Bethesda, Md., U.S.A.) Puromycin and β -fluorophenylalanine inhib. RNA synthesis in a culture of *P. f. J.* virus made in strain S3 HeLa cells with actinomycin*cip.* in the medium. B.Ketterer

750. INHIBITION OF INCORPORATION OF LEUCINE INTO PROTEIN OF CELL-FREE SYSTEMS FROM RAT LIVER AND *E. COLI* BY CHLORTETRACYCLINE. T.J.Franklin: Biochem. J., 1963, 87, 449-453 (I.C.I Ltd., Pharm. Div., Alderley Park, Macclesfield, Cheshire, England) Chlortetracycline reduced incorporation of L-[14C]leucine into the microsomal ribosomal protein of cell-free systems from rat liver and *E. coli*. The rat-liver system was apparently less sensitive to chlortetracycline and to oxytetracycline and tetracycline than the *E. coli* prep. In both animal and bacterial systems chlortetracycline did not interfere with attachment of the amino acid to the transfer RNA but prevented the subsequent transfer of the amino acid to the particulate protein. The amino acid was largely retained on the transfer RNA. *

751. MODE OF ACTION OF ACTINOMYCINS. III. LINEAGE OF ACTINOMYCIN ON NUCLEIC ACIDS AND NUCLEOTIDES. W.Kersten and H.Kersten: Hoppe-Seylers Z. physiol. Chem., 1962, 300, 21-30 (Physiol. Chem. Inst. Univ., 44 Münster i. Westf., Germany) Actinomycin-complex formation was determined spectrophotometrically. The actinomycin-deoxy-guanosine complex was stable and thermolabile, but formaldehyde had a retarding effect on its formation, probably at the position being involved. Actinomycin-DNA complex stability is independent of Mg, formaldehyde and amino groups. (German) L'Ormanish

752. EFFECTS OF ACTINOMYCIN D ON MACROMOLECULE SYNTHESIS AND EARLY DEVELOPMENT IN SEA URCHIN EGGS. P.R.Gross and G.H.Cousineau: Biochem. biophys. Res. Comm., 1963, 10, 321 (Dept. Biol., Brown Univ., Providence, R.I., U.S.A.)

Actinomycin had no effect on RNA synthesis in the sea urchin egg for the first 4 hr. after fertilisation. Subsequently it inhib. [14C]uracil uptake, but inhib. neither ¹⁴C]alanine uptake nor cell division. B.Ketterer

⁷⁵ 3. POST-TREATMENT CROSS-LINKING OF DNA REACTED WITH POLYFUNCTIONAL ALKYLATING AGENTS. J.Doskocil and Z.Sormová: Biochim. biophys. Acta, 1963. 68, 313-316 (Inst. Org. Chem. and Biochem., Czechoslovak Acad. Sci., Praha, Czechoslovakia) Covalent intermol. bonds were Jwn to be formed when DNA treated with polyfunctional alkylating agents in dil. aq. soln. was subsequently con-ned to the solid state, the cross-linking occurring in ^{U₄} absence of any free alkylating agent. B.M.Stevens

H. INHIBITION OF ENTEROVIRUS RNA SYNTHESIS BY 2-((X-HYDROXYBENZYL)-BENZIMIDAZOLE [HBB]. H.J.Eggers and I.Jamm: Nature, Lond., 1963, 197, 1327-1328 (Rockefeller Inst., New York, U.S.A.) J?8./ml. actinomycin D reduced [3H]uridine uptake by [^]infected rhesus monkey kidney cells by 95%; the yield ^{bjC}xsackie virus in infected cells was not affected. J? at concn. 210/iM completely inhib. the production [^]infective RNA of virus but had no effect on the uptake ^{iM}Uridine into cellular RNA. The time course of virus-[^]Ucd RNA synthesis is similar to that of synthesis of [^]infective RNA, suggesting that RNA synthesis precedes ^{virus} Saturation by only a short time. G.M.Lewis

⁷⁵ 5. INFLUENCE OF CERTAIN ANTIMETABOLITES ON THE INCORPORATION OF OROTIC ACID INTO SEUDOURIDINE IN ANIMALS. J.Skoda and R.E.Hand-[^]humacher: Biochim. biophys. Acta, 1963. 68, 481-[#]83 (Dept. Pharmacol., Yale Univ. Sch. of Med., New Haven, Conn., U.S.A.) 6-Azauridine and, to [^]smaller extent, 5-fluorouracil and amethopterin [^][4-14C]orotic acid incorporation into urinary [^]Mouridine in normal and leukaemic mice and into ^{*u}<ouridylic acid of rat liver sol. RNA. B.M.Stevens

T NITROFURAN DERIVATIVE [3-AMINO-6-(2-(5-[£]JITRO-2-FURYL)VINYL)-1, 2,4-TRIAZINE HYDRO-^fFLORIDE]. A NEW INDUCING AGENT FOR PHAGE [^]VELOPMENT IN LYSOGENIC E. COLI [AND A ^SCIFIC INHIBITOR OF DNA SYNTHESIS IN E. COLI]. J. H.Endo, M.Ishizawa, T.Kamiya and M.Kuwano: [^]chim. biophys. Acta, 1963. 68, 502-505 (Div. [^]Inst# Cancer Res., Fac. Med., Univ. Kyushu, [^]uoka, Japan) Prelim, comm. B.M.Stevens

I. EXTRACTION op [3H]AMINOPTERIN WITH DIHYDROFOLIC REDUCTASE. R.Silber, F.M.Huennekens and B.W.Gabrio: Arch. Biochem., 1963, 100, 525-⁵³⁰ (Dept. Biochem., Univ. Washington, Seattle, Wash., U.S.A.) Inhib. of w.b.c. dihydrofolic reductase by 10-6-10-9M aminopterin, amethopterin and dichloroamethopterin was examined. [3H]Aminopterin was ^{highly} ¹⁰P^{re} enzyme-inhibitor [E-I] complexes ^{highly} ¹⁰P^{re} enzyme-inhibitor [E-I] complexes Dialysis of the w.b.c. E-I complex produced radioactivity and corresponding reappearance of enzyme activity, the liver E-I complex was not dissociated by dialysis. The w.b.c. E-I complex was readily dissociated by [^]Shraphy on DEAEcellulose using stepwise desorption. Reactivated enzyme appeared in the h.5/^{action} and inhibitor in the 0-15M fraction. Both ion?lexes were readily dissociated by (NH4)2SO4 ^{action}. Amounts of inhibitor bound in various

(NH4)2SO4 fractions indicated a turnover no. of 50-100 at pH 8.5 for the liver enzyme. B.M.Stevens

758. DETECTION OF TUMOUR-INHIBITING MANNITOL DERIVATIVES BY MEANS OF PAPER CHROMATOGRAPHY. I.Palyi: J. Chromatography, 1962. 9, 176-179 (Res. Inst. Oncopathol., Budapest, Hungary)

A system suitable for the separation of Degranol and Mannitol-Myleran by paper chromatography is described. Soln. of Degranol were more stable than those of Mannitol-Myleran. P.D.Dawkins

759. 6-AZURACIL INHIBITION OF E. COLI B AND ITS REVERSAL BY HADACIDIN. H.T.Shigeura: Arch. Biochem., 1963, 100, 472-477 (Merck Inst. for Therapeutic Res., Rahway, N.J., U.S.A.) Growth inhibn. by 6-azauracil was reversed by hadacidin (N-formyl hydroxyaminoacetate) but growth inhibn. by hadacidin was unaffected by 6-azauracil. The inhibitory activity of 6-azauracil in the presence of hadacidin was restored by addition of adenine, adenosine, deoxyadenosine or inosine. Several other purines and pyrimidines were inactive. Inhibn. due to 6-azauracil alone was enhanced by adenine. A 6-azauracil resistant strain was sensitive to hadacidin or 6-azauridine. Hadacidin did not reverse the inhibn. due to 6-azauridine. B.M.Stevens

760. INHIBITION OF CHLOROPHYLL SYNTHESIS BY 5-FLUOROURACIL AND 5-FLUORODEOXYURIDINE. D.van Noort and A.Wallace: Biochem. biophys. Res. Comm., 1963, 10, 109 (Dept. Plant Biochem., Univ. California, Los Angeles, Calif., U.S.A.) The synthesis of chlorophyll in regreening leaves of Fe-deficient bush bean was inhib. by both 5-fluorouracil and 5-fluorodeoxyuridine. This inhibn. could be reversed by simult. application of thymidine but not uridine. B.Ketterer

761. INCORPORATION OF 5-IODODEOXYURIDINE INTO DNA OF PLANT CELLS. H.H.Smith, B.H.Kugelman, S.L.Commerford and W.Szybalski: Proc. nat. Acad. Sci., Wash., 1963. 49, 451-457 (Brookhaven Nat. Lab., Upton, L.I., N.Y., U.S.A.) Incorporation of 5-iododeoxyuridine [5-IDU] into DNA of root tip chr. of Vicia faba was demonstrated by ³H radioautography of incorporated [3H]-5-IDU and incorporation of [131Q-5-IDU]. Following 24 hr. treatment with 5-IDU a new heavy DNA component was isolated by CsCl density gradient centrifugation. Degree of thymidine replacement by 5-IDU was about 22% and slightly higher (28%) if replacement was carried out in the presence of 5-fluorodeoxyuridine. J.R.Sargent

762. FATE OF 5-BROMODEOXYURIDINE [BUdR], 5-BROMODEOXYCYTIDINE [BCdR] AND 5-IODO-DEOXYCYTIDINE [ICdR] IN MAN. J.P.Kriss, Y.Maruyama, L.A.Tung, S.B.Bond and L.Revész: Cancer Res., 1963. 23, 260-268 (Dept. Med., Stanford Univ. Sch. Med., Stanford, Calif., U.S.A.; [82Br]BUdR disappeared rapidly from blood after i.v. injn. partly by degradation and liberation of Br". [82Br]BCdR disappeared equally rapidly being degraded to BUdR. bromouracil and Br". Bromocytosine was not found. 1 hr. after injn. of either approx. 60% of the 82Br was in intracellular or intraluminal sites. After i.a. or i.v. injn. [131I]ICdR was rapidly degraded to iododeoxyuridine [IUdR] iodouracil [IU] and I". Approx. 80% or more of the 131I appeared in urine within 72 hr. mostly as I" but with small amounts of ICdR, IUdR and IU. In 3 cases after injn. of [131I]ICdR into the internal carotid artery homolat. to a

BIOCHEMISTRY

brain tumour scanning showed 1311 in the tumour region and diffusely distributed in the cerebral hemisphere. In 2 other cases given [131I]ICdR i.v. 131I was localised in an intracerebral metastasis and a hepatoma.

B.M. Stevens

763. MECHANISM OF RESISTANCE TO PYRIMIDINES IN STREPTOCOCCUS FAECALIS. I. UNUSUAL EFFECT OF 5-IODOURACIL AND 5-IODO-2'-DEOXYURIDINE. H.L.Gunther and W.H.Prusoff: J. biol. Chem., 1963, 238, 1091-1097 (Dept. Pharmacol., Yale Univ. Sch. Med., New Haven, Conn., U.S.A.) A mutant strain of S. faecalis is isolated that is resistant to the inhibn. of growth produced by 6-azathymine (7500-fold) or 6-aza-thymine 2'-deoxyribonucleoside (230-fold). The amounts of thymine and thymidine required by the mutant to attain half max. growth are increased 400-fold and 8-fold, respectively. Growth of the mutant is stim. 4-fold by addition of 5-iodouracil or 5-iodo-2'-deoxyuridine to media that contain suboptimal concn. of thymidine; no growth occurs in absence of the latter. The parent and mutant strains have similar nucleoside phosphorylase activities. The mutant utilises thymidine for synthesis of DNA thymine less efficiently.

J.N.Ashley

764. INCORPORATION OF 8-AZAGUANINE INTO SOLUBLE RNA OF BACILLUS CEREUS. D.H.Levin: J. biol. Chem., 1963, 238, 1098-1104 (Div. Biochem., Dept. Biol., M.I.T., Cambridge, Mass., U.S.A.) Incorporation of 8-azaguanine into RNA of B. cereus occurs-preferentially in the sol. RNA. A high proportion, greater than 40%, of guanine residues are replaced by azaguanine in the sol. RNA synthesised in presence of azaguanine. No other base is displaced. If the azaguanine residues are counted as guanine residues the base ratios of the sol. RNA are unaltered by the substitution. The sequential distribution of the azaguanine is identical with that of guanine in normal sol. RNA. The azaguanylate linkages in this abnormal sol. RNA are uniquely labile to mild acid. Treatment of the sol. RNA of this bacillus with RNase Ti shows that more than 75% of the total guanine residues of the unfractionated sol. RNA are located in consecutive sequences.

J.N.Ashley

765. INHIBITORY EFFECTS OF NUCLEOSIDES ON VEGETALISATION PROCESS IN SEA URCHIN EGGS. R.Lallier: Exp. Cell Res., 1963, 29, 119-127 (Centre Natl. de La Rech. Scient., Paris, France) Several purine and pyrimidine nucleosides tested inhib. the normal development of P. lividus eggs, the order of inhibitory activity being guanosine-adenosine-inosine-xanthosine-uridine. Adenine was more toxic than adenosine, its effect not being alleviated by uridine or hypoxanthine. Adenosine and inosine inhib. vegetalisation of sea urchin eggs by Li, and the phosphoric esters of adenosine counteracted the vegetalisation to some extent. The protecting action of adenosine and inosine is suggested to result from synthesis of energy-rich phosphate bonds from these nucleosides.

(French, English summary)

KJJones

766. INDUCTION OF NEOPLASMS IN PLANARIANS WITH CARCINOGENS. J.A.Foster: Cancer Res., 1963, 23, 300-303 (Stanford Univ. Sch. Med., Stanford, Calif., U.S.A.) 9*6 and 5% of Dugesia dorotocephala treated with 1,2-benzanthracene, 3'-methyl-4-dimethylaminoazobenzene and 3,4-benzopyrene respectively developed nodular growths which increased in size, became necrotic and eventually caused death. When benzanthracene treatment was followed by sectioning, 21% of the regenerating sections were affected.

In some animals highly basophilic nests of cells with increased nucleocytoplasmic ratios invaded the intestinal tract. Excessive pigmentation, giant cells and cells wth pigment globules occurred in the sub-epidermal layer under areas of epidermal hyperplasia. Numerous mitotic figures and pyknotic nuclei were apparent in hyperplasU intestinal tract and normal tissue separating channels ox. the tract was invaded and obliterated by the hyperplastif tissue.

767. EXCITATION TRANSFER AND CARCINOGENESIS.

A.Pullman and H.Berthod: Biochim. biophys. Acta» 1963, 66, 277-279 (Inst. Biol. Phys.-Chim., 13 rue Pierre Curie, Paris, France) It is concluded that Birk's criterion does not distinguish between compounds which are active and those which are inactive as carcinogens.

B.MStEV«

768. DISTRIBUTION OF PROTEIN-BOUND DYE IN SUBCELLULAR FRACTIONS FROM RAT LIVER DURING ADMINISTRATION OF 3'-METHYL-4-DIMETHYL* AMINOAZOBENZENE[3'-Me-DAB]. T.Yamada. M.Matsumoto and H.Terayama: Exp. Cell Res., I⁹⁶⁵ 29, 153-161 (Dept. Biophys. Biochem., Fac. Sci.i Univ., Tokyo, Japan) In expt. with stomach tube administration of 3'-Me-DAB, and in feeding expt. ^ polar dye concn. per unit wt. of protein was higher in ^ supernatant fraction than in 2 microsomal subfractions ^ or insol. in deoxycholate. For the supernatant fraction, the binding max. appeared 1 week after the beginning feeding, while for the other subfractions, the max. occurred 2 weeks after the beginning. The results are discussed with respect to the tumour induction mecha

K.Jones

769. AUTORADIOGRAPHIC LOCALISATION OF PROTEIN-BOUND AMINOAZO DYES. P.E.Hughes: Exp. Cell Res., 1963, 29, 327-342 (Dept. Pathol., Univ. Melbourne, Australia) All parenchymali. duct and Kupffer cells of regenerating rat liver contain** bound dye, as studied autoradiographically. Protein-^ bound material did not influence DNA function, as tiP stabiliser, gene suppressor or binding to mitotic spin-^ protein. After 2 weeks feeding of the 3'-methyl-4-^ methylaminoazobenzene, islands of cells with increase mitotic activity and decreased dye-binding capacity, were noted, while the non-carcinogenic dye did not*, the effect.

770. CHANGES IN CELLULAR DNA IN MOUSE SKIN FOLLOWING APPLICATION OF TUMOUR-PROMOTING AGENT. E.S.Meek: Exp. Cell Res., 1963, 29, 38*^{mu} 393 (Dept. Pathol., Univ. Bristol, England) »; painted with a tumour-promoting agent, the cell pr? liberation was accompanied by a slight increase in ^ f^{mu} with DNA complements greater than diploid but no *^{mu} reduction in the stem-line value, as shown by absorptions^ measurements of Feulgen-stained epithelial nuclei. *^{mu} result agreed with that expected in simple hyper^ s^{mu} des a normal tissue.

EF

771. PROTEIN-BOUND DYES IN THE SERUM AND OF RATS FED AMINOAZO DYES. J.Dijkstra and ^ Louw: Brit. J. Cancer, 1962, 16, 757-762 (Nat. binding Chem. Res. Lab., Pretoria, S. Africa) The binding

of 4-dimethylaminoazobenzene and various substitu^ analogues to serum proteins of Wistar rats was studie^ The azo-compounds were administered by stomach rub# Free dye in serum was low in first 10 hr., rose to a^ between 20 and 40 hr. then declined. The binding

{& serum paralleled that in the liver. The extent of binding of the dyes tested paralleled their carcinogenicity except for 2-methyl-4-dimethylaminoazobenzene which ^{w*}s weakly carcinogenic but strongly bound to liver proteins, though less strongly to serum proteins. D.Hamer

^{722.} PRECURSORS OF CARCINOGENIC HYDROCARBONS IN TOBACCO SMOKE. E.Gil-av and J.Shabtai: Nature, Lond., 1963, 197, 1065-1086 (Daniel Sieff Res. Inst., Weizmann Inst. Sci., Rehovoth, Israel) Data have been reviewed in support of the view that ^{*er}Penic compounds in tobacco undergo reactions during its combustion that lead to the formation of isoprene and ^{^otnatic} compounds, including the carcinogen. 3.4-^{be}nzopyrene. G.M.Lewis

^{723.} BURN TEMPERATURES OF CIGARETTE AND PIPE TOBACCOS. W.J.de Wet: S. Afr. J. agric. Sci., 1962, 5, 589-596 (Tobacco Res. Inst., Rustenburg, S. Africa). I.A.B.S.

CLINICAL BIOCHEMISTRY

^{724.} IMMUNOLOGICAL DETERMINATION OF HUMAN CHORIONIC GONADOTROPHIN IN SERUM. D.R.Mishell, jun., L.Wide and C.A.Gemzell: J. clin. Endocr., 1963, 23, 125-131 (Dept. Obstet. Gynecol., Akademiska Sjukhuset, Uppsala, Sweden) The ^{haemagglutinin}, inhibn. reaction was used. Serum was treated with acetone and the HCG-containing fraction was washed with abs. alcohol and ether. The results obtained by this method were compatible with those by various assay techniques. K.Jones

DETERMINATION OF THE HALF LIFE TIME OF HUMAN PLASMA HAPTOGLOBIN. J.Moretti, J.Borel, W.Dobryszycka and M.-F.Jayle: Biochim. biophys., 1963, 69, 205-211 (Lab. Biochim., Fac. Méd., Paris, France) [131i]Haptoglobin was inj. into ^{humans} subjects and elimination followed for 11 days. ⁱ[L^h al* life appeared to be 4 days. Breakdown products form of small peptides appeared in the urine.

⁷²⁶ (French) B.M.Stevens

HAEMOGLOBIN-BINDING CAPACITY OF THE ^{^OMUCOID} FRACTION OF HUMAN SERUM. ^{^M.Dobryszycka:} Clin. chim. Acta, 1962, 7, 761-767 (Dept. Biochem., Fac. Pharm., Med. Sch., Poland) Concn. of seromucoid, total V, ^{^8}globin [Hp] and sulphosalicylic acid-sol. Hp [SS-Hp] determined in normal sera. Seromucoid derived from serum incubated with-Hb was separated by paper electrophoresis at pH 8.6. A significant decrease was found in the 0.2-seromucoid content. Hb-binding capacity of the cone, seromucoid was investigated. ^{not be}coid showed only a small part of the total Hb-binding capacity of serum. The lost Hp activity could be traced among proteins pptd. by sulphosalicylic acid. Determinations of SS-Hp were also made in some sera, and significant differences found. The ^{importance} of SS-Hp and its relation to the total Hp of serum are discussed. V.M.Wootton

VESTIGATION OF HUMAN SERUM PROTEINS AFTER AMMONIUM SULPHATE FRACTIONATION AT

VARYING CONCENTRATIONS AND pH. R.Bo*rrillon, R.Got and G.Lévy: Clin. chim. Acta, 1962, 7, 835-845 (Fac. Méd., Lab. Biochim. Med., Paris, France)

After (NH₄)₂SO₄ fractionation of human serum proteins in varying concn. and pH the soln. were separated by DEAE-cellulose chromatography and starch gel electrophoresis. Protein identification in each fraction was simult. effected by paper-, starch gel-, and immuno-electrophoresis. V.M. Wootton

^{778.} CHARACTERISTICS OF AN ACID-DISSOCIABLE HUMAN SERUM MACROGLOBULIN. E.D.Rees: Clin. chim. Acta, 1962, 7, 846-853 (Dept. Med., Univ. Kentucky, Lexington, Ky., U.S.A.) ^y-Globulin was prep, from serum containing abnormal amounts of ^{7S}, ^{13S}, ^{18S} and ^{26S} ^y-globulin components by (NH₄)₂SO₄. or by low ionic strength fractionation. In buffer, pH 4.2, all the heavier ^y-globulin components dissociated to ^{7S} units, except for a small amount of ^{19S} component which dissociated in mercaptoethanol. Only one-half of the total ^{7S} component present in acid buffer seemed able to aggregate: this amount of aggregation was complete at any pH above 7. Aggregation was also enhanced by increased concn. or decreased temp. It was not influenced by mercaptoethanol or a chelating agent, or by increased ionic strength. Acetylation of the free amino groups decreased the aggregation. V.M.Wootton

^{779.} HUMAN PLASMA GLYCOPROTEINS. I. METHOD FOR ISOLATING COHN'S FRACTION VI AND GLYCOPROTEIN DETERMINATION IN PATIENTS WITH RHEUMATOID ARTHRITIS. W.Btlrgi and V.Geeler: Z. Ges. exp. Med., 1963, 136, 419-431 (Pathol. Inst., Univ. Ztirich, Swtizerland) A rapid electrophoretic method for isolating the glycoproteins of fraction VI, mainly consisting of (Xi-acid glycoprotein, is described. This fraction was increased in the serum of most cases of rheumatoid arthritis. (German) P.F.Meyer

^{780.} DIFFERENCES BETWEEN THE NORMAL SERUM PROTEIN PATTERNS OF AMERICAN INDIAN, NEGRO AND CAUCASIAN SUBJECTS. G.C.Klein, M.M. Cummings and J.F.Hammarsten: Proc. Soc. exp. Biol. N.Y., 1962, 111, 298-300 (V.A. Hosp., Oklahoma City, Okla., U.S.A.) Indian and Negro protein patterns are similar in that they have a lower % of albumin and higher % of ⁸ and ^y-globulins than the Caucasian. Indian pattern differs from the other 2 by having an increased % of Oci- and decreased % of (X2-globulin).

M.M.Shapland

^{781.} A SIMPLE SCREENING TEST FOR WALDENSTROM'S MACROGLOBULINAEMIA. E.B.Thorling: Nature, Lond., 1963, 197, 605-606 (Cancer Chemotherapeutic Dept., Anti-Cancer Centre, Aarhus, Denmark) A test is described in which water flowed down a filter paper past a streak of serum for 75 min., after which the pattern produced was stained with Bromphenol Blue. A characteristic pattern was obtained with normal serum. Sera from cases of Waldenstrtm's macroglobulinaemia showed a well-defined deeply stained band at the site of application due to pptn. of the high mol. wt. proteins; this was prevented if cysteine was added to cause de-polymerisation. Other cases of neoplastic disease did not show this pattern. G.M.Lewis

^{782.} HUMAN LIPOPROTEINS: ROLE IN TRANSPORT OF THYROID HORMONES. E.Toro-Goyco and M.Cancioi Science, 1963, 139, 761-762 (V.A. Hosp., Sch. Med., Univ. Puerto Rico, San Juan, Puerto Rico)

BIOCHEMISTRY

Lipoproteins from patients receiving therapeutic doses of 13*1 were isolated by density gradient techniques. Circulating thyroid hormones were bound mainly by the proteins of density greater than 1*23 g./ml., to a much less extent by OC-lipoproteins, and negligibly by δ -lipoproteins.

G.M.Lewis

783. ACID PHOSPHATASE IN SERUM: INCREASE IN ACUTE MYOCARDIAL INFARCTION. M.R.Schoenfeld: Science, 1963, 139, 51-52 (Med. Service, Lincoln Hosp., New York, U.S.A.) Significant rises in serum acid phenylphosphatase accompanied symptoms of acute transmural myocardial infarction and other thromboembolic diseases. It is suggested that the excess enzyme is released from platelets.

G.M.Lewis

784. SERUM TRANSAMINATION SYSTEM WITH PARTICULAR REFERENCE TO LIVER INJURY. L.Jaroszewicz and S.Niewiarowski: Bull. Acad. pol. Sci., 1963, 11, 61-64 (Dept. Physiol. Chem., Sch. Med., Bialystok, Poland) Colorimetric and chromatographic methods were used for transaminase activity determinations. Results were divergent. The colorimetric method was more adequate for quant. determination. Besides alanine and aspartate transaminases, there exists a system of other transaminases in human and dog serum. These enzymes participate in slow-rate transamination of 12 amino acids other than alanine and aspartic acid. The activities of these enzymes do not change significantly in the course of liver injury.

J.E.Hobbs

785. LIPOLYTIC ACTIVITY OF POST-HEPARIN PLASMA IN HYPERGLYCERIDAEMIA. D.S.Fredrickson, K.Ono and L.L.Davis: J. lipid Res., 1963, 4, 24-33 (Section on Mol. Dis., Lab. Metabolism, N.H.I., Bethesda, Md., U.S.A.) Post-heparin plasma lipolytic activity in the majority of patients with hyperglyceridaemia was equal to or greater than that found in normal subjects. Activity in patients with carbohydrate-induced hyperglyceridaemia was greater than in normal subjects, but in fat-induced γ -hyperglyceridaemia activity was abnormally low. Activity in both normal and hyperglyceridaemic subjects was uniformly dependent upon prior dietary fat intake.

J.R. Sargent

786. SIMPLIFIED METHOD FOR DETERMINATION OF SERUM ALKALINE PHOSPHATASE ACTIVITY. K.Roos: Scand. J. clin. Lab. Invest., 1963, 15, Supp. 69, 233-243 (Central Lab., Sahlgren's Hosp., Gothenburg, Sweden) A modified method, which does not require protein pptn. or any blank test, is described for the determination of a lk. phosphatase activity in serum. The results obtained with this method agreed well with those of others.

K.Jones

787. DETERMINATION OF γ -GLUTAMYL TRANSPEPTIDASE ACTIVITY IN HUMAN SERUM AND URINE. M.Otfowski and A.Szewczuk: Clin. chim. Acta, 1962, 7, 755-760 (Dept. Biochem. Oncol., Inst. Immun. Exp. Ther., Polish Acad. Sci., Wroclaw, Poland) A simple and improved method for the synthesis of γ -L-glutamyl-CX- and \bar{p} -naphthylamide is described. A procedure for determining γ -glutamyl transpeptidase activity, based on the colorimetric determination of $\bar{O}t$ -naphthylamine liberated from its γ -glutamyl deriv. is given. Synthesis of the substrates is simple. Both substrates can be used for the histochem. demonstration of the enzyme in tissue sections. γ -Glutamyl transpeptidase activity was very high in obstructive jaundice, cholangitis and liver cancer, while lower levels were found in viral hepatitis

and cirrhosis of the liver. The method may be of clinical use.

V.M.Wootton

788. LOW SERUM LACTIC DEHYDROGENASE ACTIVITY IN POST-HAEMORRHAGIC ANAEMIA. D.L.Mackler, J.J.Sampson and A.E.Lewis: Amer. J. med. Sci., 196* 245, 43-51 (Dept. Med., Mount Zion Hosp., San Francisco, Calif., U.S.A.) Haemorrhage causes a fall of serum lactic dehydrogenase activity, followed W^t rise. The rise is due to a release of the enzyme from tissues, e.g. the liver, followed by an increase of its synthesis.

E.E.Hobbiger

789. PRESENCE OF [127I]IODOTYROSINES IN EXTRACT¹ OF NORMAL HUMAN SERUM. S.C.Werner and L.Radichevich: Nature, Lond., 1963, 197, 877-878 (Dept. Med., Columbia Univ. Coll. Physn. Surgn., N.Y. York, U.S.A.) [131I]Diiodotyrosine [DIT] and mono iodotyrosine [MIT] of known sp. activity were added to normal serum and the [127QMIT and DIT estimated by isotope diln. or deriv. formation by dinitrophenylation[#] using paper chromatographic techniques. About one third of the extractable serum I appears to be present as iodo tyrosines, probably released from other compounds during the course of prep, for chromatography.

G.M.Lew

790. DYNAMICS OF PLASMA FREE FATTY ACID METABOLISM DURING EXERCISE. S.J.Friedberg, P.B.Sher. M.D.Bogdonoff and E.H.Estes: J. lipid Res., 1963, * 34-38 (Co-operative Lipid Lab. and Cardio-isotope A Unit, V.A. Hosp., Durham, N.C., U.S.A.) Frac[£] turnover rate and total turnover rates of plasma free ft^w acids were increased in human subjects during exercise. The concn. of free fatty acids in the plasma fell at the beginning of exercise, then rose to a level exceeding[^] of the resting state. Immediately after exercise a ft^w abrupt rise occurred, followed by a decline. It is inferred that exercise accelerates the efflux of plasma free fatf acids and, secondarily, increases mobilisation of free fatty acids from fat depots.

J.R. S[#]

791. QUANTITATIVE SEPARATION AND DETERMINATION OF BILIRUBIN AND CONJUGATED BILIRUBIN IN HUMAN SERUM. A.P.Weber and L.Schalm: Clin. chim. Acta, 1962, 7, 805-810 (Municipal Hosp^f Arnhem, Netherlands) In this simple method suitable for routine clinical chem. use, bilirubin and conjugated bilirubin are separated before quant. determ.[^] The serum must be protected from light. Serum is added[^] a soln. of ethyl acetate and lactic acid, followed by addition of CHCl₃ and then cone. diazo reagent. T^{**} mixture is gently shaken and then centrifuged to give[®] 2 crystal-clear layers. Should the serum contain only bilirubin, as in normal sera, the upper layer is colourless^{*} and the lower layer yellow. If the serum also contains conjugated bilirubin, the upper layer is coloured[®] For quant. determination of the conjugated bilirubin, the upper layer is transferred with a Pasteur pipette^{**} J 5 J #* which is tightly stoppered and kept in darkness for 1" room temp, and the extinction then measured. Reproducibility of the method is about 0-10 mg. pigment[†] 100 ml. serum. Small quantities of serum are^a adequate so neonatal blood can be examined.

V.M.Wootton

792. BLOOD AMMONIA IN LIVER DISEASE. J.St^{**1}: Ann. intern. Med., 1963, 58, 1-24 (Fac. Med., Strasbourg, France) Blood NH₃ at different venous levels varies in relation to circulatory conditions. Gastrointestinal haemorrhage, the regular rise in an

NH₃ reveals cirrhosis or extrahepatic block. The correlation between blood NH₃ and coma is analysed.

R.S.Toaks

793. PROPERTIES OF SERUM FRACTIONS DERIVED FROM WHEAL REACTIVE DIPHTHERIA ANTITOXIN. W.J.Kuhns: Proc. Soc. exp. Biol., N.Y., 1962, 111, 282-288 (Dept. Path., New York Univ. Sch. Med., New York, U.S.A.) Fractionation of wheal reactive diphtheria antitoxin serum produced a considerable loss of skin activity. Fractions retaining activity were mainly fixtures of y- and OC2-globulins and attempts at further separation produced a marked loss of activity particularly to components free of (X2-globulin). This supports the idea that a non-y-globulin component plays a role in the reactivity of reagins. M.M.Shapland

794. INFLUENCE OF A FAMILY DIET PATTERN HIGH IN LINOLEIC ACID ON SERUM CHOLESTEROL LEVEL: ONE YEAR STUDY. L.Swell, P.E.Schools, jun. and C.R.Treadwell: Proc. Soc. exp. Biol., N.Y., 1962, 111, 48-50 (V.A. Center, Martinsburg, W.Va., U.S.A.) A significant decrease in serum cholesterol was observed in clinically healthy subjects with elevated levels, after being placed on high linoleic acid diet. It is concluded that a dietary regimen for lowering cholesterol level is practical for long periods. M.M.Shapland

795. COLORIMETRIC DETERMINATION OF GLUCOSE IN 20 µl. OF BLOOD. D.M.Campbell and E.J.King: J. clin. Path., 1963, 16, 173-174 (Postgrad. Med. Sch., London, England) The Brown ultra-micro Cu action method was modified by pptg. proteins with J.tungstate and CUSO₄ to eliminate non-sugar reducing C₁₂haemines# The supernatant was then treated with alk. IM 4t and the amount of cuprous oxide formed determined by the colour produced with neocuproine.

