

LOUDON'S HORTUS BRITANNICUS.

CATALOGUE

ALL THE PLANTS

INDIGENOUS, **CULTIVATED** IN, OR INTRODUCED TO

BRITAIN.

PART I.

THE LINNEAN ARRANGEMENT,

IN WHICH NEARLY 30,000 SPECIES ARE ENUMERATED :

THE SYSTEMATIC NAME AND AUTHORITY,
ACCENTUATION, **DERIVATION OF GENERIC NAMES**, LITERAL ENGLISH OF SPECIFIC NAMES,
SYNONYMS SYSTEMATIC AND ENGLISH OF BOTH GENERA AND SPECIES,

HABIT, HABITATION IN THE GARDEN, INDIGENOUS HABITATION,
POPULAR CHARACTER, *HEIGHT*, TIME OF FLOWERING, COLOUR, OF THE FLOWER,

Mode of Propagation, Soil,

NATIVE COUNTRY, YEAR OF INTRODUCTION, AND REFERENCE TO FIGURES: ^

PRECEDED BY

AN INTRODUCTION TO THE LINNEAN SYSTEM,

PART II.

THE JUSSIEUEAN ARRANGEMENT,

OF NEARLY 4,000 GENERA,

WITH

AN INTRODUCTION TO THE NATURAL SYSTEM, AND A GENERAL DESCRIPTION •
AND HISTORY OF EACH ORDER.

Second Edition with Additional Supplement to February, 1832.

EDITED BY J. C. LOUDON, F.L., H., G., & Z.S.

LONDON:

PRINTED FOR LONGMAN, REES, ORME, BROWN, GREEN, & LONGMAN,
PATERNOSTER-RROW.

PREFACE.

engravings; and this circumstance, together with the important one of all the spa names being literally translated, will, by giving the meaning of almost nil the terms use botanical description, in a great measure supersede **the** necessity of a grammar of bo to the young gardener. The literal translation of the specific names may be considered to a certain extent, teaching him the Latin **language**, and the etymologies of the **geri** names will give him the meaning of a number of Greek words. The species of **tor** genus, where numerous, are subdivided into sections and subsections, which arc st defined by **specific** characters; and so copious are the descriptive particulars after species, that we will venture to assert that the genus to which any plant belongs hi known, the specific name, in a majority of cases, may be discovered by this Catalogue with the aid of a. \$}xcw\$ PiaiUarum.

In the popular **descriptions** of the Natural Orders, the medicinal properties art mica] uses are slightly noticed; and the soil, propagation, and general treatment of " , different groups indicated; so that this part of the work, in our **opinion** the most **valui** p collection of botanical **facts that** h;is **ener** been brought into so small a space, may be J if) s}dered **an epitase** of the history, uses, and culture of the whole vegetable kingdom. ^T*\ ever has a sufficient theoretical and practical knowledge of plants and of vegetable cult! to] generalise on these subjects, will find in this Natural Arrangement the rudiment " to] ing that can be said or written on botany, gardening, and agriculture.

K numerations of those species which are adapted **for** culture in the, op en air in Bri or in corresponding climates ^wth an estimate of the quantity **of ground** which **each** o or tribe would occupy, are given in the Natural Arrangement, with a view to the f< ation of arboreturns or botanic flower-gardens; but, for an explanation of this iipro and of its value to the practical gardener, we must refer to the body of the work. (p. 19 The same proportionate enumerations will prove useful in contriving the size of the diffc drawers, divisions, boxes, volumes, or pages, required for preserving a hortus si ecu * collections of drawings, of engravings, of seeds, or of specimens of woods.

The *Supplement* to the Linnean Arrangement (p. 467.) includes all the **plants** iitroo¹, to Britain, and figured in English botanical works, up to February, 1830; and *Ada Supplements* in continuation are intended to be printed from time to time, and sold raUly, or done up with new impressions of the body of the work.

No further explanation appearing necessary in this Preface, it remains for the **Edit!** state that the Linnean Arrangement audits Supplement **are** entirely *Om* work of Mr. *GKC*. DON; the Natural **Anangement** is t>imiU-<l on Unit of Professor LISDLET, vitli • additions and shemiions rendered necessary by the plan of this Catalogue; and Dr. VILLK, the profound cryptogam ist, assisted in arranging the Cryptogamia. Those *vrha* acquainted with the present state of botany, and with the botanists of this country, will a that three gentlemen better adapted for cooperating in producing a Catalogue like that submitted to the public are not to be found. All that the Editor claims for himself is plan of the work, which he certainly considers much superior to any tiling that has **pre** it. The literal translation of the specific names, the derivations of the generic names indications of derivations, jnd, above all, the general descriptions of the Natural Or will, he confidently expects, be found not only of great value in (**Irtwifilining** the n of plants, and in recognising them at sight, both individually and in masses; but in assi lie botanical student and practical gardener to acquire some knowledge of their stmc physiology, analogies, affinities, properties, uses, and culture.

JJayswater, May, 1830.

J. C. L.

THE first *Additional Supplement*, enumerating all the new plants introduced to Britain J made known there, with the scientific changes in their names, *Sec*, up to February, 189 is now (August, 1832) published. In it, the genera are arranged alphabetically, for mj ready reference from the body of the work, and from the first *Supplement* (p. 467.); and i to save the necessity of a second index. All the genera in the body of the work, and the first *Supplement* (p. 467.), to which there are any species added, or in uliich any atu Uons are made, in the first *Additional Supplement* (p. .577. to p. 602.), arc marked »ii star (•); and the same will be done, as future *Additional Supplements* are **published**.

Whoever wishes to ascertain the additions and **improvement!** made **subsequently toj** last *Additional Supplement* may consult, the *Gardenia** Magazine*; iu which, under **article** which will be henceforth contained in *wverj* number, untulwi, "Floricultur.il • Botanical Notices of New Plants, and of Old Plants of Interest, **aopplimentary** to the l» Editions of the *Encydoptectia* of Plants, and of the *HOT/US Sritirmiaa*," will be foU the name of every plant newly introduced or originated, and of every recent improvement botanical nomenclature.

Accents.—In the first sixty-two pages the acute (´) is used to denote accented syllables merely: after p. 62. it is restrained to such vowels as are sounded short, while the grave (˘) is placed over those sounded long, as M&rtha, Mary. The systematic names are distinguished as classical, i. c. names applied to plants by the ancients, by the first letter being in Italic, as jfbies; as commemorative, by the terminating letter or letters being in Italic, as Banks/a; and as aboriginal, or of uncertain derivation, by the whole word being in Italic, as *JF/rua*. All the other names are formed, in almost every case, from the Greek, but sometimes from the Greek and Latin.

RULES FOR PRONOUNCING BOTANICAL NAMES.

BYLLABLER

IN classical words *there are as many syllables as there are vowels*; except when *u* with any other vowel follows *g, q,* or *«*, and when two vowels unite to form a diphthong. The diphthongs are *<e, ce, at, ei, oi, ui, au, ru,* and *on*. These seldom coalesce in final syllables. *oo, ee, ca,* and other combinations which never occur as diphthongs, in classical words, follow, in commemorative names, the pronunciation of their primitives, as *Tēdñi, Wōdsio*.

VOWELS.

In this work, with the exception of the first sixty-two pages of the Linnean Arrangement, the sounds of the accented vowels are indicated by the mark placed over each, the long sound by a grave accent (˘), the short by an acute (´); but, as in the abovementioned sixty-two pages the acute accent alone is employed, the following observations will be found useful in showing when the vowel is to be sounded long, and when short:—

Every accented penultimate vowel is pronounced long, when followed by a vowel or a single consonant, as *AchIWka tomentosa*; but it is shortened when followed by two consonants or a double one, as *S6rbus, Taxus*; except when the first consonant is a mute and the second a liquid, as *AHWus*.

Every accented antepenultimate vowel, except *u*, is pronounced short, as *Jelleborus, Jftimulus*; but when succeeded by a single consonant, followed by *e* or *i* and another vowel, it is lengthened, as *Stellaria*; except *l*, which is short, as *7lia*.

A unaccented, ending a word, is pronounced like the interjection *ah*, as *SMeta (ah)*.

£ final, with or without a consonant preceding, always forms a distinct syllable, as *Sfero, Aidē*; also when the vowel is followed by a final consonant as *Tr̄thoma-nes, not Tricho-mane**.

/ unaccented, if final, sounds as if written *eye*, as *Splca vēti (eye)*; but, when it ends a syllable not final, it has the sound of *e*, as *A/cspilus (Mespcus), Smith// (Smithē-eye)*.

Y is subject to the same rules as *i*.

The diphthongs *ee* and *a?* conform to the rules *fore*; *ei* is generally pronounced like *eye*; the other diphthongs have the common English sounds.

In addition to the primary accent, every word of more than three syllables contains a *secondary accent*, which is regulated by the same rules. The secondary accent must always be at least two syllables before the primary accent, as in *Chēlidbnum*; for its place the ear is a sufficient guide, and even were it entirely omitted, still, however inharmonious, the pronunciation would not be incorrect.

CONSONANTS.

- *C* and *a* are hard before *a, 0,* and *«*, as *Cōrnus, Calium*; soft before *e, l,* and *y*, as *Cetraria, Citrus*.

T s affd *c*, before *ia, ie, ii, to, hi,* and *eu*, when preceded by the accent, change their sounds, *t* and *c* into *sh* as *bletuz, ficia*; and *s* into *zh*, as *Bfas/a*; but, when the accent is on the first diphthongal vowel, the pre-cellent consonant preserves its sound, as *aurantlacum*.

Ch before a vowel, is pronounced like *k*, as *Chelulonium (kel), C6lchicum [kolkekum]*; but in commemorative names it follows their primitives, as *Richardsnto*, in which the *ch* is soft.

Cm, en, ct, em, en, mn, tm, ps, pt, and other uncombinable consonants, when they begin a word, are pronounced with the first letter mute, as *Ptens (teris), t'nlcus (tukus), Gmellna (melina), 6'ndia (nidia)*; in the middle of a word they separate as in English, as *lap-sana, L'ra-na*.

Ph, followed by a mute, is not sounded; but, followed by a vowel or a liquid, sounds like */*, as *'hfeun (ficum)*.

Sch sounds like *sk*, as *&hoe'nus (skenus)*: in *//* and *zm* both letters are heard.

S, at the end of a word, has its pure hissing sound, as *Dactylis j* except when preceded by *e, r,* or *n*, when it sounds like *%*, as *Ribes (ex)*.

X, at the beginning of a word, sounds like *2*, as *Xanthium*; in any other situation it retains its own sound, as *ftxus, Tfenarix*. (*Gardener's Magazine*, vol. v. p. 333.)

J. *Jussicu.* A celebrated French systematic botanist.
Joe. *Jacquin.* An Austrian traveller in South America, and botanist
Jack. *Jackson.* An English botanist
Junghans. A botanist of Halle.

