

**During the year 2010, the plants discovered from India by the taxonomists of
BSI and other organizations**

NEW TO SCIENCE FROM INDIA

- 10 genera
- 128 species
- 3 subspecies
- 7 varieties
- 1 forma

NEW RECORDS FOR INDIA

- 2 genera
- 65 species and
- 3 subspecies
- 5 varieties

During the year 2010, the scientists of BSI published 1 new genus, 23 new species, and 5 new varieties of plants and discovered 2 genera, 60 species, 2 subspecies 5 varieties as new records for India, while the taxonomists from academia and other organizations published 9 new genera, 105 new species, 3 subspecies, 2 varieties and 1 forma of new plants and 5 species and 1 subspecies as new records for India.

SEED PLANTS

Seed plants (Spermatophytes) are the most evolved land plants on earth and are traditionally divided into flowering plants (or angiosperms) and gymnosperms.

In the present state of our knowledge India has about 17,724 species of angiosperms and 7 species of gymnosperms. Many more are yet to be identified and described.

The collated information presented here includes 02 new genera from North East India 58 new species (09 from Andaman & Nicobar Islands, 08 from Tamil Nadu, 07 from Uttarakhand, 05 from Kerala, from Arunachal Pradesh, 04 from Jammu & Kashmir, 03 from Maharashtra, 03 from Karnataka, 03 from Manipur, 01 each from Assam, Chattisgarh, Goa, Jharkhand, Nagaland, Orissa, species from Himachal Pradesh, 01 species from unknown locality in the country), 09 infra specific taxa (02 new subspecies, 06 new varieties, 01 new forma) and 23 new distributional

records from India.

FERNS AND FERN-ALLIES

Ferns and Fem-allies (Pteridophytes) live in a wide variety of habitats and often succeed in places where environmental factors discourage growth of flowering plants.

The Indian ferns account for about 12 per cent of the total fern species of the world.

In the present state of our knowledge India has about 1,261 species of ferns and Fem-allies. Many more are yet to be identified and described.

The collated information presented here includes 3 new species (one each from Uttrakhand, Meghalaya and Rajasthan) 22 species and 01 subspecies as new distributional record.

BRYOPHYTES

Bryophytes, the amphibians of the 'Plant Kingdom', and the second largest group of green plants next only to the angiosperms constitute a fascinating component of biodiversity and are widely spread in almost all climatic conditions. They are among the very few groups of plants found in Antarctica.

The Indian bryophytes account for about 15 per cent of the total Bryophyte species of the world. In the present state of our knowledge India has about 2,461 species of bryophytes. Many more are yet to be identified and described.

The collated information presented here includes 01 new genus from Kerala, Silent Valley National Park, Western Ghats 5 new species from India (01 species from Tamil Nadu, 01 from Karnataka, 01 from Kerala, 01 from Darjeeling District, West Bengal, 01 from Sikkim). 1 variety from Sikkim and 05 New distributional records.

LICHENS

Lichens are symbiotic association of a fungus with a photosynthetic partner usually a green alga or cyanobacterium. Lichens are widespread, however many species are sensitive to environmental disturbances and may be useful in assessing the effect of air pollution. Lichens have also been used in making dyes and perfumes as well as in traditional medicines.

The Indian lichens account for about 16 per cent of the total species of the world.

In the present state of our knowledge India has about 2,292 species of lichens. Many more are yet to be identified and described.

The collated information presented here includes 04 new species (01 Species from Karnataka, 01 from Tamil Nadu, 01 from West Bengal, 01 from Arunachal Pradesh) and 20 new distributional records of Lichens from India.

FUNGI

Fungi distributed worldwide, perform an essential role in nature by decomposing organic matter and are indispensable in nutrient cycling. They have long been used as source of food and in fermentation of various food products and now they are an important source of antibiotics. The Indian fungi account for about 20 per cent of the total species of the world.

In the present state of our knowledge India has about 14,613 species of fungi. Many more are yet to be identified and described.

The collated information presented here includes 01 new genus 25 new species from India (10 species from Kerala, 01 species from Maharashtra, 01 species from Karnataka, 03 species from Goa, 1 species from Himachal Pradesh, 03 species from Madhya Pradesh, 1 species from Sikkim, 03 species from un-known location) and 01 genus and 02 species as new distributional record for India.

ALGAE

Algae are large and diverse group of simple, typically autotrophic organisms from unicellular to multicellular forms. Though algae are becoming more and more open to exploitation worldwide, knowledge on algae is probably very elementary in India. The Indian algae account for about 18 per cent of the total species of the world.

In the present state of our knowledge India has about 7,184 species of algae. Many more are yet to be identified and described.

The collated information presented here includes 2 new species (01 from Madhya Pradesh and 01 from Sikkim).

MICROBES

Out of the estimated 50,000 - 3,000,000 species of bacteria and archaea, only about 8050 species have been described globally. About 937 species have been isolated from India. It is necessary to understand the diversity of bacteria and archaea present in a great variety of Indian environments, and understand their role in nature.

In the present state of our knowledge, Indian microbes represent about 11 % of the total species of the world. The collated information presented here includes 06 new genera 32 new species of microbes from India.