796. AUTOMATIC DETERMINATION OF BLOOD CHOLESTEROL. J.Boy: J. clin. Path., 1963, 16, 178-180 (Civil Hosp., Rheims, France) The determination was based on Pearson's method, with slight modifications in the proportions of the reagents, using an automatic apparatus with a const. time for the reaction and mixing processes, and a const. temp. J.B.Derbyshire

797. GUANOSINE PHOSPHATE MANNOSE IN ERYTHROCYTES. G.C.Mills and C.A.Jones: Tex. Rep. Biol. Med., 1963, 21, 57-64 (Univ. Texas Med. Branch, Galveston, Tex., U.S.A.) GDP-mannose was isolated from normal r.b.c. and from r.b.c. of a glucose 6-dehydrogenase deficient individual following a drug-induced haemolytic attack. The isolated GDP-mannose was compared with a commercial prep, using paper chromatography and anion exchange techniques. The isolated and commercial compounds were subjected to mild acid hydrolysis to yield GDP and mannose. Results indicate that GDP-mannose is the primary component in the GDP hexose peak found by anion exchange analysis of blood filtrates of human r.b.c. A.J.Martin

798. SYNTHESIS OF HAEM IN NORMAL AND LEUKAEMIC LEUCOCYTES. T.R.Walters, T.J.Gribble and J.C.Schwartz: Nature, Lond., 1963, 197, 1213-1214 (Paediatrics, Stanford Univ. Sch. Med., Palo Alto, Calif., U.S.A.) Haem synthesis, as measured by uptake of ⁵⁹Fe, can be demonstrated in w.b.c. obtained from patients with acute leukaemia, but not in those from normal individuals or patients with chronic leukaemia. The difference may be due to the lymphoblasts or

myeloblasts present in the blood in acute leukaemia. G.M.Lewis

799. ABNORMAL Hb STUDIES IN TAIWAN ABORIGINES. R.Quentin Blackwell and J.Tung-hsiang Huang: Science, 1963, 139, 771 (Biochem. Dept., U.S. Naval Med. Res. Unit No. 2, Taipei, Taiwan) Examination of 655 blood samples from 3 aboriginal tribes in Taiwan by vertical starch gel electrophoresis at pH 9.0 revealed the presence of only the A Hb. G.M.Lewis

800. ERYTHROCYTE ACID PHOSPHOMONOESTERASE AND GLUCOSE 6-PHOSPHATE DEHYDROGENASE DEFICIENCY IN CAUCASIANS. F.A.Oski, N.T. Shahidi and L.K.Diamond: Science, 1963, 139, 409-410 (Children's Hosp. Med. Center, Harvard Med. Sch., Boston, Mass., U.S.A.) Caucasian patients with r.b.c. glucose 6-PO₄ dehydrogenase deficiency also have a deficiency in r.b.c. acid phosphomonoesterase. This latter deficiency is not present in Negroes with the glucose 6-PO₄ dehydrogenase deficiency. G.M.Lewis

801. ISOLATION OF THE 'SLOW' PROTEINS Y, XI AND X2 FOUND IN PREPARATIONS OF HUMAN Hb. G.Laurent, C.Marriq, D.Nahon, M.Charrel and Y.Derrien: C.R. Soc. Biol., Paris, 1962, 156, 1456-1461 (Lab. Chim. Biol., Fac. Méd., Marseille, France) The proteins XI, Xg and Y were isolated from an ethanol-CHCl₃ extract of haemolysed human r.b.c. by chromatography on Amberlite CG-50 columns. Paper electrophoresis of the fractions from the column showed that the proteins could be obtained in a pure form. (French) M.A.Price

802. IDENTIFICATION OF THE ERYTHROCYTE PROTEINS Y, XI AND X2 WITH HUMAN CARBONIC ANHYDRASES. G.Laurent, M.Charrel, M.Castay, D.Nahon, C.Marriq and Y.Derrien: C.R. Soc. Biol., Paris, 1962, 156, 1461-1464 (Lab. Chim. Biol., Fac. Méd., Marseille, France) An estimation of the sp. enzyme activity, absorption coeff. and Zn content of purified proteins Y, XI and X2 allowed the identification of these compounds with the carbonic anhydrases of Nyman, CA V, CA III and CA II respectively. Further evidence was obtained by electrophoresis and ultracentrifugation. A decreased enzyme activity of Y compared with CA V suggested that Y had undergone some denaturation during the purification procedure. (French) M.A.Price

803. N-METHYLMETANEPHRINE: EXCRETION BY JUVENILE PSYCHOTICS. T.L.Perry: Science, 1963, 139, 587-589 (Div. Chem., California, Inst. Technol., Pasadena, Calif., U.S.A.) Three out of 18 psychotic children excreted N-methylmetanephrine in the urine although levels of bufotenin⁺, 4-dimethoxyphenylethylamine, tryptamine and 5HT were normal. G.M.Lewis

804. PHENYLKETONURIA. II. EXCRETION OF N-ACETYL-L-PHENYLALANINE IN PHENYLKETONURIA. F.B.Goldstein: Biochii. biophys. Acta, 1963, 71, 204-206 (Res. Dept., Letchworth Village, New York State Dept. Mental Hyg., Thiells, N.Y., U.S.A.) B.M.Stevens

805. MEASUREMENT OF URINARY TETRAHYDROALDOSTERONE BY GAS-LIQUID PARTITION CHROMATOGRAPHY. H.F.Carr, jun. and H.H.Wotiz: Biochii. biophys. Acta, 1963, 71, 178-184 (Dept. Psychiatry, Boston Univ. Sch. Med., Boston, Mass., U.S.A.) A mean basal excretion of 46[±]7 fg./24 hr. was determined in 5 normal subjects on normal Na intake.

BIOCHEMISTRY

Amounts increased on Na deprivation or ACTH administration. Two other, more mobile, components were observed, 1 of which was consistently increased by Na restriction. The chromatographic method was efficient, quick, accurate and reproducible.

B.M.Stevens

806. DETECTION AND DETERMINATION OF PETHIDINIC ACID IN URINE. S.L.Tomsett: *Acta pharmacol., Khb.*, 1962, 19, 368-370 (*Biochem. Labs., North Gen. Hosp., Edinburgh, Scotland*) Pethidinic acid, a major metabolite of pethidine in man, can be identified using paper chromatography.

R.S.Tonks

807. ELEVATED LEVELS OF LACTIC DEHYDROGENASE, GLUTAMIC-OXALOACETIC TRANSAMINASE, AND CATALASE IN INFECTED URINE. B.M.Brenner and V.E.Gilbert: *Amer. J. med. Sci.*, 1963, 245, 31-42 (*Dept. Med., Div. Infectious Dis., Univ. Pittsburgh Sch. Med., Pa., U.S.A.*) Normal urine possesses lactic dehydrogenase activity but is devoid of catalase or GOT activity. In human and expt. urinary tract infections the former is increased and the latter become detectable.

E.E.Hobbiger

808. ISOINTENSITY PATTERNS FROM RADIOACTIVE COLLOIDAL GOLD IN SEROUS CAVITIES. J.M.Morgan and R.Wigh: *Amer. J. Roentgenol.*, 1963, 89, 567-569 (*Dept. Radiol., Med. Coll. Georgia, Augusta, Ga., U.S.A.*) The distribution of radiation around a patient who has received an i.p. or intrapleural injn. of radioactive Au (50 to 150 pc) was plotted, and resembles the magnetic field of a bar magnet, being least intense at the head and feet.

D.E.Evans

809. IRON STORAGE IN HUMAN DISEASE. FRACTIONATION OF HEPATIC AND SPLENIC IRON INTO FERRITIN AND HAEMOSIDERIN WITH HISTOCHEMICAL CORRELATIONS. E.H.Morgan and M.N.I.Walters: *J. clin. Path.*, 1963, 16, 101-107 (*Univ. W. Australia Physiol. Dept., Perth, W. Australia*) Fe storage in the liver and spleen as ferritin or haemosiderin was measured chem. in 130 normal or diseased subjects, and compared with histochem. methods. In normal subjects, approx. 400 mg. Fe was stored in the liver and spleen, with increased or decreased storage in disease. When the tissue contained less than 500 fig./g. Fe, more was stored as ferritin than as haemosiderin, but for values greater than 1000 pg./g#, more was stored as haemosiderin. The histochem. results gave only an approx. estimate of Fe storage.

J.B.Derbyshire

810. TRYPTOPHAN-NICOTINIC ACID METABOLISM IN SUBJECTS RECENTLY OR LONG-SINCE RECOVERED FROM VIRAL HEPATITIS. M.Piazza and F.Tancredi: *Nature, Lond.*, 1963, 197, 903 (*Inst. Infectious Dis., 'Gesù d Maria', Univ. Naples Italy*) In about 60% of subjects recovered from viral hepatitis, clinical examination and many tests for liver function showed that some alteration of the tryptophan-nicotinic acid metabolism was still present, the lesion being principally connected with kynurenine oxidase activity.

G.M.Lewis

811. ORAL AND INTRAVENOUS ^{131}I -TRIOLEIN TESTS IN THE ASSESSMENT OF DISTURBED TRIGLYCERIDE METABOLISM. S.Wallach and H.L.Jones: *Amer. J. med. Sci.*, 1962, 244, 612-621 (*Dept. Med., U.S. Naval Hqsp., Chelsea, Mass., U.S.A.*) Data obtained with $[^{131}\text{I}]$ triolein suggest that in patients with coronary atherosclerosis, hypothyroidism, nephrosis and essential hypercholesterolaemia, both the production and degradation of triglycerides are increased.

E.E.Hobbiger

812. OBSERVATIONS ON HUMAN TISSUES AND TUMOUR PROTEINS. M.P.Tombs, D.Burston and N.F.Maclagan: *Brit. J. Cancer*, 1962, 16, 782-793 (*Westminster Med. Sch., London, England*) Human tissue extracts were investigated with a view to establishing the origin of the serum glycoprotein which are raised in cancer cases. Electrophoresis, immuno-electrophoresis and chromatography on DEAE-cellulose were used. The cytoplasmic proteins could be separated chromatographically into 5 main fractions and the characteristics of these fractions are described. Tumour however, were not particularly rich in acidic proteins as it was concluded that the increased circulating glycoprotein arises partly in the liver.

D.Harn*

813. γ -AMINOBUTYRIC ACID AND GLUTAMATE DECARBOXYLASE ACTIVITY [GDA] OF BRAIN TUMOURS. M.Wolleman and T.Dévényi: *J. Neur. chem.*, 1963, 10, 83-88 (*Inst. Biochem., Hungarian Acad. Sci., Budapest, Hungary*) 25 specimens of brain tumour distributed among 6 main types were analysed. No GABA could be detected in any of the tumours but it was conspicuous in normal brain. GDA $\frac{\text{GDA}}{\text{GDA}}$ 40-80% lower in tumours than normal tissue if pyridoxal phosphate was present in the reaction mixture. Omission of pyridoxal phosphate depressed normal tissue GDA $\frac{\text{GDA}}{\text{GDA}}$ but tumour GDA was depressed 80-100%. R.Woodm*ⁱ

814. SERUM GLUCOPROTEIN DISTRIBUTION IN PATIENTS WITH DIAGNOSED CANCER. D.Andriess*, J.A.P.Stroes and H.Hellendoorn: *Clin. chim. Acta*, 1962, 7, 823-827 (*Clin. Chem. Lab., Marine Hospt Overveen, Netherlands*) A new modification of KoiV and Gronwall's method for the staining of electrophoretically separated glucoproteins is given, including an elution procedure. The glucoprotein distribution $\frac{\text{GDA}}{\text{GDA}}$ sera from normal persons, patients with diagnosed but untreated cancer, and patients with diagnosed treated cancer was investigated. In several cases of cancer there were no significant changes in the distribution pattern of glucoproteins separated by paper electrophoresis, especially if the patients had not, or not recently, undergone X-ray or surgical treatment. Normal distribution were found in several sera from patients with proved malignant tumours which makes it doubtful whether $\frac{\text{GDA}}{\text{GDA}}$ protein paper electrophoresis is of greater clinical value in diagnosis of early stages of cancer. Abnormalities in the relative distribution or total amount of circulating glucoproteins may be due to treatment, so the possible influence of treatment on the results must be considered.

V.M.Wootton

815. STUDIES IN MAN ON GONADOTROPIN-RESPONSIVE FEMINISING ADRENAL CORTICAL NEOPLASIA. H.Dempsey and S.R.Hu1, jun.: *J. clin. Endocr.*, 1963, 23, 173-180 (*Div. M₁stab. Endocr., Dept. Med., Univ. Alabama Med. Center, Birmingham, Ala., U.S.A.*) Hormonal responsiveness and steroid hormone biosynthesis were studied in a patient with a feminising adrenal cortical tumour. The results suggested that the steroid biosynthetic pathways in this tumour closely resemble those usually found in normal ovarian tissue.

K.Jones

816. FURTHER STUDIES ON ORIGIN OF PREGNA Δ^{14} RC IN ADRENAL CARCINOMA. D.E.Fukushima, H.M. Bradlow, L.Hellman and T.F.Gallagher: *J. clin. Endocr.*, 1963, 23, 266-273 (*Sloan-Kettering Inst. Cancer Res., New York, U.S.A.*) Δ^{14} -Dihydroxy-A Δ^{14} -pregnene-20-one [DPO] appeared to be the major precursor of urinary pregnane-30,17,20-triol in a patient

BIOCHEMISTRY

79

⁸¹ with adrenal carcinoma. The evidence indicated that compound(s) other than DPO contributed to A5-pregnane-17,20a-triol. K.Jones

^{817.} ISOLATION OF 5CC-ANDROSTAN- AND CRYSTAL-LINE 5j8-ANDROSTAN-[3<X ->j8-O SIDE)-D-GLUCO-PYRANOSURONIC ACID-17-ONE FROM URINE OF WOMAN WITH ADRENAL ADENOMA. H.E.Hadd and R.I.Dorfman: J. biol. Chem., 1963. 238. 907-912 (Worcester Found. Exp. Biol., Shrewsbury, Mass., U.S.A.) The 2 products named in the title are isolated by countercurrent distribution. J.N.Ashley

^{818.} METABOLISM OF 19-HYDROXYANDROST-4-ENE-3,17-DIONE AND TESTOSTERONE BY HUMAN ADRENAL TISSUE. L.L.Engel and A.Dimoline: I. Endocr., 1963, 26. 233-240 (J.C.Warren Labs., Huntington Mem. Hosp., Harvard Univ., Boston, Mass., U.S.A.) Adrenocortical tissue from patients with advanced metastatic breast cancer was incubated with known natural oestrogen precursors. Although there was some transformation of testosterone to 19-hydroxyandrost-4-en-3-one there was no evidence of aromatization. G.F.Blane

^{819.} SEPARATION OF OESTROGEN CONJUGATES FROM HUMAN URINE. R.Hahnel: Clin. chim. Acta. 1962, 7, 768-775 (Dept. Biochem., Royal Perth Hosp., Perth, W.Australia) A method is described for the separation of the 3 major oestrogens, oestrone, oestradiol-17 β , and oestriol, as their conjugates from pregnancy urine. The conjugates are removed from urine on a column of anion exchange resin Deacidite and subsequent quant. elution of the oestrogen conjugates. It is thought that this method could be used for concentrating oestrogen conjugates from urines with very low estrogen content. V.M.Wootton

^{820.} IN VIVO DEIODINATION OF LABELLED L-THYROXINE TO L-3,5,3'-TRIIODOTHYRONINE [T3] IN MUSE AND HUMAN PITUITARIES. R.Grinberg, E.M.Volpert and S.C.Werner: J. clin. Endocr., 1963, 140-142 (Roswell Park Mem. Inst., Buffalo, New York, U.S.A.) Four hr. after injection of L-[131I]thyroxine into and radiothyroidectomised mice, up to 70% of the radioactivity found in the pituitaries was in the form of T₃. In pituitaries of 2 patients undergoing pituitaryectomy, 5 and 10% of the radioactivity was present K.Jones

^{821.} CONJUGATED STEROIDS IN PLASMA. DC. ESTIMATION OF FREE AND CONJUGATED STEROIDS IN ADRENAL VENOUS BLOOD AND PERIPHERAL BLOOD. G.W.Oertel, E.Kaiser and W.Zimmermann: Hoppe-Seyler's Z. physiol. Chem., 1963. 331, 77-84 (Endocr. Dept., Inst. Hyg. Microbiol., Univ. Saarlandes, Homburg, Germany) Blood from a woman with carcinoma of the breast revealed besides the secretory products of the adrenal cortex, a number of Δ^5 -3 β -hydroxysteroids, especially dehydroepiandrosterone. The conjugates probably consist of sulphates and glucurides. The estimation requires a lengthy purification procedure, for which full expt. details are given. (German) I.Cornish

^{822.} NEW STAINING TECHNIQUE FOR KETOSTEROID CHROMATOGRAMS. E.Epstein and B.Zak: J. clin. Endocr., 1963, 23. 355-357 (Dept. Clin. Pathol., St. Joseph Mercy Hosp., Pontiac, Mich., U.S.A.) In this technique, 17-KS on paper chromatograms undergo

complete reaction when immersed for a prolonged period. An aq. 1*k*., *jm*-dinitrobenzene reagent is used as the reaction medium. K.Jones

^{823.} RING D-(K-KETOLS AS METABOLIC PRODUCTS OF OESTROGEN IN NONPREGNANT HUMAN. R.Hobkirk: J. clin. Endocr., 1963. 23, 279-285 (Univ. Med. Clin. Montreal Gen. Hosp., Montreal, Canada) The ring D-OC-ketolic fraction consisted of approx. equal amounts of 16(X-hydroxyoestrone and a 16-keigestradiol-17j β fraction perhaps containing some 16 β -hydroxyoestrone. Radioautographic studies showed that 16OC-hydroxyoestrone and the 16-ketoestradiol fraction arose from oestrone, perhaps via some common intermediate. K.Jones

^{824.} ELECTROPHORESIS OF SALIVA IN STARCH GEL. R.W.Shaw, R.G.Bozek and G.E.Connell: J. dent. Res., 1962. 41. 1322-1326 (Dept. Biochem., Univ. Alabama Med. Center, Birmingham, Ala., U.S.A.)

Proteins in parotid and extra-parotid saliva from 7 individuals were separated by electrophoresis on starch gel containing a high concn. of urea buffered at pH 3.9. At least 5 zones were detected in most saliva specimens and there were variations in the pattern between individuals.

R.J.Andlaw

^{825.} COMPOSITION OF NORMAL AND PATHOLOGICAL CUTANEOUS ELASTIN. J.G.Smith, jun., E.A.Davison and R.L.Hill: Nature, Lond., 1963. 197, 1108-1109 (Div. Dermatol., Dept. Med., Duke Univ. Med. Center, Durham, N.C., U.S.A.) Fibrous proteins isolated by hot alkali extraction of normal human skin and human skin involved with actinic elastosis and pseudoxanthoma elasticum have quite similar amino acid compositions, which are similar to those of elastins from other sources.

G.M.Lewis

^{826.} BRAIN LIPIDS IN TAY-SACHS DISEASE. II. SOLUBILITY PROPERTIES OF GANGLIOSIDES. III. INCORPORATION OF 3H2O INTO BRAIN LIPIDS. S.Gatt and E.R.Berman: J. Neurochem., 1963. 10. 65-72, 73-77 (Dept. Biochem., Hebrew Univ., Hadassah Med. Sch., Jerusalem, Israel) II. Only 10% of the gangliosides in 2:1 chloroform/methanol extracts of brain from Tay-Sachs patients could be partitioned into 0.1M aq. KCl. The remainder could however be partitioned into pure water. These 2 types of ganglioside had similar chem. compositions differing from those found in normal brain in having less sialic acid and more N-acetyl hexosamine. Expt. in which soln. of gangliosides in water or 0.1M KCl were shaken with chloroform/methanol extracts of brain showed that even normal gangliosides could be bound to excess lipids and remain in the lower phase and this is postulated as the basis for differential partitioning of the 2 Tay-Sachs gangliosides.

III. A 22-month old child suffering from Tay-Sachs disease was inj. 6 times with 3H2O during the week preceding death. The brain was frozen within 3 hr. of autopsy. The relative sp. radioactivities of various brain lipids were as follows: lecithins and cephalins each 1100 counts/min./pmole; ceramides, 390; sphingomyelin, 225; cerebrosides, 190; hexosamine-containing glycolipid, 180; ganglioside, 165; 165 cytoside, 95; and cholesterol, 22. The values for phospholipid and cholesterol confirm previous findings with normal brain.

R.Woodman

^{827.} LACTIC AND MALIC DEHYDROGENASES IN HUMAN SPERMATOZOA. E.Goldberg: Science, 1963. 139. 602-603 (Dept. Zool., North Dakota St. Univ., Fargo, N.Dak., U.S.A.) Human spermatozoa, representing a homogeneous population of post-mitotic cells, contain

BIOCHEMISTRY

5 electrophoretically distinct lactic dehydrogenases and 2 malic dehydrogenases. This indicates that mol. heterogeneity of enzymes is characteristic of the individual cell and not a reflection of heterogeneity of cell types within a tissue.

828. LACTATE DEHYDROGENASES IN HUMAN TESTES.

A.Blanco and W.H.Zinkham: *Science*, 1963, 139, 601-602 (Dept. Paediatrics, Johns Hopkins Hosp., Baltimore, Md., U.S.A.) A unique form of lactic dehydrogenase was observed in the starch gel electrophoretic patterns of adult human testes, which was present in sperm but not in prepubertal testes. Its electrophoretic mobility, heat stability, kinetic behaviour with NAD analogues and chromatographic characteristics on DEAE-cellulose were intermediate to those observed for lactic dehydrogenase isoenzymes 3 and 4.

G.M.Lewis

829. IMMUNOCHEMICAL BEHAVIOUR OF PROTEINS IN HUMAN SWEAT. M.Jirka and J.Masopust: *Biochim. biophys. Acta*, 1963, 71, 217-218 (Biochem. Dept., Res. Inst. Children Development, Fac. Pediatrics, Charles Univ., Prague, Czechoslovakia) Prelim. comm.

830. ABNORMAL POLYSACCHARIDE-PROTEIN COMPLEX FROM AN AUTOPSY MATERIAL OF A NOVEL FAMILIAL METABOLIC DISORDER. N.Katsushima and Sen-Itiroh Hakomori: *J. Biochem.*, Tokyo, 1963, 53, 7-13 (Dept. Pediatrics, Tohoku Univ. Señ. Med., Sendai, Japan) Complexes isolated from the liver contained a large amount of glucose and smaller amounts of glucosamine and galactosamine and gave a blue 12 reaction. Digestion with peptide hydrolase reduced the 12 reaction. One fraction thus obtained was resistant to OC-amylase digestion.

B.M.Stevens

831. METABOLISM OF THE CHELATING AGENT DIETHYLENETRIAMINE PENTAACETIC ACID [DTPA] IN MAN. E.Stevens, B.Rosoff, M.Weiner and H.Spencer: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 235-238 (Div. Neoplastic Dis., Montefiore Hosp., New York, U.S.A.) [¹⁴C]DTPA inj. i.v. is quant. excreted in the urine in 24 hr. 90-IOC^o of orally ingested DTPA passes unabsorbed through the intestine but presence of the chelate in the urine is evidence for absorption of small amounts.

M.M.Shapland

832. CEREBROSIDES FROM HUMAN AORTAS.

L.Hausheer and K.Bernhard: *Hoppe-Seylers Z. physiol. Chem.*, 1963, 331, 41-44 (Physiol.-Chem. Inst. Univ., Basle, Switzerland) The isolation, purification and identification of cerebrosides is described. They contain non-substituted sat. and unsat. fatty acids, glucose and galactose. A comparison of the glycolipids from normal and atherosclerotic aortas is also given.

833. CONTRACTILE PROTEINS OF NORMAL AND FAILING HUMAN HEART. M.L.Nebel and R.J.Bing:

Arch. intern. Med., 1963, 111, 190-195 (Dept. Med., Wayne State Univ. Coll. Med., Detroit, Mich., U.S.A.)

The myosin of the failing human heart shows an increase in ATPase activity without change in viscosity. Prelim. studies suggest that heart failure is associated with (? caused by) changes in mol. shape and/or wt. of myosin.

E.E.Hobbiger

834. EFFECT OF THE ORAL ADMINISTRATION OF LEUCINE ON THE METABOLISM OF TRYPTOPHAN.

B.Belavady, S.G.Srikantia and C.Gopalan: *Biochem. J.*, 1963, 87, 652-655 (Nutr. Res. Lab., Tarnaka,

Hyderabad,* India) The effect of leucine on the urinary excretion of tryptophan, quinolinic acid, nicotinic acid, N-methylnicotinamide, the 6-pyridone of N-methyl-nicotinamide [NMN-6P], 5HIAA, indican and indolyl-acetic acid was studied in 6 normal subjects and 6 patients suffering from pellagra. Leucine brought about a significant increase in the excretion of quinolinic acid and a decrease in the excretion of tryptophan, NMN-6P and 5HIAA. Leucine had similar effects on the excretion of tryptophan, quinolinic acid and NMN-6P when a tryptophan load was given. However, with a nicotinamide load the decrease in urinary NMN-6P was considerably diminished.

835. DETECTION OF HYALURONIC ACID IN PLEURAL FLUIDS OF CASES WITH DIFFUSE PLEURAL MESOTHELIOMAS. J.S.Harrington, J.C.Wagner and M.Stern[†]: *Brit. J. exp. Path.*, 1963, 44, 81-83 (Pneumoconiosis Res. Unit, South African Inst. Med. Res., P.O. Box 100 Johannesburg, South Africa) Hyaluronic acid previously found in pleural mesotheliomas was identified by comparing chem. characteristics with those of a standard prep. and measured in samples from 6 proven cases: the concn. rose as the disease progressed and measurement is advocated as an aid in diagnosis of these tumours.

839. RIBONUCLEOPROTEINS IN LEAVES INFECTED WITH TOBACCO MOSAIC VIRUS. P.M.Townsley: *Res. Sta., Canada*, Lond., 1963, 197, 1274-1276 (Res. Sta., Canada for Dept. Agric., Vancouver, Canada) A technique of electrophoresis of crude prep. of TMV virus in ?[†]ar g

BIOCHEMISTRY

81

described. Using this technique, a single small sample can yield information on size of the virus particle, electrophoretic mobility, infectivity, concn. of virus Particle in the leaf, serol. activity and incorporation of fctopes into protein and RNA of the virus. J.R.Sargent

[^]0. PREPARATION AND PROPERTIES OF ARTIFICIAL ANTIGEN IMMUNOLOGICALLY RELATED TO TOBACCO MOSAIC VIRUS. F.A.Anderer: Biochim. biophys. Acta, 1963, 71, 246-248 (Max-Planck Inst. für Virusforschung, Tübingen, Germany) An Ag containing the C-terminal hexapeptide of TMV linked to a carrier protein produced an antiserum which pptd. and neutralised TMV, but the artificial Ag did not ppt. with anti-TMV serum. Prelim, comm. B.M.Stevens

^{**}1. SMALL RNA CONTAINING PSEUDOMONAS AERUGINOSA BACTERIOPHAGE. T.W.Feary, E.Fisher, Jun. and T.N.Fisher: Biochem. biophys. Res. Comm., 1963, 10, 359 (Dept. Microbiol. Ophthalmol., Tulane Univ. Sch. Med., New Orleans, La., U.S.A.) ^{?i}Pseudomonas bacteriophage designated ^f7s* has been isolated. Evidence is given that its nucleic acid component is RNA, not DNA. B.Ketterer

[^] SUBUNIT BASIS OF HEAD CONFIGURATIONAL CHANGES IN T2 BACTERIOPHAGE. D.J.Cummings: Biochim. biophys. Acta, 1963, 68, 472-480 (Nat. Inst. Neurol. Dis. and Blindness, Lab. Mol. Biol., Bethesda, Md., U.S.A.) Mol. wt. analyses of the 3d protein subunit revealed that monomers, dimers or trimers were obtained depending on the method of prep. The subunits yielded the same end group amino acids. Mol. wt. of the monomer was 42000 Daltons with ellipsoidal dimensions of 27[#]0 x 1[#]9 x 1[#]9 mji. A monomer-dimer transition occurred in the presence of Zn. Zn also markedly affected the transition between the fast and slow sedimentation forms of whole T2. A sliding subunit model of the head was formulated, which accounted for the differences in the 2 sedimentation forms. B.M.Stevens

[^]Km CONTROL OF PORPHYRIN BIOSYNTHESIS THROUGH S⁺GATIVE-FEEDBACK MECHANISM. STUDIES WITH REPARATIONS OF 6-AMINOLAEVULATE SYNTHETASE AND 6-AMINOLAEVULATE DEHYDRATASE FROM ^SHODOPSEUDOMONAS SPHEROIDES. B.F.Burnham and M-ascelles: Biochem. J., 1963, 87, 462-472 (Microbiology Unit, Dept. Biochem., Univ., Oxford, England) 6-Aminolaevulate synthetase, 6-aminolaevulate dehydratase and succinyl-CoA thiokinase have been purified by 10-, 70- and 170-fold respectively from extracts of ^Spheroides. 6-Aminolaevulate synthetase is inhib. by conpn. of haemin and by Hb and myoglobin. The inhibn. by haemin is not competitive with substrates or cofactors but is reversible by diln. Haemin inhibits porphyrin synthesis from glycine and 3-oxoglutarate by ¹⁴C-labelling. Pensions of ^R. sphaeroides but does not affect the conversion of 6-aminolaevulate into porphyrins. The characteristics of the inhibn. of 6-aminolaevulate synthetase and the results with whole cells suggest that one mechanism for the control of porphyrin biosynthesis in ^Spheroides may be through neg. feedback by haemin. •

[^] NUCLEIC ACID AND PROTEIN CONTENT DURING THE CYCLE OF PSEUDOMONAS FLUORESCENS. ⁵⁷ ANOMONAS METHANICA AND OF SPORING BACILLUS. A.C.R.Dean: Proc. roy. Soc. B, 1963, 157, 574, 586 ([^]ys. Chem. Lab., Univ., Oxford, England) The variations in the cell size and in the

RNA, DNA and protein content during the growth cycles of P. fluorescens, M. methanica and of a sporing bacillus which has some of the characteristics of B. coaculans are reported. The results are discussed in terms of those previously obtained with Bacterium lactis aerogenes.

847. BIOCHEMICAL CHARACTERISATION OF CYSTEINE-REQUIRING MUTANTS OF SALMONELLA TYPHIMURIUM. J.Dreyfuss and K.J.Monty: J. biol. Chem., 1963, 238, 1019-1024 (McCollum-Pratt Inst.. Johns Hopkins Univ., Baltimore, Md., U.S.A.) These mutants representing damage to 14 discrete cistrons which map in 5 separate regions of the S.typhimurium linkage group, are analysed with respect to their metabolic aspects. Nine cistrons are considered to be structural genes for enzymes involved in formation of sulphide. Of the remaining 5 cistrons, 2 are connected with incorporation of sulphide into cysteine, and 3 may be concerned with permeability restrictions for inorg. ions. Adenosine 5'-phosphosulphate, 3'-phosphoadenosine 5'-phosphosulphate, SO₃²⁻, and S²⁻ are probably intermediates in incorporation of sulphate S into cysteine. The S of SO₃²⁻ are utilised via a reductive dismutation that gives SO₃²⁻ and S²⁻. Four enzymes appear to be involved between 3'-phosphoadenosine 5'-phosphosulphate and SO₃²⁻, 6 between SO₃²⁻ and S²⁻, and 3 in the dismutation of SO₃²⁻. J.N.Ashley

848. METABOLISM OF GLYCYL-L-LEUCINE IN E. COLI. N.Meisler and S.Simmonds: J. gen. Microbiol., 1963, 31, 109-123 (Dept. Biochem., Yale Univ., New Haven, Conn., U.S.A.) The metabolism of glycyl-L-leucine in an E. coli strain K-12 leucine auxotroph was investigated. Organisms sensitive to growth inhibn. by the peptide are produced by ageing in an acid-producing poorly buffered medium. Sensitive, aged organisms readily take up the peptide in the presence or absence of chloramphenicol, and whole cell prep. of these organisms do not rapidly hydrolyse glycylleucine, but cell free extracts have high enzymic activity. Young organisms have high enzymic activity in whole cell prep. Growth of slope organisms is inhibited by glycylleucine and whole cell and cell-free extracts of these organisms have low hydrolytic activity. K.Brew

849. TRICHOTHECINASE. I.Horváth and J.M.Varga: Acta microbiol. Acad. Sci. hung., 1962, 9, 117-121 (Dept. Microbiol., Res. Inst. Pharm. Ind., Budapest, Hungary) Trichothecinase, an inductive enzyme of Penicillium chrysogenum inactivates trichothecin and crotocin, by splitting their ester linkage. The 2 antibiotics serve both as inducer and substrate. DNP, Na₃N and nystatin have an inhibitory effect on the enzyme synthesis, glucose has none. S.Igali

BIOCHEMISTRY

- 850. COMPARISON OF GROWTH AND PECTOLYTIC ENZYME PRODUCTION BY BACILLUS POLYMYXA.** C.W.Nagel and R.H.Vaughn: J. Bact., 1962. 83, 1-5 (Dept. Food Sci. Tech., Univ. California, Los Angeles, Calif.. U.S.A.)