- Jon.** *Jones.* An accomplished writer upon Indian matters.
- Katn.** *Kamijfer.* A traveller in Japan.
Not known.
Kitaibel. A Hungarian botanist
KnighVs Protocock&B.
- Koel.** *Koch.* A professor at Erlang.
Joeler. A writer on German and French grasses.
- Kblle.** *Kofle.* A botanist of Erlang.
- Kon.** *Kbnig.* Several German naturalists of this name.
- Kth.** *Kunth.* A Prussian botanist.
- Kunxe.** *Kunxe.* A German crytogamic botanist
Linnaus. The celebrated Swedish reformer of natural history.
- Lab.** *Labillardiere* A French botanist
- Lag.** *Lagasca.* A Spanish botanist and professor.
- Lai.** *La Lave.* A Mexican botanist
- Lam.** *Lamarck.* A French botanist
- Lamb.** *A. R. Lambert,* V. P. L. S. The most liberal botanist in England. Nothing in botany can well be completed without his assistance.
- Lan.** *Langsdorff.* A Russian botanist
- Lap.** *La Peyrouse.* A French writer upon the plants of the Pyrenees.
- Lar.** *LMToche.* A French botanist.
- Law.** *Lawrence* (Miss). An English flower-painter.
Laxmann. A German writer on Siberian plants.
Leconte. An American botanist
- Lee.** *Lechenault.* A French botanist.
- Lech.** *Ledebour.* A botanist and traveller in Siberia.
- Led.** *Lee.* A nurseryman at Hammersmith.
- Leers.** *Leers.* A German botanist
- Leh.** *Lchmann.* A German botanist and professor at Hamburg.
- Lent.** *Lejeune.* A French botanist
Leman. A botanist mentioned in Dec. Fl. Franc.
- L*** *Lcepechin.* A Russian botanist
- Lepel.** *Lepelletier.* A French botanist
- Lewis.** *Lewis.* An American traveller.
- Leys.** *Leysser.* A botanist of Halle.
- L.JU.** *Linnaus the younger.* The son of the great Linnaus.
- Lich.** *Lichtenstein.* A German botanist and professor.
- Light.** *Lighthouse.* A writer upon the Scottish
- HJeb.** *Liljeblad.* A professor at Upsal.
- Lnd.** *Lindern.* A French botanist
- Lima.** *Lindley.* An English botanist, and professor in London.
Livingston. A Scotch botanist.
Link. A Prussian botanist
Link and Otto. Prussian botanists.
Lobel An old writer upon plants.
- Lo. c.** *Loddiges* Catalogue.* Catalogue of the plants cultivated in Loddiges' nursery at Hackney.
- Lock.** *Lockhart.* Superintendant of the Trinidad botanical garden.
- Lod.** *Loddiges.* English nurserymen and botanists.
Loeffling. A Swedish botanist and traveller.
- Ul** *Loiseleur Deslongchamps.* A French botanist
- Lon.** *Londes.* A botanist of Gottingen.
- Lo.s.** *Loddiges* Supplement.*
- Lou.** *Loureiro.* A Portuguese traveller in Cochin China,
- London.** *J. C. Loudon.* Auth. of various agricultural, horticultural, and botanical works.
Linnean Society's Transactions.
Lumnitxer. A Gorman botanist
- Lum.** *Lunan.* A writer on Jamaica plants.
- Lunan.** *Lyell.* A Scotch botanist
- Lyell.** *Lyngbye.* A Danish writer upon cryptogamic matters.
- Lyng.** *Lyon.* A collector of American plants, *Ints c* *atalogue,* *Cat* *logue,* *of the* *at Clapton.*
Mocino and Sess4. Mexican botanists.
Maregraav. A traveller in Brazil.
- Ma. C.** *Marshall.* A writer on American trees.
- pt*5,** *Martius.* A Bavarian botanist, and traveller in Brazil.
- Mare.** *Masson.* A collector of plants at the Cape, and elsewhere.
- Marsh.**
- Mart.**
- Mas.**
- Mayer.** Several German botanists of this name.
- Med.** *Medicus.* A German botanist of the last century.
- Menz.** *Menxies.* A Scotch botanist, and traveller round the world with Vancouver.
- Merat.** *Merat.* A French botanist.
- Mert.** *Mertens.* A French Botanist
- Mey.** *Meyer.* A German botanist
- Mich.** *Micheli.* A Florentine botanist
- Mien.** *Miers.* A South American collector.
- Mik.** *Mi/can,* A German writer on Brazilian plants.
- Mil.** *Miller.* An English gardener and botanist
- Mir.** *Mirbel.* A French physiological botanist
- Moc.** *Mocino.* A Mexican botanist
- Moen.** *Moench.* A German botanist
- Mohr.** *Mohr.* A German cryptogamic writer.
- Mol.** *Molina.* An Italian writer upon the natural history of Chile.
- Man.** *Montin.* A Swedish botanist
- Mor.** *Morison.* An old writer on plants.
- Mord.** *Mordant de Launy.* A French botanist
- Moret.** *Moretti.* An Italian botanist.
- Moug.** *Mougeot.* A German cryptogamic botanist.
- Muhl.** *Muhlenberg.* A North American botanist
- Mur.** *Murray.* A German botanist
Mussin-Puschkin. A Russian botanist and traveller in Caucasus.
- Mus.** *Mutis.* A Spanish botanist, resident in New Grenada.
- Mutis.** *Michaux.* A French botanist, and traveller in North America.
- Mx.** *Nees and Martius.* German botanists.
- N.SfM.** *Necker.* A German writer upon botanical affairs.
- Neck.** *Nets v. Escnbeck.* A German botanist
- Kees.** *Nestler.* A botanist of Strasburgh.
- Nest.** *Niven.* Once a collector of plants at the Cape.
- Niv.** *Nocca.* A professor of Pavia.
- Noc.** *Noisette.* A French nurseryman.
- Nois.** *Noronha.* A Spanish botanist who visited Madagascar.
- Nor.** *Nuttali.* A North American botanist
- Nut.** *Oeder.* A Danish botanist.
- Oed.** *Olivier.* A French botanist and traveller in Persia.
- Oliv.** *Ortega,* A Spanish botanist
- Or.** *Othh.* A French writer in Decandolle's Prodrumus.
- Othh.** *Otto.* A Prussian gardener.
- Pat.** *Pallas.* A Russian traveller and naturalist
- Parm.** *Parmentier.* A French nurseryman.
- Patn.** *Patnn.* A Russian traveller.
- Perp.** *Perpent.* A female Italian botanist
- Pers.** *Persoon.* A French botanist
- Pet.** *Petagna.* A Neajwlitan botanist
- Ph.** *Pursh.* A Prussian botanist, and traveller in North America.
- Plu.** *Plumier.* A French botanist, and traveller in the West Indies.
- Pohl.** *Pohl.* A German botanist
- Poir.** *Poiret.* A French botanical compiler.
- Pott.** *Poiteau.* A French botanist and draughtsman.
- Pot.** *Pollini.* A professor at Verona.
- Poll.** *Pollich.* A German writer on the plants of the Palatinate.
- Pop.** *Poppig.* A German botanist
- Pou.** *Pourret.* A French botanist. -
- Presl.** *Presl.* A Bohemian botanist
- Bad.** *Raddi.* An Italian cryptogamic botanist, and traveller in Brazil.
- Rani.** *Raeschel.* A German botanist
- Raft.** *Rafim'sque Schnialz.* A modern writer upon botanical matters.
- Ram.** *Ramand.* A French botanist
- R. E P.** *Ruiz and Pavon.* Spanish botanists, and travellers in Peru and Chile.
- if. %S.** *Rbmer and Schultes.* German editors of Linnaus's Species Plantarum.
- Rau.** *Rau.* A German botanist
- R.Br.** *Robert Brown.* A distinguished English botanist, and traveller in New Holland.
- Rchb.** *Reichenbach.* A German botanist
- Red.** *Redout*.* A French botanical draughtsman.
- Redout.** *Redowski.* A Russian botanical collector
- Reich.** *Reichard.* A botanist of Frankfort
- Reinw.** *Reinwardt.* A professor at Leyden.
- Ret.** *^clhan.* A writer upon the Flora of Cambridgeshire.
- Req.** *Requjen.* A French botanist
- Retx.** *Rctxius.* A German botanist

- Reyn.* *Reynier.* A botanist of Lausanne.
Rh. *Rhède.* Author of *Hortus Malabaricuft.*
Rich. *Richard.* A French botanist.
Risso. *Risso.* An Italian writer upon Oranges
Riv. *Rivinus.* A German botanist.
R. It. *Redout&s Liliace'es.*
Rob. *Robson.* An English botanist
Roch. *RocheL.* Superintendant of the garden at Pest.
Roem. *Roemer.* A German botanist
Rohde. *Rohde.* A botanist of Bremen.
Rol. *Rolander.* A Swedish botanist
Roll. *Rollinson.* A nurseryman near London.
Rose. *Roscoe.* An English botanist, and writer upon Scitammee.
Roth. *Roth.* A German botanical writer.
Rox. *Roxburgh.* An Indian botanist
Rtb. *Rottboll.* A Danish botanist
Rtl. *Rattier.* A German missionary.
Rud. *Rudge.* An English writer upon botanical subjects.
Rudol. *Rudolph.* A German botanist
Rum. *Rumph'ns.* Author of *Herbarium Am. boinensis.*
Rus. *Russel.* A botanist of Aleppo.
Sab. Sabine. An English amateur of botany.
Sal. *Salisbury.* An English botanist
Saint. *The Prince of Salm Dyck.* A noble German amateur.
S. \$ TV. *Schroder and JVetttiland.* German botanists.
Santi. *Santi.* An Italian botanist
SavL. An Italian botanist
Savig. *Savigny.* A French botanist
Schaff. *Schriffjer.* A German writer upon F6ngi.
Schk. *Schkuhr.* A German writer upon grasses and ferns.
Schl. *Schleichcr.* A Swiss plant collector.
Schlee. *Schlechtendahl.* A German botanist
Schmidt. *Schmidt.* A Bohemian botanist
Schott. *Schott.* A traveller in Brazil.
Schous. *Schousboe.* A writer upon the Flora of Morocco.
Sehr. *Schroder.* A German botanist
Schrank. *Schrank.* A Bavarian botanist
Schreb. *Schreber.* A German botanist
Schu. *Schubler.* A professor at Tubingen.
Schult. *Schultes.* A Bavarian botanist
Schulx. *Schiltz.* A German botanist.
Schum. *Schumacher.* A Danish botanist
Schw. *Schweigger.* A German botanist, author of *Flora Erlangensis.*
Schwa. *Schweegrichen.* A German cryptogamic botanist
Schwein. *Schweinitz.* An American botanist
Sco. *Scopoli.* An Italian botanist
Seb. *Sebastiani.* An Italian botanist.
Sessi. *Sessi.* A Mexican botanist
Sib. *Sibthorp.* An English botanist, and traveller in Greece.
Sirb. *Sieber.* A botanical collector.
Sims. *Sims.* An English garden botanist
Sm. *Sir J. E. Smith.* An English botanist, and purchaser of the Linnæan herbarium.
Silt. *Sinclair.* Nurseryman at New Cross.
Sol. *Solander.* A Swedish botanist, and companion of Sir Joseph Banks in Cook's voyage round the world.
Sole. *Sole.* A writer on mints.
Son. *Sonnerat.* A French botanist, and traveller.
Sow. *Sowerby.* An English botanical draughtsman.
Sparmann. A Swedish travelling botanist.
De Spin. A botanist of Turin.
Sprengel. A German botanist
Stackhouse. An English botanist
Slechmann. A writer on *Artemisia.*
Stephan. A Russian botanist
Sternberg. A noble German botanist
Steudef. A German botanist
Steven. A Russian botanist
Sturm. A German botanical draughtsman.
Stier. A Swiss botanist.
Swert. *Swertius.* An old writer on plants.
Swt. *Sweet.* An English botanist
Swx. *Swartx.* A Swedish botanist, and traveller in the West Indies.
Symes. *Symes.* A writer on English plants.
Ten. *Tenore.* A Neapolitan botanist
Thib. *Thibaud de Chanvalon.* A French botanist
Thomas. A Swiss collector of plants.
Thore. A French botanist
Thory. A French botanist
Thou. *Du Petit Thouars.* A French botanist, and traveller in Madagascar.
Thouin. *Thouin.* A French botanist
Thuil. *Thuillier.* A French botanist
Thun. *Thunberg.* A Swedish botanical traveller.
Timm. *Timm.* A German botanist
Tineo. A professor at Palermo.
Tode. *Tode.* A German writer on *Fungi*
Torrey. *Torrey.* An American botanist
Tou. *Tournefort.* An old French botanist, and traveller in Greece and Asia Minor.
Trot. *Trattinik.* A botanist of Vienna
Trent. *Trentepohl.* A German botanist
Trev. *Treviranus.* A German botanist
Trin. *Trinius.* A writer on grasses.
Turn. *Dawson Turner.* An English writer on sea weeds.
Turp. *Turp.* A French botanist and draughtsman.
Turra. *Turra.* An Italian botanist
Tus. *Tussac.* A French writer on the Flora of the Antilles.
Uc. *Ucria.* A botanist of Palermo.
Urv. *D'Urville.* A Captain in the French navy.
Vail. *Vaillant.* A French botanist and traveller.
Van. *Vandelli.* A Portuguese botanist.
Ven. *Ventenat.* A French botanist
Vest. *Vest.* An Styrian botanist
Vig. *Vigvier.* A writer upon Poppies.
Vil. *Villars.* A French botanist
Vit. *Vitmann.* A German botanist
Viv. *Viviani.* An Italian botanist
W. *Willdenow.* A German botanist
Wahl. *Wahlenberg.* A Swedish botanist
Wai. *Wallich.* Superintendant of the botanical garden at Calcutta.
Wald. *Waldstein.* A noble German patron of botany.
Wallr. *Wallroth.* A German botanist
Walt. *Walter.* A writer on the Flora of Carolina.
Wan. *Wangenheim.* A German botanist
 *Waldstein and Kitaibel.* Authors of the Flora of Hungary.
 *Weber and Mohr.* German botanists.
 *Wat.* *Watson.* An English writer upon trees and shrubs.
Web. *Weber.* A German cryptogamist
WeideL. *WeideL.* A German botanist.
Wethe. *Wethe.* A German writer on *Rbb*
Wein. *Weinmann.* A German gardener, superintendant of one the royal gardens in Russia.
Weis. *Weis.* A German botanist
W. en. *Willdenow's Enumeration of the Plants in the Berlin Garden.*
West. *West.* An English botanist
Wibel. *Wibel.* A German botanist
Wig. *Wiggers.* A German botanist
Wik. *Wikstrom.* A Swedish botanist
With. *Withering.* An English botanist
Wnl. *Hendland.* A German garden botanist.
Woods. *Woods.* An English writer on roses.
Woodw. *Woodward.* An English botanist.
Worm. *WonnshioId.* A Norwegian botanist
Wre. *Wredow.* A German divine and botanist
Wrede. *Wrede.* A German botanist.
WuL. *Wulfen.* A German botanist
Y. *Young.* A writer in the Linnean Transactions.
Zea. *Zea.* A Spanish botanist
Zey. *Zeyher.* A German gardener.
Zuc. *Zuccagn.* Superintendant of the botanical garden at Florence.

METHODS OF NAMING AND NUMBERING PLANTS.

In gardens or garden scenery where accuracy and intelligence are aimed at, all the less common plants, ligneous and herbaceous and the varieties of fruits, should have their names affixed to them; with the addition of their native country, year of introduction if exotic, and natural order. Larch, oak, and yew are the most desirable timbers for forming tallies in which to write or paint these names. The cheapest and best description of cast-iron tally is that of Mr. Stuart Murray (Caret. Mag. vol. Hi. p. 29.), the next best then used in the garden of the Horticultural Society. (Gard. Mag, vol. vi. p. 407.) For trees, shrubs, and large plants, the names may be painted on the ends of bricks, as in Mr. Todd's arbutus or, what is better, there are incised bricks in imitation of Stuart Murray's tally, and earthenware tallies with joints, and with the names impressed by types on the clay before burning, manufactured by Patke of Tonstall near Newcastle under Lyne, in Lancashire of Clay Hills near hmdtma. [Gard. Mag. vol. vi, p. 399.]

Where plants cannot be named, they should have number affixed to them referring to the catalogue and that the names may be painted on wood, iron, or earthenware tallies. But as the common numbers require the use of the pen or pencil, gardeners have devised signs for them which may be readily cut with the knife on sticks.

SETOJJS MODE OR CUTTING NUMBERING ON STICKS

Is much the simplest, and at the same time the most comprehensive, The signs made use of are as under.

The advantages of these marks over those in common use are, that they are more easily made by simple distinct cuts; and that no number, however high, requires more marks than would require figures written with a pen. The only way in which the memory is apt to misgive, in this scheme, is by confounding / and \, si ami K, A and y, with each other, and a child would confound the figures G and 9; but this slight inconvenience will be remedied by the following U, which may be easily brought into the mind. Let us recollect Out, in writing, we naturally draw a stroke at top, to the at bottom, thus /, and not in the opposite direction, thus \: now, in all the above numbers which differ from each other in the direction of the diagonal line, that which is in the direction usual in writing precedes the other, thus / \ sy N /, \; the other two, 3 6 1 8 9

A and V will not be confounded, on recollecting that V is the usual numeral letter for five.

As an example of application, suppose we take species 341, variety 8, the tally cut thus, —

The long cut (—) **between** the number of the species and the number of the variety is merely to separate the one from the other, and is to be considered as the sign of separation. By the use of this **tign several** numbers may be cut on one stick; it is a fixed rule that the number shall always read from the root or sharpened end of the tally, because it is necessary for the operator to hold that end in his hand in cutting the marks. Names written on tallies, on the contrary, should always read from the top, by which means the letters are kept at the greatest practicable distance from the soil.

DRYING PLANTS AND FORMING A HERBARIUM.

THE best mode for gardeners, and such as have little spare time to dry specimens of plants, is to gather them when perfectly free from exterior moisture, place them between paper, and press them with bag* of hot sand. In this way they dry of their natural color in a few hours. (*Mag. Nat. Hist.* vol. i, p. 196.) Or they may be dried in sand (*Ibid.* vol. iii, p. 459.)

To fill up a space that would otherwise remain an unseemly blank, we shall likewise observe, that every **gardener** ought to dry plants and form them into a herbarium. The **herbarium** may be a folio volume of stout thick paper, white, if he can afford it; if not, brown; allowing in binding the thickness of it leaf for every page, in order that, when filled with specimens, it may shut close and preserve its form. Mr **Toward**, who has formed one of the handsomest gardener's herbariums we have any where seen, in four thick folio volumes, uses cartridge paper; **lining** is the back of each leaf a leaf of brown blotting paper, and round the margin of both surfaces of the double leaf so formed strips of cartridge paper. These strips rather more than **compensate** for the thickness of the dried specimens; so that when the leaves are bound up, their edges cut, and the books shut close, the external air is excluded, and the appearance as neat as that of any printed volume. (*Gard. Mag.* vol. iv. p. 4:16.) The **specimens**, if dried in sand, or between loose leaves of paper in any old book, may be fixed to the cartridge side of the leaves of the herbarium book, according to any arrangement which may be preferred,

DRAWING PLANTS, FLOWERS, FRUITS, &c

EVERY gardener ought also to be able to draw **plants**; and this he may acquire himself by copying with a pen or pencil, without the aid of colors (for all the essential objects of drawings may be effected by lines), the outlines of the ribs, veins, and other inner lines of the different parts of the dried **specimens** as they lie flat before him on the paper. Having practised this for some time, he may then draw plants, flowers, and fruits from nature beginning by washing one side of a pane of glass over with gum, holding that when dry between his eye and the plant or other object to be drawn, and then tracing the object with the point of a nail in the gum, or on it with the point of a black pencil. (*Gard. Mag.* vol. vi. p. 205.) The outline of hard fruits, such as the apple and pear, may be correctly taken by dividing them into **two parts**, and that of soft fruits if not too ripe. (*Gard. Mag.* vol. iv. p. 230.) Every gardener ought also to be able to draw landscapes, figures, and animals, all in the manner of garden pictures, and pictures of gardens and maps of estates. This he may acquire by **copying** the various engravings in our *Encyclopedia of Gardening and Agriculture*; and for figures, and landscape-scenery more particularly, by copying the elementary plate (Pl. I. sold by itself, under the title of *Elementary Detail for Pictorial Map-drawing*, for 3s. 6d.) of our *Illustrations of Landscape-Painting and Garden Architecture*. He may afterward draw figures and landscapes from nature, first through a gummed pane of glass, and next on paper; and finally, measure and draw from nature implements and buildings, and map gardens, parks, and farms.

On correctly applying, pronouncing, and spelling the names of plants; on drawing plans neatly, and being able to produce off hand a sketch of any thing; on being able to measure and value all kinds of country work; above all, on good penmanship, spelling, and writing a correct and intelligent letter, much of the success in life of a gardener depends. Without possessing these qualities, by a regular course of education at school, or determining to labour hard at self-instruction till he has possessed them, no young man in the present improving age should attempt the profession.

HORTUS BRITANNICUS.

PART I.

LINNEAN ARRANGEMENT.

of plants. For this purpose some one organ, common to plants in general, is fixed on: and, according to certain condition* in which this organ is found, individual species are referred to their places in the system, as words, by their Initial letters, are referred to their places in U alphabetical dictionary.

It) toe proffrcu of artificial syiicms dille/nt organs have been filed on by diilinul Waniit*; but those which have been most exteriilv,ly employee) are tie *eonBai* by Tonrrncfort, and the stamens and pistil* by Unnsiu. The »y«tem of Ionrrndbrt >:* been i RG-HI deal employed in France, and may be comldeied as the artificial system or that country; that of Lfimirus has been empWed in most other countries, and is justly esteemed by far the most perfect artificial syiicm which has hitherto been produced. It b, therefore, adopted In this work.

wervw, " will soon parcel re that it is to be understood merely as a dictionary, to make nut any plant that jnay fall in hia WHY." (*Gram, of Bot.*) " I f we examine," says Decandol 1 e," the jirti licid systems which hava Been hitherto deviged, we shall find the n«*t celebratcil Of them, that which was proposed by Linnaus, to po»»e*s a dclleied superiority over all others, not only because it is consistently derived from one siuipI* ejiple, but also because the author of it, by means of n new nomenclature, has given to his terms the gi «l>tinctn«s of meaninK." (*Elements of tiu Philos. of I'inats, by UcaimhUc <In«t Sprncgel*) V
11 of subsequent advance* in science may enable k>tamMs to dispense with the Liimenu system altogether, it "not for ui to afllnn; but in the mean time nothing can be inure certain than that the Linnean system is the nest leading arrangement for such a work as the present, in Uie existing »tale of botanical knowledge in on tain. *

^According to the Linnean »\sIom all plant* are furnishi d with flower*, either conspicuous OT loottupteuoui. ine plant!! with contpkoual flowers are arranged according to the number and position of illicir stamens and P"TM*; those with inconspicuoui Bowen are arranged awctnliiig to I lie situation of the flowers on the plant, or according to other circutit>tanL-c* in the plnnt itMIC

To discover the u.niic ol ;> plant by the Linnean system, therefore, all that it iry for a beginner is to possess a specimen of It in flower, and to benblc to know it! different parts by the m n n given them by botanists. To d&Korer the CIOM, order, ami genus of a plant, it is only necessary to be able to distinguish and name the (liff'eretit part* of the (lower. TheM [Kirts are: the cabx or cup [*J'ig. 1. a*), which in that leaf, or thane leaves, by which the flower is usually enclosed when in a hud, ami which, when the flower Is expamtwl, appear under it. The corolla (*corona*, a crown) is the colored leaf, oi leaves, of a flower [*fig. 1. It*]. Ike Btamt-n (or flwt principle of any thing) is the thread-like proews, or processes, Imme. ili.itcly within the leaves or the corolUi (*J'ig. 2.*): It cotwlfis of two parts, the Slfment of umad /a) and the anther /> i ibis nniher contains what is called lliejtollen, or " IviiiK meal c\ In the centre ill the flower is the pistil '*J'xg-SJ*' it consists of thnM parts, the y,t-t nu of the fruii and ttic »ti^nia fir summit (c), which cruwn* Hie style, and is dettiititll tu receive the fructifying pollen.

The pistil and utamen are the es^ntial parts of a flower. The corolla or the calyx may be "antinK, »nd jret the Sower will I*-, tfrnioid perfect, became the absence of those parts is no obstaclu to rujHinlurtiilli. Kvcn the Itjl* ;uid the li.liuiciii may be absent without preventing the "tDntiori or riptinik of the fruit; and there am many (lowers vrhloh tuncr the author sitting olo«» " the corolla, .Vc, without a IILLIUTII, and the Itigma to the germen without a style; but the "the germen. u» i, th ma are essential.

The seed is contained in the pericarp, or seed-vessel, which is the germen when j^own to maturly. The name of the seed-vi... VLiirism-rnrrling totu form, substance, &c.; hut the word pericarp (g"'"> about, *karpon*, a fruit; is apntteahle (o all its varit T : the base ur medium lvliieli connects the other parts of the fructification. (*Magimiu- <rf Nnlurat JJtllory, vol. I. p. fisa*)

The degree of knowledge conveyed bj the i<>lowing Table, init the precedinji observations, will enable a "alnncr to discover at least the das* and ordex of any plant wbleh he may find in flower.

The author has been assisted in the preparation of this work by the following gentlemen, who have been consulted in the selection of the names of the plants, and in the arrangement of the system: Mr. J. Smith, Mr. J. Jones, Mr. J. White, Mr. J. Black, Mr. J. Green, Mr. J. Brown, Mr. J. Grey, Mr. J. Gold, Mr. J. Silver, Mr. J. Lead, Mr. J. Iron, Mr. J. Copper, Mr. J. Tin, Mr. J. Zinc, Mr. J. 2653. SAGITTA*RIA L. AIIROW-HKAD. (Sagitta, arrow; form of lvs of some species.) Alistriace*. 15.-2L

I. SAGITTATIFOLIE. — Leaves sagittate or hastate.

Table with columns for species names (e.g., latifolia W., Doni's Swt, obtusifolia L.), leaf characteristics (e.g., broad-leaved, obtuse), and geographical data (e.g., England rivers, N. Amer. 1819, Nepal 1820).

II. ANGUSTIFOLIE. — Leaves subcordate, lanceolate, or linear.

Table with columns for species names (e.g., natans Mx., falcata Ph., acutifolia L., angustifolia B. R.), leaf characteristics (e.g., lance-leaved, rigid-leaved, floating), and geographical data (e.g., W. Indies 1787, N. Amer. 1806, Carolina 1812).

III. TRIBIDA. — Leaves trifid or triparted.

Table with columns for species names (Chinese), leaf characteristics (Chinese), and geographical data (China 1812).

2654. BEGO^NX L. BEGONIA. (Michael Begon, a French promoter of botany.) Begoniaceae. 27.-47.

I. INEQUALICORDATAE. — Leaves unequally cordate.

Table with columns for species names (e.g., njtidatf.*, ch6toma Jac., discolor H.K., kidney-shaped, long-leaved, tuberos, shining, doubtful, two-winged, simulatc, painted, few-flowered, spreading, waved, sweet-scented, small hairy, two-rowed), leaf characteristics, and geographical data (e.g., Jamaica 1777, Caraccas 1800, China 1804, Brazil 1818, W. Indies 1793, Amboyna 1810).

II. SEMICORDATAE. — Leaves semicordate.

Table with columns for species names (e.g., acuminata Dry., acutifolia Jac., humile, neat, shaggy-leaved, sweet-scented, Elm-leaved, silver-spotted), leaf characteristics, and geographical data (e.g., Jamaica 1790, W. Indies 1818, W. Indies 1788, Brazil 182a, W. Indies 1789, W. Indies 1816, S. Amer. 1822, Brazil 1819).

III. OXITMIFBUS. — Leaves roundish^ ovate, or palmate.

Table with columns for species names (e.g., scandens Swz., Kibra dwf., palmate D. Don), leaf characteristics (e.g., climbing, palmate), and geographical data (e.g., Guiana 1822, Nepal 1819).

Table with columns for species names (e.g., POTERION L., agrimony-lyd, sanguisorba L., polygamous, sweet hybrid, tailed shrubby, prickly shrubby), leaf characteristics, and geographical data (e.g., Poterion, a cup; infused in cooling drinks., England ch.hil., Hungary 1803, France 1683, Canaries 1779, Levant 1595).

Table with columns for species names (e.g., AMIRO^LA Pers., nitida Pers., Lagunca nitida R.Sfp.), leaf characteristics, and geographical data (Peru 1824).

Table with columns for species names (e.g., ACIDO^TON Swz., stinging), leaf characteristics, and geographical data (Jamaica 179a).

Table with columns for species names (e.g., TOELY^GONOM L., Cynocrambe L.), leaf characteristics, and geographical data (S. Europe 1710).