The elaboration of the enzyme by *B. polymyxa* occurred during the log. phase and ceased when the stationary phase was reached. The sp. activity of the extracellular enzyme remained relatively const. until lysis occurred. The increased sp. activity of die intracellular enzyme may be explained if one assumes that the rate of secretion of the intracellular enzyme is dependent upon the concn. of the extracellular enzyme. The concn. of the intracellular pectolytic enzyme dropped markedly at the end of the log. growth phase; the enzyme was released into the medium during the stationary growth phase and subsequent lysis of the cells. The intra- and extra-cellular enzymes were shown to be similar or identical in that both were Ca dependent pectic acid transeliminases.

C.Toothill

- 851. EFFECT OF TYPE OF CARBOHYDRATE ON GROWTH AND PROTEIN SYNTHESIS BY TETRAHYMENA PYRIFORMIS.** H.Reynolds and J.B.Wragg: J. Protozool., 1962. 9, 214-222 (Human Nutr. Res. Div.. Agric. Res. Service, U.S.Dept. Agric., Washington, D.C., U.S.A.)

T. pyriformis multiplied more rapidly, developed larger cells, and achieved greater growth as measured by O.D., when dextrin rather than glucose was present in the media. In the presence of 0*3 mg./ml. amino acid N, glucose concn. of 0*1%-1Qf caused a proportional increase in growth; from 1"OP/o-3*OP/o, there was no effect; while above 3*0% the effect was inhibitory. With dextrin, max. growth paralleled carbohydrate concn. from 0-1-3QP/m. At raised N levels, the inhibitory concn. of glucose was lowered but growth in dextrin was not affected. At 1"Jo carbohydrate levels, the total cell protein/ml. of culture was 60% greater, protein per cell approx. bQP/o greater, and cells were 1*5-2*0 times larger in media containing dextrin than media with glucose. Growth as measured by O.D. in media with 0-3 mg./ml. N and 1 or 2% dextrin was not reduced by the presence of 1 or 2% glucose.

R.J.Walker

- 852. LOCALISATION OF ARGININE DIHYDROLASE SYSTEM^f IN STREPTOCOCCUS FAECIUM.**

W.Trentini and W.Chesbro: Biochim. biophys. Acta, 1963. 67, 511-513 (Dept. Microbiol., Univ. New Hampshire, Durham, N.H., U.S.A.) Neither arginine deiminase nor ornithine carbamoyltransferase was found in the membrane fraction of *S. faecium*.

" B.M.Stevens

- 853. LOCALISATION OF SOME PHOSPHATASES IN YEAST.** G.J.M.Tonino and E.P.Steyn-Parvé: Biochim. biophys. Acta. 1963, 67, 453-469 (Lab. Physiol. Chem., Univ., Utrecht, Netherlands)

Cells were fragmented by shaking with glass beads, protoplasts were disrupted hypotonically or isotonically. The non-sp. phosphatase with a pH optimum of 3-4 occurred only in the cell wall of commercial baker's yeast. The highly sp. a-glycerophosphatase was found entirely in the unstructured cytoplasm of a 17 hr. culture of *Saccharomyces carlsbergensis* No. 74 This strain contained only 1 non-sp. alk. phosphatase. In a 17 hr. culture approx. 70% was bound to particles sedimenting from 3000 £ to 100000 x £ and the remainder was sol. In a 24 hr. culture 70-85% of the enzyme was sol.

B.M.Stevens

- 854. ACID PHOSPHATASE OF YEAST. LOCALISATION AND SECRETION BY PROTOPLASTS.** W.L.McLellan,

jun. and J.O.Lampen: Biochim. biophys. Acta, 1963, 67, 324-326 (Inst. Microbiol., Rutgers, New Brunswick N.J. U.S.A.) B.M.Stevens

- 855. LOCATION OF ENZYMES IN AZOTOBACTER AGILIS.** S.A.Robrish and A.G.Marr: J. Bact., 1962. 83, 158-168 (Dept. Bact., Univ. California, Davis, Calif., U.S.A.)

If the cells of *A. agilis* are disrupted by osmotic shock, respiratory enzymes and the compound characteristic of cell wall and cytoplasmic membranes are recovered almost completely in large particles. Tb^e large particles obtained by osmotic shock were found by E.M. to consist of cell wall, cell membrane and an internal membrane, appearing as either vesicles or tubules in section. These envelopes are free of all the sol. cytoplasmic material and are essentially free of ribosomes. Small particles obtained by osmotic shock ^ are ribosomes; small particles obtained by sonic oscitf* tion consist of both ribosomes and amorphous material. Presumably fragments of the envelope. C.Tootu¹¹

- 856. ENZYMIC HYDRATION OF cis-9,10-EPOXYOCTA DECANOIC ACID BY CELL-FREE EXTRACTS OF GERMINATING FLAX RUST UREDOSPORES.**

G.R.Hartmann and D.S.Freer: Biochem. biophys. R^s Comm., 1963, 10, 366 (Dept. Agric. Biochem., North Dakota Univ., Fargo, N.Dak.. U.S.A.)

An enzyme from flax rust uredospores which catalyses tn^b hydra tion of cis-9,10-epoxyoctadecanoic acid to threo* 9,10-dihydroxyoctadecanoic acid has been identified a^c partially purified. B.Ketterf

- 857. y. 6-DIOXOVALERATE AMINOTRANSFERASE ACTIVITY IN RHODOPSEUDOMONAS SPHEROIDES.**

A.Neuberger and J.M.Turner: Biochim. biophys. AC^d, 1963, 67, 342-345 (Dept. Chem. Pathol., St. Mary Hosp. Med. Sch., London, England) The transaminase from *R. sphaeroides* was partially purified and substrate specificity and other prop. were examined. Prelim, comm.

B.M.Steven*

- 858. ACTIVATION OF ISOCITRATE LYASE AND TRIOSEPHOSPHATE DEHYDROGENASE IN AZOTOBACTER VINELANDE EXTRACTS.** I.R.Kennedy and M.J.Dilworth: Biochim. biophys. Acta. 1963, 67, 226-239 (Inst. Agric., Univ. Western Australia, Nedlands, Australia)

Isocitrate lyase was formed during growth of *A. vinelandii* on acetate. Requirements for Mg and cysteine were confirmed but EDTA P^{10v} n₁₁rf, more efficient than cysteine. The velocity was half n₁₁ at 8-6 x 10-5M threo-D_s-isocitrate. DL-isocitrate cO^{*} up to 8mM did not inhibit. Triosephosphate dehydrogenase was identified in (NH4)2SO4 fractions of crude extracts. EDTA again activated more efficiently than cysteine. Activations by cysteine and EDTA are con¹¹ cluded to be due to binding of inhibitory heavy nieg¹¹ in the assay medium. B.M.Steven

- 859. OXYGEN INHIBITION IN AZOTOBACTER VINE- LANDH. SOME ENZYMES CONCERNED IN ACETATE METABOLISM.** M.J.Dilworth and I.R.Kennedy: Biochim. biophys. Acta. 1963, 67, 240-253 (Inst. Agric., Univ. Western Australia, Nedlands, Australia)

Evidence is presented for the presence of phosphate X^{ans} acetylase and malatesynrJietaseinAuVinslaaa¹¹ M_{SVT} showed a requirement for thiol activation. EDTA s^{un} tuted for cysteine as an activator for acetate Wnasc¹¹ Exposure of crude cell-free extracts to 1 atm. O₂J^{or} & resulted in a loss of 45fo of acetate kinase activity

* Phosphate transacetylase activity. 32% of isocitrate kinase activity and 42% of malate synthetase activity.

¹⁰ NEW ACIDIC COMPOUND FORMED DURING FERMENTATION OF GRAPE JUICE BY DIFFERENT YEASTS. B.Iñigo and F.Bravo-Abad: Rev. esp. Fisiol., 1962, 18, 163-170 (Dept. Ind. Fermentation, Madrid, Spain) 18 yeasts were examined and all were found to produce this substance except C. pulcherrima. The compound has a different Rf value from acids normally present in wines. Ir. absorption suggests that the substance has OH, CH₃, CH₂ and C=O groups,
te (Spanish) K.R.Rees

**. GLYCEROL FORMATION IN BAKERS' YEAST. H.Holzer, W.Bernhardt and S.Schneider: Biochem. 2- 1963, 336, 495-509 (Physiol. Chem. Inst., Univ. Freiburg i. Br., Germany) Under conditions of ¹⁴C steady state fermentation of glucose bakers' yeast was found to form 1 mol. ethanol and 0.2 mol. glycerol for each mol. of glucose used. No accumulation of glycerophosphate was observed. Yeast cells, in contrast to many animal cells, show no initial formation of glycerol because of the low level of d-glycerophosphate dehydrogenase activity present.

(German) L.Cohn
FREE AND BOUND INTRACELLULAR LACTIC ACID IN LACTOBACILLUS CASEI AND OTHER ORGANISMS. M.N.Camien, A.V.Fowler and M.S.Dunn: J. biol. Chem., 1963, 238, 1167-1174 (Chem. Lab., Univ. California, Los Angeles, Calif., U.S.A.) L. casei contains intracellular free L-lactic acid and D-lactic acid as a chem. bound constituent of insol. cellular material. Bound D-lactic acid is also present in Mycobacterium ranae and probably occurs in cells of other bacteria including higher animals. Labelled D-lactate appreciably incorporated into the bound D-lactic acid of V. casei. The relation of the results to occurrence of TTT-hydroxy acids as chem. bound cellular products of L. casei. J.N.Ashley

863. METABOLISM OF CITRATE BY PROTEUS VULGARIS. A.Kasamaki, S.Sasaki and S.Usami: J. Biochem., Tokyo 1963, 53, 89-94 (Dept. Bot., Fac. Sci., Hokkai Univ. Sapporo, Japan) Sonic extracts produced Slywyllic acid as the only keto acid from citrate by ¹⁴C-labeled aerobically or anaerobically. OKetoglutarate Qxi fated only when NADP was added. The extract contained citrate, isocitrate, succinate and NADPH₂. Isocitrate dehydrogenase was demonstrated. NADP accelerates citrate kinase. Malonate and cyanide inhibit the inhibition. NADPH₂ dehydrogenation and oxidation were inhibited by cyanide but the dehydrogenation was inhibited by promazine or benzoate. B.M.Stevens

864. INTERMEDIARY METABOLISM OF DIPLOCOCCUS GROWTH IN PHIL. U.S. II. ENZYMES OF A ACETATE FERMENTING SYSTEM. S.M.Klein and R.D.Sagers: J. Act., 1962, 83, 121-126 (Dept. Bact., Brigham Young Univ., Provo, Utah, U.S.A.) Glycine is cleaved to one carbon unit by cell free extracts of D. glycinophilus, the a-C being transferred to acetyl at the oxidation level of formaldehyde. Mitochondria ¹⁴C unit is condensed with a second glycine at the serine which is then deaminated to pyruvate; the latter compound reacting with ADP elding acetate, this being the main energy Action in the fermentation. The sp. activities

of the various enzyme systems are as follows (pM substrate acted upon/hr./mg. protein) serine aldolase 9-12; serine dehydrase 180; pyruvate oxidising and acyl generating system 98; phosphotransacetylase 96; acetokinase 3600. If coupled together these enzymes could account for the fermentation of glycine to acetate, CO₂ and NH₃ and could account for the conversion of 2-labelled glycine to doubly-labelled acetate as previously demonstrated.

C.Toothill

865. HYDROLYSIS OF CHOLINE-O-SULPHATE BY CELL-FREE EXTRACTS FROM PENICILLIUM. I.H.Segel and M.J.Johnson: Biochim. biophys. Acta, 1963, 69, 433-434 (Dept. Biochem., Univ. Wisconsin, Madison, Wis., U.S.A.) Prelim. comm. B.M.Stevens

866. OXIDATIVE PHOSPHORYLATION COUPLED WITH NITRATE RESPIRATION WITH CELL FREE EXTRACT OF PSEUDOMONAS DENITRIFICANS. T.Ohnishi: J. Biochem., Tokyo, 1963, 53, 71-79 (Biol. Inst., Fac. Sci., Nagoya Univ., Nagoya, Japan) A sonic extract from P. denitrificans showed ATP formation coupled with NO₃⁻ respiration. The ratio of the difference in the amount of ³²P incorporation into org. compounds with and without NaNO₃ to the amount of NO₃⁻ reduced [P/2e] was 0.25 with succinate as electron donor. When NADH₂ lactate or formate replaced succinate P/2e was lower. Effects of medium tonicity and Mg, ADP and inorg. phosphate concn. were examined. An apparent apyrase activity was found which responded like the phosphorylating activity to changes in the medium.

B.M.Stevens

867. UTILISATION OF PHENOL BY CERTAIN BACTERIA AS SOURCE OF CARBON. M.Raynaud and P.Daste: C.R. Soc. Biol., Paris, 1962, 156, 1489-1493 (Lab. Microbiol., Fac. Sci., Poitiers, France) Pseudomonas resinovorans was capable of utilising phenol as a source of carbon. The rate of growth in phenol was similar to that in glucose or succinic acid. Max. growth was obtained with concn. of phenol of 10⁻⁴ g./ml. At higher doses the phenol became toxic with death of the cells in concn. of 2 x 10⁻³ g./ml. Flavobacterium resinovorum was incapable of utilising phenol.

(French) M.A.Price

868. REDUCTION OF PHENAZINE-N-OXIDES BY MICROBIAL CELLS. Tchan Gi Bak and LYoshioka: J. Biochem., Tokyo, 1963, 53, 111-116 (Pharmaceut. Fac., Osaka Univ., Osaka, Japan) E. coli and other micro-organisms reduced phenazine 5,10-di-N-oxide to phenazine. The reduction was more rapid anaerobically than aerobically. Aerobically, H donors stimulated. E. coli cells also reduced hydroxy- and 2-methoxyphenazine di-N-oxides and phenazine 5-N-oxide. Effects of pH and several inhibitors were examined. B.M.Stevens

869. BIOCHEMICAL CHANGES DURING ACETATE DEPRIVATION AND REPLETION IN EUGLENA. JJ.Blum and D.E.Buetow: Exp. Cell Res., 1963, 29, 407-421 (Gerontol. Branch, Natl. Heart Inst., Natl. Inst. Hlth., Bethesda, Md., U.S.A.)

In a streptomycin-bleached strain of E. gracilis, the paramylon content decreased by 90% during the 13-day acetate starvation, the RNA by 55%, the protein by 45%, and the DNA by about 30%. The decrease in DNA is attributed to the failure of the starved cells to resynthesise DNA after their last division. Following the return of the starved cells to a complete medium, there was a lag period of growth, after which log. growth resumed with a

BIOCHEMISTRY

normal generation time. The data suggested the operation of control mechanisms allowing the cells to utilise cytoplasmic components selectively for survival. K.Jones

870. CAROTENOID PRODUCTION BY STREPTOMYCIN-BLEACHED EUGLENA. R.B.Smillie and N.Rigopoulos: *J. Protozool.*, 1962, 9, 149-151 (Dept. Biol., Brookhaven Nat. Lab., Upton, N.Y., U.S.A.) Streptomycin-bleached *E. gracilis*, strain Z, was cultivated under conditions which yielded good growth rates and high cell densities. During cell division there was little production of carotenoid but after the cessation of cell division, the carotenoid content of the cells rapidly increased. During carotenoid synthesis the cell no. remained constant while the packed cell vol. decreased. R.J.Walker

871. PECTOLYTIC ACTIVITY OF MICRO-ORGANISMS ISOLATED FROM SPOILAGE OF CANNED JACK FRUIT [ARTOCARPUS INTEGRIFOLIA LINN.] G.Rangaswami and R.Swaminathan: *Indian J. Microbiol.*, 1962, 2, 45-50 (Microbiol. Lab., Dept. Agric., Annamalai Univ., Annamalainagar, Madras St., India) Spp. of *Aspergillus* and *Streptomyces* isolated from the spoilage of canned fruit produced protopectinase, polygalacturonase and pectin methyl esterase in culture. G.M.Lewis

872. METABOLISM OF ISOXANTHOPTERIN BY ALCALI-GENES FAECALIS. W.S.McNutt, jun.: *J. biol. Chem.*, 1963, 238, 1116-1121 (Dept. Pharmacol., Tufts Univ. Sch. Med., Boston, Mass., U.S.A.) *A. faecalis*, isolated in pure culture from soil, utilises the naturally occurring pteridine, iso-xanthopterin, as sole source of C and N. 7-Oxylumazine, tetraoxyppteridine, and xanthine-8-carboxylic acid are probably intermediates in metabolism of this pteridine. The enzymically catalysed ring contraction of tetraoxyppteridine to give xanthine-8-carboxylic acid involves cleavage of the bond between positions 7 and 8. C-6 of the tetraoxyppteridine becomes C-8 of the purine ring and C-7 of the pteridine appears as the carboxylic acid. Xanthine-8-carboxylic acid is not an effective precursor of riboflavin in *Eremothecium ashbyii*. J.N.Ashley

873. STRUCTURE OF AMIDOMYCIN AND VALINO-MYCIN [CYCLIC DEPSIPEPTIDES]. M.M.Shemyakin, E.I.Vinogradova, M.Yu.Feigina and N.A.Aldanova: *Tetrahedron Letters*, 1963, 6, 351-356 (Inst. Chem. Natural Products, U.S.S.R. Acad. Sci., Moscow, U.S.S.R.) Letter. I.A.B.S.

874. STRUCTURE OF ENNIATINS [FROM FUSARIUM STRAINS] AND RELATED ANTIBIOTICS. M.M.Shemyakin, Yu.A.Ovchinnikov, V.T.Ivanov and A.A.Kiryushkin: *Tetrahedron*, 1963, 19, 581-591 (Inst. Chem. Natural Prod., U.S.S.R. Acad. Sci., Moscow, U.S.S.R.) I.A.B.S.

875. BIOSYNTHESIS OF 7-CHLORO-6-DEMETHYL-TETRACYCLINE [BY STREPTOMYCES AUREOFACIENS ATCC 13900] IN PRESENCE OF AMINOPTERIN AND ETHIONINE. S.L.Neidleman, E.Bienstock and R.E. Bennett: *Biochim. biophys. Acta*, 1963, 71, 199-201 (Squibb Inst. for Med. Res., New Brunswick, N.J., U.S.A.) B.M.Stevens

876. BIOCHEMICAL STUDIES ON STREPTOMYCES AVREOFACIENS. II. IONIC INFLUENCES ON FORMATION OF CHLORTETRACYCLINE. MJárai and J.Kollár: IE. ROLE OF ORGANIC CHLORINE COMPOUNDS IN

BIOSYNTHESIS OF CHLORTETRACYCLINE. J.Kollár and MJárai: *Acta microbiol. Acad. Sci. hung.*, 1962, 9, 145-148, 149-156 (Microbiol. Labor. Dept. Antibiotics, Chinoim Pharm. Works, Budapest, Hungary)

II. The inhibitory effect of some S containing compounds (e.g. 2-mercaptopbenzthiazole at a concn. of Q'2mM) on the biochem. chlorination of *S. aureofaciens* could be reversed by Cu and Ag ions. In the presence of CuBr₂ &* formation of bromtetracycline was enhanced. These refl to a sp. metabolic role of Cu in biochem. halogenation,

III. Agitated culture of the organism was able to utilise the chlorine of chlorinated fatty acids for the formation of chlortetracycline. Bromide as well as sorn heterocyclic compounds inhib. this reaction. The utilisa^htion of org. and inorg. chloro compounds presumably have a common reaction pattern. S.Iga^h

877. SULPHYDRYL GROUPS ESSENTIAL FOR PENICILLINASE ACTIVITY OF AEROBACTER CLOACAE. J.T.Smith: *Nature*, Lond., 1963, 197, 900-901 (Pf Bacteriol., Guy's Hosp. Med. Sch., London, England) The penicillinase of *A. cloacae* was inhib. strongly by β -chloromercuribenzoate, less by N-ethylmaleimide and least by iodoacetamide. Reactivation of the enzyme with thiol compounds occurred most readily with 2"chlor-mercuribenzoate inhibn. The enzyme was resistant to oxidation with ferricyanide and (>)-iodosobenzoate. The data suggest that sulphhydryl groups are essential for activity of this penicillinase. G.M.Lew^{ew}

878. STUDIES IN BIOSYNTHESIS OF FUNGAL METABOLITES. V. UTILISATION OF SULPHUR-CONTAINING AMINO ACIDS AS PENICILLIN SIDE-CHAIN PRECURSORS. E.Albu and R.Thomas: *Biochem. J.*, 1963, 37, 648-652 (Squibb Inst. Med. Res., New Brunswick, N.J., U.S.A.) During investigations of the possible incorporation of amino acids as penicillin side-chain precursors by *Penicillium chrysogenum*, a new biol. active component was observed on bioautographic examination of the culture filtrate after methionine feeding expt. Apparently homologously related penicillins were similarly formed from ethionine, S-methyl cysteine and S-ethylcysteine. S-ethylcysteine was the most effective precursor and gave rise to a penicillin which was readily purified and shown to be the N-ethyl-D,L-α-acetyl deriv. of 6-aminopenicillanic acid. Consequently, methionine and its homologues appeared to be incorporated only after oxidative decarboxylation as in the formation of benzylpenicillin from phenylalanine. This was confirmed by demonstrating chromatographically the formation of the same series of penicillins by direct feeding of the corresponding intermediate mercapto-a⁺ mercaptotaurine.

879. BIOCHEMICAL STUDIES ON STREPTOLYSIN S FORMED IN PRESENCE OF YEAST RNA. I. PURIFICATION AND SOME PROPERTIES OF THE TOXIN. J.Koyama and F.Egami: *J. Biochem.*, Tokyo, 1963, 53, 147-154 (Dept. Biophys. Biochem., Fac. Sci. Univ., Tokyo, Japan) Streptolysin S was purified from supernatants of resting cell suspensions of *Streptococcus pyogenes* in a medium with oligoribonucleotides from RNase I core of yeast RNA. By successive zymography and DEAE-cellulose column chromatography toxin with 100000 haemolytic units/O.D. unit at 260 mji was reproducibly obtained. This prep. contained nucleotides and amino acids. B.M.Stevens

880. SELECTIVE PENETRATION OF AMMONIA AND ALKYLAMINES INTO STREPTOCOCCUS FAECALIS

AND THEIR EFFECT ON GLYCOLYSIS. M.Zarlengo and A.Abrams: *Biochim. biophys. Acta.* 1963, 71, 55-77 (Dept. Biochem., Univ. Colorado Sch. Med., Denver, Colo., U.S.A.) Selective penetration of free base into cells of *S. faecalis* suspended in NH₄Cl, Jethylamine chloride, dimethylamine chloride or triethylamine chloride soln. at pH 7.0 or below, measured by automatic continuous titration of H⁺. Appearance was practically instantaneous. Selective penetration of NH₃ was freely reversible and produced NH₄⁺ accumulation. An equation describing the relation between amine uptake and extracellular concn. of const. pH permitted estimation of intracellular pH and following free amine penetration. The intracellular pH of stationary phase cells was estimated at approx. 5.0. Retarded glycolysis in 'aged' cells was noted immediately following selective penetration of trimethyl or alkylamines at const. extracellular pH. K and Na restored glycolysis more slowly. K and Na elicited a efflux at const. extracellular pH from non-glycolysing cells. B.M.Stevens

INCORPORATION OF RADIOACTIVE PHOSPHORUS IN LEUCOCYTE DURING EXTRUSION OF PROTEIN INDUCED BY STAPHYLOCOCCAL LEUCOCIDIN. A.M.Woodin and A.A.Wieneke: *Biochem. J.*, 1963, 90, 480-487 (Dunn Sch. Path., Univ., Oxford, England) When polymorphonuclear w.b.c. are incubated with leucocidin there is a stimulated incorporation of ³²P into several nucleotides of the cell and also leucocidin other acid-sol. components. Treatment with leucocidin does not increase the permeability of the cell to orthophosphate and in the presence of ³²P does not increase the radioactivity of the orthophosphate of the ³²P inhibitors of glycolysis reduce the incorporation of tritiated lipids and nucleotides of the leucocidin-exposed cell but do not reduce the amount of protein denuded from the cell. The incorporation of [¹⁴C]-isotope into nucleotides and of [¹⁴C]acetate into lipids and proteins increased when ³²P was treated with leucocidin, but the rate of loss of ¹⁴C radioactivity from nucleotides in ³²P labelled with ³²P and transferred to a medium of leucocidin activity is decreased in the presence of leucocidin. It is suggested that the stimulated incorporation of ³²P into leucocidin-treated w.b.c. does not result from increased turnover of any compound of the cell but from direct utilisation at the cell surface of ³²P orthophosphate.

PENETRATION OF CALCIUM BY POLYMORPHONUCLEAR LEUCOCYTE TREATED WITH STAPHYLOCOCCAL LEUCOCIDIN AND ITS SIGNIFICANCE IN EXTRUSION OF PROTEIN. A.M.Woodin and A.A. Wieneke: *Biochem. J.*, 1963, 87, 487-495 (Dunn Sch. Path., Univ., Oxford, England) After treatment with leucocidin there is an accumulation of Ca in polymorphonuclear w.b.c. and a loss of Mg. The decrease in ⁴⁵K protein from ⁴⁵K granules of the leucocidin-treated cell is inhibited and becomes simultaneous to result from an increased availability of ⁴⁵K to some soluble components of the cytoplasm. When Ca is omitted from the medium the ⁴⁵K protein from ⁴⁵K granules of the leucocidin-treated cell is inhibited and becomes simultaneous to the release of protein can be induced by adding ⁴⁵K. If ⁴⁵K-free medium is used the amount released is increased. This decreased efficiency of Ca to ST is evident if certain nucleoside phosphates are present in the medium. The extrusion of protein from the

granules of the leucocidin-treated w.b.c. is accomplished by reactions that do not cause hydrolysis of ATP.

MORPHOLOGICAL CHANGES ASSOCIATED WITH EXTRUSION OF PROTEIN INDUCED IN POLYMORPHONUCLEAR LEUCOCYTE BY STAPHYLOCOCCAL LEUCOCIDIN. A.M.Woodin, J.E.French and V.T. Marchesi: *Biochem. J.*, 1963, 87, 567-571 (Dunn Sch. Path., Univ., Oxford, England) W.b.c. treated with leucocidin have been examined with the light-microscope and E.M. When Ca is present in the medium the cells lose their granules and vesicles can be seen in the cytoplasm and in the medium. Some of the vesicles are fused to the surface of the cell. In the absence of Ca the random brownian motion of the granules persists for at least 30 min. There is no degranulation and vesicles cannot be observed. When Ca is added to the leucocidin-treated cells after incubation in Ca-free medium the brownian motion stops, some of the granules disappear and vesicles can be seen in the cytoplasm. The sp. activities of some enzymes in the granules and the vesicles have been measured. It is suggested that the vesicles are produced from granules, some of which have discharged part of their contents. The conversion of the granules into vesicles may be simult. with the fusion of the granule and the cell surface. It is suggested that the release of protein from the vesicles follows rupture of the membrane at the site of fusion, or occurs by a permeability change at the site of fusion or by both processes.

IMMUNOLOGY OF TUBERCULOSIS. I. FRACTIONATION OF TUBERCULIN PARENT SUBSTANCE. H.Micke: Z. Immun.-Forsch., 1962, 124, 224-229 (Paiil-Ehrlich-Inst., Frankfurt a.M., Germany) Human tubercle bacilli were grown on a synthetic liquid medium and the culture fluid was then fractionated by paper electrophoresis. Four protein fractions were isolated, together with 2 carbohydrate fractions, various nucleic acid, lipid and enzyme components.

PHYSICAL INVESTIGATIONS OF BEHAVIOUR OF BACTERIAL SURFACES. VI. CHEMICAL MODIFICATION OF SURFACE COMPONENTS. VII. RELATIONSHIP BETWEEN C-POTENTIAL AND SURFACE CHARGE AS INDICATED BY MICROELECTROPHORESIS AND SURFACE CONDUCTANCE MEASUREMENTS. G.J.Gittens and A.M.James. VIII. CAPSULAR MATERIAL OF STREPTOCOCCUS PYOGENES. M.J.Hill. A.M.James and W.R.Maxted: *Biochim. biophys. Acta*, 1963, 66, 237-249, 250-263, 264-274 (Dept. Chem., Chelsea Coll. Sci. and Technol., London, England)

VI. The electrophoretic mobility of suspensions of *Aerobacter aerogenes* cells after treatment with JD-toluene-sulphonylchloride, fluoro-2,4-dinitrobenzene, diazomethane, methanolic HCl, dicyclohexylcarbodiimide, N-ethyl-5-phenylisoxazolium-3'-sulphonate, ethylene and propylene oxides or ethyleneimine was determined at various pH. Ir. spectra were also determined. No adsorption of ions on to the basic surface matrix occurred. The mobility value was largely determined by the surface ionogenic groups, modified by gegenion association. Diazomethane and methanolic HCl were the most suitable reagents for carboxyl group modification on alcohol stable surfaces. Fluoro-2,4-dinitrobenzene and JD-toluene-sulphonyl chloride were most suitable for NH₂.

VII. The variation of C-potential of normal and ethyleneimine treated *A. aerogenes* cells, determined in different salt and buffer soln., demonstrated the importance of gegenion concn. The variation of surface con-

BIOCHEMISTRY

ductance was determined at various ionic strengths. The surface conductance correction to the ζ -potential of cells was very important for ionogenic surfaces, particularly at low ionic strengths but was negligible for non-ionogenic surfaces. The surface charge of *Aerogenes* was unaffected by ion adsorption on to the basic matrix in contrast to the marked ion adsorption on to the unionised amino surface of the ethyleneimine treated cells at pH 10 \times 3.

Vm. Repeated washing in phosphate buffer did not affect the electrophoretic mobility of young 'matt' [M] cells but the mobility of young 'glossy' [G] cells was decreased to the value characteristic of old G cells. In a large no. of strains the mobility and the hyaluronic acid content increased to a max. at the end of the log. growth phase and decreased to the original values during the stationary phase. Variation with pH of the mobility of 24 hr. cells of M and G variants of a no. of different types confirmed the presence of NH₂ and carboxyl groups on the surface. The effects of hyaluronidase on the surface were also examined.

886. 2-KETO-3-DEOXY-OCTONATE, CONSTITUENT OF CELL WALL LIPOPOLYSACCHARIDE PREPARATIONS OBTAINED FROM E. COLI. E.C.Heath and M.A.

Ghalambor: Biochem. biophys. Res. Comm., 1963, 10, 340 (Rockham Arthritis Res. Unit and Dept. Bacteriol., Univ. Michigan, Ann Arbor, Mich., U.S.A.)

A compound isolated from O \times 1N H₂SO₄ hydrolysates of lipopolysaccharide obtained from cell wall of *E. coli* has been characterised as 2-keto-3-deoxy-octonate.

B.Ketterer

887. OCCURRENCE OF CELL WALL CONSTITUENTS IN STABLE PROTEUS L FORMS. T.H.Morrison and C.Weibull: Acta path. microbiol. scand., 1962, 55, 475-482 (Central Bact. Lab., Stockholm, Sweden)

Diaminopimelic acid (DAP) and hexosamine levels were studied in 4 stable *Proteus* L form strains and in the small (0.3%) fraction of one strain. Paper chromatographic determinations revealed traces of DAP in strains L VI, L18 and LD52, and about 0.3% in strain L9. The former 3 strains also contained significantly less hexosamine than the fourth.

L.Friedmann

888. CELL WALLS OF PROPIONIBACTERIUM SPECIES: FRACTIONATION AND COMPOSITION. J.Allsop and E.Work: Biochem. J., 1963, 87, 512-519 (Twyford Lab., Twyford Abbey Road, London, England) Cell walls of *P. rubrum* and *P. peterssonii* prep. by conventional methods were very similar in composition. Walls were not digested by lysozyme except after treatment with hot formamide. Density-gradient centrifuging of *P. peterssonii* walls produced 2 homogeneous fractions; both contained mucopeptide components and carbohydrates (glucose and galactose) and one also had protein. Hot formamide extracted most of the carbohydrate and protein and left residues which, though not identical, both contained the mucopeptide amino acids D-glutamic acid, D-alanine, L-alanine, LL-diaminopimelic acid, glycine (in approx. equimolar amounts); also muramic acid, glucosamine and galactosamine. The only free end-amino groups belonged to glycine.

889. COMPARATIVE ACTION OF THREE LYSOZYMES OF DIFFERENT ORIGIN ON TWO GLYCOPEPTIDIC SUBSTRATES ISOLATED FROM MICROCOCCUS LYSODEIKTICUS. P.Jollès: Biochim. biophys. Acta, 1963, 69, 505-510 (Lab. Chim. biol., Fac. Sci., Univ. Paris, France) Two sol. purified glycopeptidic sub-

strates of lysozyme were isolated and analysed. Hen's egg white, duck's egg white and human milk lysozymes hydrolysed both. Duck's egg white lysozyme was the most active enzyme. Chromatographic expt. and amino acid analyses showed this enzyme had a higher content of basic amino acids than the other two.