Table with columns for species names (e.g., CASTA^NEA TOU, vesca Gae.), leaf characteristics, and geographical data (England woods).

Table with columns for species names (e.g., asplenifolia, hulis aurcis, cnsis Spr., pumila Mx.), leaf characteristics (e.g., intermediate, Asplenium-lyd, golden-leaved, American, dwarf), and geographical data (Europe, America, China, N. Amer. 1699).

Table with columns for species names (e.g., (^STRYA Mx., vulgaris IV., Cfrpinus O^stryaL., virginica W.), leaf characteristics (e.g., HOP-HORNBEAM, common, Virginian), and geographical data (Italy 1724, N. Amer. 1622).

Table with columns for species names (e.g., (^RPINUS L., 2 inclsa, 3 variegata, 4 ^uercifolia Desf., americana Mx., * orientall* Law.), leaf characteristics (e.g., HORNBEAM, Birch, common, cut-leaved, variegated, Oak-leaved, American, Eastern), and geographical data (Britain woods, Britain gard., Europe, N. Amer. 1812, Levant 1739).

CLASS XXIII. ORDER 1.

POLYGAMIA MONGACIA.

2833- rNGA Plu. INGA. (A South American name adopted by Marcgraff.) LegMimbea. 25.—113.

I. VE^R& — Leaves simply pinnate ; leaflets large, 2 to 9 pairs, upper ones larger ; unarmed.

i. PTER6PODJ5. — Common petioles evidently winged.

Table listing botanical specimens with columns for species names (e.g., Quassia-leaved, white, Feuille's), leaflet counts (e.g., 20, 8, 16), and geographical locations (e.g., Brazil, Guiana, Cayenne, Lima, Caraccas, Para, Brazil, Cumana, W. Indies, Brazil).

ii. AprER6PGDiB. — Common petioles scarcely winged or perfectly naked,

** HYMEN JSODEJL — Leaves conjugately pinnate, scarcely bipinnate ; pinna one-paired, bearing two, three, or many leaflets ; spiny or unarmed.

i. BIGE'MINA. — Leaves bigeminate ; leaflets ntenly one pair in each pinna.

Table listing botanical specimens with columns for species names (e.g., microphylla W., clAlcis W., cat's claw, honey-bearing, fetid), leaflet counts (e.g., 16, 20, 20, 20, 20), and geographical locations (e.g., Cumana, E. Indies, W. Indies, Arabia, AV. Indies).

—Leaves conjugately pinnate; plnnje bearing two or many pairs of leaflets,

Table listing botanical specimens with columns for species names (e.g., round-podded ff, purple, wood-fruited, two-paired), leaflet counts (e.g., 10, 60, 20), and geographical locations (e.g., W. Indies, E. Indies, Malabar).

III. SAMVNUJE. — Leaves dupkalely pinnate.

Table listing botanical specimens with columns for species names (e.g., Zygia, tufted), leaflet counts (e.g., 20, 30), and geographical locations (e.g., Jamaica, Mexico).

Table listing botanical specimens with columns for species names (e.g., fairest, Houston's, Houstoni, anomalous, Acacia grandiflbra W.), leaflet counts (e.g., 20, 10), and geographical locations (e.g., Mexico).

*2834. I-E V^MIMOSA. [Mimos, "a mimic; mimics animal sensibility.) Leg.Mmosea. 21.— 7S.

U^MIMOSA. — Legumes compressed, moniltform, with the ribs at the articulations contracted ; flowers red.

—Leaves conjugately pinnate; leaflets two pairs, interior pair smaller than the inferior ; stamens four, rarely five.

Table listing botanical specimens with columns for species names (e.g., Sensitive Plant, blunt-leaved, strigoss, bundle-flwd, uni ci, lively, chaste, hispldish, blush, many-fingered, viscid, microcipphala), leaflet counts (e.g., 3, 1, 1, 1, 2, 1), and geographical locations (e.g., Brazil, Trinidad, Cumana, Jamaica, Brazil, P.I.R, Pa.R, Brazil, Orinoco).

HABKA*8IA. — Legumes compressed, hispid ; margins straight, not contracted at the articulations

Table listing botanical specimens with columns for species names (e.g., sleeping, AuW-spined, roughened), leaflet counts (e.g., 1, 1, 1), and geographical locations (e.g., S. Amer., VeraCruz, W. Indies).

HI. BATAUCAULON. — *Legumes compressed, flat, smooth, or scarcely pubescent; ribs parallel, not contracted at the articulations, unarmed or prickly; leaves bininate; flowers whitish or pale yellow.*

SUPPLEMENT.

To save unnecessary reference from the body of the work to this Supplement, and at the same time to indicate when a reference to it is necessary, an asterisk (*) is placed in the body of the work before such of the genera as are divided or repeated here, and also in those places where new genera should have come in. Those genera or species in this Supplement, which are merely alterations of the names, or distribution in the Natural System, of genera or species in the body of the work, are distinguished by a section (§). The same mark, in the body of the work, indicates that the name, or its place in the Natural System, is altered in the Supplement

Europe, but they are so abundant in all parts of the world that an order can scarcely be found more universally and equally disjunct. It is singular, that, with the exception of the climbing species of Clematis and of Xanthorrhiza, scarcely an instance occurs in Ranunculaceae of a shrubby stem. All the perennial species may be propagated by division, and those which are woody by that mode or by layers or cuttings: the annuals and most of the perennials bear seeds freely.

7. ORDER II. DILLENIAE-K.

Genera 12, Species 29; Hot-house Species 11; Green-house Species 18; Hardy Ligneous Species 0;
Hardy Herbaceous Species 0. f 0 feet; £ 0 feet j * 0 feet.

Fine plants, almost exclusively confined to tropical countries. Dillenia speciosa, a native of India, is a most noble tree with large yellow flowers, rivalling those of a Magnolia. Hibbertia volubilis is a green-house plant well known for the beauty of its blossoms, and their powerfully fetid smell. The medical properties of this order are scarcely known; a decoction of the leaves or bark is astringent, and used for gargles; and the acid juice of the fruit of some of the species of Dillenia is used in India, mixed with water, as a pleasant beverage in fevers. The foliage of many of the species is extremely scabrous, whence the dried leaves are used for the same purposes as fish-skin and sand-paper in Europe; those of Trachytella aspera are even employed in China for polishing works of metal. Most of the species strike readily by cuttings of the ripened wood in sand under a bell-glass.

10. ORDER III. MAGNOLIA*CEÆ

Genera 5, Species 37; Hot-house Species 3; Green-house Species 11; Hardy Ligneous Species 23;
Hardy Herbaceous Species 0. f 62 feet; £ 0 feet; * 0 feet

Essential part of the bark of Magnolia glauca and Liriodendron tulipifera is employed for the same purpose as Jesuit's bark, and from the fruit of Magnolia acuminata a tincture is prepared which has some reputation for removing attacks of rheumatism. The fruit of Illicium anisatum is the material which flavours the liqueur called Anisette de Bourdeaux. The Magnolias are exclusively inhabitants of Asia and America, no species having hitherto been found either in Europe or in Africa. The shoots of most of the species do not strike freely, and therefore they are generally propagated by layers, grafting, inarching, and sometimes seeds; two or three of the species by cuttings.

11a ORDER IV. ANONA*CEÆ

Genera 9, Species 45; Hot-house Species 40; Green-house Species 1; Hardy Ligneous Species 4;
Hardy Herbaceous Species 0. f 11J ft.; £ 0 feet; * 0 feet.

The plants of this order are closely allied to Magnoliaceae, from which they are principally distinguished by the absence of stipule, and by the structure of their anthers and seeds. The latter consist of a hard maw albumen, ruminated, as the botanists call it, that is to say, perforated by the substance of the seed-coat, every direction. They are all trees or shrubs, and chiefly inhabitants of the hottest parts of the tropics. A few have been discovered straggling into the temperature zones of America. The fruit of the Annona is many species highly esteemed as an article for the dessert, especially that of the Cherimoya, which has a reputation of being the finest fruit in the world, next to the mangosteen. The hard fruits of the species Uvaria are highly aromatic; those of one of them furnish the pepper athiopicum of the shops. The Annona Asimina is the only one which contains any hardy species, and these are so delicate as to be seen only in this country. In Brazil, the bark of Xylopia sericea is used for cordage; for which it is admirably adapted. Cuttings or layers.

28. ORDER XIII. CRUCIFER.E {erut, a ctoa>fen>, to bear; form of corolla}.

Genera 88, Species 7G1; Hot.futuuc Specie* 0 ; Green-house Species 77; Hardy Ligtuous Speciet IS;
Hardy fferftsjrjrwu Species GO5. J (J ft; £ 50 feet; £ 3 fat,

The importance of this order to mankind, and the singular nature of iu botanical ctmtracters, render expedient to speak very fully upon It: in irbich tin: remark) at the letiul M Di-camlnHi- who has " Cruciferie fiarticuar attention, will be chiefly followed. Thi; older omulttl wliully of annual of aAn biitnial, herbs, occasionally assuming a suMVutesivnt habit; then, however, never exceeding the I of three feet The roots are either thick and perennial, or annu.il or biennial and slender, idntott " perpendicular and undivided. The young rtots are t'ypea with a little tilicjiih, called the i-oleorliiia, 1 produced by the extended ruptured ceat of the epidermis when the rootlet first api<ani. This is a character, and deserves attention. The stems are round or somewhat angular, branched, and often, (VO) the annual species, indurated at the base The branches proceed from the axiilir of the leave*, but the most ones are abortive In most case*. The racemes are always opposite J^—^V/N. to the leaves; sometime* the terminal branch is abortive, when the raceme appears to be terminal; but this is merely owing to that circuin. /r XX a stance. The leaves arc simple, generally radical or alternate, l. opposite. The flowers are either white, yellow, or purple, or in a few flape species bright blue. The fruit in called either a siliigua or sillicula, the former being a linear pod containing many seeds, the Utter a roundish pod containing one or very few seeds, whence this

Older, which is the same as the Lintean class Tetradyndmia. Is divided by TJnnsui Into two pans, L-aliil Siliijutus.- and Silirutbsw. In the Mod, tlm raiiu'al ami ciityliit.nm arc sjinliet to embc otbar in dittront wt;>, from which the subordLTD or M. lJoonJulU itt-rive their characters. When the edffe of the cotyledons is presswl doted to the radicuU, so that a cross section would be an at jig. 5. a, tat cotyledons arc said to be necumbent, ns in all l'lcirnrlhlea.; wheo the side Of tin; riiEylxui> l- jrttwel to the r.idicila ns at b, the R are called incurbeiti, as in Nuturliizeii-. If the cotyledons arc incunl-t, and at the same time half folded together or LDiuiplicate, u at c, the suborder Orthojilur«e Is formed; when the cotyledons are iiu-unthreit anil spirally psw • that a sts-tion would be ai at d. they constitute the suborder BpinUbesi: and finally, when Hie cot) <" arc incumtnliit, »itd doubled twice \a their length, as at t, we have DilecolMjtB

The whole order is preeminently European; 166 species are found in the north and middle of Europe, and on the seashores of the Mediterranean; 45 are found between Mogadore and Alexandria; 18* in the Japan, 70 at the Canaries; 2 in Saint Helena; 2 in the West Indies; 11 in America: 48 in North America; 5 in Kamtchatka and the bordering islands; and finally, 33 are common to several parts of the northern hemisphere. It appears that there are about 100 species in the southern hemisphere, and about 800 in the northern hemisphere: 30 of the whole of the tropics; 548 of the temperate zone of the northern hemisphere; and 86 of the southern. The forty-first degree of north latitude may be considered the equator of Cruciferae, about half being found on one side of it, and half on the other. Their station is very variable; many in a few open sandy places, some form the vegetation about the limits of the perpetual snows of lofty mountains, and many follow the footsteps of man through all parts of the world.

The most useful qualities of the turnip, the radish, the rape, and the cabbage and its multifarious varieties, are all well known. The greater part of the order consists of plants possessing high antiscorbutic powers. These appear to depend upon a certain acrid, volatile, oily principle, the chemical nature of which is imperfectly known.

The herbage of the scurvy-grass, and other plants of this order, are rendered mild when taken inwardly; thus, when any cruciferous plants are found to be eatable, either from experience or other circumstances, it is to be understood to depend upon a reduction of this acrid principle.

The use of the powers of this last are will render the horseradish, the scurvy-grass, and others, so remarkably mild as antiscorbutics; they are also believed to possess diuretic and diaphoretic properties. It is to be remarked, that the radish and turnip are always eatable, when their texture is succulent and watery, as in the roots of the radish and turnip, and the leaves of the cabbage tribe. A further diminution of the acrid principle is produced by blanching. Cruciferae are said to possess a greater share of azote than any other tribe of plants; this is apparent in their fetid smell when fermented. The embryo of all the order abounds in oil, whence many of them are employed with much advantage for expressing, either for eating or for feeding lamps. Some of the species are extremely beautiful and fragrant, as the Stocks, the Gillyflowers, the Hesperidies, the Candytufts, and many others. The Hutchinsias, Drabas, Cardamines, &c. are among the most interesting of the order. Almost all the species are propagated by seeds, but some of them grow by cuttings, and the Perennials by division.