917. HE ART WOOD CONSTITUENTS OF SCIADOPITYS VERTICILLATA SIEB. ET ZUCC. I. CONSTITUTION OF SCIADIN. M.Sumimoto: Tetrahedron, 1963, 19, 643-655 (Fac. Agric., Kagoshima Univ., Japan) Investigations on the constitution of sciadin, a new diterpenoid bitter principle, are reported, and the isolation of 4 new diterpenoid ester is described. I.A.B.S.
918. SESQUITERPENOID. III CONSTITUTION AND STEREOCHEMISTRY OF VALDIVIOLIDE. FUEGIN, WINTERIN AND FUTRONOLIDE [ISOLATED FROM DRIMYS SPECIES]. H.H.Appel, R.P.M.Bond and K.H.Overton: Tetrahedron, 1963, 19, 635-641 (Univ. Tecnica Federico Santa Maria, Valparaiso, Chile). LA.B.S.
919. LONGICYCLENE, FIRST TETRACYCLIC SESQUITERPENE [FROM PINUS LONGIFOLIA. ROXB.]. U.Ramdas Nayak and S.Dev: Tetrahedron Letters, 1963, 4, 243-246 (Nat. Chem. Lab., Poona, India) Letter. I.A.B.S.
920. NATURE OF SESQUITERPENIC HYDROCARBON CALARENE AND STRUCTURE OF J-GURJUNENE. J.Vrkoc, J.Krepinský, V.Herout and F.Sorm: Tetrahedron Letters, 1963, 4, 225-229 (Inst. Org. Chem. and Biochem., Acad. Sci., Prague, Czechoslovakia) Letter. LA.B.S.
921. NATURAL PRODUCTS [SESQUITERPENE LACTONES] FROM ACHILLEA LANULOSA. E.H.White and R.E.K.Winter: Tetrahedron Letters, 1963, 3, 137-140 (Dept. Chem., Johns Hopkins Univ., Baltimore, Md., U.S.A.) Letter. I.A.B.S.
922. CAROTENOID PIGMENTS OF NEMATODE-TRAPPING HYPHOMYCETE ARTHROBOTRYS OLIGOSPORA (FRES.). L.R.G.Valadon and R.C.Cooke: Phytochemistry, 1963, 2, 103-105 (Dept. Bot., Royal Holloway Coll., Univ. London, Englefield Green, Surrey, England) β -Carotene is the major carotenoid of A. oligospora; γ -carotene, torulene and neurosporoxanthin are also present. It is suggested that

the pigment characteristics of the nematophagous series may be an aid in elucidating their taxonomic affinities.

B.H.Davi*

923. CAROTENOID PIGMENTS OF PROTOMYCES INUNDATUS DANGEARD. L.R.G.Valadon: Phytochemistry, 1963, 2, 71-73 (Dept. Bot., Royal Holloway Coll., Univ. London, Englefield Green, Surrey, England) P. inundatus contains a-, β - and γ -carotene, with β -carotene predominating. It is suggested that if carotenoid contents of fungi are to be used as a taxonomic tool, absorption spectra of the total extracts give only limited information; one must know all the carotenoids present using a well defined medium under strict cultural conditions. B.H.Davi#

924. STEREOCHEMISTRY OF PANAXADIOL. S.Shibata*, O.Tanaka, M.Nagai and T.Ishii: Tetrahedron Letter 1962, 26, 1239-1242 (Fac. Pharm. Sci., Univ. Tokyo, Japan) Panaxadiol, a sapogenin of Ginseng roots (Panax ginseng C,A, Mey), is the first example of naturally occurring β -C/D 13 (X-H tetracyclic triterpenoid). I.A.B.S.

925. CARDIAC GLYCOSIDES [USCHARIDIN, CALO" TROPIN, CALOTOXIN, USCHARIN AND VARUS-CHARIN] OF CALOTROPIS PROCERA. D.H.G.Croft, R.F.Curtis, C.H.Hassall and T.L.Jones: Tetrahedron Letters, 1963, 2, 63-67 (Dept. Chem., Univ. Coll. Swansea, Wales) Letter. I.A.B.*

926. CONSTITUTION OF ANTIARIGENIN AND ANTIOSIDE. C.Juslen, W.Wehrli and T.Reichstein: Helv. chim. Acta. 1962, 45, 2285-2296 (Inst. Org. Chem., Univ. Basel, Switzerland) The conversion of β -antiarin to tetra-O-acetyl-antiroside demonstrated the structural relationship between the 2 compounds. The side is des-aldehyde-12-O-acetyl-j8-antiarin. The relationship between di-O-acetyl-antiogenin and di-ogenin was shown by chem. transformation, thus proving the structure of the steroid nucleus and the distribution of all O-atoms. The Q-is-configuration on C3 and C5 demonstrated by formation of a cyclic sulphite. (German) A.V.Sf

927. SAPONINS OF SPIROSTANOL SERIES. K. CONSTITUTION OF DIGITONINS. R.Tschesche and G.Wulff: Tetrahedron, 1963, 19, 621-634 (Org. Chem. Inst. Univ.. Bonn. Germany). I.A.B.*

928. [STRUCTURE OF] CYANOMACLURIN. P.Madhava Nair and K.Venkataraman: Tetrahedron Letters, 1963, 5, 317-320 (Nat. Chem. Lab., Poona, India) Letter. A.f. \$, LA.*

929. STRUCTURE [IRIDOID] OF ASPERULOSIDE. L.H.Briggs, B.F.Cain, P.W.Le Quesne and J.N.S. hoolerty: Tetrahedron Letters, 1963, 2, 69-74 (Dept. Chem., Univ. Auckland, New Zealand) Letter. I.A.B.*

930. CHEMICAL CONSTITUENTS OF AUSTRALIAN FLINDERSIA spp. XVI. CONSTITUENTS OF W.S.D. of FLINDERSIA LAEVICARPA C.T.WHITE AND FRANCIS. G.J.W.Breen, E.Ritchie and W.C.Taylor: Aust. J. Chem.. 1962, 15, 819-823 (Dept. Org. Chem., Univ. Sydney, Australia) Light petroleum, β -carotene and methanol extraction of the milled wood of F. laevicarpa, and subsequent chem. treatment yielded skimmianine, hesperidin, β -sitosterol, and two alcohols. These were identified as 1,5-diphenylpentan-3-ol and (~) threo-1,5-diphenylpentan-1,3-diol using i.r., chem. degradation and synthesis. D.G.-U. ^

^{931.} TISSUE HYDROXY-CINNAMIC ACIDS AND SOIL MOISTURE STRESS. W.A.Gortner: Nature, Lond., 1963, 197, 1316-1317 (Pineapple Res. Inst. of Hawaii, Honolulu, Hawaii) Evidence is presented at the amounts of hydroxy-cinnamic acid deriv. present in Pineapple stem tissue is inversely related to the soil moisture content. As these compounds are involved in metabolism of IAA, this observation has implications in connection with growth effects and flowering that may be influenced by moisture stress. G.M.Lewis

^{932.} PLANT POLYPHENOLS. K. GLYCOSIDIC PATTERN OF ANTHOCYANIN PIGMENTS. J.B.Harborne: Phytochemistry, 1963, 2, 85-97 (John Innes Inst., Bayford, Hertford, England) The anthocyanins of colour varieties of *Lathyrus odoratus* and *Streptocarpus* have been identified, and the sugars of some 40 other anthocyanins determined. Twenty-two new anthocyanins have been isolated, including the first representatives of the following glycosidic classes: 3-rhamnosides, 3-(xylosylgalactosides), 3-glucoside-3-rhamnosides, 5-glucoside-3-sophorosides, 5-phloroside-7-glucosides and 5-glucoside-3-sambubiosides. Each of the 22 unusual disaccharides sophorose and sequestrin occurred combined in the anthocyanins of Plant genera. Structures previously proposed for pigments of *Matthiola incana* flowers and of red cabbage have been revised. This work brings the no. of known classes of anthocyanins to 17. B.H.Davies

^{933.} TOBACCO POLYPHENOLS. I. BIOSYNTHESIS OF GLUCOSIDES AND O-GLUCOSE ESTERS OF 2'-HYDROXYCINNAMIC ACIDS. V.C.Runeckles and J.Woolrich: Phytochemistry, 1963, 2, 1-6 (Imp. Tobacco Co. of Canada Ltd., Montreal, Quebec, Canada) Leaf discs of *Nicotiana tabacum* var. Delcrest metabolise 2'-coumaric acid and ferulic acid with the formation of the corresponding glucose esters and O- β -D-glucosides. In 40 hr. more glucoside accumulates than glucose ester, when either acid is supplied. B.H.Davies

^{934.} COMMON ACIDIC CONSTITUENT OF WESTERN AUSTRALIAN RUTACEAE. A.M.Duffield, P.R.Jefferies and P.H.Lucich: Aust. J. Chem., 1962, 15, 812-818 (Dept. of Pt. Chem., Univ. Western Australia, Nedlands, Australia) Ether extraction and subsequent chem. treatment of dried tissue of *Philothea hasselli* and *Eriostemon spp.* yielded eriostoinic acid, C₂₀H₂₄O₅. Its structure has been elucidated using u.v., i.r., and chem. techniques, and shown to contain a benzodipyran skeleton. D.G.Upshall

^{935.} (10-PENTADECENYL)RESORCINOL FROM *VILLEA PYRAMIDALIS*. J.L.Occolowitz and A.S. te Stroet: Aust. J. Chem., 1962, 15, 858-861 (Defence Research Labs., Dept. Supply, Maribymong, Victoria, Australia) Light petroleum extract of pods of *Villea pyramidalis* (family Protoaceae) and subsequent removal of solvent yielded a red, sticky material. U.v., i.r. and analysis indicated its major constituent to be (10-penta-decenyloxy)resorcinol. D.G.Upshall

^{936.} ROLE OF PHENOLASES IN FORMATION OF QUINOID FUNGAL METABOLIC PRODUCTS OF ASPERGILLUS FUMIGATUS FRES. AND PENICILLIUM SPINULOSUM THOM. E.Kilster and B.T.Little: Biochim. biophys. Acta, 1963, 67, 288-294 (Dept. Ind. Microbiol., Univ. Coll., Dublin, Ireland) Colorimetric tests with a range of phenolic substrates showed that endo-cellular laccases with same specificity were responsible for fumigatin and spinulosin formation. A para-

phenolase mechanism is proposed. Exo-cellular laccases were found only in strains producing fumigatin and these enzymes were responsible for the Bavendamm reaction. The intensity of this reaction was not quant. related to the gross phenolase activity or to the formation of fumigatin. B.M.Stevens

^{937.} STRUCTURE OF MUNETONE [ISOFLAVONE FROM MUNDLEA SUBEROSA]. C.S.Barnes, J.L.Occolowitz, N.L.Datta, P.Madhavan Nair, P.S.Riadke and K.Venkataraman: Tetrahedron Letters, 1963, 5, 281-288 (C.S.I.R.O.. Chem. Res. Lab., Melbourne, Australia) Letter. LA.B.S.

^{938.} SYNTHESIS OF PRATENSEIN. 5,7,3'-TRIHYDROXY-4'-METHOXYISOFLAVONE [FROM TRIFOLIUM PRATENSE]. E.Wong: Tetrahedron Letters, 1963, 3, 159-161 (Plant Chem. Div., D.S.I.R.t Palmerston North, New Zealand) Letter. LA.B.S.

^{939.} CITRUS FLAVONOID COMPLEX: CHEMICAL FRACTIONATION AND BIOLOGICAL ACTIVITY. L.Freedman and AJ.Merritt: Science, 1963, 139, 344-345 (Product Development Lab., U.S.Vitamin and Pharm. Corp., Yonkers, New York, U.S.A.) A study was made of the anti-inflammatory activity of the fractionated components of a citrus flavonoid complex. Several highly active components, distinct from hesperidin and naringin, were isolated and tested for their ability to inhibit increase of capillary permeability in guinea-pig. G.M.Lewis

^{940.} ISOLATION OF CITRONIN FROM PEEL OF ARGENTINE ORANGES [NARANJA DULCE]. CITRUS SINENSIS. Linn. A.Rahman and A.A.Khan: Rec. Trav. Chim. Pays-Bas, 1962, 81, 102-106 (Dept. Quimica, Universidad del Sur, Bahia Blanca, Argentina) The isolation of citronin from oranges is described and its structure established as a 7-rhamnoglucoside of 5,7-dihydroxy-2'-methoxyflavanone. The chem. prop. of this compound and some of its deriv. are described and discussed. G.C.Barr

^{941.} ISOTHIOCYANATE-PRODUCING GLUCOSIDES IN SPECIES OF CAPPARIDACEAE. A.Kjaer and H.Thomsen: Phytochemistry, 1963, 2, 29-32 (Oig.-Chem. Dept., Royal Vet. and Agr. Coll., Copenhagen, Denmark) A series of 38 botanically authenticated spp. of Capparidaceae have been analysed by paper chromatography for their content of isothiocyanate-producing glucosides. The distribution pattern indicates the predominance within the family of glucocapparin and glucodeomin. The taxonomic significance and possible biogenesis of the glucosides are discussed. B.H.Davies

^{942.} GLUCOSIDES OF COUMARINIC AND J2-COUMARIC ACIDS IN TONKA BEAN. F.A.Haskins and H.J.Gorz: Science, 1963, 139, 496-497 (Dept. Agronomy, Univ. Nebraska, Lincoln, Neb., U.S.A.) jS-Glucosides of coumarinic and jD-coumaric acids were detected in extracts of cotyledons, exocarps, and seedling leaves of *Dipteryx odorata* Willd. The presence of L-glucosidase having specificity for the cis glucoside suggests that, as in sweet-clover, coumarin is synthesised through the conversion of L-coumaryl glucoside to coumarinyl glucoside, which hydrolyses to coumarinic acid; on spontaneous lactonisation, this produces coumarin. G.M.Lewis

^{943.} STRUCTURE OF BRUCEOL. A.N.Duffield, P.R. Jefferies, E.N.Maslen and A.L.M.Rae: Tetrahedron, 1963, 19, 593-607 (Dept. Chem. and Physics, Univ.

BIOCHEMISTRY

Western Australia, Nedlands, Australia) A novel coumarin, bruceol, has been isolated from Eriostemon brucei F.Muell. Prelim. chem. studies have been made and the complete structure determined by X-ray crystallography of a monobromo deriv. LA.B.S.

944. TETRAHYDROFRANKLINONE. P.M.Brown, J.S. Burton and R.Stevens: Tetrahedron Letters, 1963, 5, 289-291 (Brewing Ind. Res. Fndn., Nutfield, England) Franklinone is a ketone based on a phloroglucinol nucleus and found in the essential oil of Acradenia f. franklinii (Kippist). It is closely related in structure to a degradation product of the hop p-acid, colupulone. I.A.B.S.

945. COMPONENTS OF HEARTWOOD OF DALBERGIA LATIFOLIA ROXB. M.M.Rao and T.R.Seshadri: Tetrahedron Letters, 1963, 4, 211-215 (Dept. Chem., Univ. Delhi, India) The new compounds isolated are all related to dalbergin, a 4-phenyl coumarin deriv. LA.B.S.

946. BETACYANINS AND THEIR DISTRIBUTION. T.J.Mabry, A.Taylor and B.L.Turner: Phytochemistry, 1963, 2, 61-64 (Dept. Bot. and Plant Res. Inst., Univ. Texas, Austin, Tex., U.S.A.) Thirty-eight spp. including 13 previously uninvestigated genera, in 10 families usually grouped in the Centrospermae were surveyed by electrophoresis and chromatography for the presence of betacyanin and anthocyanin pigments. Betacyanins were observed in all 38 spp. but no anthocyanins were detected. B.H.Davies

947. PREPARATION OF ANTHOCYANIDINS AND THEIR GLYCOSIDES FROM RELATED FLAVONOIDS. H.G.Krishnamurty, V.Krishnamoorthy and T.R.Seshadri: Phytochemistry, 1963, 2, 47-60 (Dept. Chem., Univ. Delhi, Delhi, India) Improvements in the method of reductive acetylation of flavonols provide pure samples of anthocyanidins, the examples studied being cyanidin and its O-pentamethyl and O-5, 7, 3', 4'-tetramethyl deriv. The method can also be used for the conversion of the flavonol glycosides into anthocyanins; the prep. of cyanidin and pelargonidin-3-rhamnoglycosides are described. 3-Hydroxyflavanones undergo isomeric change into V-base acetates on heating at 150-155° with acetic anhydride soln. and a base catalyst, and these undergo conversion into anthocyanidins. This mechanism is supported by expt. evidence, and the biogenetic significance of this new transformation is discussed. B.H.Davies

948. PHLEBIARUBRONE, BASIDIOMYCETE PIGMENT RELATED TO POLYPORIC ACID. T.C.McMorris and M.Anchel: Tetrahedron Letters, 1963, 5, 335-337 (New York Bot. Garden, New York, U.S.A.) The bright red pigment phlebiarubrone produced by Phlebia strigosa is shown to be the *g*-terphenyl deriv., 3, 6-diphenyl-4, 5-methylene dioxy-1, 2-benzoquinone. LA.B.S.

949. INCORPORATION OF [¹⁵N]HYDROXYLAMINE INTO PROTEINS OF WHEAT SEEDLINGS. W.L.Kretovich, A.A.Bundel and N.V.Borovikova: Life Sci., 1963, No.3, 184-189 (A.N.Bach Inst. Biochem., Acad. Sci., Moscow, U.S.S.R.) N of hydroxylamine as the hydrochloride or the oxime could enter into the reactions of protein synthesis in wheat seedlings. It is suggested that in plants hydroxylamine is an intermediate in the reduction of nitrate to ammonia. K.Jones

950. BIOCHEMICAL TESTS INDICATIVE OF REACTION OF CASTOR BEAN TO BOTRYTIS. C.A.Thomas and

R.G.Orellana: Science, 1963, 139, 334-335 (U.S. Agric. Res. Service, Beltsville, Md., U.S.A.) Peptides acid cellulolytic enzymes caused browning and maceration of capsules of varieties of castor bean susceptible to Botrytis, but not in resistant varieties. Resistance to the hydrolytic enzymes was correlated with both a low content of flavonols and related compounds and the presence of oxidised compounds in injured tissue which inactivated enzymes. GM.

951. PHOSPHORUS LEVELS OF NORMAL AND CONDITIONED TOBACCO CALLUS TISSUE. M.J.Merrett: Biochim. biophys. Acta, 1963, 69, 405-406 (Dept. Biol. Sci., Bradford Inst. Technol., England) Conditioned tissues possessed a higher level of P compared with normal tissue although acid-sol. org. P was not increased. B.M.Stevens

952. SYNTHESIS OF ENZYMES DURING GERMINATION OF FUNGUS SPORES. D.Gottlieb and P.G.Caltriden: Nature, Lond., 1963, 197, 916-917 (Dept. Plant Pathol., Univ. Illinois, Urbana, Ill., U.S.A.) Resting spores of Ustilago zaeae have a very low O₂ consumption and several enzymes necessary for glucose metabolism are undetectable. With increasing period of incubation in & Jo molasses, O₂ uptake and incorporation of [¹⁴C]phenylalanine into protein increased steadily. At the time of development of the germ tube, all the enzymes of the hexose-monophosphate shunt and citric acid cycle were present or had increased significantly concn. It is concluded that morphol. manifestation of development appears long after physiol. mechanisms & to operate. G.M.

953. PURIFICATION OF FACTORS INDUCING CELL DIVISION EXTRACTED FROM PLUM FRUITLETS. D.S.Letham: Life Sci., 1963, No.3, 152-157 (Fiji Res. Div., Dept. Sci. Indust. Res., Auckland, New Zealand) Two fractions with cell division-promoting activity were extracted from plum fruitlet. One factor (Ai) seemed to be an N⁶-substituted adenine, as shown by its u.v. spectra. The second factor, identified as myoinositol, promoted cell division only in the presence of K.Jones

954. ARGININOSUCCINIC ACID IN GERMINATING SEEDS OF Vicia faba L. J.T.Barber and D.Boulter: Nature, Lond., 1963, 197, 1112 (Hartley Bot. Lab., Univ. Liverpool, England) Arginine, arginosuccinic citrulline and ornithine have been determined in ungerminated seeds and 6- and 14-day-old seedlings of V. faba. Vacuum-infiltration of [¹⁴C]arginine in 10-day-old cotyledon showed that arginosuccinic acid and proline were the first amino acids to be labelled later, ornithine, citrulline, glutamic and aspartic acids and finally alanine and γ -amino butyric acid became labelled. GM.

955. UREA SYNTHESIS IN YOUNG BARLEY ROOTS BY MEANS OF THE ORNITHINE CYCLE. H.Kating: Biochem. Z., 1963, 336, 489-494 (Pharm. Inst., Bonn, Germany) Roots, 2 to 4 days old, from young varieties of summer barley were placed in a nutrient medium containing NaH₁₄CO₃ and ammonium sulphate. After 2 to 4 hr. radioactively labelled citrulline, arginine and urea were detected. The presence of ornithine carbamylase, arginase and urease was shown. (German) 14C

956. COLORIMETRIC ESTIMATION OF 4-HYDROXYPIECOLINIC ACID, 4-AMINOPIECOLINIC ACID

- PIPECOLINIC ACID IN PLANT EXTRACTS BY MEANS OF NINHYDRIN. W.Schenk: Biochem. Z.. 1963, 336. 557-563 (Inst. Allgemeine Bot., Univ. Halle/Saale, Germany) Powdered material from *Strophanthus* J.Sindeus was extracted with aq. ethanol and separated from nitrogenous substances on a Dowex 50 column.
- ¹Aminopipecolinic. 4-hydroxypipecolinic and piperujinic acid were eluted with 3N NH₄OH and separated by Paper chromatography. Spots were cut out and treated with 0.2% ninhydrin in 90% acetic acid at 100°. (German) L.Cohn
- * PREPARATIVE DEMONSTRATION OF RED CELL WALL PIGMENT OF SPHAGNUM MAGELLANICUM. H.Rudolph: Ber. dtsch. bot. Ges.. 1963. 76, 72-73 (Bot. Inst. Christian-Albrechts-Univ., Kiel, Germany) Prelim, comm.
- ifco (German) H.(3pik)
- ¹ CONVERSION OF 3-INDOLEACETALDOXIME [IAOx] TO 3-INDOLEACETONITRILE [IAN] BY PLANTS. S.Mahadevan: Arch. Biochem.. 1963. 100, 557-558 (JDept. Biochem.. Indian Inst. Sci., Bangalore, India) leaves and mycelia of *Aspergillus niger* (Mulder), *Penicillium chrysogenum* (51-20F3), *Fusarium oxysporum*, *Cubense* and *Gibberella fujikuroi* converted IAOx to and IAA. Prelim, comm. B.M.Stevens
- INHIBITION OF NITRATE ASSIMILATION BY AMMONIUM IN CHLORELLA. P.J.Syrett and I.Morris: chim. biophys. Acta, 1963, 67, 566-575 (Bot. J. Pl., Univ. Coll., London, England) *C. vulgaris* J. Completely ceased to assimilate NO₃⁻ on addition of id J. NO₃⁻ assimilation recommended when the NH₄⁺ disappeared. NH₄⁺ did not inhibit NO₃⁻ reduction by Peking C source and hence unable to assimilate NH₄⁺. Chlorella nitrate reductase was sp. for NAD⁺, the glutamic dehydrogenase was sp. for NADP. addition inhib. NO₃⁻ assimilation completely, but only partially inhib. NO₂⁻ assimilation. B.M.Stevens
- fcn B.M.Stevens
- MECHANISM OF NITRITE REDUCTION IN CHLOROPLASTS. M.Losada, A.Paneque, J.M.Ramirez and F.del Campo: Biochem. biophys. Res. Comm., 1963, 10, 298 (Section Bioquímica y Fisiol. Celular, Centro de Investigaciones Biol., C.S.I.C., Madrid, Spain) Washed spinach chloroplast fragments will not photoreduce of NO₂⁻ in the presence of xin and a thermolabile substance from chloroplast presumably nitrite reductase. B.Ketterer
- LOW TEMPERATURE SPECTRA OF CHLOROPLAST FRAGMENTS. W.L.Butler and J.E.Baker: Biochim. Biophys. Acta, 1963, 66, 206-211 (Instrumentation Lab. Market Quality Res. Div., Agric. Marketing Beltsville, Md., U.S.A.) Absorption and fluorescence excitation spectra of fragments, obtained by oscillation and differential centrifugation, were at -196°. Several chlorophyll pigments including the one absorbing near 705 mp were resolved. No separation of pigments was achieved by differential centrifugation. The smallest fragments, in a 173000 x g, contained chlorophyll pigments in the same intact chloroplasts and fluorescence excitation showed that energy transfer between the pigments to the same degree. B.M.Stevens
- PROPERTIES OF AQUEOUS EXTRACTS OF CHLOROPLASTS WITH ABSORBANCY MAXIMUM AT 740 mji. Ghorion: Biochim. biophys. Acta. 1963. 66, 212-217 du Phytotron, Gif-sur-Yvette, Seine-et-Oise.

France) The absorption spectrum of a detergent-buffer extract of tobacco chloroplasts showed a bathochromic shift on treatment with aq. alcohol or acetone. The max. moved from 668 mji to 740 mp owing to crystn. of chlorophyll mol. on chloroplast protein particles. The solvent acted on the whole protein-pigment complex. The aggregation of chlorophyll was in the range of 10⁹ mol./particle. (French) B.M.Stevens

963. EMERSON EFFECT IN ISOLATED CHLOROPLASTS. P.M.Bishop and C.P.Whittingham: Nature. Lond., 1963, 197, 1225-1226 (Dept. Bot., Queen Mary Coll., London, England) The O₂ production resulting from flash illumination was measured in spinach chloroplast fragments illuminated with low intensity continuous light. The O₂ yield depended markedly on wavelength and there appeared to be 2 pigment systems, one absorbing at 675 and 700 mji and one at 651 and 675 mp. The data indicate the existence of a long-lived photosynthetic intermediate. G.M.Lewis

964. CHLOROPLAST STORAGE WITH RETENTION OF PHOTOSYNTHETIC ACTIVITIES. W.C.Duane and D.W.Krogmann: Biochim. biophys. Acta, 1963. 71, 195-196 (Dept. Chem., Wayne State Univ., Detroit, Mich.. U.S.A.) B.M.Stevens

965. SOLVENT-INDUCED CHANGES IN ABSORBANCY OF ISOLATED CHLOROPLAST FRAGMENTS. J.Aghion, E.Porcile and J.A.Lippincott: Nature. Lond., 1963. 197, 1110-1112 (Lab. du Phytotron, Centre N*tl. de la Recherche Sci., Gif-sur-Yvette (Seine-et-Oise). France) Treatment of *Nicotiana tabacum* chloroplasts with 65% methanol or 52% ethanol at pH 8.5 causes the formation of a substance absorbing at 740 mji. It was found that chlorophyll remains bound to the chloroplast structure at higher alcohol concn. than are required to produce the 740 mp absorbancy max. 75% methanol causes a reversible bleaching of chlorophyll. These changes may be due to enzymic processes as they are prevented by boiling, very low temp., or by addition of Cl₁Cl₂. A decrease in size of the chloroplast fragments accompanying the formation of the 740 mji absorbancy max. is consistent with crystn. of the chlorophyll mol. G.M.Lewis

966. EFFECT OF LIGHT INTENSITY ON FAR RED INHIBITION OF CHLOROPHYLL FLUORESCENCE IN VIVO. W.L.Butler: Biochim. biophys. Acta, 1963. 66, 275-276 (Instrumentation Res. Lab., Market Quality Res. Div., Agric. Marketing Service, Beltsville, Md., U.S.A.) B.M.Stevens

967. EFFECT OF ULTRAVIOLET LIGHT ON PHOTOPHORYLATION AND HILL REACTION. N.Shavit and M.Avron: Biochim. biophys. Acta. 1963. 66, 187-195 (Biochem. Section. Weizmann Inst. Sci., Rehovoth, Israel) Photophosphorylation and more especially Hill reaction activity of Swiss chard chloroplasts or chloroplast fragments were reduced by short X.u.v. irradiation. Ascorbate prevented the reduction especially for Hill reaction activity. SH containing compounds could not replace ascorbate. Chloroplast prep. with no Hill reaction activity but high photophosphorylative activity could be prep. Irradiation was shown to destroy chloroplast plastoquinone. The activity of irradiated chloroplasts was stim. by plastoquinone addition but non-irradiated chloroplasts were similarly stim. B.M.Stevens

BIOCHEMISTRY

- 968. PHOTO-INDUCED ELECTRON PARAMAGNETIC RESONANCE IN MUTANT PHOTOSYNTHETIC SPECIES LACKING CAROTENOIDS OR CHLOROPHYLL.** G.M.Androes, M.F.Singleton, J.Biggins and M.Calvin: *Biochim. biophys. Acta.* 1963, 66, 180-187 (Lawrence Rad. Lab., Univ. California, Berkeley, Calif., U.S.A.) The association of the photo-induced electron paramagnetic resonance signal in photosynthetic tissue with the necessity for the presence of chlorophyll was demonstrated with a variety of mutant organisms. B.M.Stevens
- 969. DYNAMIC ROLE OF TRIPLET STATES IN PHOTOSYNTHESES.** G.W.Robinson: *Proc. nat. Acad. Sci., Wash.*, 1963, 49, 521-529 (Gates and Crellin Lab. Chem., California Inst. Technol., Pasadena, Calif., U.S.A.) The possible significance of triplet state quenching, triplet energy transfer, triplet-triplet annihilation, and triplet energy multiplication in photosynthesis is discussed. J.R.Sargent
- 970. EVIDENCE FOR OCCURRENCE OF CYCLIC PHOSPHORYLATION IN VIVO.** G.Forti and B.Parisi: *Biochim. biophys. Acta*, 1963, 71, 1-6 (Nat. Res. Council for Redox Studies in Plants, Lab. Plant Physiol., Inst. Plant Sci., Univ., Milano, Italy) The ATP level in leaves was increased many times on illumination in the presence of β -chlorophenylidimethylurea [CMU] although CMU completely inhibits O₂ evolution and CO₂ fixation. The light effect in the presence of CMU was observed under strictly anaerobic conditions as well as in air and was very rapid. B.M.Stevens
- 971. FUNCTION OF CYTOCHROME*i* IN PHOTOSYNTHETIC ELECTRON TRANSPORT.** G.Forti, M.L. Bertolé and B.Parisi: *Biochem. biophys. Res. Comm.*, 1963, 10, 384 (Inst. di Science Bot., Università di Milano, Italy) Expt. are described showing that H₂O is the terminal electron donor in cytochrome *f* reduction and that this reduction is accompanied by the formation of one mole of ATP per electron pair transferred. Doubt is cast on the view that NADP is reduced by the same light reaction responsible for the oxidation of cytochrome *U*. B.Ketterer
- 972. ELECTRON-TRANSPORT SYSTEM IN PHOTOSYNTHESIS OF GREEN PLANTS ANALYSED BY SENSITIVE FLASH PHOTOMETRY.** H.T.Witt, A.Mittler and B.Rumberg: *Nature, Lond.*, 1963, 197, 987-991 (Max-Volmer Inst., Phys.-chem. Inst. der Technischen, Univ., Berlin, Germany) A reaction scheme for the electron transport system in photosynthesis is presented based on short-time absorption changes as measured by sensitive flash photometry. The scheme includes coupling of 2 light-reactions. NADP or similar substances are reduced by transfer of electrons from water through at least 8 reaction cycles including an unknown Y, activated chlorophyll *a*, plastoquinone, an unknown E, cytochrome, activated chlorophyll *jil*, an unknown Z and ferredoxin. J.R.Sargent
- 973. INTRACELLULAR DISTRIBUTION OF THE EARLY PRODUCTS OF PHOTOSYNTHESIS.** C.R.Stocking, G.R.Williams and A.Ongun: *Biochem. biophys. Res. Comm.*, 1963, 10, 416 (Univ. California, Davis, Calif., U.S.A.) Chloroplasts were isolated non-aqueously to prevent leaching. After 5 sec. of photosynthesis about 7V% of newly formed carbon compounds are in the chloroplasts while after 60 sec. of photosynthesis this level has dropped to 50%. B.Ketterer

GENERAL BIOCHEMISTRY

- 974. EVIDENCE OF AN EXTRATERRESTRIAL ORIGIN FOR SOME ORGANIC CONSTITUENTS OF METEORITES** M.H.Briggs: *Nature, Lond.*, 1963, 197, 1290 (Jet Propulsion Lab., California Inst. Technol., Pasadena, Calif., U.S.A.) The isotopic composition of the H, C and S of org. matter extracted from 3 carbonaceous chondrites indicated an extraterrestrial origin for this material. G.M.Lewis
- 975. MODEL SYSTEM FOR TRANSCELLULAR ACTIVE TRANSPORT.** D.S.Parsons: *Nature, Lond.*, 1963, 197, 1303-1304 (Dept. Biochem., Univ. Oxford, England). G.M.Lewis
- 976. CHEMICAL REACTION ACCELERATED TRANSPORT OF MOLECULES THROUGH MEMBRANES.** J.H.Wang: *J. theor. Biol.*, 1963, 4, 175-178 (Dept. Chem., Yale Univ., Conn., U.S.A.) The diffusion of mol. through membranes is often accelerated if the membrane contains mol. which combine rapidly and reversibly with the diffusing spp. The example of O₂ transport through a membrane containing Hb is examined mathematically > a treatment which accounts for all data in previous reports. G.F.Bla&^e
- 977. PROPERTIES OF MITOCHONDRIAL PREPARATIONS FROM THE SMALL-INTESTINAL MUCOSA OF THE GUINEA-PIG.** H.S.A.Sherratt and G.Hoflscher: *Biochim. biophys. Acta*, 1963, 69, 403-405 (Dept. Med. Biochem. Pharmacol., Med. Sch., Univ. Birmingham, England) A variety of substrates w# oxidised and good P/O ratios were obtained. B.M.Stevens
- 978. DEPENDENCE OF MONOAMINE OXIDASE ACTIVITY AND PEROXIDATIVE CONVERSIONS ON MITOCHONDRIAL STRUCTURE.** H.Aebi, F.Stocker and M.Eberhardt: *Biochem. Z.*, 1963, 336, 526-544 (Med.-cn^g Inst., Univ. Bern, Switzerland) Mitochondria ^U dog or rabbit kidney and rat liver were used to study & combined action of MAO and catalase. In these expk the peroxidative conversion of [14c]formate to ^ 9 L^p found to give theoretical yields of O₂, NH₃ and MCTM prep. of freeze dried and lysed mitochondria. Mitoy, chondria not subjected to swelling showed only 10-2W. die activity of lysed mitochondria. If swelling of mito chondria was inhib. by ATP and serum albumin, ty^t Triton X-100 caused no appreciable change in MAO activity. (German) k^cnn
- 979. FREE FATTY ACIDS IN CARROT-TISSUE PREPARATIONS AND THEIR EFFECT ON ISOLATED CARROT MITOCHONDRIA.** L.Dalgarno and L.M.Birt: *Biochem. J.*, 1963, 87, 586-596 (Russell Grimwade Sch., Univ. Melbourne, Victoria, Australia) The t^y B^p amounts of fatty acids, both free and combined, P[^]fe carrottissue homogenates and mitochondrial prep. estimated by gas chromatography. and the influence no. of these acids on mitochondrial prop. determine is concluded that the amounts of free fatty acids gen in the homogenate during the isolation of the partic sufficient to depress the activity of various oxidases (notably the succinate-oxidase system) and to uncoupl oxidation and phosphorylation. The protective effect of serum albumin, added during the disruption of the tissue is ascribed to its ability to bind fatty acids.