53. ORDER XIV. RESEDA[^]CEJE.

Genus 1, Species 23; *Hot-house Species* 0; *Green-house Species* 6; *Hardy Ligneous Species* 0;
Hardy Herbaceous Species 17. ± 0 feet j j£ i o | ft.; £ 0 feet

This order differs from Crucifere in the capsules being unilocular and the stamens indefinite, as well as in the seeds being destitute of an umbilical cord. Weeds of no interest, except the *Reseda odorata* for its delicious fragrance. *R. Luteola*, a common annual in waste places, yields a yellow color fit for dyeing. A natives of Europe and North Africa. Seeds.

1459 *Reseda* L. Q *YI

54. ORDER XV. DATISCEIE.

Genus 1, Species 2; *Hot-house Species* 0; *Green-house Species* 0; *Hardy Ligneous Species* 0;
Hardy Herbaceous Species 2. £ 0 feet; £4}feet; ^ 0 feet

Differs from the preceding order in having an inferior ovary, and in the seeds being furnished with albumen. This order consists only of one genus, containing three species, natives of the south of Europe, Nepal, and North America. They are strong coarse hardy perennials, with the appearance of hemp.

DIVISION,

2805 *Datisca* W. 0 2

55. ORDER XVI. CAPPARDEJE.

Genera 11, Species 72; *Hot-house Species* 51; *Green-house Species* 5; *Hardy Ligneous Species* 0;
Hardy Herbaceous Species 16. £ 0 feet; £8ft feet; * 0 feet

These are nearly related to Crucifers, of the properties of which they partake. Many are very pretty plants, especially *Cleome rosea*, and the various species of *Crataeva*. The common caper is an elegant bush, remarkable for its large white flowers and long purple stamens. The species are found occasionally in various parts of the world. The different kinds of *Capparis* are reputed to be stimulating, antiscorbutic, and aperient. The bark of the root of the common caper passes for a diuretic medicine. Several species of *Cleome* have an acrid taste, which has been compared by travellers to that of mustard. The root of *Cleome dodecandra* is employed as a vermifuge in the United States; and the leaves produce an inflammation of the skin, whence they are used in Cochinchina as a sinapism. *Dec.* Cuttings or seeds.

62. ORDER XVIII. BIXONEJE.

Genera 4, Species 9; *Hot-house Species* 9; *Green-house Species* 0; *Hardy Ligneous Species* 0;
Hardy Herbaceous Species 0. 10 feet; £ 0 feet j £ 0 feet

The plants of this order are few in number, and not remarkable either for beauty or use. The *Bixa OreUty* is chiefly known for producing the seed catted in the shops *Arnotta* (*JZocon*, FT.) and used for coloring cheese; the properties of the *Arnotta* are slightly purgative and stomachic. They are all bushes or 10*4 trees, and mostly tropical. Azaras, Chilian shrubs with fragrant flowers, are not yet known in the garden* * Europe. Cuttings.

64. ORDER XX. VIOLARIEK.

Genera 12, Species 135; *Hot-house Species* 13; *Green-house Species* 13; *Hardy Ligneous Species* 0;
Hardy Herbaceous Species 109. ± 0 feet; £ 11 feet; £ 0 feet

This is one of the most favorite orders with gardeners; consisting, as it chiefly does, of the *Violet* £*nu? from which most of the others are recent dismemberments. The greater part are hardy herbaceous plants, some of which are remarkable for their perfume, others for their brilliant colours, and all for their beauty. They are natives of the temperate or cold zones of both hemispheres, often growing at great elevations above the sea. Among them is a tribe called *Alsodines*, consisting of ^ffruitescent tropical plants; but none of them have been introduced into the gardens of this country. The attention of collectors should be directed to curing the shrubby *Violkces* of Brazil, some of which possess great interest. The medical *Passiflora* order are found principally in their roots, which appear to possess, in all cases, emetic properties, in a more or less degree. One of the *Ipecacuanhas* is the root of a Brazilian violet. M. Decandolle has the observations upon the affinities of the *Violaride*. — They are very nearly akin, he observes, to the *Passiflora*, *Droseraceae*, and especially to the *Passiflora*?. From the first they are distinguished by their fruit, leaves furnished with stipules, and two-celled anthers j from *Droseraceae* by their solitary style, lengi

embryo, and stipulate leaves, the veneration of which is involutive, not circinate. From Passiflora they differ in their fruit being capsular, not berried; in their albumen being compact and shining, not pitted; in their stamens being hypogynous, not perigynous; in their anthers being attached along their whole length, not by their middle; finally, in their stigmas being one and not three. The genus Calyptrion approaches Passiflora in its twining stem, and Hymenanchera borders upon Polygalee on account of its monospermous Pericarpium with solitary pendulous seeds. Divisions, seeds, and cuttings.

68. ORDER XXI. DROSERA'CEAL

Genera 5, 5jKde<16; Hot-house Species 0; Green-house Species 5; Hardy Ligneous Species 0

Hardy Herbaceous Species 11. f 0 feet; £ 2 feet; £2}feet

This order of sun-dews is a small group of plants, natives of marshes or inundated grounds in all the temperate parts of the world. The species are very remarkable for the abundance of glandular hairs with which all parts of the forage are covered. Only two species are in any degree frutescent. The young leaves are always rolled up in the circinate manner, so remarkable in ferns. Their medicinal properties appear to be singular. The leaves have the power of curdling milk. Divisions or seeds, some by leaves.

69. ORDER XXII. POLYGA^LEJE.

Genera 6, Species 64; Hot-house Species 5; Green-house Species 41; Hardy Ligneous Sproites 1;

Hardy Herbaceous Species 17. 2 1 foot; £ 5 feet; £ 0 feet

Most of the plants of this order are interesting, and deserving the attention of the gardener, some for their neatness, some for their beauty, and some for their use in medicine. They are natives of most countries, and are either low herbaceous plants, occasionally less than an inch in height (small specimens of Pol^gala purpurea), or shrubs varying from a dwarf, rigid, spiny habit, to a tall, graceful, drooping appearance. Polygaleae are remarkable for the union of their stamens into a single body, their one-celled anthers opening with a pore, juff their irregular flowers, one of which is often keel-shaped, and beautifully crested or bearded. The leaves have generally a bitter astringent taste, which is much more abundant in the roots, combined with an acrid and somewhat resinous flavor: these properties are particularly sensible in P. Senege, which is reputed to be singularly used as a remedy for dysentery. The well known Ratanhia root, of Chile, is the produce of a plant of this order, and possesses powerful tonic and astringent qualities. According to the analysis of a French chemist, it contains gallic acid, but neither tannin nor resin. Cuttings or seeds,

Genera 26, Species 531: Hot-house Species 11; Green-house Species 27; Hardy Ligneous Species 1;

Hardy Herbaceous Species 492. f 1 foot; £ 38* feet; JkI J feet

This order consists of herbs or low undershrubs, inhabiting the mountains and pastures of all parts of the world, and in Europe and Siberia they are particularly abundant, and least so in Africa and South America. Many are annual weeds, as most of the Cerastiums, Spargulas, and others. Several of the Silenes are very ornamental. Among the Anemones are to be found some dwarf species of considerable elegance. But it is in Dianthus that the principal of the order consists: this genus is almost unrivalled for the brilliancy of its colours, the neatness of its flowers. From the finest of its species the title of the order has been derived.

76. ORDER XXVII. LINEAE.

Genera 2, Species 43; Hot-house Species 0; Green-house Species 6; Hardy Ligneous Species 2; jftmfy Herbaceous Species 35. £ 3 feet; £ 12 feet; A 0 feet

Separated by If. Decandolle from Caryophyllae, from which it is well distinguished by its fruit having several cells, or in the language of the botanist just named, being formed by the cohesion of several carpella. Most of the species are pretty plants, bearing yellow, blue, or white flowers. They are of immense importance in the world, on account of the tenacity of their fibres when made into flax. The seeds of common flax are between mucilaginous and oily; the leaves of *Linum catharticum* and *L. selaginoides*, the latter a native of Peru, are purgative. Cuttings, division, or seeds.

* 921 *Zinura Bauh.* *2 341 419 *RadAola Dil.* ■ ■

77. ORDER XXVIII. MALVA* Cj&&.

Genera 22, Species 591; Hot-house Species 203; Green-house Species 97; Hardy Ligneous Species 8; Hardy Herbaceous Species 83. f 28J feet; £ 25 feet j £ 0 feet.

Before this order was dismembered of Bombacae and Byttneriaceae, it contained most of the grandest flower* in nature. Even now, the splendor of the various species of *J/Alva*, *ylthseVi*, to which the hollyhock belong* and */ibiscus*, renders it one of the most remarkable groups of plants. With the exception of the numerous genus *Sida*, nearly all Malvaceae are objects worthy of the gardener's care, particularly those which are hardy, in stoves or green-houses, the softness of their branches and leaves renders them peculiarly liable to the attacks of the red spider, mealy bug, and scale, from which few collections are free; a circumstance which makes them less generally esteemed than the surpassing beauty of many of them merits. The greater part of the order is clothed with stellate pubescence, and a reniform one-celled anther is a character common to the whole. These two peculiarities, together with the alternate stipulate leaves, distinguish Malvaceae from all the rest of *Dichlamy'der*. All the species abound in a nutritive mucilage; a quality which renders the young heads of the *Ochro*, or *Hibiscus esculentus*, an object of great value within the tropics, as an ingredient in soups. In Brazil, the *Abutilon*, esculentum serves the same purposes. The emollient properties of */Ithaca officin&li*f* or *Guimauve* of the French, are well known to physicians, as a remedy for catarrhs and pulmonary complaints. A decoction of the leaves of *Spharfxcea cisplatna* is used for similar objects in Brazil. A species of *lavbnv** is employed in the same country as a diuretic in the form of a decoction. The straight shoots of *SW* micrantha* are employed as rocket sticks at, *Ilio Janeiro*. The chewed leaves of *Sida carpinifolia* allay the inflammation occasioned by the stings of wasps. The tough fibres of many Malvaceae are manufactured into cordage. Their petals are astringent; whence those of *Jibiscus rbsa sinensis* are used in China to blacken the eyelashes and the leather of shoes. The fibrous threads in which the seeds of *Gossypium* are enveloped furnish the valuable cotton, an article of immense importance to the world; these threads, when examined by the microscope, will be seen to be finely toothed, which explains the cause of their adhering together with greater facility than those of *Bi'mbax* and several *Apocf nae*, which are destitute of teeth, and which cannot be spun into thread without an admixture of cotton. Division, cuttings, or seeds.

9a ORDER XXXIII. CHLENATEJE. -

Genus 1, Species 25 Hot-house Species 2; Green-house Species 0; Hardy Ligneous Specie* 0;
Hardy Herbaceous Species 0. ± 0 feet 5 £ 0 feet j ^ 0 feet

This order, according to Petit Thouars, is allied to Malvaces, in having an involucre to the flower, and
the stamens being monadelphous; but, according to Jussieu, it is allied to Ebenaces, from the petals being
connected at the base, and in the seeds being furnished with albumen. Shrubs and trees, with simple
alternate rtipulaccous leaves, chiefly natives of Madagascar. The genus Hugdiua does not agree with the
rest of the genera of this order, in being destitute of the involucre to the flower, therefore it is placed in
Chlenaceis affines by Decandolle. Cuttings.

* 1935 HugtwwVil.

91. ORDER XXXIV. TERNSTRGZMIA'CEIE.

Genera 11, Specks 19; Hot-house Species 10; Green-house Specks 41 Hardy Ligneous Specks 5;
Hardy Herbaceous Specks 0. f 18 ft 3 £ 0 feet; * 0 felt

A very small order, consisting wholly of trees or shrubs, bearing handsome white or yellowish flowers. They
are nearly related to Camellies, from which they do not differ at all in habit. Nothing is known of their pro-
Perties. Noronha states that a species of Saurauja found in Java has a subacid fruit, in flavor resembling the
Tomato, and that is eaten by the Javanese under the name of Koleho. Inarching, cuttings, or layers.

Genera 11, Specks 32; Hot-house Species 1S; Greenhouse Species 20; Hardy Ligneous Specie 0; Hardy Herbaceous Species 0. 1 0 feet; £ 0 feet i & 0 feet*

These are also known under the name of *Hesperidete*. They consist of trees or shrubs of the greatest beauty and utility. The well-known orange and lemon are the representatives of the order, the characters of which are so well defined that there is no material deviation from the type afforded by those species. The thick leaves, articulated with the petiole, and abounding in transparent reservoirs of odoriferous oil, are the most obvious peculiarities. The flower* are fragrant, and the fruit in all cases fleshy, and generally eatable. The wood is particularly close-grained. The volatile oil contained in the reservoirs of the leaves and fruit possesses powerful tonic and stimulating properties. M. Decandolle thus explains the singular structure of the fruit of the orange. In the opinion of this learned botanist it consists, first, of a thick, valvless, indchiscent indusium or coat, which is most likely to be considered a continuous torus. Secondly, of several carpella, verticillate around an imaginary axis, often separable without laceration; membranous, and either containing seeds only, or filled with pulp, lying in innumerable little bags proceeding from the inner coats of the cells. Cuttings, and sometimes by layers, budding, grafting, and inarching.

100. ORDER XXXVIII. HYPERICINEJE.

Genera 7, Species 90: Hot-house Species 4; Green-house Species 34; Hardy Ligneous Species 14; Hardy Herbaceous Species 38. 1 9} ft. j jg 14 ft. j fe 0 feet*

The whole of these abound in a resinous juice, and are in most cases glandular in some degree. Their leaves are all dotted, and, which is very remarkable, the dots are often black, even upon the yellow petals. These latter have a singular obliquity, which is not indicated by their outline, but by the arrangement of their veins. The juice just noticed as abundant in this order is yellow, viscid, rather bitter, often purgative or anthelmintic, and so very analogous to Gamboge, that the juice of *Hypericum baccatum*, and some other Guiana species, has received the name of American Gamboge. Most Hypericinee are bitter, and slightly astringent, whence they have been used as febrifuges. A small part of the order is tropical; but in its most genuine form it consists of herbaceous or undershrubby plants, delighting in the shade of groves and thickets in the cooler parts of Europe and Asia. Nearly all the flowers are yellow; those of *H. cochinchinense* are dull red. Seeds, division, or cuttings.

134. ORDER L. GERANIA*CE.SL

Genera 5, Species 366; Hot-house Species S; Green-house Species 276; Hardy Ligneous Species 0; Hardy Herbaceous Species 87. 2 0 feet; £ 15 feet; * 0 feet

The Geraniums are well known to all gardeners for their beauty, and the facility with which h y f varieties are produced among them. Geranium and Eridium are chiefly natives of the northern hemisphTM and Pelargonium of the southern. Different as they appear from Vinifere in most respects, there are so^{0ST} points in which a curious resemblance may be found between the two orders. The young stems of both * articulated and separable at the articulations; and the lower leaves are opposite, while the upper^{onc} ,2r alternate. In Geraniaceæ? no tendrils are produced, but the peduncles are opposite to the leaves, as in /'SL and occupy the place of tendrils. M. Dccandolle observes, that of the true Geraniaceæ, some are d*24 i acid, especially those of which the leaves and bark are succulent; several exhale a resinous smell which » sometimes agreeable, but occasionally so powerful as to be unpleasant. The resinous principle is so abundan which are DUUI dccunieu vulnerary, ana in £. moscnaiuin, tr. praicnsc, anu others, in wriien it IS Unlieu * slight aromatic principle, whence they have been recommended for various purposes, and among others i removing calculous disorders. The astringent property of the geraniums is also present in *G. maculatum*, which grows in much abundance about Philadelphia; the root of this plant, boiled in milk, is used for tr⁹ cholera in children. Barton is of opinion, that it would be a good substitute for gum kino in nephritis ft¹⁰ obstinate diarrhoeas. Cuttings, division, or seeds; or sometimes by cuttings of the roots.

Hardy Herbaceous Species 11. 1 0 feet; £ 6 feet; * 0 feet

confounded with the last order. It is the opinion of modern botanists, that the species are more nearly allied to Rutaceae or Zygophyllaceae, and that their character and peculiar habit are quite sufficient to distinguish them. The beauty of the genus Oxalis is very great, and the readiness with which the species are cultivated and caused to flower, would have been expected to make them universal favorites; they are now however, much soon in cultivation. Their properties are well known: all of them have a slightly acid taste, and depends on the presence of oxalic acid. Oxalic acid exists in great abundance. Several species are employed in Brazil as a purgative. Most commonly by division, offsets, or seeds, but also by cuttings.

140. ORDER LIV. ZYGOPHYLLEJE.

Genera 7, Species 32; Hot-house Species 8; Green-house Species 22; Hardy Ligneous Species 0;
Hardy Herbaceous Species 2. ± 0 feet; £ 3 feet; ^ 0 feet

The hardness of the wood of the shrubby species of this order is most remarkable, if the softness of the herbaceous ones is remembered. To this the extreme difficulty of propagating Guaiacum is to be ascribed. Zygophyllum Falago is employed as an anthelmintic, but it is in the Guaiacum that the medicinal virtues of the order are found: all the genus is extremely exciting; the wood and bark of Guaiacum and sanctum have a rather bitter acrid flavor, and are principally used as sudorifics, or alteratives; they have been found to contain a particular substance differing both from gum and resin, which has been called guayacine. Many of the species bear beautiful flowers, especially the Nonnifera, which, with their brilliant yellow Cistus-like blossoms, enliven many an arid waste in the tropics, and are found in the colder latitudes of the world. Cuttings, division, or seeds.

141. ORDER LV. RUTACEAE.

Genera 37, Species 162; Hot-house species 18; Green-house Species 137; Hardy Ligneous Specks 1;
Hardy Herbaceous Species 4. ± 22 feet; £ 5 feet; * 0 feet.

Resting and extensive, but rather heterogeneous, group of plants, natives of all countries and all situations. The species are either fetid northern herbaceous plants, as the garden rue, or neat heath-like southern aromatic odor, as the Cape Diosmas; broad or long-leaved Australian shrubs, with a stellate umbeliferous panicle, or tropical trees with panicles of pallid minute flowers, as the Cuspanas and Zanthoxylum. The medicinal properties of many genera are considerable. Ifuta and N-ganum are emmenagogue, and sudorific. Cape Diosmas abound in a volatile oil of an agreeable smell, but acrid flavour; several species are reputed antispasmodics. The Zanthoxylums are said to possess acrid, stimulating, and diaphoretic qualities; Clava Herculi and Jraxineum are said, in America, to be powerful sudorifics and diabetics. According to Barton, they possess a remarkable power of exciting copious salivation, not only by being applied to the mouth, but even when taken internally; they have both been found powerful remedies in the dysentery of the muscles of the mouth. Zanthoxylum caribaeum is regarded in Guiana as a detersive in the dysentery, and febrifuge. Brucca is used as an astringent in dysenteries. The famous febrifugal Angostura is the produce of Cusparia febrifuga. Cuttings, division, or by inarching.

147. ORDER LVI. SIMARUBACEAE.

Genera 3, Species 5; Hot-house Species 5; Green-house Species 0; Hardy Ligneous Species 0;
Hardy Herbaceous Species 0. f 0 feet; £ 0 feet; ^ 0 feet

Plants, found in equinoctial America, constitute this order. They are trees or shrubs, with a bark, a milky juice, and pinnate leaves. The Simaruba officinalis is well known as the most bitter hitherto discovered; the same property exists, in a milder degree, in the rest of the genus. Simaruba amara is a very ornamental plant, but rare, at present, in collections. Cuttings.

148. ORDER LVII. OCHNATEJE.

Genera 3, Species 15; Hot-house Species 14; Green-house Species 1; Hardy Ligneous Species 0;
Hardy Herbaceous Species 0. ± 0 feet; £ 0 feet; * 0 feet

Yellow-flowered tropical shrubs with lucid leaves. The roots and leaves of Walkeria serrata, a bitter tonic; a decoction of them, either in water or milk, is used in Malabar as tonic, stomachic, and febrifuge. The bark of Gomphia hexasperma is found useful in healing sores produced in cattle infested with insects. Cuttings.

149 ORDER LVIII. CORIARIEAE

Genus 1, Species 2; Hot-house Species 0; Green-house Species 1; Hardy Ligneous Species 1;
Hardy Herbaceous Species 1, fl foot; £10 feet; £ 0 feet

Five species constitute the whole of this order, distributed in South Europe, New Zealand, Peru, and Mexico. They possess no beauty, and are only interesting on account of their problematical station in a botanical arrangement. The leaves of *C. wrightii* are astringent, and are employed in dyeing black. The berries are very poisonous. On one occasion, during the Spanish war, fifteen French soldiers were taken after eating them, and three died from their powerful narcotic effects. Cuttings and suckers.

2797 Coriaria L. 1 0

SUBCLASS II. CALYCIFLORES. Petals separate, inserted in the calyx.

Genera 1149, Species 11435; Hot-house Species 2089; Green-house Species 3486; Hardy Ligneous Species 1 & Hardy Herbaceous Species 4552. ± 283 feet j £ 15 feet ^ ± 7 feet

150. ORDER LIX. CELASTRINEAE.

Genera 18, Species 114; Hot-house Species 19; Green-house Species 53; Hardy Ligneous Species 42;
Hardy Herbaceous Species 0. f 46) feet; £ 0 feet; ^ 0 feet

This order differs from the succeeding, in having the stamens alternate with the petals; the sepals imbricated in aestivation; and the ovary wholly superior. It consists entirely of shrubs or small trees, with simple, rarely compound, alternate or opposite leaves, and inconspicuous flowers of a greenish or white colour. Several are favourite ornaments of our shrubberies, as the *Staphylea*, the *Celastrus*, and the *Euonymus*; the latter of which is valued on account of its beautiful-colored fruit. The fruit of *Euonymus europaeus* is a bitter purgative, as is also the inner bark, and in strong doses powerfully emetic. The famous Paraguay tea *Uncaria* is a species of *Uncaria*. The bark of *Prinos verticillatus* possesses such active, astringent, bitter, tonic and febrifugal qualities, that it is used in North America, with success, as a substitute for *Cinchona*. A decoction of the twigs of *Maytenus boaria* is used to bathe the swellings produced by the poisonous shade & the tree lily. Cuttings, suckers, layers, and seeds; sometimes by grafts.

154. ORDER LX. RHAMNACEAE

Genera 18. Species 171; Hot-house Species 32; Green-house Species 87; Hardy Ligneous Species 511
Hardy Herbaceous Species 1. f 79 feet; £ 3 feet; £ 0 feet

In habit, this altogether agrees with the last, from which the medical properties of the species are not different. Throughout the order, as far as it has been examined, there is a remarkable agreement between the fruit and the inner bark, especially in *Zanthoxylum catharticum*, *Fringula*, and others, in which they both are purgative and emetic. Some, as the *Jujuba* and the African *Lote*, nevertheless, yield a wholesome and nutritious fruit; and the berries of the greater number yield under the chemist's hands, green or yellow dyes of importance in manufactures. The leaves of *Azadirachta indica* are substituted for tea by the poorer among the Chinese. The bark of *Ceanothus cuneatus* is esteemed in Mexico as a good febrifuge. Cuttings, suckers, and seeds.

156. ORDER LXII. SAMYDEAE.

Genera 2, Species 14; Hot-house Species 14; Green-house Species 0; Hardy Ligneous Species 0;
Hardy Herbaceous Species 0. ± 0 feet; £ 0 feet; £ 0 feet

Tropical shrubs or small trees, with entire, stipulate, alternate leaves, covered with pellucid dots; the axillary flowers of little show. Some of the species of *Samyda* are pretty, but very rare. Their properties are unknown. M. Decandolle remarks, that in their fruit they approach *Bixineae* and *Flacourtiaceae*. In account of the position of their stamens must be arranged in the vicinity of *Rhamnaceae* and *Rosaceae*. Cum

1368 *Samyda* L. 11369 *Casaria* Jac.

157. ORDER LXIII. HOMALIACEAE.

Genera 4, Species 8; Hot-house Species 5; Green-house Species 2; Hardy Ligneous Species 1;
Hardy Herbaceous Species 0. J 3 feet; £ 0 feet; ^ 0 feet

Evergreen handsome shrubs, with alternate leaves and deciduous stipule; they are readily known by their parietal placenta, an unusual character among the orders that surround them. Blackwell's *Agave* is a species of *Homalium*. Little is known of their medical properties; the root of *Homalium racauba* is used in Guiana as a cathartic. Cuttings or layers.

1598 <i>Homalium</i> Jac.	11146 <i>Astranthus</i> Lou.	
1465 <i>Blackwellia</i> Com.	1138 <i>Aristotelia</i> L.	1 0

at the Cape of Good Hope, and by the Pultenaas, Daviosias, Aotuses, and multitudes of similar genera to New Holland. The wood of the order is very hard and durable, with a yellow tinge, sometimes changing more green, as in the Laburnum of Europe, and in the better known Brazil wood of commerce, produced by *Cassia*.