980. CHEMICAL PROPERTIES OF BRAIN MITOCHONDRIA. S.Lövtrup and L.Svennerholm: *Exp. Cell Res.*, 1963, 29, 298-313 (Inst. Neurobiol., Univ. GSteborg, Sweden) Chem. prop. of isolated brain mitochondria studied, and it is concluded that brain mitochondria are very similar to those from other tissues. They have the ability to oxidise fatty and amino acids, resembling muscle mitochondria. However, dissimilarities existed, many of them possibly being on the physico-chem level. K.Jones

981. MECHANISM OF RESPIRATORY CONTROL. I. ACTION OF DINTTROPHENOL ON GLYCOLYSIS OF PEAS. R.Bianchetti and E.Marré: *G. Biochim.*, 1962, 11, 162-174 (Inst. di Scienze Bot., Univ. Milan, Italy) The effect of DNP on respiration, fermentation, content of nucleotide labile P, levels of free and phosphorylated carbohydrates, alcohol, acetaldehyde and pyruvate was studied in segments of pea internodes. DNP increased O₂ consumption from 0.97 to 1.27 and was accompanied by large decrease in labile P (as ATP). DNP also increased amounts of pyruvate, aldehyde and alcohol, but phosphorylated and free effect fell. Expt. confirm the view that the primary and DNP is to uncouple phosphorylation in mitochondria which leads to a decline in ATP and an increase in ADP. B.Payne

982. DIFFERENTIAL EFFECTS OF ROTENONE AND ENZYME ON MITOCHONDRIAL ELECTRON AND ENERGY TRANSFER. L.Ernster, G.Dallner and G.F. (Winnherg) J. biol. Chem., 1963, 238, 1124-1131 The effects of rotenone on respiration, phosphorylation, reactions of rat liver mitochondria are compared with those of Amytal. Rotenone inhibits aerobic Uccin NAD-linked substrates but not that of NAD A? Jnhib. is not relieved by DNP, nor by added cytochrome f, but is overcome by added vit. B₆. Rotenone also inhibits endergonic reduction of acetoacetate by succinate, but not the dismutative reduction of acetoacetate by pyruvate plus malate. Inhibition of extramitochondrial NADH2 is also inhib. by rotenone. He, but only partially in presence of added cytochrome f. NADH2 oxidase activity of submitochondrial particles is also highly sensitive to rotenone. Amytal, rotenone does not affect the mitochondrial membrane as far as PO₄-ATP exchange, and the resting as well as the DNP-induced ATPase reaction. Rotenone does not decrease the P:O ratio with succinate as substrate. Rotenone appears to block NAD-flavin-linked electron transport more specifically than does Amytal. Rotenone also differs from Amytal because it is firmly bound to mitochondria and to submitochondrial particles. J.N.Ashley

983. ELECTRON TRANSFER SYSTEM. LI. ISOLATION AND CHARACTERISATION OF D(-)-j8-HYDROXYBUTYRIC APODEHYDROGENASE FROM OX HEART MITOCHONDRIA. I.Sekuzu, P.Jurtshuk, jun. and D.E.Green: J. biol. Chem., 1963, 238, 975-982 F. A. T. Y. M. Res. Univ. Wisconsin, Madison, Wis. j8-hydroxybutyric apodehydrogenase is isolated by lecithin with cholate and (NH₄)₂SO₄ and by iso-lation with a thiol as a substrate. Requirement for unsat. in IV O/VU concn. of a thiol is needed for max. IM b Asp f enzyme. The activity is inhib. by Cd²⁺ (in presence of 2,3-dimercaptopropanol), on enzymic oxidation of j8-hydroxybutyrate may involvement of vicinal dithiols. The active

D(-)-j8-hydroxybutyric dehydrogenase of mitochondria is probably a lecithinoprotein complex with a dithiol functional group. J.N.Ashley

984. COMPARATIVE STUDY OF ELECTRON TRANSPORT IN MICROSOMES. D.Garfinkel: *Comp. Biochem. Physiol.*, 1963, 8, 367-379 (Johnson Res. Found., Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) Microsomes from the same (or analogous) organs in different spp. resemble each other more closely than microsomes from different organs of a single sp. This has been shown for the following group of organisms; *Rattus*, *Oryctolagus*, *Rana*, *Gallus*, *Carpoides*, *Pseudemys*, *Homarus*, and embryonic pig. In any sp. cytochrome Jbs is almost always richest in microsomes from the liver, followed by kidney, lung, intestinal mucosa, testes and adrenals. Mammals show more activity than (in order), birds, reptiles, fish, amphibia and Crustacea. Information is given on flavin, CO-binding pigment and total haem and enzymic activity of NADH2-cytochrome f reductase, NADH2-cytochrome b5 reductase, and NADPH₂ cytochrome f reductase. M.S.Laverack

985. OXIDATIVE PHOSPHORYLATION AND RESPIRATORY CONTROL IN DIGITONIN FRAGMENTS OF OX HEART MITOCHONDRIA. D.W.Haas and W.B. Elliott: *J. biol. Chem.*, 1963, 238, 1132-1136 (Dept. Biochem., Univ. Buffalo Sch. Med., N.Y., U.S.A.)

The prep., with digitonin, of large batches of mitochondrial fragments which effect oxidative phosphorylation when /3-hydroxybutyrate, NADH2, or succinate is the substrate, is described. The respiratory pigments that function during electron transport in these fragments are the same as those in intact mitochondria. The relative concn. of these pigments in these fragments are similar to those in the intact system, but the abs. concn. show a 3-fold increase in the cytochrome content of the fragments and a 2-fold increase in flavoprotein over that in intact mitochondria. The fragments show respiratory control ratios of 3-4 with j8-hydroxybutyrate and NADH2 when ADP is the phosphate acceptor, and ratios of 1-2 with succinate in presence of Amytal. J.N.Ashley

986. EVALUATION OF GLYCOLYTIC AND CITRIC ACID CYCLES IN HOMOGENATES OF DYSTROPHIC MOUSE MUSCLE. G.L.Mayers and N.Epstein: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 450-452 (Dept. Ped., New York Hosp., Cornell Med. Cen., New York, U.S.A.) The glycolytic cycle, as measured by lactic acid production, and the citric acid cycle, measured by O₂ consumption, appeared to operate as efficiently in homogenates from dystrophic mouse muscle as in those from normal muscle. M.M.Shapland

987. EFFECT OF THE LIVER ON THE EXTRACELLULAR REDOX QUOTIENT LACTATE/PYRUVATE. EXPERIMENTS WITH ISOLATED PERFUSED RAT LIVER. H.Schimassek: *Biochem. Z.* 1963, 336, 468-473 (Physiol.-Chem. Inst., Univ. Marburg/Lahn, Germany) The ratio lactate/pyruvate remained const. in the isolated perfused liver even though the substrate levels rose in the perfusion medium and liver as a result of a lactate flux of 20 pmole/g. liver/hr. This ratio was 10 and identical with that observed in vivo. (German) L.Cohn

988. OXIDATION OF SUCCINATE AND THE CONTROL OF THE CITRIC ACID CYCLE IN THE MITOCHONDRIA OF GUINEA-PIG LIVER, MAMMARY GLAND AND KIDNEY. E.A.Jones and H.Gutfreund: *Biochem. J.*

BIOCHEMISTRY

1963. 87, 639-648 (N.I.R.D., Shinfield, Nr. Reading, Berks., England) The rate of oxidation of succinate by respiring liver mitochondria phosphorylating ADP to ATP is only half that of broken or uncoupled mitochondria. It was concluded that in these particles phosphorylation is the rate-determining step during the coupled oxidation of succinate. The addition of oxaloacetate to liver mitochondria oxidising succinate and synthesising ATP caused only a limited inhibn. of the oxidation of succinate, whereas the same concn. of oxaloacetate ($1^{*}7\text{mM}$) completely inhib. the oxidation of succinate when the synthesis of ATP was uncoupled by the addition of DNP. This and other results pointed to the conclusion that ATP was utilised during the metabolism of oxaloacetate by mitochondria. This energy requirement appears to be limited to the local removal of oxaloacetate from the vicinity of the succinate-oxidase system. The total amount of oxaloacetate metabolised by liver mitochondria is remarkably independent of a variety of conditions. Mammary-gland mitochondria metabolise oxaloacetate more slowly than do liver mitochondria, and in this system the rate of removal of oxaloacetate appeared to be the rate-determining factor in the oxidation of succinate under a variety of conditions.

989. DISTRIBUTION OF LYSOSOMAL ENZYMES IN ANIMAL TISSUES. S.Shibko, K.A.Caldwell, P.L. Sawant and A.L.Tappel: J. cell. comp. Physiol., 1963. 61, 85-92 (Dept. Food Sci. Technol., Univ. California, Davis, Calif., U.S.A.) Distribution and activity of β -galactosidase, cathepsin, RNase, α -glucuronidase, acid phosphatase and aryl sulphatase in muscle, liver and spleen tissue of 8 spp., representing the main phyla of the animal kingdom was studied. Spp. differences are discussed. G.M.Lewis

990. IN VITRO EFFECT OF ASPARTIC ACID ON SOME AMINO ACIDS AND ON THE RESPIRATION OF CEREBRAL TISSUE. U.Bonomi and L.T.Tenconi: G. Biochim., 1962, 11, 146-156 (Lab. Direzione Centrale Med., Milano, Italy) The O₂ uptake of rat cerebral cortex slices and homogenates was studied in presence of glucose and aspartate. It was found that aspartate alone only partly inhib. uptake in cerebral slices, but with addition of glucose O₂ uptake was increased. In both these reactions glutamate was synthesised. Glutamine synthesis was increased by presence of aspartate and glucose, but γ -aminobutyrate synthesis increased only in presence of glutamate. Variations in endocellular amino acids did not always follow a similar pattern to those of the supernatant. Comparison of data of slices and supernatant indicated that glutamic-aspartic transaminase is at least in part located at the periphery of the cell, and in this position may condition the ratio of glutamate and aspartate during absorption, and thus the energy metabolism of the brain. B.Payne

991. RELAXING FACTOR SYSTEM OF HEART MUSCLE. H.Abe, M.Takauji, H.Takahashi and T.Nagai: Biochim. biophys. Acta. 1963, 71, 7-14 (Physiol. Inst. Med. Hochsch. Sapporo, Japan) Relaxing activity of micro somes was very low but crude extracts or a microsome-cofactor system inhib. cardiac myofibrillar ATPase. Relaxing factor system activity was lower in heart than in skeletal muscle although prop. were similar. A protein-free relaxing substance was obtained by eluting a cellulose column with adsorbed microsomes with an ATP soln. containing cofactor. The prop. resembled those of skeletal muscle relaxing substance. Ouabain had no

effect on relaxing factor system, relaxing substance or myofibrillar ATPase. Heart myofibrillar ATPase was $I^{*}5$ inhib. by relaxing factor systems of heart or skeletal muscle or by EDTA than the myofibrillar ATPase of skeletal muscle. Uterine muscle, liver and brain had no relaxing factor system. (German) B.M.Stevel*

992. ROLE OF THE PHOSPHORYLASE ENZYMES IN CARDIAC CONTRACTION: A PROPOSED THEORY THE RHYTHMICAL PRODUCTION OF ENERGY IN THE HEART. N.Haugaard: Nature. Lond. 1963. 197, I 1072-1074 (Dept. Pharmacol., Sch. Med.. Univ. Pennsylvania, Philadelphia, Pa., U.S.A.) It is proposed that AMP, produced during any stage of heart contraction cycle, causes an increase in phosphorylase & activity. This results in increased glycolysis bringing phosphorylation of ADP, and through the action of myokinase, disappearance of AMP. Thus a discontinuous rhythmic formation of high energy phosphate bonds occur. J.R.Sarg

993. EFFECT OF LEUCINE-ISOLEUCINE AND VALINE ANTAGONISM AND COMPARISON WITH THE EFFECT OF ETHIONINE ON RAT LIVER REGENERATION. P.D.Spolter and A.E.Harper: Arch. Biochem., 1963, 100, 369-377 (Dept. Biochem., Univ. Wisconsin, Madison, Wis., U.S.A.) Less liver tissue, protein DNA were regenerated in 4 days after partial hepatectomy in rats fed a high leucine diet than in controls fed the leucine diet plus isoleucine and valine ad lib. The regeneration was, however, similarly depressed in pair fed controls. Rats on the high leucine diet regenerate more RNA and had more liver RNA 2 and 4 days after partial hepatectomy than pair fed controls receiving leucine and valine as well. The RNA content returned to normal 10 days after operation. In males ethionine interfered with liver protein. DNA and RNA regeneration more than would be expected from its depression of food intake. B.M.Stevens

994. METABOLISM OF THE TRANSPLANTED DOG KIDNEY. P.Nathan, E.C.Foulkes, L.S.Wilchens, B.F.Miller: Proc. Soc. exp. Biol., N.Y. 1963, IV 207-210 (May Inst. Med. Res., Cincinnati Jetet Cincinnati, Ohio, U.S.A.) Slices from second kidney transplant in advanced state of rejection. Take up O₂ within normal limits. Results were interpreted as indicating that cytotoxic actions are not a major factor in transplant rejection. M.M.Shapiro

995. CHEMICAL COMPOSITION AND TERMINOLOGY OF SPECIALISED ORGANELLES (MELANOSOMES AND MELANIN GRANULES) IN MAMMALIAN MELANO-CYTES. M.Seiji, T.B.Fitzpatrick, R.T.Simpson and M.S.C.Birbeck: Nature, Lond., 1963, 197, 1082-1084 (Dept. Dermatol., Harvard Med. Sch., Boston, Mass., U.S.A.) Three stages in the development of melanin granules are defined. Sucrose density analysis of homogenates of mouse melanomas as used separate mitochondria and melanosomes, which show marked chem. and enzymic differences. Melanosomes are distinctive subcellular particles with unique distribution in cytoplasm of melanin-forming cells; they have a specialised metabolic pathway in which tyrosine is converted to melanin but are otherwise biol. inert. G.M.Lewis

996. PARTIAL KINETIC ANALYSIS OF THE CHIMERIC LUMINESCENCE OF PHENAZINE METHOSULPHATE. R.H.Steele and B.S.Breckinridge: Biochem. biophys.

BIOCHEMISTRY

[^]EATHOGENESIS OF URAEMIA, vn. INFLUENCE
FROM TYRAMINE ON THE FORMATION OF ACETOIN
HEART PYRUVIC ACID IN THE RAT BRAIN. LIVER.
HEART AND ILEUM. F.Bigler, H.ThOlen and H.Staub:
Helv. Physiol. pharmacol. Acta. 1962. 20. 368-372
(Med. Universitätsklinik Basel, Switzerland) The
hypothesis that the increased acetoin levels in blood and
c.s.f. of renal and hepatic patients are caused by endo-
genous amino acids was examined. 10 " 2M pyruvate increased
tenis ^v ^{in vitro} synthesis of acetoin from pyruvate by homo-
[^]nythet- ^{k_{ra:n*}} liver and ileum, and decreased the
utylein ^U heart muscle. The concen. of acetoin and
toe C₆" 8lycol is lower in the rabbit cerebrum than in
re oelium and the brain stem.

DQO or SURFACE STRUCTURE OF ERYTHROCYTES FROM
 G. f. ANIMAL SOURCES. G.V.F.Seaman and
 (*W. bruck: Arch. Biochem.. 1963. 100. 493-502
 *al. "P., chem. Inst. der Univ. KÖln, K61n-Linden-
 troj. h. term. any). Proteolytic enzymes reduced the
 W. ^{IC} _{IC} ^{mobil} itics of human and chimpanzee
 la. * hum decreases depending on the enzyme specificity.
 5. ^{witw?} k.c. the reductions were semiquant. corre-
 "acetylated neuraminic acid containing mucoids. With
 other animal r.b.c. proteolytic enzymes produced small
 decreases or no change in mobility; with chicken r.b.c.
 mobility was increased. Treatment of r.b.c. with
 neuraminidase reduced the electrokinetic charge markedly
 In all cases. The sialic acid on the surface of chicken
 r.b.c. was predominantly N-acetylneuraminic acid while
 that from horse r.b.c. was mainly N-glycolyneuraminic
 acid. Successive treatments with neuraminidase, papain
 and trypsin revealed marked differences between r.b.c.
 from different spp.

OXIDATIVE INACTIVATION OF ENZYMES.
M.S.Melzer,^r and S.I.Epstein: Arch. Biochem., 1963,
100, 436-440 (Dept. Chem., Tufts Univ., Medford,

Mass., U.S.A.) RNase lost very little activity after treatment with 55000 mol. H₂O₂/mol. at pH 5*00. Using a modified Kunitz method, the slope with H₂O₂ was - 0-072 ± 0-014 whereas the control slope was - 0-086 ± 0-016. With 3-aminotriazole [3-AT] and H₂O₂ the slope was -0-080 ± 0-016. Denaturation of the enzyme is suggested to be a necessary first step for complete inactivation by H₂O₂. 3-AT was unreactive with 12 amino acids but did react with the oxidised forms of cystine and cysteine. 3-AT also reacted strongly with basic haemin alone or in the presence of H₂O₂, histidine or acetate. A mechanism for catalase inactivation by 3-AT and H₂O₂ is suggested. B.M.Stevens

1002. 1,2-DIHYDRO-1, 2-DIHYDROXYBENZENE AND SEVERAL OTHER SUBSTANCES IN THE METABOLISM OF BENZENE. T.Sato, T.Fukuyama, T.Suzuki and H.Yoshikawa: J. Biochem., Tokyo, 1963, 53, 23-27 (Dept. Nutr. Biochem., Inst. Public Health, Tokyo, Japan) Paper chromatographic and electrophoretic prop, and colour reactions of *trans*- and *cis*-benzeneglycol were examined. On incubation with liver supernatant, phenylsulphate and catechol sulphate were produced, the *trans*-isomer producing more catechol sulphate than the *cis*-isomer. Urine of rabbits dosed with benzene contained a substance which behaved as *trans*-benzeneglycol chromatographically and electrophoretically and also a substance which yielded JiaBfi-benzeneglycol after treatment with *p*-glucuronidase. A compound which appeared to be the precursor of phenylmercapturic acid was also demonstrated in the urine by paper chromatography.

and E.KULONEN. V. NOTE ON THE EFFECT OF**

BIOCHEMISTRY

GLUTAMINE ON THE INCORPORATION OF ETHANOL CARBON. H.-M.H2kkinen and E.Kulonen: Arch. int. Pharmacodyn.. 1963. 142. 74-85. 86-89 (Res. Labs.. State Alcohol Monopoly (Alko). Helsinki. Finland) IV. Rates of turnover of ^{14}C are studied in rat liver, brain, plasma, r.b.c. and liver lipid fractions after ingestion of [^{14}C]ethanol. Half-lives found are: liver lipids 50 hr., plasma 40 hr., r.b.c. 117 hr., whole brain homogenate 168 hr., brain cytoplasm 84 hr., and brain mitochondria 630 hr. In brain incorporation is highest in the micro-somes.

V. 2 hr. after ingestion of [^{14}C]ethanol total recoverable ^{14}C from whole liver, brain, and blood is reduced by simult. oral administration of L-glutamine 2 g./kg. ^{14}C in non-volatile residues is not affected. S.E.Smith

1008. MECHANISM OF BIOLOGICAL N-DEALKYLATION. H.Keberle, W.Riess, K.Schmid and K.Hoffmann: Arch. int. Pharmacodyn.. 1963. 142. 125-140 (Ciba Res. Labs.. Basel. Switzerland)

The metabolism of orally administered D- and L- N-methylglutethimide is studied in dogs. The 2 optical isomers are each excreted as 2 glucuronides. One of each pair undergoes N-demethylation. the nature of which is discussed.

(German) S.E. Smith

1009. STEREOSPECIFIC METABOLISM OF OPTICAL ISOMERS OF a-PHENYL, (X-ETHYLGUTARIMIDE (DORIDEN) [GLUTETHIMIDE]. H.Keberle, W.Riess and K.Hoffmann: Arch. int. Pharmacodyn.. 1963. 142, 117-124 (Ciba Res. Labs.. Basel. Switzerland)

The metabolism of orally administered glutethimide is studied in dogs. The results show that the (+) and (-) optical Isomers are metabolised differently, the former being hydroxylated in the glutarimide ring, the latter hydroxylated in the ethyl side chain. All the metabolites are conjugated to a great extent.

(German) S.E. Smith

1010. NON SPECIFICITY OF BASIC AMINO ACIDS AND AMINES OF THE TISSUES OF THE SNAIL (HELIX POMATIA. L.). J.Cardot, J.Ripplinger and M.Lonchamp: C.R. Soc. Biol.. Paris. 1962. 156,

1433-1435 (Lab. Zool.. Fac. Sci.. Besancon. France)

Separation of extracts of heart and nervous tissue of Hg^{2+} by paper and column chromatography showed the presence of die basic amino acids ornithine, lysine, arginine and histidine and several amines. The amino acids were without effect on the snail heart. The amines accelerated the snail heart. They were found in both heart and nervous tissue. They did not include histamine, tyramine, dopamine and 5HT. It is concluded that they are not cardioaccelerator transmitters. (French) M.A.Price

1011. CHEMICAL COMPOSITION OF MARTESIA

FRAGILIS. V.V.Srinivasan and S.Krishnaswamy: Life Sci.. 1963. No. 3. 149-151 (Zool. Res. Lab.. Univ. Madras. S. India) The contents of water. N. protein. lipids. ash and glycogen of wood-boring pholads. M. fragilis. are reported. K.Jone-

1012. EFFECTS OF OCTACOSANOL ON CHICK COMB GROWTH. E.Levin: Proc. Soc. exp. Biol., N.Y.. 1963. 112. 331-334 (VioBin Corp.. Monticello. 111, U.S.A.) The C28 straight chain sat. alcohol octacosanol was found in wheat germ oil. This expt. study confirms and extends its action on the combs of White Leghorn chicks in that it significantly increases comb growths a direct relationship between dose and response was not found.

D.N.Wheatley

1013. ELECTROPHORETIC STUDIES OF RED CELL HAEMOLYSATES SUPPLEMENTED WITH PHOSPHORYLATED CARBOHYDRATE INTERMEDIATES. Y.Sugita and A.Chanutin: Proc. Soc. exp. Biol., NJ.. 1963, 112. 72-75 (Biochem. Lab.. Univ. Virginia Med. Sch.. Charlottesville, Va.. U.S.A.) The

electrophoretic behaviour of 3 different fractions of huff^{H} blood stored for a month at 4° was followed after the bW^{I} haemolysate was treated with various substances containing phosphate groupings. It was found that the fraction designated B could be neatly increased by the addition of 2,3-diphosphoglycerat J and of ATP and with this increase the fractions f and A were reduced. Smaller increases were found with ADP and 3-phosphoglyceric acid. The addition of fructose 1,6-diphosphate introduced a new electrophoretic component. The explanation might lie in the reversibility of the binding of phosphoric esters with proteins.

1015. POSSIBLE FUNCTIONS OF CHAINS OF CATALYSTS

H. RJ.P.Williams: J. theoret. Biol.. 1962. 3. 209-229 (Wadham College. Oxford. England) The oxidap phosphorylation system is considered in detail. Function of the chain of catalysts involved is discussed placing special emphasis upon the ordering in space of the catalysts and their substrates.

G.F.B**

METHODS

1016. BIOSYNTHESIS OF CHLOROGENIC ACID AND RELATED CONJUGATES OF HYDROXYCINNAMIC ACIDS. CHROMATOGRAPHIC SEPARATION AND CHARACTERISATION. K.R.Hanson and M.Zucke*: J. biol. Chem.. 1963, 238. 1105-1115 (Dept. Biochem.. Connecticut Agric. Exp. Station. New & Conn.. U.S.A.) A system for partition chromatography on SiO_2 gel is used for quant. separation of COP mixtures of phenolic conjugates (compounds related to chlorogenic acid [3-O-caffeoylequinic acid]). A solvent gradient of 10% cyclohexane- CHCl_3 (by vol.) \$ 30% \text{jerf}\$ butyl alcohol- CHCl_3 (by vol.) is used. TDF of the peak effluent vol. for any 2 compounds resolve independent of the gradient applied and of the length of the column under specified conditions. The methods

a prelim. short SiO_2 gel column fractionation step is applied to potato tuber cortex and pulp tissue, to tissue slices that have been kept in water, and to tissue cultured in soln. containing L-phenylalanine and 4- Fe^{2+} acid. Eighteen components are resolved and characterized by various methods. Culture of the tissue markedly stimulates phenolic biosynthesis and causes accumulation of 3-O-B-coumaroylquinic acid, with previously known conjugates of $\text{L}-\text{coumaric}$ and caffeic acid with

acid. and also conjugates of these hydroxycinnamic acids with glucose. Chlorogenic acid, the main phenolic component and a previously unknown conjugate of caffeoic acid and quinic acid are present in both cultured and treated tissue. The role of phenylalanine in phenolic synthesis and of 3-O-*β*-coumaroylquinic acid in biosynthesis of chlorogenic acid are discussed. J.N.Ashley

1017. PREVENTION OF EXCESSIVE FOAMING.

R.C.R.Barreto: *J. Chromatography*, 1962, 9, 121 (Central Lab. Tuberculosis and Inst. Phthisiol. and Pneumology, Rio de Janeiro, Brazil) Notes.

1018. USE OF 5-DIMETHYL-2,4-OX AZOLIDINE-DIONE FOR DETERMINATION OF INTRACELLULAR pH. W.Thomason: *Scand. J. clin. Lab. Invest.*, 1963, 15, 55-51 (Dept. Clin. Chem., Rigshospitalet, Copenhagen, Denmark). P.D.Dawkins K.Jones

1019. QUANTITATIVE INFRA-RED ANALYSIS FOR «ULPHONATE AND SULPHATE ESTERS AND NOTE ON ALKYLATION OF NUCLEOSIDE ANALOGUES. E.R.Katritzky, R.G.Shepherd and A.J.Waring: *Rec. av. Chim. Pays-Bas*, 1962, 81, 443-450 (Chem. Univ. Cambridge, England) It is shown that intronate esters can be determined quant. by extraction and measurement of peak heights in the i.r. by observing the rate of disappearance of ethyl methanesulphonate by this method, the rate of ethylation under physiol. conditions was observed for 9-ethylguanine and several other methylated purines and pyrimidines.

1020. APPLICATION OF THE ARCHIBALD ULTRACENTRIFUGAL METHOD FOR STUDY OF DILUTE POLYSYRENE-PYRIMER SOLUTIONS. I. THEORY AND SOME SUMMARY DATA ON THE SYSTEM POLYSTYRENE-METHYL ETHYLKETONE. H.Fujita, H.Inagaki, T.Kotakai and H.Utiyama: *J. phys. Chem.*, 1962, 66, 4-10 (Kyoto Univ., Japan) The theory for the Archibald ultracentrifugal method for polydispersed systems¹, solutes has been improved and extended. It the determination of the wt.-average mol. wt. and scattering second virial coefficient of a given system²,³ or sedimentation expt. performed under conditions appropriate to the Archibald method. The validity of the equations have been verified expt. G.C.Barr

1021. SPECTROPHOTOMETRIC DETERMINATION OF CAFFEINE IN COFFEE AND TEA PRODUCTS, WITH SPECIAL REFERENCE TO COFFEE AND CHICORY MIXTURES. R.F.Smith and D.L.Rees: *Analyst*, 1963, 88, 310-313 (Labs., J.Lyons and Co. Ltd., London, England). L.A.B.S.

1022. MICROAPPARATUS FOR ABSORPTION OF ETHYLENE [IN TOTAL AMOUNTS AS LOW AS A FRACTION OF A MICROLITRE] AND ITS USE IN DETERMINATION OF ETHYLENE IN EXHALED GASES FROM HUMAN SUBJECTS. G.Ram Chandra and M.Specker: *Biochim. biophys. Acta*, 1963, 69, 423-425 (Dept. Plant Sci., Univ. Alberta, Edmonton, Canada) Prelim, comm. B.M.Stevens

1023. PROBES FOR SAMPLING GROUND-WATER FOR GAS ANALYSIS. A.J.Rutter and J.R.Webster: *J. Ecol.* 1962, 50, 615-618 (Imperial Coll., London, England). J.H.Tallis

1024. IMPROVED ELECTRON MICROSCOPIC AUTORADIOGRAPHY. TECHNIQUE FOR PRODUCING THIN FILMS

AND ITS APPLICATION TO [3H]THYMIDINE-LABELLED MAIZE NUCLEI. J.K.Koehler, K.M.Bhle-thaler and A.Frey-Wyssling: *J. cell. Biol.*, 1963, 16, 73-80 (Dept. Physics, New Mexico Highlands Univ., Las Vegas, N.Mex., U.S.A.) A method for producing uniformly thin layers of photographic emulsion over tracer-labelled cell sections is described. Carbon-coated specimens on E.M. grids are placed on a glass disc previously coated with a drop of the emulsion at 45° and centrifuged at 10000 r.p.m. in an M.S.E. basket-type centrifuge. The dry, cooled discs are developed for 7-14 days in Kodak D19b diluted 1:1. The method is illustrated using root tips of 3-5 day old maize seedlings terminally exposed to a soln. containing 10 f.c./ml. [³H]-thymidine for 24 hr. The finest cell structures may be observed and no digestion of gelatin is required.

P.Barrow

1025. LIQUID SCINTILLATION COUNTING OF SOLUTIONS CONTAINING CAROTENOIDS AND CHLOROPHYLLS. E.A.Shneour, S.Aronoff and M.R.Kirk: *Int. J. appl. Radiat.*, 1962, 13, 623-627 (Lawrence Radiat. Lab., Univ. California, Berkeley, Calif., U.S.A.)

Direct bleaching with chlorine has overcome the self-absorption in liquid scintillation counting of soln. containing ³H- or ¹⁴C-labelled carotenoids or chlorophylls, and restored most of the counting efficiency. B.Payne

1026. STORAGE OF STANDARDISED RADIOACTIVE SOLUTIONS. J.H.Harley, N.A.Hallden and I.M.Fisenne: *Nature*, Lond., 1963, 197, 1230 (U.S. Atomic Energy Commission, Hlth. and Safety Lab., New York, U.S.A.) Expt. on the storage of ¹³⁷Cs, ¹⁴⁴Ce, ⁹⁵Zr, ¹³¹I, ¹⁴⁰Ba and ¹⁰⁶Ru in polythene ampoules showed that the nuclide may be kept in soln. by addition of the appropriate acid or carrier; Ru adsorbs on polythene and at least 25% remains on the walls. G.M.Lewis

1027. IODINATION OF TRIPHENYLMETHANE DYE-STUFFS. G.Hillman and E.Kuhlmann: *Hoppe-Seylers Z. physiol. Chem.*, 1963, 331, 109-113 (Chem. Lab. Med., Univ. Klin., Ttbingen, Germany). (German) I.Cornish

1028. RAPID METHOD FOR DETERMINING SULPHATE IN WATER EXTRACTS OF SOILS. A.Massoumi and A.H. Cornfield: *Analyst*, 1963, 88, 321-322 (Chem. Dept., Imperial Coll. Sci. and Technol., London, England). L.A.B.S.

1029. METHOD FOR RAPID DETERMINATION OF ALCOHOL IN BODY FLUIDS. R.M.Maboa: *Analyst*, 1963, 88, 320-321 (Dept. Physiol., Hannah Dairy Res. Inst., Ayr, Scotland). L.A.B.S.

1030. DETERMINATION OF TOTAL SULPHUR DIOXIDE CONTENT OF CIDERS. L.F.Burroughs and A.H.Sparks: *Analyst*, 1963, 88, 304-309 (Res. Sta., Long Ashton, Bristol, England). L.A.B.S.