The following useful remarks upon the properties of the order are made by M. Decandolle: —
 "The family of leguminous plants, though established upon characters of primary importance, offers, nevertheless, so large a number of species and such singular botanical anomalies, that it is easy to foresee that its properties will exhibit little uniformity. Still more exceptions may be anticipated, if one reflects that the chemical principle which is found most abundantly in every part of leguminous plants, and to which we must attribute their principal properties, is the extractive. It is probable that this principle, either from its own nature, or from its peculiar power of uniting with different matters, or perhaps instead of being a simple principle, it is rather a compound of different matters; it is probable, I say, that the extractive principle exhibits much less uniformity in its results than any other. It is, without doubt, to the presence of the extractive principle, in considerable quantities, that many leguminous plants owe their purgative properties, which are common to several extracts, and which many chemists attribute to the acetate of potash, which they are almost universally found to contain. Thus the leaves and foliaceous pods of *Cassia Senna* Lin., of *Cassia lanceolata* Forth., of *Cassia emarginata* of the Antilles, of the *Cassia marylandica* employed in the United States, of *Collitea arborescens*, of *Genista purgans*, and perhaps also of *Coronilla Emericus*, act as brisk purgatives, and often cause wind and pain in the bowels. The juice of *Coronilla varia* excites vomiting, and may even become

juicy pulp that exists in the *Cassia fistula* Lin., in the *Tamarindus indica* Lin., in the *Ceratonia siliqua* Lin., and probably in the *Inga vera* and *I. punctata*, which are eaten in small quantities in the Antilles; but which, taken more copiously, would have the same effect as our Carobs. There are some fruits of Leguminosae, for example, the *Sophbra* and the *Gleditschia*, with tumid pods, in which is found a juice which surrounds, it is true, the seeds, as in the plants just mentioned, but which differs from them altogether in very astringent and nauseous flavour; the nature and properties of this juice deserve to be examined by chemists, and would undoubtedly throw some light upon the nature of Leguminosae. It is induced to think that the astringent Juice of the *Sophbra* is a secretion of the pericarp, whilst the sweet and purgative juice of the *Cassia* would be a secretion of the external part of the seed; but this hypothesis requires to be verified, what leads me to this opinion, is the flavour commonly found in husks in the Carobs, for example, the hull is astringent, and the pulp sweet and laxative. But let us return to the properties which may be attributed to the extractive principle. It is undoubtedly from some one of these modifications that the singular property of the *Piscidia* and many *Galegas* is derived, which are employed in America to stupefy fish, which are taken with this means as readily as with *Nuxvomica*. The decoction of the root of *Galega virginiana* is considered in America as a powerful vermifuge. It is, perhaps, indeed, to the very same cause that the rubefacient power of the fresh leaves of some Leguminosae are to be ascribed, which act readily upon the skin if applied as plasters I

found in small quantities, the seed may serve as food for man and animals, as we see in French beans, pea lentils, chick peas, beans, and many others, &c. If found in a more considerable quantity, it will render them purgative or emetic, as in the *Cytisus Laburnum*, the *Nagyris fœtida*, and even in most *Coronillas*. It is remarkable that the botanical characters of Leguminosae should so strictly agree with the properties of their seeds: the latter may be divided into two sections; namely, first, those of which the cotyledons are thick and filled with fascula, and destitute of cortical pores, and which, moreover, in germination do not undergo any change, but nourish the young plant by means of that supply of food which they already contain; secondly, those of which the cotyledons are thin, with very little fascula, and furnished with cortical pores, and which change at once into leaves at the time of germination, for the purpose of elaborating food for the young plant. All the seeds of the first section are employed as food in different countries; none of those of the second section are ever so employed: the *Cajan*, which has long been classed among the *Cylisi*, was apparently an exception to this general rule; but observation has proved the contrary. Bearing in mind its known properties, I formerly paid particular attention to its structure, and I have shown in a note which accompanies my catalogue of the Montpellier garden, that the *Cajan* forms a particular genus much more nearly allied to the French bean than to the *Ciftisi*, and that it, in fact, belongs to the first of the sections which I have just described. The seeds of Leguminosae present also many other anomalies more difficult to reduce to any

or *Coumarouina odorata* of Aublet, which, under the name of Tonquin bean, is used for perfuming snuff; there are others which, like the chick pea, have rather a bitter taste and exciting properties, and are on that account administered for the jaundice. There are others again, like those of the *Andra*, which are so bitter as to be used in Java and Brazil as tonic, alexiteric, and vermifuge. In a word, are not the aperient and diuretic properties which are observable in the herbage and the roots of many leguminous plants, such as broom, beans, Ononis, *Moringa pterygosperma*, *imthyllis cretica*, &c. to be attributed to a modification of the extractive principle? There are, in another view, roots which are furnished with tubercles, that is to say, with reservoirs of fascula, which furnish mankind with wholesome food, as we see in the *Lathyrus tuberbus*, which is eaten in Holland, the *Dolichos tuberbus*, and the *D. bulbosus*, which the Indians use as food. The *Torilis* of the liquorice have a sweet and mucilaginous taste, which is well known by every body, and which, as an acrid and rather exciting principle, causes it to be employed as a pectoral; the analysis of this root published by M. Robiquet, proves that, independently of its woody skeleton, the same kind of amylaceous fascula is found as in the tubercle roots of which we have just been speaking; it is thence seen that the acrid flavour of decoctions of liquorice depends on the small quantity of resinous oil which it contains, and that

for their bitterness, and are used as febrifuges; the different kinds of *Geotrhya* and *Andira* possess this bitter and febrifugal quality in a remarkable degree; in India, the bark of the *Agati grandiflora* and of *Guilandina Bonduilla* are employed for the same purpose. The barks of many leguminous plants are remarkable for their astringent qualities, caused by the quantity of tannin which they are found to contain; this is observable in the *Acacia Catechu*, and in the *Acacia arabica*, which is used for tanning leather and elsewhere. It is well known that almost all colouring matter proceeds from the extractive principle; as it appears that this principle abounds in Leguminosae, we ought to find in them a considerable number of the colors which are used by dyers: to this family, in fact, belong the principal blue colors, and the name of indigo, extracted from every kind of *Indigifera*, and from some *Galegas*; and the red color which are yielded by all the species of *Casipalinia* and of *Haematoxylon*. We may add the red juice, drawn from the *Pterocarpus draco* and *santalinus*, under the name of sandal and of dragon's blood; the *Biktra frondosa*, under the name of gum lac; and also from *Dalbergia Monetaria*. These juices appear to differ in many particulars, but their history and analysis are at present so far from being known, that it is impossible to form a true estimate of the nature of their differences. But anomalies of this nature are far from being confined to the plants just mentioned. Among the exotic drugs employed in the art they are common: such, for example, are the balsam of *Capivi*, produced by the *ropalifera*; the balsam of Peru, &c.

Jfuttg says, If obtained from Myrospermum perufferum, and the balsam of Tolu from M. toluifemum th* Cachou, which has been found to be almost pure tannin; and which is supposed to be produced by Jcticia SSF* of the same character is that remarkable resin that is yielded by Hymenocallis gum Arabic, Produced by the bark and roots of Acacia vera, Senegal, arabica, and others; gum tragacanth obtained from Astragalus officinalis; gummifer, and vdrus; and finally, manna, secreted by A. Utagt Maurtrum." Cuttings

The arrangement of the tribe of plants has been found to be attended with much difficulty. By Linnaeus, and the writers who succeeded him the number of genera was much smaller than those of the present age; many additions have been made in consequence of the discovery of New Holland, and a large number of subdivisions in old genera have been from time to time introduced. To combine these scattered improvements under one uniform system has lately been attempted by the author, from whom the foregoing extract has been taken. M. Decandolle's system is the most useful to explain the principles upon which it is founded. He divides Leguminosae into two orders, Papilionaceae and Mimosa, the first of which consists of plants the radicle of whose seed is curved, and the second of those whose radicle and cotyledons are straight. The latter is divided into two principal forms: one of which, comprehending all the genera with papilionaceous flowers, and an obscurely lobed calyx, is called Swartzia. The last is not subdivided, but the Papilionaceae divide themselves into the two great tribes pointed out by M. Decandolle, namely, those with fleshy cotyledons and eatable pulse, Sarcobata; and those with foliaceous cotyledons and seeds which are not eatable, Mimosa. Each of these is divisible by three, upon slight differences in the fructification. In Mimosa the former, it is valvate, in the latter, imbricated; the first constitute a single tribe, the Utin, distinguished by less momentous peculiarities of structure. Having premised thus much, the following tabular explanation will be intelligible:—

19a ORDER LXVIII. ROSA^CEJE.
Genera 46, Species 783; Hot-house Species 12; Green-house Species 73; Uardfr Ligneous Species 478; Torrfy Herbaceous Species 219.1199Jfeet; £28 feet j ^ 0 feet.*

With the exception of Chrysobalaneae and Sanguisdrbee, this order is so uniform in its appearance, th>§ JZosa, the type from which all the other genera are to be considered variations, when justly understood, *>11 be found to contain every form of structure which is essential to the order. Having stated this, it will be <0> once obvious, that if the other genera have such close affinity to /tdsa, they must also bear a great analogy f^ beauty. And this is, indeed, the fact .rfm^gdalus and Prhnus among trees, and Potentilla, 6^eum, ft**1 others, among herbaceous genera, rival the rose in their blossoms, and, in many particulars, surpass that 0^2 lovely of all flowers in foliage and general appearance. But it is not for charms alone of smell, or blossom, ^ foliage, that this order has fixed itself so high in the estimation of mankind. It has also the rare merit^ comprehending all the most important of the fruits of the temperate regions of the world. Thus the apple and the pear belong to Pyrus, the apricot to Armeniaca, the plum to Prbnus, the peach and the nectarine to P^***1 Eriobotrya produces the loquat, Mispilus the medlar, and, finally, the quince is borne by the Cydbnia. TP^6 medical powers of many plants of this order are not less active than their fruit is excellent. The principal^*^ this is the well-known Prussic acid, which exists in abundance in the leaves and kernels of many K^k-*(especially of Prunus and yfm^gdalus: it is the basis of Laurel water, which, when taken in small doses, ac^*1 either as a violent purgative or as an emetic; and, in stronger doses, is said to destroy irritability withou exciting inflammation; these properties, however, although thus dangerous in the distilled water of the l^*^ and other similar plants, can scarcely be said to exist in any important quantity in the plants in a state ^ nature. The kernel of the bitter almond, for example, in which the Prussic acid is more abundant than usu^> is used for many culinary and other purposes without any bad effect. There are, however, cases in which >> if said to be dangerous to eat the fresh leaves or kernel; as in the Clrasus virginiana, the leaves and fruit o^ which are reputed in the United States to be poisonous to certain animals. Besides the Prussic acid, there a i^ several other principles which abound in the order. All Drupnceae yield a gum which is nearly allied to f^8^ Arabic, and which affords a strong evidence of the affinity that exists between Rosaces and Legumino^ A great deal of astringency is found in many species, whence different parts have been occasionally employ^ as febrifuges, and as remedies for hemorrhage, diarrhoea, and dysentery. The root of the Tormentilla is y^Z fox tanning in the Ferro Isles; and that of the Capollim cherry in Mexico. The bark of Clrasus vrgin^*^ la uottu nasa fabrifitHTP, in the United Statp. Potentilla pntan^ has ho^>> p. nismis for the ump p^*^*^ of tanm; it has been used in America and Europe as a substitute for Jesuit's baric, inc^*^ DrYas octopetala in the north of Europe, of Jtobus irecticus in Norway, of Prunus spinbsa and C^rasus avia^ and of Aosa rubiginbsa, have been manufactured into a sort of substitute for tea. The bark of the ^*^*^

It must not be omitted, that the order Rosaceae nearly answers to the fcosandria of Linnseus.

223. ORDER LXXIX. LYTHRARIEAE or SALICA'RLE.

Genera 11, Species 61; Hot-house Specks 23; Green-house Species 13; Hardy Ligneous Species 0; Hardy Herbaceous Species 25. ± 0 feet; £ 10J ft.; ^ 1 foot

Most of these are very showy plants, in particular the genera *Lythrum* and *Lagerstr&ceWa*, which are *Jf representatives of the order. They are chiefly natives of temperate climates, on mountains and among busne*. *P&plis* is a common bog plant in England. *Heimia* is remarkable for its yellow flowers. Little is known of the properties of *Salic&riae*; they are mostly astringent; the common *Salic&ria* is used in inveterate diarrh&ea; a species of *Lythrum* is used in Mexico as a vulnerary and astringent; and *Lawsbn&ia*, which is used by the Turkish women to stain their nails, is also supposed to possess similar properties. There is a plant of this order called *Hanchinol* in Mexico, which is said to possess much more remarkable powers than any of the preceding; its expressed juice, taken in doses of four ounces, excites violent perspiration and secretion of urine, and is said to cure venereal disorders in an incredibly short space of time. Cutting, division, and seeds.

226. ORDER LXXX. TAMARISC&NEIE.

Genus 1, Species 6; Hot-house Species 3; Green-house Species 0; Hardy Ligneous Species 3; Hardy Herbaceous Species 0. ± 17J ft.; £ 0 feet; *0 feet

Shrubs, rarely herbs, with twiggy branches, small entire scale-like leaves which are usually g'a and small white or rose-coloured flowers which are disposed in spikes or racemose spikes. This order differs from *Onagrariae* in the ovary being free, and in the imbricate estivation of the calyx; and from *Lythrar&ae* in petals being inserted at the bottom of the calyx, as well as in its aestivation. The species are >^11V ^0 Europe, Asia, and Africa. Some of the kinds of r&marix have an astringent tonic bark, and yield, - ^0 burnt, a large proportion of sulphate of soda. Cuttings.

899 <i>T&maixL.</i>	*3	█
-------------------------	----	---

227. ORDER LXXXI. MELASTOMA*CEE.

Genera 12, Species 76; Hot.house Species 69; Green-house Species 3; Hardy Ligneous Species 0; Hardy Herbaceous Species 4. JO feet; £ 2 feet; *0 feet

All these are remarkable as handsome tropical shrubs or trees, with large purple or white flowers* with several cost*, or nerves as they are incorrectly termed. The genera admitted in the body of this pty are those received by the greater part of previous writers; they have been much increased, and ap&is not with great propriety, by Mr. D. Don. The species are generally ill treated in collections, where f&ic& J&adim^ frequently to be found under the form of sickly stunted plants, instead of noble broad-leaved s& the c shrubs, with masses of brilliant flowers. To be grown well they require much heat, much moisture L^berly> summer, and much pit-room and head-room. The fruit of true *Melastomas* is a fleshy insipid J^e who which is for the most part eatable, and is often so deep a black as to dye the teeth and mouths pr <<^ ^ the eat it. They are nearly related to *Myrtaceae*, from which they differ in the want of essential q'i £^11V ^0 dot-like reservoirs of the loaves which contain it. The juice of the leaves of *Mic&ma succosa ana a>w>* as a lotion for recent wound* by the inhabitants of Guiana. Cuttings and seeds.