1031. ISOTOPIC METHOD FOR ENZYMIC ESTIMATION OF OXALOACETATE. G.L.Sfller and O.Wieland: *Biochem. Z.*, 1963, 336, 447-454 (H Med. Univ. Munchen, Germany) Oxaloacetate was extracted from rat liver, rapidly frozen after removal from the animal, by homogenising it in ice-cold 6% HClO₄. Assays were done on a neutralised soln. in the presence of [1-14C]-acetyl-CoA and citrate condensing enzyme isolated from pig heart. [1-14C]citric acid was ptd. at pH 5 by the addition of AgNO₃ and its radioactivity determined in a flow or liquid scintillation counter. Rat liver was found to contain 5×10^{-9} mole oxaloacetate/g. wet wt.

BIOCHEMISTRY

1032. DETERMINATION OF POLYOXYETHYLENE GLYCOL IN NON-IONIC DETERGENTS. P.H.Elworthy: J. Pharm., Lond., 1963, 15, 216-217 (Roy. Coll. Sci. Technol., Glasgow, Scotland) A letter. The method described was applied to commercial detergents. J.M.Whitmarsh
1033. DETERMINATION OF SMALL AMOUNTS OF LONG CHAIN ALIPHATIC AMINES IN AQUEOUS SOLUTION. H. SOMH OBSERVATIONS ON THE COBALT THIO-CYANATE METHOD. M.W.Desai and T.K.S.Murphy: Indian J. Chem., 1963, 1, 106-108 (Chem. Eng. Div. Atomic Energy Establishment, Trombay, Bombay, India). L.A.B.S.
1034. H₂O₂ AND FeSO₄ USED TO DETECT PHOSPHATE ESTERS WHICH ARE DIFFICULT TO HYDROLYSE. P.Venker and G.Schmidt: J. Chromatography, 1962, 9, 121-122 (Inst. Angewandte Isotopenforschung der Inst. Biol. Deutschen Akad. Wissenschaften Berlin, Berlin-Buch, Germany) Note. (German) P.D.Dawkins
1035. ASSAY OF INTRINSIC FACTOR WITH ANTI-INTRINSIC FACTOR SERUM IN VITRO. J.Abel, W.Bouma and H.O.Nieweg: Biochim. biophys. Acta, 1963, 71, 227-229 (Div. Haematol., Dept. Med., State Univ., Groningen, Netherlands) The method provided a more sp. method for detecting intrinsic factor than previously described methods. Prelim, comm. B.M.Stevens
1036. RELAXIN ASSAY METHODS. B.G.Steinert: Trans. N.Y. Acad. Sci., 1963, 25, 307 (Warner-Lambert Res. inst., Morris Plains, N.J., U.S.A.) The guinea-pig pubic symphysis palpitation method and mouse pubic ligament method are compared as assay procedures for relaxin. The former method is prone to subjective variation and the latter offers greater precision, speed and objectivity as well as having comparable sensitivity and specificity. K.Brew
1037. SEPARATION OF BETAINE AND CHOLINE ON ION-EXCHANGERS. A.Niemann: J. Chromatography, 1962, 9, 117-118 (Landw. Forschungsanstalt Btlnthof, Hanover, Germany) Notes. (German) P.D.Dawkins
1038. SEPARATION OF HOMOLOGOUS SERIES OF 2,4-DINITROPHENYLOSAZONES BY COLUMN PARTITION CHROMATOGRAPHY. D.P.Schwartz: J. Chromatography, 1962, 9, 187-194 (Dairy Products Lab., Eastern Utilization Res. and Development Div., Agric. Res. Service, U.S. Dept. Agric., Washington, D.C., U.S.A.) Ethanolamine-benzene systems have been used for the separation of the 2,4-dinitrophenylosazones of CX-keto-aldehydes, 2,3-diketones and glyoxal on celite partition columns. P.D.Dawkins
1039. SIMPLE SYSTEM FOR THE CREATION OF A CONCENTRATION GRADIENT IN THE MOBILE PHASE. J.C.Hauton: J. Chromatography, 1962, 9, 257-260 (H8p. Timone, Marseille, France). (F. French) P.D.Dawkins
1040. PAPER ELECTROPHORESIS THROUGH DIALYSING BARRIERS. R.C.R.Barreto and A.M.Cutrim: J. Chromatography, 1962, 9, 173-175 (Central Lab. Tuberculosis and Inst. Phthisiol. and Pneumol., Univ. Brazil, Rio de Janeiro, Brazil) A method is described for separating low mol. wt. electrically charged compounds from proteins by electrophoresis on paper strips with collodion bridges inserted on either side of the starting

line. Low mol. wt. compounds proceed freely through the collodion semi-permeable membrane whereas the displacement of proteins is barred, thus alleviating the necessity of deproteinising biol. fluids before electro* phoresis. P.D.Dawta*

1041. ISOLATION AND IDENTIFICATION OF ISO-Nicotinic ACID HYDRAZIDE [INH] AND ITS META-BOLIC PRODUCTS. R.C.R.Barreto and S.O.Sabino: J. Chromatography, 1962, 9, 180-186 (Inst. Phthf* and Pneumol., Univ. Brazil, Rio de Janeiro, Brazil) Combined paper electrophoresis and paper chromatography in 2-dimensional separations are described for jp study of acid metabolites of INH. Better separations of the non-acid metabolites are obtained by means of 2-dimensional paper chromatography on unbuffered Paper A sequential procedure for the localisation of INH and some of its deriv. on paper chromatograms is devised. P.D.W

1042. WICK SYSTEMS IN CIRCULAR PAPER <CHRC GRAPHY. T.Medwick, R.G.Johl and N.Adler: J. Chromatography, 1962, 9, 118-120 (Chem. Di- Merck and Co. Inc., Rahway, NJ., U.S.A.) Note. P.D.Dawkins

1043. CENTRIFUGAL CHROMATOGRAPHY. IV. SIMPLE DISTRIBUTOR FOR CENTRIFUGAL CHROMATOGRAPHY. M.Pavli&k, J.Rosmus and Z.Deyl: J. ChromatograP^ 1962, 9, 92-95 (Automation Dept., Tech. Univ., Prague, Czechoslovakia) A simple distributor or mobile phase for centrifugal paper chromatography is described which enables the mobile phase to be changed rapidly and lends itself to gradient elution paper chromatography. P.D.Dawkins

1044. RAPID PAPER CHROMATOGRAPHIC FRACTIONATION OF COMPLEX MIXTURES OF WATER-SOLUBLE SUBSTANCES. H.T.Gordon, W.W.Thornburg and L.N. Werum: J. Chromatography, 1962, 9, 44-59 & ept. Entomol. Parasitol., Univ. California, Berkeley, U.S.A.) Three alcohol-pyridine-water-acetic BP solvents are described for a rapid preliminary fractionation of crude biol. extracts by paper chromatography. The primary system contains isopropanol. For substances with very high Rf values in this system isopropanol is replaced by isobutanol and for those with very low Rf values by methanol. Rf values of a large no. of org. and inorg. compounds in the 3 systems are tabulated. P.D.Dawkins

1045. PAPER CHROMATOGRAPHIC SEPARATION CYCLIC OLIGOMERIC PEPTIDES OF CAPROLACTAM. K.Czerepko: J. Chromatography, 1962, 9, l''-203 (Irrst. Allgemeine Chenu und Inst. physiol. Cherru Med. Akad., Bialystok, Poland) The cyclic oligomers of Caprolactam have been separated on filter paper impregnated with thymol as stationary phase and developed with a sat. aq. soln. of thymol. The Parent lactam and its cyclic amides were detected with J^dim bismuth iodide. (German) P.D.Dawkins

1046. FRAME FOR PHOTOGRAPHIC PROCESSING-MS AUTORADIOGRAMS OF PAPER CHROMATOGRAMS AND ELECTROPHOREGRAMS. O.Horesovsky, J.Dubal and I.M.Hais: J. Chromatography, 1962, 9, 260-261 (Res. Inst. Pharm. Biochem., Prague, Czechoslovakia) Notes. P.D.Dawkins

1047. AUTOMATIC COUNTER FOR RADIOACTIVE CHROMATOGRAMS ON PAPER STRIPS. J. t. J. Chromatography, 1962, 9, 96-105 (Lab. Clin.)

Nucleaire, Val-Benoit, Liège, Belgium) An apparatus is described which moves chromatographic paper strips successively under the counter tube. An endless strip of cellulose acetate carries up to 15 bands of ^{32}P or ^{35}S arranged on 5 tracks or 3 bands of ^{50}Cr and ^{35}S arranged on 3 tracks. After scanning one track the counter tube moves sideways to the next track. Radioactivity is registered on a graphic recorder.

(French) P.D.Dawkins
1048. GAS-FLOW COUNTING OF CARBON-14 COMPOUNDS: AN IMPROVED TECHNIQUE. H.J.Perkins and M.D MacDonald: Science, 1962, 138, 1259-1260 (Canada Agric. Res. Sta., Lethbridge, Alberta, Canada) Reproducibility in counting by a gas-flow method of samples of ^{14}C -labelled compounds is much improved by spraying the lower surface of the planchet with an 'antistatic' agent in aerosol form. G.M.Lewis

1049. VALIDITY OF RESULTS OBTAINED WHEN A STREAM-SPLITTING DEVICE IS USED BEFORE GAS-LIQUID CHROMATOGRAPHY DETECTOR. A.Karmen, J.C.Caffrey and R.L.Bowman: J. lipid Res., 1963, 4, 8-11 (Lab. Technical Development, N.I.H., Bethesda, Md., U.S.A.) When effluent gases are divided into 2 streams of a given ratio the components in the gas stream are divided in the same ratio. Thus mixtures may be divided into 2 separate streams which may be assayed in radiation and mass detectors.

1050. PREPARATIVE SCALE GAS CHROMATOGRAPHY. M.V. Vreede: Chromatography, 1962, 9, 116-117 (Molab- Org. Chem., State Univ. Ghent, Belgium) P.D.Dawkins

1051. VOLMAN COLLECTOR FOR GAS CHROMATOGRAPHY. R.Teranishi, J.W.Corse, J.C.Day and W.G. Jennings: J. Chromatography, 1962, 9, 244-245 (Western Reg. Res. Lab., Albany, Calif., and Univ. California, Davis, Calif., U.S.A.) Notes. P.D.Dawkins

1052. IMPROVED SAMPLING VALVE FOR GAS CHROMATOGRAPHY. D.J.McEwen: J. Chromatography, 1962, 9, 266-269 (Res. Labs., General Motors Corp., Warren, Mich., U.S.A.) Notes. P.D.Dawkins

1053. GAS CHROMATOGRAPHY FRACTION COLLECTOR AND TRANSFER SYSTEM. C.M.Drew and J.H.Johnson: J. Chromatography, 1962, 9, 264-266 (Res. Dept., U.S. Naval Ordinance Test Station, China Lake, Calif., U.S.A.) Notes. P.D.Dawkins

1054. CHANGES OCCURRING WITH THE IMMOBILE LIQUID PHASE IN GAS-LIQUID CHROMATOGRAPHY. II. EFFECT ON RETENTION VOLUMES. R.A.Keller and G.H.Stewart: J. Chromatography, 1962, 9, 1-12 (Dept. Chem., Univ. Arizona, Tucson, Ariz., U.S.A.) Chemical and physical changes which occur in the immobile liquid phase of gas chromatographic columns during conditioning and use are discussed. P.D.Dawkins

1055. THIN LAYER CHROMATOGRAPHY OF BILE ACIDS. P.Eneroöd: J. lipid Res., 1963, 4, 11-16 (Dept. Chem., Karolinska Inst., Stockholm, Sweden) Solvent systems suitable for thin-layer chromatographic separation of 40 different bile acids are described. The influence of substituents and chain length on the separation factors in different solvent systems has been examined. J.R.Sargent

BIOPHYSICS

- 1056. PHOTOELECTRIC MEASUREMENT OF SMALL FLUCTUATING RETARDATIONS IN WEAKLY BIREFRINGENT, LIGHT-SCATTERING BIOLOGICAL OBJECTS. I. REVOLVING TILTED COMPENSATOR METHOD.** R.D.Allen and L.L.Rebhun: *Ex p. Cell. Res.*, 1963, 29, 583-592 (Dept. Biol., Princeton Univ., Princeton, N.J., U.S.A.) A photoelectric method is described for the analysis of birefringence in light-scattering biol. subjects. The sensitivity and range of the method could be varied easily, the smallest detectable retardation being about 10^{-8} radian (0.1 Å). Birefringence fluctuations with a period of the order of 1 sec. could be analysed. K.Jones
- 1057. FUNCTIONAL ANALYSIS OF CHEMICAL SYSTEMS IN VIVO USING LOGICAL CIRCUIT EQUIVALENT. n. THE IDEA OF A MOLECULAR AUTOMATON.** M. Sugita: *J. theoret. Biol.*, 1963, 4, 179-192 (Hitotsubashi Univ., Tokyo, Japan) The author's earlier theory of cellular control mechanisms is here revised and extended and the application of digital analysis discussed. The concept of a mol. automaton is introduced, the logical nature of which is equivalent in the terms of electronics to a switching circuit having input, output, and a time delay. G.F.Blane
- 1058. PLOTTING KINETIC DATA TO DETERMINE REACTION ORDER AND SPECIFIC RATE CONSTANTS.** G.M.Mullet and C.R.Noddings: *Science*, 1962, 138, 1346 (Chem. Eng. Lab., Dow Chem. Co., Midland, Mich., U.S.A.) The Pessen method for obtaining from kinetic expt. both order of reaction and rate const. by means of single straight-line graphs has been combined with the concept of unit time to permit handling of data over the range of 0 to 99% conversion or reaction. C.M.Lewis
- 1059. UNCERTAINTIES INHERENT IN DETERMINATION OF EFFICIENCY OF COLLISION BETWEEN VIRUS PARTICLES AND CELLS.** A.G.Ogston: *Biochim. biophys. Acta*, 1963, 66, 279-281 (Dept. Phys. Biochem., John Curtin Sch. Med. Res., Australian Nat. Univ., Canberra, A.C.T., Australia) Even in the most favourable case of collision with small spherical objects, the collision efficiency can be measured only if it is considerably less than 10^{-3} . B.M.Stevens
- 1060. PATHOLOGY OF EFFECT OF LASER BEAM ON SKIN.** L.Goldman, D.J.Blaney, D.J.Kindel, jun., D. Richfield and E.K.Franke: *Nature*, Lond., 1963, 197, 912-914 (Dept. Dermatol., Univ. Cincinnati, Ohio, U.S.A.) Prelim. investigations with a light-weight type solid laser with a ruby crystal showed that superficial destructive lesions may be produced in the skin of man. The more intense the colouring of the skin, the deeper the reaction. Deep necrotic lesions were produced in black pigmented regions of the rabbit ear. G.M.Lewis
- 1061. ACTION SPECTRA FOR ULTRAVIOLET LIGHT INACTIVATION OF SYSTEMS CONTAINING 5-BROMOURACIL SUBSTITUTED DNA. I. E. COLI 15 T'A'U.** R.Boyce and R.Setlow. II. BACTERIOPHAGE T4. R.Setlow and R.Boyce: *Biochim. biophys. Acta*, 1963, 68, 446-454, 455-461 (Biol. Div., Oak Ridge Nat. Lab., Oak Ridge, Tenn., U.S.A.) I. 22% of the thymine was substituted by 5-bromouracil with no loss in viability. U.v. sensitivity of substituted cells was greater than that of normal cells at all X between 230-0 m μ and 313*0 m μ by a factor depending on the X . 5-Bromouracil absorption was not sufficient to account quant. for the X dependence

of the sensitivity of substituted cells.

II. Phage with an estimated SO^*Jo of thymine replaced by bromouracil were inactivated by light in the range 230-0-313*1 m μ Li Sensitivity of substituted phage was greater than that of normal phage by a factor of approx 4 at 240-0-290*0 m μ /x. The factor increased to 7 at 230*0 m μ and to 88 at 313*1 m μ . The long X dependence of the sensitivity was largely accounted for by the greater u.v. absorbancy of bromouracil as compared with thymine. B.M.Stevens

- 1062. AUTORADIOGRAPHIC INVESTIGATION ON INCORPORATION OF [3H]AMINO ACIDS INTO THE CYTOPLASMIC NUCLEUS DURING POST-MITOTIC, PRESYNTHETIC PHASE AND DNA DUPLICATION PHASE [S-PHASE]. OF NORMAL AND X-IRRADIATED MICE.** K.Gerbaud, W.Maurer and J.Brtlikner: *Biochim. biophys. Acta*, 1963, 68, 462-471 (Inst. Med. Isotopenforschung, Univ. Koln, Germany) With nuclei of the same cell type incorporation/unit cell vol. was nearly constant. After simult. application of [14C]thymidine, nuclei in the S-phase were additionally labelled by ^{35}S -tracers, permitting differentiation of nuclei synthesising DNA from those not synthesising DNA. In epithelial cells of the jejunum crypts, [3H]leucine or [3H]tyrosine incorporation/unit nuclear vol. was const. throughout the generation cycle excepting mitosis. Whole body irradiation with doses up to 800 r had no effect on [3H]leucine or [3H]tyrosine incorporation into nuclei of epithelial cells of liver and jejunum crypts within the first 2 hr.

- (German) B.M.Stevens
1063. ULTIMATE MAXIMUM VALUES OF RBE [RADICAL BIOLOGICAL EFFECT] OF FAST NEUTRONS AND GAMMA RAYS FOR CHROMOSOME ABERRATIONS. G.J.Neary, J.R.K.Savage, H.J.Evans and J.Whittle: *Int. J. rad. Biol.*, 1963, 6, 127-136 (M.R.C., Radiobiol. Research Unit, Harwell, Didcot, Berks., England) Chr. radiations in *Tradescantia* microspores produced by short and long exposures were examined. At low doses or long exposure times the RBE of the fast neutrons was high, approaching in the limit values of the order of 100. B.M.Stevens

- 1064. KINETICS FOR TWO-BREAK CHROMOSOME CHANGES.** S.Wolff: *J. theoret. Biol.*, 1962, 3, 314-314 (Biol. Div., Oak Ridge Nat. Lab., Tenn., U.S.A.) Data from a variety of biol. systems were examined and found to be compatible with an equation formulated to describe the theoretically expected kinetics for chrom. chr. exchanges. G.F.Blane

- 1065. DIFFERENTIAL INHIBITIONS OF SYNTHESIS OF SOLUBLE AND PARTICULATE RNA.** E.Wainfan, L.R. Mandel and E.Borek: *Biochem. biophys. Res. Commun.*, 1963, 10, 315 (Dept. Biochem., Coll. Phys. and Exptl. Columbia Univ., New York, N.Y., U.S.A.) are reported showing that u.v. irradiation of *Escherichia coli* mutant damages sol. RNA synthesis and particulate RNA synthesis differently. B.Ketterer

- 1066. DNA SYNTHESIS IN X-IRRADIATED CULTURES INFECTED WITH POLYOMA VIRUS.** J.Minowada and G.E.Moore: *Exp. Cell Res.*, 1963, 29, 31-35 (Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.) The X-irradiated (10000 r or 2000 r on 1 or 2 days before virus inoculation) mouse-embryo cultures supported virus multiplication with typical and rapid cytopathic effects, the growth rate of the virus being higher than that in non-irradiated ones. It is suggested that increased DNA synthesis obtained in the X-irradiated cultures represents mainly newly synthesised viral DNA. K.J.

- ^{1067.} GROWTH AND NUCLEIC ACID SYNTHESIS IN NORMAL AND ULTRAVIOLET IRRADIATED CELLS OF VIBRIO CHOLERAE. N.K.Kapoor, P.Sagar and S.C. Agarwala: Indian J. exp. Biol., 1963, 1, 84-87
 Central Drug. Res. Inst., Lucknow, India) Chloramphenicol has been shown to significantly inhibit DNA synthesis and to some extent RNA synthesis in normal cells of *V. cholerae*. In the case of u.v. irradiated cells, chloramphenicol completely prevents the recovery of RNA synthesis from the effects of irradiation and inhibits RNA synthesis almost to the same extent as in the normal cells. The incorporation of [14C]adenine, specifically taken up by the nucleic acids, is also inhibited by chloramphenicol in both normal and irradiated cells. *in vivo*, chloramphenicol prevents the abrupt decline in the case of irradiated cultures during the later stages of growth, presumably due to lysis. *
- ^{1068.} LOW-TEMPERATURE REVERSAL OF ULTRAVIOLET PHOTOCHEMICAL REACTION PRODUCT OF 2'-V⁴XYURIDINE. W.H.Prusoff: Biochim. biophys. Acta, 1963, 68, 302-310 (Dept. Pharmacol., Yale Univ. Sch. Med., New Haven, Conn., U.S.A.) U.v. irradiation of frozen or liquid 2'-deoxyuridine soln. decreased absorbancy. Storage at -2(f resulted in reappearance of 20% of the original absorbancy within 5 hr. and/or 70% within 71 hr. Little or no absorbancy increase occurred at room temp., 5° or 7(f. Uracil, but not thymine, thymidine, 5-fluoro-2'-deoxyuridine, 5-bromo-2'-deoxyuridine or 5-iodo-2'-deoxyuridine, behaved similarly. 100- and 1000-fold increases in acid-AirS³ generation at room temp, and 5° respectively. S² added before or after irradiation prevented reversion. Irradiation of deoxyuridine in [³H]water and

- ^{1069.} EFFECT OF OXYGEN AND N-ETHYLMALEIMIDE ON INACTIVATION OF RNase BY Y-IRRADIATION. J. Bridges: Biochim. biophys. Acta, 1963, 67, 331-335 (Isotope Res. Div., Wantage Res. Lab., Wantage, Berks., England). B.M.Stevens

- ^{1070.} INCORPORATION OF [³H]THYMIDINE IN DNA IN MOUSE TISSUES AND ITS RADIATION EFFECTS. K.F.Garder and F.Devik: Int. J. rad. Biol., 1963, 6, 157-172 (Hlth. Phys. Dept., Inst. for Atomenergi, Kjeller pr. Illestrfm, Norway) Mice received 200 ²⁰ ^μc or 5 ⁵ ^μc pHthymidine or 4 ⁴ ^μc [14C]thymidine. Weight activity and degree of labelling in autoradiographs were determined in 7 tissues at intervals up to 120 days. Cellular death due to radiation occurred in mice receiving 200 ^μc and possibly also in those receiving 5 ^μc. In several tissues thymidine incorporation did not decrease proportionately to the amount available. JK , B.M. Stevens

- ^{1071.} VISCOSITY OF SINGLE-STRANDED DNA AFTER IRRADIATION IN THE NATIVE STATE. U.Hagen: ¹⁹⁶³ ¹⁹⁷ ^{10⁴-1005} (Radiol. Inst. Freiberg/Breisgau, Germany) The T₁ of single-stranded DNA and the hydrogen bonds between strands have nearly the same radiosensitivity to X-rays. If about 37% about 30000 r. After separation of the single-stranded DNA, the T₁ drops to 50% after 500 r. If DNA is irradiated, the loss in T₁ is small. Sensitivity of the single nucleotide chain might be in? ²et vol. in the coiled single-strand DNA than that in the stiff double helix. G.M.Lewis

- ^{1072.} X-RAY INDUCED RADICALS IN WHOLE BACTERIOPHAGE AND PHAGE NUCLEIC ACID. A.Müller: Int. J. rad. Biol., 1963, 6, 137-142 (Inst. für Strahlenbiol., Kemforschungszentrum Karlsruhe, Germany) The electron spin resonance [ESR] absorption of DNA, extracted from purified *E. coli* T2 bacteriophage and irradiated in vacuo at various temp., showed pronounced hyperfine structure when measured in vacuo at room temp. When DNA received increased X-ray doses in vacuo at room temp., satn. of radical concn. occurred at a few hundred kr. The initial energy expenditure measured at room temp., after irradiation at various temp., was 8-30 e-V/radical induced. The e.s.r. of whole phage irradiated in vacuo at various temp., was, at room temp., equal to the absorption of phage DNA plus that of a similar quantity of protein; similarly, dependence of radical concn. on dose was the sum of contributions from DNA and protein.

B.M.Stevens

- ^{1073.} DEHYDROPEPTIDE PRODUCTION IN RADIOLYSIS OF SOLID PEPTIDES: A RADIOLYTIC SYNTHESIS OF PYRAZINE DERIVATIVES FROM CYCLIC DIPEPTIDES. M.K.-English and W.M.Garrison: Nature, Lond., 1963, 197, 895-896 (Lawrence Radiation Lab., Univ. California, Berkeley, Calif., U.S.A.) Evidence is presented for the formation of pyrazine deriv. through γ -radiolysis of solid glycine-, alanine- and glycylalanine-anhydrides, followed by dissolution in alkali.

G.M.Lewis

- ^{1074.} SYNTHESIS OF ORGANIC COMPOUNDS BY HIGH-ENERGY ELECTRONS. J.Oró: Nature, Lond., 1963, 197, 971-974 (Lawrence Radiation Lab., Univ. California, Berkeley, Calif., U.S.A.) Irradiation of gaseous methane-ammonia-water mixtures with 5 meV electrons from a linear accelerator causes formation of org. compounds among which amino acids, hydroxy acids and their corresponding amides and nitriles predominate. Irradiation of methane-ammonia-water mixtures in the solid state results in a similar pattern of org. compounds.

J.R.Sargent

- ^{1075.} CATHEPSIN C AND ULTRAVIOLET MEDIATED INHIBITION OF MITOCHONDRIAL REACTIONS. R.E. Beyer: Exp. Cell Res., 1963, 29, 212-219 (Inst. Enzyme Res., Univ. Wisconsin, Madison, Wis., U.S.A.) The relation between u.v. inactivation of mitochondrial DNP-activated ATPase and cathepsin C activity contained in the prep, was studied. The data are interpreted to indicate that far-u.v. action of lysosomal cathepsin C acting upon mitochondrial protein is probably not the basis of previously noted inactivation of mitochondrial enzyme systems following* u.v. irradiation. K.Jones

- ^{1076.} EFFECT OF ULTRAVIOLET IRRADIATION [AT 254 m/i] OF E. COLI STRAIN B ON SUCROSE-GRADIENT-SEDIMENTATION PATTERN OF ITS CELL-FREE EXTRACT. A.ROisch, A. Edelman and J.A.Cohen: Biochim. biophys. Acta, 1963, 68, 271-277 (Med. Biol. Lab., Nat. Defence Res. Org. TNO, Rijswijk, Netherlands) Extracts of fully 32P-labelled cells sedimented in 3 peaks of 50 S, 30 S and 4 S in a sucrose gradient between 5 and 20% Tn pH 7-4, 0.05 M tris (hydroxymethyl)-aminomethane buffer with 10⁴ M ^{mg#} in the swinging-bucket rotor No.25 of the Spinco model-L ultracentrifuge. Extracts of cells exposed to 32P⁴ for 5 min. had all their ³²P between 4 and 30 S. U.v. irradiation had no effect. If 20 min. with 32POJ3 followed the 5 min., 32P appeared in 30 S and 50 S fractions. This was altered by 200 erg/mm² u.v. irradiation; in wild type 4 S material accumulated while in the u.v. sensitive mutant 20 S material also accumulated.

BIOPHYSICS

Chloramphenicol caused 20 S accumulation in both. 400 crg/mm.2 u.v. irradiation produced 20 S accumulation in wi Id type. BM Stevens

1077. RECOVERY OF OXIDATIVE PHOSPHORYLATION IN RAT LIVER MITOCHONDRIA AFTER WHOLE BODY IRRADIATION. J.C.Hall, A.L.Goldstein and B.P.Sonnenblick: *J. biol. Chem.*, 1963, 238, 1127-1140 (Newark Coll. Arts and Sci., Rutgers State Univ. N.J., U.S.A.) Rat liver mitochondrial protein decreases to 1b% of the control value after exposure to a single acute dose (840 r) of whole body irradiation for 6 hr. and returns to normal within 24 hr. The no. of mitochondria decreases to some extent during the first 3 hr. and then recovers; irradiated mitochondria vary greatly in size and fragility. Consumption of O₂ varies markedly after irradiation. It is higher with all substrates 6 hr. after irradiation and returns to normal in 24 hr. The rate of synthesis of ATP decreases by 20% after irradiation for 1 hr. and remains at this level for 12 hr. In most cases it returns to normal after 24 hr. and in every case after 48 hr. P:O ratios are decreased by 25% after irradiation for 3 hr. and remain so for 12 hr. Control levels are attained within 24 to 48 hr.

J.N.Ashley

1078. BIOCHEMICAL STUDIES ON IRRADIATED PROTOZOA. I. EFFECT OF METABOLITES ON RESPIRATION OF X-IRRADIATED TETRAHYMENA PYRIFORMIS. J.S.Roth: *J. Protozool.*, 1962, 9, 142-146 (Inst. Cell. Biol., Univ. Connecticut, Storrs, Conn., U.S.A.)

Cells of *T. pyriformis* suspended in 0.07 M phosphate buffer, pH 7.4, failed to show a decrease in O₂ consumption when irradiated with 600000 r; while lower doses appeared to stimulate O₂ uptake slightly. Irradiation in water with increasing doses led to a reduction in the O₂ consumption. This fall in respiration was prevented by the addition of pyruvate or acetate. Pyruvate stim. the respiration of irradiated cells particularly at 10 and 60 min. post-irradiation. Lactate was less effective than pyruvate in increasing the O₂ uptake of irradiated cells while thiocetic acid had little effect. The growth lag of *T. pyriformis* increased proportionately with increasing radiation, no cells surviving 600000 r. The lag period or subsequent growth rates were unaffected by the presence of metabolites during irradiation.

R.J.Walker

1079. BIOCHEMICAL AND MORPHOLOGICAL STUDIES OF RADIATION INJURY IN TISSUE CULTURE: COMPARISON WITH CELLULAR INJURY IN ANTIGEN-ANTIBODY REACTIONS. H.Hayashi, A.Tokuda, T.Ono and Y.Takaba: *Brit. J. exp. Path.*, 1963, 44, 1-10 (Dept. Path., Kumamoto Univ. Med. Sch., Kumamoto, Japan) Monocytes from rabbits' peritoneal sacs were cultured in chamber which allowed sampling of culture fluid and visual observation. Irradiation by X-rays released an inactive sulphhydryl protease. Later release of non-sulphhydryl protease occurred simult. with morphol. changes in cytoplasm and mitochondria.

D.L.Gardner

1080. VARIATIONS IN BLOOD CONTENT OF STRONTIUM-90/YTTRIUM-90 OF MICE INJECTED AFTER 200 r WHOLE BODY X-RAY DOSE. B.Holmberg, M.Dahlstrom and E.Wallgren: *Int. J. rad. Biol.*, 1963, 6, 181-186 (Cancer Res. Div. Radiumhemmet, Stockholm, Sweden) Male albino mice received 4 J.C.⁹⁰Sr i.p. at various times after irradiation. The ⁹⁰Sr/⁹⁰Y content of whole blood was estimated at various intervals after injn. The values of ⁹⁰Sr obtained agreed with a theoretical equation expressing the overall state

of isotope in blood after i.p. injn. The const. for inflow and outflow of isotope in the blood were increased in irradiated animals as compared with non-irradiated controls. The injury to isotope transport routes to and from the blood system thus indicated was demonstrable 5 min* after irradiation. B.M.Stevens

1081. CHANGES IN EXCRETION OF SODIUM BY SALIVA AFER WHOLE-BODy IRRADIATION IN RATS. J.Ondráckova, M.Rakovic and V.Gregora: *Nature*, Lond. 1963, 197, 915 (Inst. Biophys., Med. Fac., Charles Univ., Prague, Czechoslovakia) Rats were inj. i.p. with ²²Na and irradiated with 1000 r X-rays. There is * significant increase of 22Na concn. in saliva of irradiated rats after 72 and 96 hr. compared with controls.

G.M.Lewis

1082. EFFECT OF GAMMA IRRADIATION IN PIGS FED LOW VITAMIN A RATIONS. T.N.Meacham, T.J.Cunha, G.E.Combs, H.D.Wallace, A.C.Warnick, Shirley and C.F.Simpson: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 30-34 (Dept. Anim. Sci., Univ. Florida, Agr. Expt. Stn., Gainesville, Fla., U.S.A.) Vit. A deficiency had no effect on the survival period of pigs exposed to lethal γ -radiation (350 r). M.M.Shaplan

1083. RECOVERY OF CENTRAL NERVOUS SYSTEM FUNCTIONS IMPAIRED BY LETHAL HEAD X-IRRADIATION. V.Nair, H.Sugano and L.J.Roth: *Proc. Soc. exp. Biol.*, N.Y., 1963, 112, 273-277 (Dept. Pathol., Univ. Chicago, Ill., U.S.A.) Male Sprague-Dawley rats were given 10000 r to the head only. response to a 150 mA, 0.2 sec. duration electrical stimulus was measured daily after irradiation. There was a loss of hind limb tonic extension observed in control animals. The response recovered progressively until death. The report presented evidence that recovery from injury to the c.n.s. occurs in spite of the animals becoming moribund. D.N.Whitfield

1084. SUCCESSIVE CHANGES IN SKIN EPITHELIUM OF YOUNG AXOLOTL (SIREDON MEXICANUM) AFER ROENTGEN IRRADIATION. V.V.Bnmst: Amer. J. Roentgenol., 1963, 89, 624-647 (Lab. Radiobiol., Roswell Park Mem. Inst., Buffalo, N.Y., U.S.A.) dose of 250 to 9000 r was given to the head of the animal, *S. mexicanum*, and animals were killed at intervals for histol. examination. Definite changes were observed following a dose of 500 r and occurred sooner after irradiation as the dose was increased. Regeneration of the epidermis occurred in 40 to 50 days if the animal survived long (doses up to 3000 r). The outer surface of the epithelium became very uneven and fissured and contained more pigment, many giant cells and more melanophores than that of the control animals. D.E.Evans

1085. IMPACT OF IONISING RADIATIONS ON EMBRYO AND FOETUS. R.Rugh: Amer. J. Roentgenol., 1963, 89, 182-190 (Dept. Radiol., Coll. Phys. and Surg., Columbia Univ., N.Y., U.S.A.) A review. D.E.Evans

1086. DEVELOPMENT OF X - IRRADIATED AND N¹⁰O¹⁷ IRRADIATED MOUSE OOCYTES TRANSPLANTED X-IRRADIATED RECIPIENT FEMALES. L.E.Glass, Teh Ping Lin: *J. cell. comp. Physiol.*, 1963, 60 (Dept. Anat., Sch. Med., Univ. California, Francisco, Calif., U.S.A.) Unfertilised oocytes agouti C3H mice exposed to 250 r X-irradiation were much less successful than non-irradiated eggs in implantation.

^{^n} and development in recipient Cal A? induced to ^{^ulate} by hormone injn. Irradiation of the recipients ^{^e}taces their pregnancies. It appeared that death of irradiated oocytes was primarily due to oocyte injury and ^{^t} irradiation in vitro was less damaging than in vivo, [^] petition for uterine sites between native and donor SSs was observed.

G M Lewis

¹⁰⁸ J. RADIATION DAMAGE IN MUSCLE CELL MEMBRANES AND REGULATION OF CELL METABOLISM. A.Portela, J.C.Perez, P.Stewart, M.Hines and V. ^{^d y}: Exp. Cell Res., 1963, 29, 527-543 (Dept. ^{^nat}- Emory Univ., Atlanta, Ga., U.S.A.) In frog ^{^ated} muscles, high doses (100000 r) of X-irradiation and ^{^led} prolonged relaxation time, more rapid fatigue, ^{^t} increased ATP and glycogen content, but increased [^] and Na effluxes, Na influx and O₂ consumption. ^{^tch} latency and rise time were not changed. Mg-^{act} ^{^d} activity of homogenates or mitochondria! suspensions decreased immediately after irradiation, ^{^increased} with time more rapidly than in controls. ^{^tch} interpreted to support the hypothesis that irradiation results in membrane damage, both in the sarco-syn* membrane and in the mitochondrial structure.

^{108.8} RADIATION DOSE-RESPONSE CHARACTERISTICS OF LEUCOCYTES IN MOUSE. W.W.Smith, I.M.Alderman, C.A.Schneider and J.Comfield: Proc. Soc. exp. ^{^1} N.Y., 1962, 111, 182-186 (Nat. Cancer Inst., Bethesda, Md., U.S.A.) Differences of the days¹ of 50 rad were detected by lymphocyte counts 1-4 days after [^] sublethal irradiation and 100 rad by granulocyte counts 3, 4 days after 98-100 lethal doses. [^] nor injn. Crimtoxin did not improve the accuracy of dose distribution after 3 days.

M.M.Shapland

¹⁰ [^]VARIATIONS IN SURVIVAL TIME AFTER WHOLE-BODY IRRAIDATION AT TWO TIMES OF DAY. D.J. Pizzarello, R.L.Witcofski and E.A.Lyons: Science, 1963, 139, 349 (Dept. Radiol., Bowman Gray Sch. of Med., Winston-Salem, N.C., U.S.A.) Rats irradiated [^] 100 r whole-body X-irradiation survived more ¹³ days when irradiated in the morning, but only [^] if irradiated at night.

CM.Lewis

¹⁰⁹⁰ CHRONIC GAMMA RADIATION AFFECTS DISTRIBUTION OF RADIAL INCREMENT IN PINUS RIGIDA 1963 - G.M.Woodwell and L.N.Miller: Science, 1963, 139, 222-223 (Biol. Dept., Brookhaven Natl. Lab., U.S.A.) Exposure of pitch pine ⁵ r/day chronic ionising radiation at rates between 1 and ^{*ien} X for several yr. causes reduction of radial increment throughout the stem, the reduction being most pronounced near the base of the tree.

CM.Lewis

¹⁰⁹¹ OP ^{^C} VERY FROM RADIATION-INDUCED DELAY IN GAMETES OF ARBACIA PUNCTULATA 1963 - P. McColla: Science, 1962, 138, 1341-1342 (Radiol. Physics Div., Argonne Nat. Lab., Argonne, Ill., U.S.A.) Recovery of A. punctulata sperm from ev. egg. Recovery of the egg is prevented by removal of the unfertilised egg is not necessarily the same as in the zygote.

CM.Lewis

¹⁰⁹² EFFECTS OF RADIOPROTECTIVE AGENTS ON FOOT DEFORMITIES AND GAIT DEFECTS IN PRE-NATALLY X-IRRADIATED RAT. B.H.Ershoff,

C.W.Steers, jun. and L.Kmger: Proc. Soc. exp. Biol., N.Y., 1962, 111, 391-394 (Western Biol. Labs., Culver City, Calif., U.S.A.) Radioprotective agents largely prevented the occurrence of foot deformities and defective gait, and partially prevented the development of abnormal cerebral hemispheres in the young of rats exposed to a single dose of 150 r X-irradiation.

M.M.Shapland

¹⁰⁹³ PROTECTIVE EFFECT OF OLIVE OIL AGAINST X-RAY IRRADIATION OF HAMSTERS. W.Lohmann, W.F. Denny, W.H.Perkins and A.J.Moss, jun.: Int. J. rad. Biol., 1963, 6, 195 (Dept. Radiol., Univ. Arkansas, Little Rock, Ark., U.S.A.) Injn. of oil did not alter the effect of 800 r X-irradiation on the incorporation of [14c]thymidine into DNA. Prelim. comm. B.M.Stevens

¹⁰⁹⁴ RADIOPROTECTION BY SULPHUR IN COMPOUND CHI₃S₈. A. Van de Vorst and J.Duchesne: Int. J. rad.piol., 1963, 6, 191-193 (Inst. d'Astrophys. de l'Univ. de Liège, Cointe-Sclessin, Belgium) Resistance of CHI₃S₈ to X-rays was estimated from changes produced in the quadruple resonance line of ¹²⁷I. (French) B.M.Stevens

¹⁰⁹⁵ RADIOPROTECTIVE ACTION OF DIMETHYL SULPHOXIDE. C. Van der Meer, P.W.Valkenburg and M.Remmelts: Int. J. rad. Biol., 1963, 6, 151-155 (Med. Biol. Lab., Nat. Def. Res. Org., TNO, Rijswijk, Z.H., Netherlands) Protection against a lethal dose of X-rays was somewhat better in CBA/Rij mice than in C57BL/Rij mice. At protective doses the O₂ tension in the spleen was markedly reduced especially in the CBA/Rij mice. I.p. injn. of dimethyl sulphoxide caused an abrupt rise in b.p. lasting a few min. B.M.Stevens

¹⁰⁹⁶ RADIOPROTECTIVE EFFECTS OF COMBINED HYPOXIA AND β -AMINOETHYL ISOTHIURONIUM BROMIDE HYDROBROMIDE IN [X-IRRADIATED] MICE. L.M.Zatz: Int. J. rad. Biol., 1963, 6, 105-115 (Dept. Radiobiol., Stanford Univ. Sch. Med., Palo Alto, Calif., U.S.A.) No evidence of significant therapeutic synergism was found. A relative increase in the no. of deaths 3-6 days after irradiation in the protected mice is suggested to indicate that the protective agents had a selective action on modes of death. B.M.Stevens

¹⁰⁹⁷ DISTRIBUTION AND CHEMICAL FORMS OF RADIATION PROTECTIVE AGENT (S-(2-AMINOETHYL) THIURONIUM BROMIDE HYDROBROMIDE IN MAMMARY TUMOUR-BEARING MICE. B.Shapiro, E.E. Schwartz and CKollmann: Cancer Res., 1963, 23, 223-228 (Res. Lab., Dept. Radiol., Southern Div., Einstein Med. Center, Philadelphia, Pa., U.S.A.)

^o C57BL/6J mice bearing a s.c. transplanted mammary adenocarcinoma received either 140 or 280 mg./kg. [35s]2-mercaptoethylguanidine [MEG] or 140 mg./kg. [35s]bis(2-guanidoethyl) disulphide [GED] i.p. After 20 min. the tumour had taken up less agent than most vital organs except brain. More GED appeared in tumour in animals receiving GED than in those receiving MEG. The tumour contained the same ³⁵S compounds as normal tissues. Distribution of protective agent was also examined 120 min. after GED injn. Tumour-bearing animals appeared to have difficulty in excreting the protective agents. Optimum conditions for protecting normal tissue but not tumour are suggested to be injn. of large doses of MEG 20 min. before irradiation.

B.M.Stevens

¹⁰⁹⁸ CHEMICAL PROTECTION FOR INCORPORATION OF ³²P INTO NUCLEIC ACIDS OF LYMPHATIC CELLS

BIOPHYSICS

AGAINST Y-IRRADIATION. LHonjo, Y.-T.Tchoe, Y.Takamori and M.Akaboshi: Nature, Lond., 1963, 197, 914-915 (Dept. Biol., Fac. Sci., Univ., Osaka, Japan) The incorporation of ^{32}P into RNA and DNA is impaired in rabbit lymphatic cells *in vivo* after Y" irradiation. Cysteamine exerts some protective effect if present during radiation, whereas S, 2-aminoethylisothiuronium-Br-HBr does not, and has a noxious effect on the cells.
G.M.Lewis

1099. PROTECTION OF TISSUE CULTURE CELLS AGAINST IONISING RADIATION. III. INFLUENCE OF ANOXIA ON RADIOPROTECTION OF TISSUE CULTURE CELLS BY CYSTEAMINE. AJ.Vergroesen, L. Budke and O.Vos: Int. J. rad. Biol., 1963, 6, 117-126 (Med. Biol. Lab. RVO-TNO, Lange Kleiweg 139, Rijswijk, Z.H., Netherlands) 4 mM and 16 mM cysteamine soln. gave dqse reduction factors [DRF] of 1.9 and 3*3 respectively while anoxia gave a DRF of 2*6 on X-irradiation. Puck's pjdting technique was used. 4 mM and 16 mM cysteamine soln. under anoxic conditions gave DRF of 3 and 3.95, respectively. When conditions were arranged to give intensive contact between air and a thin layer of cysteamine soln., chem. measurements indicated that the cysteinine was oxidised rather quickly. Under such conditions the protective action of cysteamine was that expected of the Residual concn. of cysteamine present during irradiation^
B.M.Stevens

1100. TEMPORARY RADIO^TABILTY IN EXTRACELLULAR BACTERIOPHAGES AFTER TRAPPING OF MOLECULES OF CYSTEINE CYSTEAMINE GROUP. G.Hotz: Int. J. rad. Biol., 1963, 6, 143-149 (Inst. ftr Strahlenbiol., Kemforschungszentrum Karlsruhe, Germany)

Some phages of the 10 strains tested acquired temporary radioresistance if incubated in nutrient broth containing 0.5 M cysteine or cysteamine before X-irradiation in an anoxic medium in which the SH concn. was reduced below that required for protection. O₂ removed the acquired protection but treatment with N-ethylmaleimide did not affect the acquired protection.
B.M.Stevens

1101. EFFICIENCY OF TETRACYCLINE IN REMOVING RADIOSTRONTIUM FROM RATS. H.Smith: Int. J. rad. Biol., 1963, 6, 197-198 (U.K.A.E.A., Annan, Scotland) Tetracycline did not increase the rate of removal of Sr from bone.
B.M.Stevens

1102. RADIOACTIVITY IN LARGE MARINE PLANKTON AS FUNCTION OF SURFACE AREA. C.Osterberg, L. Small and L.Hubbard: Nature, Lond., 1963, 197, 883-884 (Dept. Oceanography, Oregon State Univ., Corvallis, Ore., U.S.A.) The concn. of the radio-nuclides ^{40}K , ^{65}Zn , ^{95}Nb , $^{103-106}\text{Ru}$, ^{95}Zr , ^{51}Cr and ^{141}Ce was not dependent on the surface area of euphausids and copepods of varying size. In the tunicate *Salpa*, the highest radioactivity was found in the digestive tract.
G.M.Lewis

1103. RADIOIODINE IN MILK OF COWS CONSUMING STORED FEED AND OF COWS ON PASTURE. B.Kaw, C.P.Straub and LR.Jones: Science, 1962, 138, 133* 1335 (Robert A.Taft Sanitary Eng. Center, U.S. Publ. Hlth. Serv., Cincinnati, Ohio, U.S.A.) ^{131}I was measured in mi lk 2 months after termination of the Russian nuclear test series in 1961 and found to be $270/\text{^131I}$ per 1. milk in cows at pasture. This concn. decreased with a half-life of 7 ± 1 days. No ^{131}I was found in sheltered cows that consumed stored feed. G.M.Lewis

1104. STRONTIUM-90 AND CALCIUM IN MILK OF MINIATURE SWINE. R.O.McClellan and L.K.Bustad: Int. J. rad. Biol., 1963, 6, 173-180 (Biol. Lab., Hanford Lab., G.E.C., Richland, Wash., U.S.A.) The mean $^{90}\text{Sr}/\text{Ca}$ of the milk of 9 young adult primiparous swine fed 25 or 125 mcg of ^{90}Sr daily was 0*10 that of diet. The mean $^{90}\text{Sr}/\text{Ca}$ of plasma was 0*23 that of diet and the mean $^{90}\text{Sr}/\text{Ca}$ of milk was 0*38 that of plasma. With increasing time after parturition the ^{90}Sr content of the milk increased from 1^ to more than 3% of the ^{90}Sr ingested each day. The Ca content of the milk also increased with time after parturition but the $^{90}\text{Sr}/\text{Ca}$ of the milk increased relative to the $^{90}\text{Sr}/\text{Ca}$ of the diet.
B.M.Steve

1105. DETERMINATION OF ^{90}Sr AND ^{228}Th IN BIOLOGICAL MATERIALS. F.W.Bruenger, D.R.American and B.Stover: Health Physics, 1963, 9, 232-236* Anat., Univ. Utah, Salt Lake City, Utah, V⁸⁵A¹³³ Details are given of a method for the separation of ^{90}Sr and ^{228}Th from biol. specimens, in particular, dog faeces. The ^{90}Sr technique is a modification of the nitrate pptn. method for separation from Ca. T^{228}Th determinations require two pptn. with H_2O_2 , first at pH 4 and then at pH 9, followed by pptn. with eerie m-nitrobenzoate and treatment on an ion exchange column* ck

1108 ^EFFECT OF OPSQNINS ON INTRACELLULAR SUR-
FVAL OF BACTERIA. CRJenkin: Brit. J. exp. Path.,
1953, 44, 47-57 (Dept. Microbiol., Univ. Adelaide,
South Australia) Using Salmonella typhimurium
~~strains, Phagocytosis of bacteria by mouse peritoneal
macropages was measured by clearance studies with
bacteria absent a isotonically labelled. When serum opsonins were
absent bacteria were phagocytosed but continued to sur-~~
Vive a ^{and} f multiply intracellularly. D.L.Gardner

1109 **IM-XING¹** DETECTION OF 'CELL-FIXED' HAEM-AGGLUTINATING ANTIBODIES TO TUBERCULIN PURIFIED PROTEIN DERIVATIVE IN HUMANS. S.O. Freedman, R.Turcotte, A.J.Fish and A.H.Sehon: J. Immunol., 1963, 90, 52-59 (McGill Univ. Clin., Montreal, Que., Canada) Extracts of peripheral blood w.b.c. of all adults tested contained IgM agglg. Ab to PPD. Subjects with pos. tuberculin skf^{em} tests had significantly higher titres of these 'cell-fix'd' Ab than did tuberculin neg. subjects. The 'cell-fix'd' Ab are probably adsorbed from the serum of the w.b.c. donor. Serum titres were in general higher than those obtained with leucocyte extracts. N.RXing

111. CHROME TYPHOID VACCINE. E.E.Vella: J. Hyg., Lond., 1963, 61, 43-51 (D. Bruce Lab., E. Everleigh, Marlborough, Wilts., England). A typhoid vaccine was prep. by treating *Salmonella typhi* with 1% formalin and 0.02% chrome alum. Aggl. tests showed that the formalin-chromate treatment preserved the Vi-Ag of the organism, and sufficient V-antigenicity was confirmed. The typhoid antigen was produced by the vaccine in rabbits, the rabbit sera gave passive protection to mice against *S. typhi*, and the vaccine produced active im-

munity in mice. The Vi-antigenicity and immunogenicity of the vaccine were retained on storage at 4°, but were lost at 41°.

1112. MORPHOLOGICAL AND IMMUNOHISTOCHEMICAL STUDIES OF THE PATHOGENESIS OF INFECTION AND ANTIBODY FORMATION SUBSEQUENT TO VACCINATION OF MACACA VIRUS WITH AN ATTENUATED STRAIN OF PASTURELLA TULARENSIS. I. INTRACUTANEOUS VACCINATION. M.H.McGavran, John D. White, • H.T.Eigelsbach and R.W.Kerpsack. II. AEROGENIC VACCINATION. John D. White, M.H.McGavran, P.A.Prickett, J.T.Tullis and H.T.Eigelsbach: Amer. J. Path., 1962, 41, 259-267, 405-409 (U.S. Army Chem. Corps., Fort Detrick, Frederick, Md., U.S.A.)

I. Monkeys were vacc. by i.d. injn. with 1×10^5 viable cells of a live vaccine of *P. tularensis* (LVS). LVS multiplied at the local site for 2 weeks and gave rise to lymphatic and haematogenous spread. They were found in the tracheobronchial lymph nodes between the 14th and 28th day. By the 90th day all sites were sterile. Cells containing Ab to LVS were found in regional lymph nodes and spleen 3 to 5 days after inocn. and at the inocn. site on the 14th day.

II. Monkeys were exposed to an aerosol of a live vaccine strain of *P. tularensis* (LVS). The average dose of viable cells received was 270000. LVS initiated a monocytic inflammatory response in the respiratory bronchiole that resolved by the 14th day. A min. and transient inflammatory response occurred in the lymph nodes and spleen. By the 90th day all sites were sterile. Plasma cells containing Y" globulin were found in the tracheobronchial lodes and the spleen on the 5th day and in the lung, and peri-bronchial lymphoid tissue by the 7th day. D.G.Scott

1113. COMPARISON OF BORDETELLA PERTUSSIS CELLS AND FREUND'S ADJUVANT WITH RESPECT TO THEIR ANTIBODY INDUCING AND ANAPHYLACTOGENIC PROPERTIES. J.Munoz: J. Immunol., 1963, 90, 132-139 (Rocky Mountain Lab., Hamilton, Mont., U.S.A.) Susceptibility to fatal anaphylactic shock in mice was equally enhanced when one injn. of 1 mg. of egg albumin was mixed with Freund's adjuvant or with 2 billion Bordetella pertussis cells. The mice which received egg albumin in Freund's adjuvant produced 10 to 100 times more Ab than those which received an equiv. amount of Ag mixed with B. pertussis. No direct correlation between the Ab titre of individual mice and their susceptibility to fatal anaphylaxis was observed whether Ag was given alone, with adjuvant or with pertussis. N .R.Iing

1114. CROSS-IMMUNISATION OF GUINEA-PIGS WITH PRODUCTS OF BRUCELLAES ABORTUS, MELITENSIS AND SUIS. J.Keppie, K.Witt and H.Smith: Brit. J. exp. Path., 1963, 44, 84-87 (Microbiol. Res. Estab.,

Porton, Wilts., England) Crude cell wall prep, and culture filtrates from attenuated *B. abortus* and virulent *B. meUtenis* and *B. suis* were used to immunise guinea-pigs. Protection was provided against all 3 spp. although *B. suis* Ag was most promising. D.L.Gardner

1115. LYSINE DEFICIENCY AND HOST RESISTANCE TO ANTHRAX. I.Gray: J. exp. Med., 1963, 117, 497-508
(U.S.Army Unit, Fort Detrick, Frederick, Md., U.S.A.)
Rats died within 2 days of inocn. with *B. anthracis* spores when they were fed a diet in which casein was replaced by gluten. When lysine was added to the gluten diet to bring die total concn. to that of the control diet resistance improved only slightly. Decreased ability of the RE system to

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

break down the organism is considered as a major factor of the decreased resistance of the lysine-deficient rats to anthrax.

1116. EPIDEMIOLOGICAL ANALYSIS OF TETANUS VACCINATION IN HUNGARY. L.Kubinyi, O.Rudnai and G.Baisy: *Acta microbiol. Acad. Sci. hung.*, 1962, 9, 133-143 (State Inst. Hyg., Budapest, Hungary) As a result of active immunisation against tetanus in Hungary the general morbidity has decreased to one half-one tenth, dependent on the age, compared with the corresponding prevaccn. levels. At present the majority of cases occur in older patients. The case fatality of tetanus has not changed: the standardised average is 43°. Jo. S.Igali

1117. THE REITER STRAIN OF TREPONEMA PALLIDUM. ORIGIN, CULTIVATION, AND USE IN IMMUNISATION OF RABBITS. A.H.Christiansen: *Acta path. microbiol. scand.*, 1963, 57, 81-86 (Treponematoses Dept., Statens Seruminst., Copenhagen, Denmark) Immunisation with lyophilised Reiter-treponemes caused a marked production of at least 2 types of Ab, antilipid and antipolysaccharide. However, the antilipid Ab disappeared quickly, whereas the antipolysaccharide were detectable over a longer period. I.Friedmann

1118. INTERACTION OF RICKETTSIAE AND PHAGOCYTIC HOST CELLS, in. OPSONISING ANTIBODIES IN HUMAN SUBJECTS INFECTED WITH VIRULENT OR ATTENUATED RICKETTSIA PROWAZEKII OR INOCULATED WITH KILLED EPIDEMIC TYPHUS VACCINE. C.L.Wissemann, jun., J.R. Gauld and J.G.Wood: *J. Immunol.*, 1963, 90, 127-131 (Dept. Microbiol., Univ. Maryland Med. Sch., Baltimore, Md., U.S.A.)

Although an injn. of conventionally killed epidemic typhus vaccine appeared to cause more rapid appearance of Ab, the titres attained were low and usually did not increase further. Serum from all groups enhanced phagocytosis of R. mooseri, but for the most part these Ab occurred in lower titres than the Ab involved in the opsonisation of R. prowazekii. N.R.Iing

1119. CHARACTERISTICS OF LIPID-ADSORBED VIRUS VACCINES. J.S.Youngner and V.Alexrod: *J. Immunol.*, 1963, 90, 1-11 (Dept. Microbiol., Sch. Med., Pittsburgh, Pa., U.S.A.) Hexadecylamine-adsorbed vaccine elicited an acute inflammatory response with predominantly polymorphs. Spp. differences in response to lipid-adsorbed vaccine were encountered; marked adjuvant action occurred in guinea-pigs and mice but not in rabbits and chickens. The influence of route of inocn., suspending medium and loading of lipid with Ag on Ab response were determined. A series of water-insol. lipids with different polar groups and side-chains were tested for adjuvant activity. N.R.Iing

1120. A SIMPLE RAPID METHOD FOR PRODUCTION OF VIRAL ANTIBODIES IN MICE. S.Berkovich: *Proc. Soc.exp. Biol.*, N.Y., 1962, 111, 127-129 (Res. Div. Infect. Dis., Children's Hosp. Med. Center, Boston, Mass., U.S.A.) Virtually similar titres of Ab were produced in serum and ascitic fluid in mice inj. with viral Ag followed by Ehrlich ascites tumour cells.

M.M.Shapland

1121. IMMUNOGENICITY OF INACTIVATED VACCINIA VIRUS. A.V.Ramanarao: *J. Path. Bact.*, 1962, 84, 367-377 (I.N.H.S., Asvini\ Colaba, Bombay, India) The efficiency of i.m. vaccines consisting of virus inacti-

vated by acetylethyleneimine [AEI] or formaldehyde [HCHO] was compared with i.d. living virus in the rabbit by measuring neutralising Ab response and the resistant of skin to i.d. challenge 17 weeks later with living virus*. All agents produce a basal immunity, that of the living virus being highest, that of HCHO-inactivated virus being more effective than that of AEI inactivated virus. Necrosis of skin did not follow i.d. challenge in rabbits immunised with live virus. Absence of necrosis was not correlated with level of neutralising Ab. D.MuU>

1122. CLINICAL REACTION OF NIGERIAN CHILDREN TO MEASLES VACCINE WITH AND WITHOUT Y-GLOBULIN. D.Morley, S.L.Katz and S.Krugman: *J. Hyg. Lond.*, 1963, 61, 135-141 (Wesley Guild Hosp., Ilesha, W. Nigeria) Enders 'B' liquid or lyophilised measles vaccine was given to 146 Nigerian children, a further 378 children received vaccine plus Y-globulin. The vaccine alone produced fairly severe reactions, but the children who received vaccine and y-globulin had only minor reactions. LB-Derbystu^

1123. EFFICACY OF MEASLES VACCINE. J.Hartfield and D.Morley: *J. Hyg. Lond.*, 1963, 61, 143-147 (Wesley Guild Hosp., Ilesha, W. Nigeria) 1000 Nigerian children, aged between 6 months and 120 also received y-globulin. Controls received Y-globulin plus inert material. In an outbreak in a village measles occurred in 19 out of 27 controls, 2 of whom died, but not in 26 vacc. children. 80 cases of measles were seen in vacc. children in an out-patient clinic, and 192 cases in controls, of whom 11 were to have died. J.B.Derbyshu^

1124. AN ANAMNESTIC ANTIBODY INCREASE IN FERRETS CROSS-INFECTED WITH INFLUENZA A2-VIRUS AFTER MYXOVIRUSES NOT BELONGING TO THE GROUP. A.Harboe: *Acta path. microbiol. scand.*, 1962, 55, 425-436 (Virus Dept., Nat. Inst. Publ., Oslo, Norway) In cross-infected ferrets influenza A2-virus provoked an anamnestic Ab titre increase to different influenza B-strains, to influenza C and Sendai virus in the haemagglut. inhibn. test. Usually this increase was about 2-fold. A table illustrating various degree* antigenic relationship between myxovirus strains is presented. I.Friedmann

1125. CHROMATOGRAPHIC PROOF OF THE HETERogeneity OF ANTIBODIES AGAINST PSEUDO-RABIES VIRUS. A*R.Neurath, A.Zuffa and CALtaner-Z. Immun.-Foisch., 1962, 124, 156-163 (Oncol. Res. Inst. Bratislava, Czechoslovakia) Antisera prep. *Sainst were submitted to DEAE-cellulose chromatography and SDS-phoresis. Ab were distributed among the resulting protein fractions. (German) D.P.Wins*

1126. POLIOMYELITIS NEUTRALISING ANTIBODIES IN MOTHERS AND THEIR NEWBORN INFANTS. A.Alice-vogt and H.J.Otte: Z. Immun.-Foisch., 1962, 197-205 (Hyg. Inst., Univ. Munster, Germany) A series of 195 mothers, 81% had adequate titres of neutralising Ab against poliovirus types I, II and III. In 8 cases the Ab were transmitted to the infant, but 7 mothers had type II Ab and 13 type III Ab which the infants lacked. 17 of the infants had Ab (11 to TyP^ in titres up to 16) which could not be demonstrated in their mothers. (German) D.P.Winstanley

- ¹¹²? PASSIVE TRANSFER OF IMMUNITY TO BLUE TONGUE VMJS FROM VACCINATED MATERNAL MICE TO THEIR OFFSPRING. S.Svehag and J.R.Gornam: Res. vet. Sci., 1963, 4, 109-113 (Washington State Univ. Dept. Vet. Sci., Pullman, Wash., U.S.A.)
 Mice were immunised during pregnancy with blue tongue virus, and some were allowed to nurse their young whilst some of the baby mice suckled foster dams. Neutralising Ab was passed to the offspring only by lacteal transfer. J⁺ Passive immunity increased during the first 12 days J⁺.Mrth and was lost after weaning. No detectable passive immunity was obtained by the offspring of ? that ate fed blue tongue virus-infected mouse brain.

J.B.Derbyshire

- DISCUSSION**
Distribution of Adenovirus antibodies in normal children. C.W.Potter and W.I.H.Shedden: J Hyg, Lond., 1963, 61, 155-160 (Sheffield Univ. W. / ? ; 1 Dept sh e f f e l d, England) Adenovirus ^ pausing Ab was measured in 42 specimens of maternal and cord serum, and on 197 sera from children up to 14 years. Ab to types 1 and 3 was found in approx. half the fetal and cord samples, with higher titres in the cord and active Ab appeared early in life. Ab to types 1, 2 and 5 was found more frequently than Ab to types 3, 6 and 7. It was concluded that infection with types 1, 2 and 4 endemic in Sheffield. J.B.Derbyshire

1129. COMPLEMENT-FIXATION TITRES AGAINST THE SPECIES-SPECIFIC TRACHOMA ANTIGEN IN SERA OF TRACHOMA PATIENTS. A.L.Terzin, M.R.Fornazaric S.,^a P.^b Brltascvic: J. Hyg. Lond., 1963, 61, 31-42 elcjjii^c Fac, Sarajevo, Yugoslavia) 3 semi-purified in Q^d ry body suspensions of trachoma virus were used and a^e te sts^f on Bedsonia-neg. sera from trachoma patients, ^feri^g against Psittacosis-pos. sera. A saline-formol Ag was either either a buffered-sucrose-K glutamate [SKG] - Ag or an SKG-formol Ag. The SKG-formol Ag best species-specific reactions, and it was not ant-i-complementary. However, it contained a group-sp. component which reacted with psittacosis-pos. sera, so that it only detected trachoma CF Ab specifically in Bedsonia^h sera. The species-specific component was the same as in the Ig sera. J.B.Derbyshire

- 1136. PROTEOLYTIC MECHANISM IN RECURRENCE OF ARTHUS-TYPE INFLAMMATION BY THIOL COMPOUNDS.** H.Hayashi, H.Miyoshi, R.Nitta and K.Udaka, Brit. J. exp. Path., 1962, 43, 564-573 (Dept. Path., Kumamoto Univ. Med. Sch., Kumamoto, Japan)
 An Arthus reaction was induced in rabbits by i.d. injn. of bovine serum. Healing lesions were reactivated by local injn. of reduced glutathione. The response was associated with increased protease activity in euglobulin prep, from local skin. A pos. but less severe response occurred with cysteine but not with other reducing agents.

D.L.Gardner

1137. CUTANEOUS ANAPHYLAXIS IN THE GUINEA-PIG AND ITS RELATIVE INSUSCEPTIBILITY TO AN ANTI-HBTAMINE. J.P.Craig and D.L.Wilhelm: J. Immunol., 1963, 90, 43-51 (Lister Inst. Prev. Med., London, England) Whereas triprolidine caused a 500-5000-fold suppression of the permeability response to i.d. injn. of histamine it was never capable of suppressing the anaphylactic response more than 10-fold. The findings

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

indicate that histamine plays little or nor role in the events leading to the increase in capillary permeability or cutaneous anaphylaxis, regardless of its presumed role in other manifestations of immediate hypersensitivity.

N.R.Ling

1138. PASSIVE ANAPHYLAXIS IN VITRO. V. DESENSITISATION OF SENSITISED TISSUES. P.Liacopoulos: *J. Physiol., Paris*, 1962, 54, 599-618 (Centre de Rech. Allergiques, Hôp. Broussais, 96 rue Didot, Paris, France) The reversibility of the sensitisation process by the desensitisation of isolated tissues previously sensitised either actively or passively both *in vivo* and *in vitro*, has been demonstrated. Incubation of sensitised organs with non-sp. V-globulins of the rabbit, guinea-pig or horse, regularly produced complete desensitisation. Prolonged washing, or incubation in a medium sat. with CO₂ produced at least a partial desensitisation.

1139. ROLE OF MASTOCYTES IN THE ANAPHYLATOID REACTION PROVOKED BY DEXTRAN. L.Kato and B.Cozsy: *J. Physiol., Paris*, 1962, 54, 619-624 (Inst. Microbiol. and Hyg., Univ., Montreal, Que., Canada) Compound 48/80 provoked local mast cell disruption in the skin of the rat when inj. i.d., and disruption of nearly all the mastocytes when inj. i.v. Dextran 0*79 mg./100 g.-30 mg./100 g. induced increased capillary permeability and intense oedema formation without mast cell disruption. It is suggested, therefore, that liberation of loose binding histamine and 5HT from the mast cells is not involved in the dextran-induced acute inflammatory reaction.

1141. ACTIVATION BY IRRITANTS OF SLOW-CONTRACTING SUBSTANCES AND THEIR RELATION TO VASCULAR CHANGES OF INFLAMMATION IN RAT. W.G.Sp3ctor and D.A.Willoughby: *J. Path. Bact.*, 1962, 84, 391-403 (Dept. Morbid Anat., Univ. Coll.

Hosp. Med. Sch., London, England) Exudates induced in rats by intrapleural injn. of turpentine contained material causing a slow contraction of plain muscle. The activity was max. at 2-3 hr., was virtually absent after 24 hr. and closely paralleled the alterations in ability of exudates to increase vascular permeability. Rat plasma acquired similar prop. within 3 min. of addition of turpentine. The activity could be separated into 2 fractions on Sephadex columns. One resembled a slow reacting substance of guinea-pig origin. The other resembled bradykinin in some respects and was closely associated with permeability-increasing activity.