... marginal ribs, and an inferior ovarium and single style, are the great features or characters of the order. It is there that the Allspice, the Clove, the Rose-apple, and the Guava find their place in the common myrtle. The section with capsular fruit comprehends, with the exception of the Myrtaceae, almost wholly handsome hard-wooded New Holland or South Sea shrubs, with yellow flowers and stamens: yellow flowers are very uncommon. The volatile oil contained in the leaves, and the floral envelopes, gives these plants the fragrance which has celebrated by poets of all ages. It is very aromatic, a little acrid, and slightly tonic and is under the form of Cajeputi oil, the produce of Melac&ca Luceadtfndron, or of oil of the clove this oil is so abundant as to constitute nearly a fifth of the whole weight of the bark. Produce it There is also a considerable proportion of astringent principle in these plants - in the bark of Myrtus Ugni and multiflora of Chile, and Jambbsa malaccensis, it is so abundant as to render those plants of great use in cases of dysentery. Eucalyptus resinifera produces an astringent substance resembling gum kina The leaves of the Chilean myrtles, Leptospermum jeparium, and other species, have been used as substitutes for tea. Cuttings and seeds.

... of the gourd, the melon, and the cucumber, succulent climbing vegetables, the fruit of which is so many of our comforts and necessities. The importance of the gourd in hot countries is so great, where, from the nature of the climate, few of those culinary vegetables that are so common in the north are to be found. Decandolle observes, that as the violent action of the Colocinth resin is much increased by its mixture with it of gum, it is probable that the difference in the fruits of the order depends on the proportions between these two substances. The seeds of the gourd, like those of the Cucurbitaceae, have a sweet and milky, and readily from

natives of damp ditches or way-sides, in cool parts of the world; In the tropics they are extremely rare The simplicity of their structure, and uniformity of their appearance, have rendered their classification a matter of very great difficulty. It has been attempted in modern days by Sprengel, Lagasca, Koen, and Decandolle, all of whom have added much to our knowledge. The arrangement of Koch and IK^c candolle is here adopted as the most perfect, upon the whole, of any yet published. The culinary and agricultural importance of many species is well known; the parsnep and carrot form a large part of the staple winter store of the inhabitants of Europe, as the Arracachas do of those of South America; and the Prangos of Thibet is supposed to be the most important and productive of any in the whole world, as a forage plant. The medicinal properties of Umbelliferae are not more powerful than they are at variance with each other. While the seeds of some are aromatic, and stimulating in the highest degree, the fresh roots and leaves of others are not less narcotic. This has been supposed to arise from the difference in the state of the sap in different parts of the plant; and it has been thought that the narcotic principle is only to be found in the ascending sap, while the aromatic stimulant properties are found in the juices, which are fully elaborated and matured. It has been already observed, that their dangerous properties are often removed by cultivation; the common celery is a familiar instance of this; but the most remarkable, that of Cenanthe pimpinelloides, a most dangerous species when wild which is cultivated about Angers for the sake of its roots, which are there called Jouancettes, and about Saumur, where they are known by the name of Mouchons. The roots of some Umbelliferae contain a large proportion of sugar; those of the carrot, when dried, more than an eighth; those of the parsnep just an eighth; and those of the chervil about eight parts in 100. Galbanum, Opopanax, and Assafoetida, are all the produce of different species of Umbelliferae. Division or seeds, sometimes by cutting

Arallacea are a slight divergence from the well-known Umbellifera, with which they nearly agree except in being usually frutescent, and from which they are obviously distinguished by their 5-celled iridium. Their flowers have no beauty, but the foliage of many is extremely fine, especially of the species of i^i^ lum; that of our common ivy must not be omitted. Their medicinal properties are much the same as Umbelliferae, except the fruit, which differs in virtues as it does in botanical structure. Their bark aromatic gum resin, as in Aralia umbellifera. Their roots are tonic, with, in some cases, the flavor of panax. The famous ginseng, which is produced by a Panax, is reputed to have powerful tonic, restorative, aphrodisiacal qualities; but it is probable that these have been greatly exaggerated. Cuttings, layers, and

348. ORDER CXXI. SAPOXTEJE.

Genera 11, Species 44; Hot-house Species 31; Green-house Species 6; Hardy Ligneous Species 7;
Hardy Herbaceous Species 0. f 25 feet; £ 0 feet; * 0 feet

These are also shrubs and trees, which are mostly evergreen, and natives of the warmer regions of the world. Some of the *Burttias* are found in the southern states of N. America, but none of the order exists in Europe. They are chiefly valuable for their fruit, which, in many cases, contributes richly to the dessert. *Mimusops Unga*, *Imbricaria malabirica*, and *Arghnia Sideroxylon* are all of this description; the star apples of the W Indies, the produce of several species of *Chrysophyllum*, and particularly of *C. Chinio*, are esteemed delicious; and the Medlars, Lucumas, and Sapotillas of equinoctial America, all the fruit of different kinds of *Tchras*, are among the most valuable productions of the western world. The seeds of all the order are oily; those of *Jpcharas Saputa* are accounted diuretic and aperient. Their oil is not fluid, but so concrete as to have the appearance and consistence of butter, whence the name of butter-tree has been applied to different species both in Africa and India. The most famous of this description is the Indian mava, mahva, or madhuca, the *B.issia butyracca* of botanists; the seeds of which are so oleaginous, that a single tree has been known to produce three quintals of oil; the dried flowers of the same tree are mixed by some Indians with their food, and a kind of spirit is distilled from them by others. The juice of all the sapotas is milky, but not acrid and poisonous like that of most other lactescent orders, but, on the contrary, yielding a wholesome beverage or food. According to Brown, the bark of some of the *Achras* and *Lucumas* is so astringent and febrifugal, that it is substituted for quinquina. Cuttings and seeds.

349. ORDER CXXII. EBENACEAE.

Genera 4, Species 38; Hot-house Species 12; Green-house Species 22; Hardy Ligneous Species 1;
Hardy Herbaceous Species 0. \pm 6 feet; £ 20 feet; \blacktriangle 0 feet

Some of these are hardy trees or shrubs, with deciduous leaves and white flowers, natives of woods, mountains, and banks of streams in North America, Europe, and New Holland; others are tropical evergreens. Of the latter, many of the *Diospyros* produce eatable fruit; as, for example, the *Mabolo* of the Philippines Islands, which is as big as a peach, and the *Kaki* of Japan, which resembles an apricot. All these fruits are remarkable for their extreme austerity before maturity, and the necessity of letting them decay, like our medlars, before they are fit for table. These are also distinguished for the excessive hardness of their wood, and for the black color it sometimes acquires when old, as the *Ebony*. The bark of *Diospyros virginiana* is used in North America in intermittent fevers. Cuttings and layers.

5791 *Maba* Forst 12889 *Diospyros* L. 4 0
2890 *Cargillfe* U. Br. 11373 *Royena* L.

350. ORDER CXXIII. BREXIEAE.

Genus 1, Species 3; Hot-house Species 3; Green-house Species 0; Hardy Ligneous Species 0;
Hardy Herbaceous Species 0. \pm 0 feet; £ 0 feet; * 0 feet

A very obscure order, its place in the Natural System is extremely doubtful. Fine trees with the habit of *Theophrastus*, and with axillary bunches of white flowers. Cuttings.

523 *Brexia* Nor.

351. ORDER CXXIV. OLEACEAE.

Genera 11, Species 124; Hot-house Species 11; Green-house Species 23; Hardy Ligneous Species 90;
Hardy Herbaceous Species 0. f 1374 ft. \gg £ 0 feet \gg S 0 feet

The olives are known by their monopetalous corolla, with a valvular aestivation, two stamens alternate with the segments, a bilocular ovary with no discus at the base, and pendulous collateral ovula. They were formerly commonly cultivated with the jasmynes. They have all similar odors to their flowers either bitter and astringent; these properties are particularly apparent in the ash, which has often been successfully as a febrifuge. From the exudation of many species of that genus, the mild purgative called is formed; it is most commonly found upon the *Oleum europæum*. M. Decandolle remarks, that in proof of the natural affinity of the plants here combined, and of the propriety of separating the jasmynes from them, he has found that all the olives, as now restricted, will bud or graft upon one another, but not on the *Jasminum*. Thus the lilac will graft on the ash, the *Chionanthus*, and the *Fontansea* and even upon *Phillyrea* and the olive will take upon the *Phillyrea*, and even on the ash. Cuttings, layers, and by grafts or buds.

----------------	--	-------------------	--	-------------------

354. ORDER CXXVII. APOCY'NEA

Genera 36, Species 145; Hot-house Species 115; Green-house Species 14; Hardy Ligneous Species 9; Hardy Herbaceous Species 7. f 7 feet; j£ 8 feet; ± 0 feet.

now turn from the contemplation of plants endowed with mild and agreeable properties, and fragrant
y-t... and often bearing food for man, to others which are among the most delegerous and mtaumous;
nose juices though milky are not a wholesome and delicious beverage like those of Saptea, but, on the contrary,
jina caustic, or bitter. They are readily known by the twisted direction of the segments of the corolla, which
lar > compared to the rays of a Catherine's wheel, whence they were called by Linnrous, Contort*. By
Vin... greatest part of the order consists of tropical trees and shrubs; a few Apocynums, Amsonias, and
are natives of the colder zones of the earth. Many are elegant climbers, as the different species of
and Melodlnus. The splendid Oleander belongs to JVtrium; the different species of Plumitria, Cam-
Strophanthus, and Ardulno arc stove plants of the greatest beauty. The medicinal action of these
is highly powerful. In general, the Apocyns are acrid, stimulating, and astringent; these principles,
hiff in excess) act so powerfully on the nerves as to produce stupefaction. The root of Ophi6xylon is very
Ph... and purRative: under the name of snake-root it is used in India as an antidote to the bites of serpents,
e bark of Cerbera Mnehas is purgative; of ifchites antidyscnte'rica, and the Wrightfo of the same name,
la. PKt-ut and febrifugar: the leaves of the Finca arc so astringent, that they have been used successfully in
fining, those of A'trium Oleander are said to abound in free gallic acid. The inspissated juice of a species
er w^A known in Mexico under the name of Ycotli, is a fatal poison. Cuttings or divisions.

Resident at Augusta, in Georgia.</p> <p><i>Zuccarini</i>. <i>G. Zuccarini</i>. Author of a monograph on the genus <i>Oxalis</i>, and of other papers.</p> |
|--|--|

ADDITIONAL ABBREVIATIONS.

- Hybrid. Known or presumed to be hybrid, but where raised not precisely known.
 English hybrid, Scotch hybrid, &c. Hybrid, with the country in which it has been raised stated.
 Gardens. Varieties which have appeared and are preserved in gardens.

FIRST ADDITIONAL SUPPLEMENT.

The alphabetic mode of arrangement has been adopted to avoid the necessity of a second Index. The number prefixed to each genus and species declares the relative place for each in the Hirtus; and such genera as have not been inserted there have here a star (*) prefixed to them, their etymology given, and their Linnean class and order, and Natural order, stated. In the copies of the Hirtus Britannicus which may hereafter be printed, stars will be inserted into the plates wherever the additions made in the Supplement come in, in order that the reader may be apprised of their existence, and lose as little time as possible in turning to them.

The species to which this character (\$) is prefixed are those which have been raised in the Exotic Nursery of Mr. Joseph Knight, King's Road, Chelsea, from seeds collected and brought home by Mr. Baxter. The names of these species have been verified and authenticated by Mr. Knight's very able and intelligent foreman, Mr. Alexander Scott, who, while he trusts that each may be found accurately denominated, nevertheless reminds us that Proteaceous plants are subject to great variation in foliage, in their progress upwards from a seedling state. Besides the above, Mr. Baxter's seeds have produced various other species of *Banksia* and *Dryandra*, and species of *Pectis*, *Oxylobium*, *Mirbella*, *Gomplomaum*, *Hévea*, *Burtonia*, *Pultenaea*, *Brachysema*, *Kennedyia*, *Daviesia*, &c.: many of which, when farther advanced in growth and age, may prove to be new species.

Whoever wishes to ascertain the additions and improvements made subsequently to the present *Additional Supplement* may consult the *Gardener's Magazine* in which, under the article, which will henceforth be contained in every number, entitled, "Floricultural and Botanical Notices of New Plants, and of Old Plants of Interest, supplementary to the latest editions of the Encyclopaedia of Plants, and of the Hirtus Britannicus," will be found the name of every plant newly introduced or originated, and every recent improvement in botanical nomenclature. At the close of every year, or of every two or three years, according to the accumulation of matter, these names and improvements will be collected and published in additional Supplements similar to the present one.

 Professor Lindley has remarked, Bot. reg. 1350., that he has proof that 11350. represents the 1* pal-
 lida of Hortus Kewensis, which he identifies also with that of Thunberg; and he considers t. 314. of
 Bot reg. to represent but a smaller variety of the same species; but remarks, " the supposed variety
 figured at t 287. of this work is altogether another species." Agreeably with this view, a new specific
 epithet, with the name of its author, are wanting for No. 9015. of Hortus Britannicus.

	In 1830, M. Decandolle sent to the collection of the Horticultural Society the follow'ng species of this genus; clongata, thnuis, echinaria, subangularis, subcrocea, intertexta, minfortnis. These names are not in the Hortus Britannicus, and although some of the Cactean plants (see under Cereus and OpAntia) sent by M. Decandolle may have died in the Horticultural Society's collection, yet as they have possibly been also sent to other collections, it is deemed proper here to register the names and the details relative to each will be supplied in a future Supplement