D.Murray

1142. TUBERCULIN HYPERSENSITIVITY: STUDIES WITH RADIOACTIVE ANTIGEN AND MONONUCLEAR CELLS. K.Kay and W.O.Rieke: *Science*, 1963, 139, 487-490 (Dept. Anat., Univ. Washington, Seattle, Wash., U.S.A.) [131]PPD was taken up *in vitro* by lymphocytes and neutrophils of guinea-pig sensitive to tuberculin more frequently than by the cells from non-sensitive ones. Passive transfer of tuberculin hypersensitivity by PHlymphocytes indicated that significant no. of

radioactive cells migrated to the site where the skin ^{aS} tested with PPD only when the test was made immedia^ly after transfusion; they are therefore not required in large no. at the site for a reaction to develop.

G.M.Lewis

1143. IN VITRO CELL MIGRATION AS A MODEL FOR DELAYED HYPERSENSITIVITY. M.George and JH^a Vaughan: *Proc. Soc. exp. Biol., N.Y.*, 1962, 111-514-521 (Dept. Microbiol., Sch. Med. and Dent.,^a Rochester, N.Y., U.S.A.) The ability of Ag to In^a cell migration in tissue culture was confirmed with PJ^a toneal exudate cells for tuberculin hypersensitivity; reaction also occurred in the delayed hypersensitivity that developed after immunisation with a protein Ag & Freund's adjuvant.

M.M.Shapla^{no}

1144. IN VITRO PRODUCTION OF ANTIBODY BY D^a? LAYERED PHASE CORNEAL LIMBAL LYMPHOID FOCT. H.M.I.Leibowitz and JJ.Parks: *J. exp. Med.*, 1963, 117, 197-212 (Wilmer Ophthal. Inst., Johns Hopkins Hosp., Baltimore, Md., U.S.A.) A biphasic allerg^a reaction occurred in the cornea of a rabbit eye inj. with sol. protein Ag. The early stage, with diffuse cloud^a of the cornea was due to delayed hypersensitivity ^a he was accompanied by infiltration of the periphery of t&^a reaction by mononuclear cells. The later response C^a I sely phenomenon) was Ab-dependent and accompan^a by infiltration by plasma cells. The eye appeared n^a for a few days between the 2 reactions. Explants of & first stage mononuclear infiltrate were maintained xn culture. Later the fluid surrounding the cells contain^a sp. humoral Ab, indicating that the cells present i^a delayed reaction were capable of later production O^a.

H.E.H.^o5

1145. E.M. STUDY OF DELAYED SENSITIVITY T RITIN IN GUINEA-PIGS. B.Goldberg, F.S.Kantor^a B.Benacerraf: *Brit. J. exp. Path.*, 1962, 43, 621-631 (Dept. Path., New York Univ. Sch. Med., N.Y..) Ferritin and picryl guinea-pig albumin were used to produce delayed hypersensitivity in guinea-pig skin. Ferritin was found only in macrophages, which were characteristic cells of the reaction. Ferritin clearance and cellular uptake from skin appeared independent of any immune mechanism.

^{1152. COMMON ANTIGENS BETWEEN CATTLE AND HORSES AND BETWEEN MEN AND HORSES DEMONSTRATED BY THE IMMUNE HAEMOLYSIS TEST.}
^{D.O.Schmid and L.Erhard: Z. Immun.-Forsch., 1962,}
^{124, 149-155 (Inst. Blutgruppenforschung Tierzuchtforsch. e.V., Mtinchen, Germany)} Human anti-A serum contained haemolysins against blood group factor C of the horse. A serum produced by immunising horses with r.b.c. from other horses contained a haemolysin against the Z factor of cattle. (German) D.P.Winstanley

^{1153. Rh SPECIFICITY OF HETERO-ANTIBODIES FROM GUINEA-PIGS IMMUNISED WITH EXTRACTS OF HUMAN Rh POSITIVE AND NEGATIVE ERYTHROCYTES.I. AND II.} A.Majsky, M.Kreckova, R.Zikova and M.Poslusna: Z. Immun.-Forsch., 1962, 124, 115-119, 120-123 (Inst. Haematol., Prague, Czechoslovakia) I. Extracts prep. by the method of Levine et al. failed to produce anti-D Ab.
^{II. An extract prep. from D-pos. r.b.c. heated at 56° for 1 hr. stimulated complete anti-D Ag in 4 out of 5 guinea-pigs. Extracts from D-neg. cells had no effect. The complete Ab was not identical with human complete anti-D for they aggl. r.b.c. coated with incomplete anti-D.} (German) D.P.Winstanley

^{1154. OCCURRENCE OF RHEUMATOID FACTOR AND OTHER ABNORMALITIES IN FAMILIES OF PATIENTS WITH AGAMMAGLOBULINAEMIA.} H.Fudenberg, J.L. German HI and H.G.Kunkel: Arthritis and Rheumatism, 1932, 5, 565-588 (Rockefeller Inst., New York, N.Y., U.S.A.) D.G.Scott

^{1155. REACTIVITY OF RHEUMATOID ARTHRITIS SERA WITH ALTERED AND AGGREGATED HUMAN Y-GLOBULIN.} I.Oreskes, J.M.Singer and CM.Plotz: J. Immunol., 1963, 90, 107-115 (Dept. Med., Mount Sinai Hosp., New York, N.Y., U.S.A.) Commercial pools (14) of human y-globulin varied widely in their reactivity. When heated at 63° for 10 min. reactivity of the prep. increased to about the same level in all cases. Purified 7 S Y-globulin, when denatured under conditions which avoided aggregation, was also reactive. It is concluded that reactivity of pooled y-globulin for rheumatoid factor is primarily due to denaturation. N.R.Ling

^{1156. IMMUNOELECTROPHORESIS OF SERUM CONTAMINATION OF PERFUSED ORGANS.} R.Depieds, G.Cartouzou, S.Lissitzky, H.Gignoux and D.Gignoux: C.R. Soc. Biol., Paris, 1962, 156, 1450-1454 (Lab. Parasitol., Fac. Med., Marseille, France) Rabbit organs which had been washed by prolonged perfusion contained blood proteins. The lines of pptn. obtained after immuno-electrophoresis of liver, kidney and tongue extracts against cock anti-rabbit serum were due to direct reactions between the contaminating serum proteins and Ab of the immunoserum. The kidneys showed the greatest contamination with blood proteins. (French) M.A.Price

^{1157. a-2-MYELOMA. FALLIBILITY OF ARBITRARY CLASSIFICATIONS OF PROTEINS.} S.E.Ritzman, R.H. Thurm and W.C.Levin: Tex. Rep. Biol. Med., 1963, 21, 74-92 (Univ. Texas Med. Branch, Galveston, Tex., U.S.A.) A case of X-2-myeloma with typical clinical pattern, X-ray findings and bone marrow features is described. The multiple myeloma protein revealed several unusual features; on paper electrophoresis it migrated as a homogeneous (X-2-globulin fraction; on ultracentrifugation it revealed the presence of 2 intermediate

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

fractions; immunol. it belonged to the y type myeloma protein; ppm. at 56° qualified it as a pyroglobulin. It is suggested that classification of myeloma proteins be based upon their immunol. prop. A.J.Martin

1158. ANTIBODIES TO GENETIC TYPES OF YGLOBULIN AFTER MULTIPLE TRANSFUSIONS. J.C.Allen and H.G.Kunkel: *Science*, 1963, 139, 418-419 (Rockefeller Inst., New York, N.Y., U.S.A.) 71% of the sera from a group of children who had received multiple transfusions contained anti-Gm agglutinins, each highly sp. for a single Gm factor. It was concluded that these Ab resulted from the introduction of foreign y globulin through multiple transfusions. G.M.Lewis

1159. IMMUNOLOGICAL COMPARISON OF IMMUNOGLOBULINS FROM HUMAN BLOOD SERUM, URINE, AND MILK, USING DIFFUSION-IN-GEL METHODS. L.A.Hanson and I.Berggard: *Clin. chim. Acta*, 1962, 7, 828-834 (Dept. Bact., Univ., Gothenburg, Sweden)

Normal serum and urine contained 2 or 3 low mol. wt. Y-globulins (YL"globulins) which were antigenically deficient compared to 7 S Y-globulin. 2 serum YL" globulins gave interference reactions with 2 corresponding urine VT-globulins. One of the YL"-globulins gave a reaction of interference with a milk immunoglobulin. The other YL"globulin gave a reaction of partial interference with another milk immunoglobulin, and was antigenically deficient compared to this protein. In comparative immuno-electrophoretic studies, reactions of interference were obtained between one Bence-Jones protein and 2 urine y-globulin ppt., and between another Bence-Jones protein and a third urine YL" globulin ppt. V.M.Wootton

1160. IMMUNOELECTROPHORETIC CHARACTERISATION OF PROTEOLYTIC ENZYMES. V.Raunio and O. Gabriel: *Nature*, Lond., 1963, 197, 1012-1013 (Pediat. Metabol. Branch, Nat. Inst. Arthritis and Metabol. Diseases, Bethesda, Md., U.S.A.) Pptn. lines were produced on a nr>scope slide by immuno-electrophoretic analysis of human urinary macromol. components and serum Ab produced in rabbits. After exhaustive washing, the slide was placed in buffer against an agar slide that had been exposed to Hb soln. After incubation in a moist chamber for 1 hr., the slides were fixed and stained with amido black to reveal the area of enzymic activity as a clear zone against a dark background. G.M.Lewis

1161. PROPERTIES OF ANTHEUCOCYTIC SERUM. A.E.Stuart: *Brit. J. exp. Path.*, 1962, 43, 614-620 (Dept. Path., Univ., Edinburgh, Scotland) Rabbit anti-guinea-pig leucocyte sera, which inhib. motility and phagocytosis, contained haemolysin, Forssman Ab and Ab against muscle, liver, kidney and spleen. The most sensitive detection of these complex, overlapping Ab was by tanned r.b.c. haemaggl. D.L.Gardner

1162. IMMUNOCHEMICAL IDENTIFICATION OF SALIVARY PROTEINS. H.R.Stoffer, F.W.Kraus and A.C. Holmes: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 467-471 (V.A. Hosp., Birmingham, Ala., U.S.A.) 7 proteins in whole saliva and parotid secretion were immunochemically similar to plasma proteins by ring-pptn., micro-immuno-electrophoresis and micro-double-diffusion methods employing sp. antisera. M.M.Shapland

1163. IMMUNOLOGICAL AND ELECTROPHORETIC ANALYSIS OF RAT LIVER MITOCHONDRIA AND OTHER

CELLULAR FRACTIONS. V. D'Amelio, V.Mutolo and A.Barbarino: *Exp. Cell Res.*, 1963, 29, 1-16 (Lab. Comp. Anat., Univ., Palermo, Italy) Rat liver mitochondria were composed of at least 12 components, either anodic or cathodic, their immuno-electrophoretic pattern being different from that of the microsomes and of the cell sap. The microsomes exhibited at least 7 components and the cell sap 14. When mitochondria were treated with deoxycholate, some Ag were progressively brought into soln., while others were firmly bound to the mitochondrial membranes. K Jones

1164. HEPATIC ANTIGENS IN THE BLOOD OF RATS WITH TOXIC LIVER DAMAGE. E.Espinosa and I.Insunza: *Proc. Soc. exp. Biol.*, N.Y., 1962, 174-177 (Univ. Chile, Escuela Med., Lab. Fisiopatol., Santiago, Chile) Liver Ag of O_t, j8 and y-globulin electrophoretic mobilities were detected in rat sera following induced acute hepatic damage. M.M.Shapland

1165. NEPHRITIS AND LUNG HAEMORRHAGE. R.L.De Gowin, Y.Oda and R.H.Evans: *Arch. intern. Med.*, 1963, 111, 16-22 (Dept. Int. Med., Univ. Chicago, 111, U.S.A.) Lyophilised and pulverised dog's lung was inj. into Flemish Giant rabbits daily for 3 weeks. Dogs inj. i.v. with the serum of these rabbits developed lung lesions and nephritis which were not duplicated by inj. of normal rabbit serum. E.E.Hobbiger

1166. E.M. LOCALISATION OF NEPHROTOXIC SERUM IN RABBIT GLOMERULI WITH FERRITIN CONJUGATED ANTIBODY. R.B.Arhelger, J.A.Gronvall, O.B.Carr and J.G.Brunson: *Lab. Invest.*, 1963, 12, 33-37 (Pathol. Dept., Mississippi Med. Center, Jackson, Miss., U.S.A.) Rabbits were given i.v. chicken anti-rabbit kidney serum to produce glomerulonephritis. 12 hr. later kidney blocks were flooded with ferritin-conjugated Ab to chicken a-globulin for 3 min. and prep, for E.M. Ferritin was located mainly in the glomerular basement membrane. Control procedures were neg. A.M.Mackay

1167. NEPHROTOXIC SERUM NEPHRITIS IN NEWBORN RATS. D.K.Hammer, JJ.Vazquez and F.J.Dixon: *Lab. Invest.*, 1963, 12, 8-15 (Div. Expt. Pathol., Scripps Clin. and Res. Fdn., La Jolla, Calif., U.S.A.) Anti-rat kidney serum was inj. into newborn rats to produce acute glomerulonephritis and proteinuria. The serum a-globulin and rat C^f were localised by fluorescence microscopy to mature glomeruli of the inner cortex. These glomeruli showed progressive damage but the peripheral ones escaped injury. The disease was self-limited due to the production of new normal nephrons from the latter zone. A.M.Mackay

1168. EFFECT OF INJECTING HETEROLOGOUS GLOMERULAR BASEMENT MEMBRANE PREPARATIONS IN PREGNANT SHEEP. R.W.Stebly: *Proc. soc. Exp. Biol.*, N.Y., 1963, 112, 15-18 (Dept. Obstet. and Gynecol., Univ. Chicago, 111, U.S.A.) 3 pregnant sheep were used to study the effect of heterologous glomerular basement membrane prep, which are known to cause fatal glomerulonephritis. All 3 developed the fetal nephritis but all the foetal or newborn lambs were normal even when suckled on the mother's colostrum. D.N.Wheatley

1169. LOCALISATION OF ACROSOMAL ANTICENICITY IN GUINEA-PIG TESTES. R.E.Mancini, O.W.Davidson*, O.Vilar, M.Nemirovsky and D.C.Bueno: *Proc. Soc. exp. Biol.*, N.Y., 1962, 111, 435-438 (Inst. Anat.,

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

111

Fac.de Med., Buenos Aires, Argentina) Homologous guinea-pig testes antisera were shown by immunofluorescence to contain Ab directed against the acrosome of the spermatid and the head of the sperm. Sp. localisation occurred in the testis of sensitised as well as unsensitised animals.

M.M.Shapland

1170. HIGH CONCENTRATION OF ANTIBODIES TO GROWTH HORMONE OBTAINED BY NEW PROCEDURE. J.Morat6-Manaro: Endocrinology, 1963, 72, 667-668 (Lab. Endocr. Res., Pasteur Hosp., Montevideo, Uruguay) A high titre of Ab using small amounts of human growth hormone was obtained by the immunity granuloma technique in rabbits. Good titres of anti-thyroid Ab were also obtained.

H.C.Jones

1171. ACUTE INHIBITION OF THYROID FUNCTION IN THE RAT PRODUCED BY RABBIT ANTIBODY TO BEEF THYROTROPIC HORMONE. S.Reichlin and R.L.Boshans: Proc.Soc.exp.Biol., N.Y., 1962, 111, 139-140 (Endocrinol. Dept. Med., Sch. Med. and Dent., Rochester, N.Y., U.S.A.) Inj. of rabbit anti-beef TSH produced acute inhibn. of 131I released from the thyroid.

M.M.Shapland

1172. E.M. STUDY OF HASHIMOTO THYROIDITIS. W.J. Irvine and A.R.Muir: Quant. J. exp. Physiol., 1963, 48, 13-26 (Dept. Therapeutics, Royal Infirmary, Edinburgh, Scotland) E.M. of thyroid tissue from patients with Hashimoto's thyroiditis showed that the basement membrane was more or less continuous. Contact was observed between the invading lymphocytes and the epithelial cells of the gland.

H.C.Jones

1173. AN IMMUNE CHROMATOGRAPHIC METHOD FOR ASSAY IN SERUM OF ANTIBODIES TO GLUCAGON AND INSULIN. Y.Kologlu, L.L.Wiesel, V.Positano and G.E.Anderson: Proc. Soc. exp. Biol., N.Y., 1963, 112, 518-523 (Dept. Med., Brooklyn Hosp., New York City, N.Y., U.S.A.) Non-flocculating and non-PPtg. Ab were measured quant. by a chromatographic technique. Glucagon and insulin did not produce Ab which gave cross-reactions in this system.

D.N.Wheatley

1174. INSULIN-BINDING ANTIBODIES IN RELATION TO INSULIN THERAPY. J.N.Harris-Jones, H.Miller and G.Owen: J. clin. Path., 1963, 16, 120-123 (Llanelli Hosp., Llanelli, Carmarthenshire, Wales) Insulin-binding Ab was detected by incubating [1S]finsulin with serum samples, and subjecting the sera to zone electrophoresis or immunoelectrophoresis with autoradiography. Ab was detected in the majority of 50 subjects receiving iigulin, 2nd in expt. animal sera. Binding occurred in the p- and a~lobulins.

J.B.Derbyshire

1175. EFFECTS OF 6-MERCAPTOPURINE [6-MP] ON SUSCEPTIBILITY OF GUINEA-PIGS TO EXPERIMENTAL ALLERGIC ENCEPHALOMYELITIS. J.D.Thomson and K.W.Austin: Proc. Soc. exp. Biol., N.Y., 1962, 111, J21-23 (Dept. Physiol., Coll. Med., State Univ., Iowa, U.S.A.) No significant difference was found between incidence of paralysis in guinea-pigs inj. with both homologous bragg in complete Freund adjuvant and **, and animals given Ag alone.

M.M.Shapland

1176. ENHANCEMENT OF EXPERIMENTAL ALLERGIC ENCEPHALOMYELITIS BY ADRENALECTOMY. E.Levine, E.J.Wenk, T.N.Muldoon and S.G.Cohen: Proc. Soc. exp. Biol., N.Y., 1962, 111, 383-385 (Dept. Path., St. Francis Hosp., Jersey City, N.J., U.S.A.) Adrenalectomy or adrenal enucleation increased incidence and severity of expt. allergic encephalomyelitis. This effect was reversed by cortisone.

M.M.Shapland

.1177. LYMPHATIC DISSEMINATION OF ENCEPHALITIC EMULSION AND ITS RELATION TO PREVENTION OF ALLERGIC ENCEPHALOMYELITIS [EAE] BY LYMPHODECTOMY. S.Levine and E.J.Wenk: Proc. Soc. exp. Biol., N.Y., 1962, 111, 385-387 (Dept. Path., St. Francis Hosp., Jersey City, N.J., U.S.A.) It was not possible to prevent EAE in rats by removal of popliteal and inguinal lymph nodes before foot pad injn. of homologous brain emulsion because of dissemination in superficial and retroperitoneal nodes.

Spread of emulsion was more restricted after flanking injn. and so EAE was prevented by bilat. excision of axillary, inguinal and elbow nodes.

M.M.Shapland

1178. AN IN VITRO GLIOTOXIC EFFECT OF SERUM FROM ANIMALS WITH EXPERIMENTAL ALLERGIC ENCEPHALOMYELITIS [EAE]. O.Berg and B.Kallen: Acta path. microbiol. scand., 1962, 54, 425-433 (Dept. Neurol., Univ., Lund, Sweden) Seras of

guinea-pigs and rabbits with EAE contained a factor which was selectively toxic for glial cells cultured in vitro from neonatal rat brain tissue. There was no correlation between the gliotoxic factor and the clinical status of the animals. It has not been demonstrated in sera of rats with EAE.

I.Friedmann

1179. SERA OF ANIMALS WITH EXPERIMENTAL ALLERGIC ENCEPHALOMYELITIS AND PATIENTS WITH MULTIPLE SCLEROSIS USING IMMUNE PRECIPITATION IN AGAR GEL AND IMMUNO-ELECTROPHORESIS.

O*Berg and SJ.Dencker: Acta path. microbiol. scand. 1962, 54, 434-438 (Dept. Neurol., Univ., Lund, Sweden) Ab against c.n.s. tissue were found in sera from animals with expt. allergic encephalomyelitis. Immuno-electrophoretically the nervous tissue Ag migrated like a J₁protein. No Ab to human brain tissue were found in sera from 4 patients with multiple sclerosis.

I.Friedmann

1180. SPHINGOLIPID ANTIBODIES IN SERA OF ANIMALS AND PATIENTS WITH C.N.S. LESIONS. M.Yokoyama, E.G.Trams and R.O.Brady: Proc. Soc. exp. Biol., N.Y., 1962, 111, 350-352 (Lab. Neurochem., Nat. Inst. Neurol. Dis. and Blindness, Bethesda, Md., U.S.A.) Anti-asialoganglioside Ab were detected in the sera of animals and patients with viral encephalitis having brain damage, in 5 out of 14 patients with Tay-Sachs disease and 3 out of 14 schizophrenic patients. Anti-ganglioside Ab were found in the sera of 8 of 42 patients with multi. pié sclerosis, all 8 patients possessing the homozygous hr (c) blood group Ag.

M.M.Shapland

1181. EXPERIMENTAL PRODUCTION OF MUSCULAR DYSTROPHY-LIKE LESIONS IN RABBITS AND GUINEA-PIGS BY AUTO-IMMUNE PROCESS. C.Tal and E.Libani: Brit. J. exp. Path., 1962, 43, 525-529 (Dept. Nervous Dis., Hadassah Med. Sch., Jerusalem, Israel)

Guinea-pigs and rabbits were given homologous or heterologous muscle homogenates with Freund's adjuvants. Histopathol. changes found in skeletal muscles up to 1 yr. later were similar to those of muscular dystrophy in man.

D.L.Gardner

1182. VENOM OF THE BULGARIAN SAND VIPER IE. AUTO-ANTIBODIES TO THE VENOM OF VIPERA AMMODYTES AND COMMON ANTIGENS IN ITS VENOM AND SERUM. M.Gomtor and S.Nedjalkov: Z. Immun.-Forsch., 1962, 124, 211-218 (Res. Inst. Epidemiol., Sofia, Bulgaria) The serum of the Bulgarian sand viper contained auto-Ab to its venom demonstrable by the Ouchterlony technique. The serum of the snake was also toxic, but this toxin was destroyed in 30 min. at 58° and had nothing to do with the venom.

IMMUNOLOGY AND EXPERIMENTAL PATHOLOGY

The serum and venom had certain non-toxic Ag in common. The snake is recommended as a laboratory animal for research on autoimmunity. (German) D.P.Winstanley

1183. SKIN HOMOGRAFT SURVIVAL IN CHRONIC RENAL INSUFFICIENCY. A.B.Morrison, K.Maness and R.Tawes: Arch. Path., Chicago, 1963, 75, 139-143 (Dept. Path., Univ. Med. Center, Rochester, N.Y., U.S.A.) Chronic renal insufficiency was induced in adult Sprague-Dawley rats by 2 stage partial nephrectomy. Between 6 and 9 months later, when serum inorg. PO₄ and blood urea showed established renal insufficiency, hybrid homografts of skin were placed on control and expt. rats. Survival time of the grafts was significantly prolonged in rats with renal insufficiency. This was correlated with the blood urea but not with serum P. The reasons for prolonged survival time is given as possibly adrenal hypertrophy. R.Mitchell

1184. COMPLETE SPERMATOGENESIS IN INTRATESTICULAR HOMOTRANSPLANTS OF FOETAL AND NEONATAL TESTES IN THE RAT. C.D.Turner and H.Asakawa: Proc. Soc. exp. Biol., N.Y., 1963, 112, 132-135 (Dept. Biol., Duquesne Univ., Pittsburgh, Pa., U.S.A.) Testis transplants were performed from neonatal or 15-16 day foetal Sprague-Dawley rats into either the tunica albuginea or the renal capsule of adult c^o rats. Transplants were rejected in 29% of animals within 3 weeks. The remaining 71% of the grafts developed into testis tissue with maturation through all stages of spermatogenesis. The incidence of 'takes' in the grafts to kidney was similar, but the testis did not produce histol. normal sperms. This suggests that the cryptorchid environment prevents complete spermatogenesis in testis grafts. D.N.Wheatley

1185. ANAESTHETIC ASPECTS OF RENAL HOMOTRANSPLANTATION IN MAN. L.D.Vandam, J.H.Harrison, J.E.Murray and J.P.Merrill: Anesthesiology, 1962, 23, 783-792 (Div. Anesthesia, Dept. Surg. and Med., P.B.Brigham Hosp., Boston, Mass., U.S.A.) An account is given of 17 renal transplants between identical twins. The problems presented by both donor and recipient are discussed. The chief problem to be solved is tissue-immune response. A. A. Zimmerman

1186. SKIN COMPATIBILITY OF DIFFERENT CBA SUB-LINES SEPARATED FROM EACH OTHER IN THE COURSE OF A VARYING NUMBER OF GENERATIONS. O.E.A.Inder: Transplantation, 1963, 1, 58-60 (Inst. Tumour Biol., Karolinska Inst., Stockholm, Sweden) Tissue compatibility was tested between sublines of CBA mice by observing the fate of skin grafts. No homograft reactions occurred between mice of sublines separated for 8 or less generations. Between sublines separated by 10 or more generations, occasional grafts showed evidence of reactions and some were rejected. J.R.Anderson

1187. HISTOCOMPATIBILITY ASSOCIATED WITH X CHROMOSOME IN MICE. D.W.Bailey: Transplantation, 1963, 1, 70-74 (Cancer Res. Inst., Univ. California Med. Center, San Francisco, Calif., U.S.A.) Skin grafts were exchanged between F₁ hybrids of 2 inbred strains of mice (the expt. was designed to detect X-ray mutations at the histocompatibility loci, and the fathers of the hybrids had received X-irradiation). Some of the grafts between reciprocal hybrids were rejected, and the more rapid rejection of selected second-set skin grafts of hybrid and parental strains supported the conclusion that tissue incompatibility resulted from transplantation Ag determined by factors carried by the reciprocal X chr. Difference in host reactivity determined by genes

on the X chr. is considered a less likely possibility.

J.R.Anderson

1188. KOTOPIC LABELLING OF CORNEAL STROMAL CELLS PRIOR TO TRANSPLANTATION. F.M.Polack: Transplantation, 1963, 1, 83-96 (Dept. Ophthalmol., Coll. Phys. and Surg., Columbia Univ., New York, N.Y., U.S.A.) The cells of the central part of the rabbit's cornea were destroyed by freezing, and regeneration was studied histol. for up to 100 days. Labelling of proliferating cells was accomplished by injn. of [³H]thymidine into the ant. chamber, and was observed by autoradiography sections. Following epithelial desquamation, transparency returned and regeneration of epithelial and stromal cells was virtually complete in 6 weeks. To obtain optimal and uniform labelling throughout the damaged area, several injn. of [³H]thymidine were required within 8 days after freezing. Good radioautographs were obtained up to 12-13 months later.

J.R.Anderson

1189. EVOCATION AND PERSISTENCE OF TRANSPLANTATION IMMUNITY IN RATS. D.Steinmuller and L.J.Weiner: Transplantation, 1963, 1, 97-106 (WistarInst., Philadelphia, Pa., U.S.A.) The rate of development, strength and duration of homograft immunity was determined in Lewis rats following orthotopic skin grafting or injn., by various routes, of spleen cells or dissociated epidermal cells of BN rats. Immunity was assessed by estimating the proportion of viable epithelium in skin homografts of 6 days duration. Immunity induced by skin grafts persisted for over 200 days. Injn. of spleen cells induced less prolonged immunity, the duration depending on the dosage. The i.p. route was the most effective, i.v. and i.d. less so, and s.c. ineffective in the dosage employed. Dissociated epidermal cells were less effective than spleen cells.

J.R.Anderson

1190. EFFECT OF SPLENIC HOMOGENATES ON HOMOLOGOUS CELLS IN VITRO. W.Rosenau and H.D.Moon: Lab. Invest., 1962, 11, 1260-1265 (Pathol. Dept., California Univ. Med. Sch., San Francisco, Calif., U.S.A.) Highly inbred mice were sensitised to homologous cells by i.p. and intrasplenic injn. Splenic lymphocyte suspensions were added to homologous tissue culture cells, which they destroyed. At the same time the sensitised lymphocytes underwent cytolysis. Splenic homogenates of both control and sensitised mice were cytolytic to a similar degree.

A.M.Mackay

1191. PATTERN OF REJECTION IN RAT SKIN HOMOGRAFTS AND ITS RELATION TO VASCULAR NETWORK. B.H.Waksman: Lab. Invest., 1963, 12, 46-57 (Neurol. Res. Lab., Massachusetts Gen. Hosp., Boston, Mass., U.S.A.) Histol. studies of rat skin homografts showed the earliest change to be accumulation of mononuclear cells within and just without the venous channels of the graft. Later these cells destroyed epithelium and blood vessels. Vessel obstruction and destruction led to ischaemic death of the graft. The vascular pattern of grafted site affected the relative importance of different elements in the sequence of changes.

A.M.Mackay

1192. CHANGES IN PLASMA PROTEINS OF MICE DURING REJECTION OF SKIN HOMO- AND HETEROGRAFT. E.E.Peacock, jun. and W.P.Biggers: Proc. Soc. exp. Biol., N.Y., 1962, 111, 131-133 (Dept. Surg., Univ. North Carolina Sch. Med., Chapel Hill., N.C., U.S.) Application of a single hetero- or homograft caused an increase in α_2 globulin levels. Excision of graft before necrosis caused the level to return to normal

M.M.Shapland

1193. CROSS CIRCULATION IN NORMAL AND INTOXICATED PARABIONTS. R.T.Binhammer and J.K.Hull: Proc. Soc. exp. Biol., N.Y., 1962, 111, 134-139 (Dept. Anat., Univ. Cincinnati Coll. Med., Cincinnati, Ohio, U.S.A.) Up to 30 days after union there was no statistical difference in the r.b.c. and plasma transfer times of normal parabiotic rats. Intoxicated pairs exhibited a slowing of overall cross circulation with faster plasma transfer time than that for r.b.c. M.M.Shapland

1194. PASSIVE TRANSFER OF TRANSPLANTATION IMMUNITY. HI. INBRED GUINEA-PIGS. L.S.Najarian and J.D.Feldman: J. exp. Med., 1963, 117, 449-456 (Div. Expt. Path., Scripps Clin., La Jolla, Calif., U.S.A.) Transplantation immunity was passively transferred in inbred guinea-pigs with pHlthyridine-labelled lymphoid cells sensitised to homologous tissues. Autoradiographs of the homologous skin graft sites undergoing rejection contained few or no labelled cells. Passive transfer of transplantation immunity was also accomplished with sensitised cells enclosed in cell-impenetrable chambers. When tuberculin sensitivity was passively transferred labelled cells were readily found at the challenge site. The homograft reaction and delayed sensitivity of tuberculin type are dependent on different immunol. mechanisms within the same spp. H.E.Jones

1195. ACQUIRED TYPE OF REFRACTORINESS TO GRAFT-VERSUS-HOST REACTION IN ADULT Fi HYBRID MICE. M.Fox and J.Choward: Transplantation, 1963, 1, 2-14 (Dept. Surg. Sci., Univ. Med. Sch., Edinburgh, Scotland) Adult (C57BL x CBA) Fi hybrid mice inj. with adult mice spleen cells of either Parental strain showed depression of graft-versus-host reaction following injn. of spleen cells of the other parental strain. Injn. of C57BL cells into the hybrids also resulted in refractoriness following a 2nd injn. of C57BL cells. The spleens of C57BL -> (C57BL x CBA)Fi chimaeras were almost completely occupied by C57BL cells, which retained anti-host activity and probably reacted against subsequently inj. CBA cells. Only a small proportion of 'Plein cells of CBA -> (C57BL x CBA)Fi chimaeras were of CBA type, and these were considered likely to retain anti-host reactivity; subsequently inj. CBA cells incased in the spleen more than those of the 1st injn. and a graft-v-host reaction ensured. J.R.Anderson

1196. TRANSPLANTATION OF ANTIBODY PRODUCING CELLS OR THEIR PRECURSORS BY PARABIOSIS. L.W. McDonald: Life Sci., 1963, No.1, 36-43 (Cancer Res. Inst., New England Deaconess Hosp., Boston, Mass., U.S.A.) Expt. results are presented for the transplantation of an immunol. conditioned cell by parabiosis, as studied with rats. The transplantation of such $^{35}\text{Ce}^{\text{U}}$ appeared not to be related to X-irradiation of the immunised member of die pair. K.Jones

1197. T⁴rj, OF HISTOCOMPATIBILITY FOR ALLOGEN-EIC GRAFTS. M.Matsukura, A.L.Mery, J.LJVnjel and G.Mathieu: Transplantation, 1963, 1, 61-64 (Hop. Saint-Louis, Paris, France) This test, previously applied unsuccessfully between inbred strains of mice, Pec³?* to homografting an animal with skin from a proskin⁴ recipient and following graft rejection, with as "to". Prospective donors. The graft surviving longest considered likely to indicate the least incompatible Dr. direct evidence is advanced, from homograft and J. Upon rabbits, that the test may have some value, Possible use in homografting is discussed. J.R.Anderson

1198. LETHALITY OF A FORSSMAN ANTISERUM FOR MICE. L.S.Kind and J.Donch: Proc. Soc. exp. Biol., N.Y., 1962, 111, 241-242 (Dept. Microbiol., Univ. California Med. Center, San Francisco, Calif., U.S.A.) Mice could be killed by i.v. injn. of rabbit antiserum to boiled guinea-pig kidney. Evidence is presented that these deaths were due to Foissman Ab. M.M.Shapland
