| HARES.      | Indian Hares.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FOOD.<br>39 | Food.—All the species of Lepus are probably used as articles of Ifood,<br>but they are as a rule dry and tasteless, and by no means so good for,<br>the table as the European hare. In his list of "Mammals used for Food<br>in the <i>Industrial Survey of India</i> , Dr. Forbes Watson mentions Lepus<br>nigricollis, L. pallipes, L. peguensis, and L. ruficaudatus. Of these L.<br>nigricollis is generally considered the best, one writer describing it as<br>"nearly, if not quite, equal to the English hare in flavour." |
| FUP.<br>40  | Domestic—The FUR is valuable in trade, being used largely for linings,<br>cloaks, &c, also in the manufacture of felt for hats. Referring to the<br>latter use, the author of the article "Hare" in <i>Spons' Encyclopedia</i><br>writes: "It is about the best hair for hat-maker's purposes." In his list<br>of "Furs and Fur-bearing Mammals" Dr. Forbes Watson gives only<br>Lepus nigricollis, L. pallipes, and L. ruficaudatus, but the other species<br>found in Thibet and YaVkand are doubtless equally valuable.         |
| 4 <b>I</b>  | Lagomys, Cuv.<br>THE PIKAS, OR MOUSE-HARES.<br>A genus of small and robust animals, short-eared and tailless, referred by<br>Jerdon to the family of Leporidae or Hares, but separated by Blanford,<br>in his account of the Mammalia of the second Yarkand Mission, as a distinct<br>family, Lagomyids. It is convenient for the purposes of this work to con-<br>sider them under Jerdon's classification as Hares. The species are: —                                                                                           |
| 42          | 1. Lagomys auritus, W. Blanf.<br>Habitat.—A species differing from L. roylei in having much longe<br>ears and a lighter colour. Found on the Panong lake, but probably als<br>a native of other parts of Laddkh.                                                                                                                                                                                                                                                                                                                   |
| 43          | 2. L. curzonis, <i>Hodgson</i> ,<br>Vem.— <i>Phise-karin</i> , KoRZAK.<br>Habitat.—The higher ranges of the Himálaya from 14,000 to 19,00<br>feet. It has been found in Laddkh and Sikkim.                                                                                                                                                                                                                                                                                                                                         |
| 44          | 3. L. eriseus, <i>W. Blanf.</i><br>Habhat.—Resembles L. auritus, but amongst other differences ha<br>longer and softer hair, of a grey colour. Found in the Kuenlun Range i<br>Yarkand, south of the Sunju pass.                                                                                                                                                                                                                                                                                                                   |
| 45          | 4. L. ladacensis, <i>Günther</i> .<br>THE LADAKH PIKA.<br>Vern.—Zabra, karin, phise karin, LADAKH.<br>Habitat.—A species found in the high plateaux of Lddakh, with a fu<br>and very soft fur, and separated by Blanford from L. curzoniae, wi<br>which it was formerly supposed to be identical.                                                                                                                                                                                                                                  |
| 46          | 5. L. macrotis, <i>Günther</i> .<br>Retained by Blanford as a distinct species, though he is strongly d<br>posed to suspect that L. auritus is the summer, and L. macrotis, t<br>winter, form of the same species. First described by GUnther, found<br>the Second Yarkand Mission, at a place called Duba on the north side<br>the Kuenlun.                                                                                                                                                                                       |
| 47          | 6. L. roylei, Ogilby.<br>THE HIMALAYAN MOUSE-HARE.<br>Vern.—Rang-rünt, or rang-düni, KUNAWAR.<br>Habitat.—The Himalaya from Kashmir to Sikkim. The species w<br>first made known through a specimen obtained by Royle from the Ch<br>Mountain, near Simla.                                                                                                                                                                                                                                                                         |
| <b>4</b> 8  | 7. L. rufescens, <i>Gray</i> .<br>Habitat.—Afghanistan and Persia.<br>H. 48                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Hartshorn; Iv                                                                                                                                                                                                                                                                                                                                                                                              | у,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | (J. Murray.)                                                                                                             | HEDERA                                                                                |

| mixed with the leaves of Luculia as a blue dye, but he expresses his opinion<br>that it is of value more as a mordant than a real dye. Dr. Q. Watt,<br>however, in the Calcutta Exhibition Catalogue, remarks: "I found no<br>trace of the use of either species (H. capitellata and H. scandens) as a blue<br>dye among the Nagas; although both plants are very plentiful, the Nagas<br>regularly import from Manipur and Assam the <i>room</i> dye (Strobilanthes<br>flaccidifolius)." Dr. Schlich says of H. capitellata, <i>Wall</i> .: "The Lep-<br>chas grind up the green leaves and steep the article to be dyed in the<br>infusion." "It yields a <i>green</i> dye."<br>From the preceding remarks, as also those under Baccaurea sapida,<br>(Vol. I., 362) it is clear that there must be some mistake regarding this dye-<br>stuff, and it therefore seems highly desirable that the whole subject should<br>be re-investigated. Definite information is wanting as to the actual species<br>of Hedyotis used by the Lepchas, as to whether it be used as a true dye<br>or as a mordant, and as to the plant mixed with it (if any) to produce the | DYE.                         |

| HEDYSARUM, Linn.; Gen. PL, /., 5/0.<br>A genus of herbs, belonging to the Natural Order LEGUMINOS^E, which numbers amongst its species the valuable European fodder plant, the Sainfoin, H. onobrychis, Linn. The eight Indian species, however, seem to be of no value as fodder; though a new species, H. Wrightianum, Aitch. et Baker, discovered by Aitchison while with the Afghan Delimitation Commission, is described by him as being greedily eaten by goats and sheep. No attempt seems up to this time to have been made to introduce the cultivation either of Sainfoin or of the Spanish Sainfoin (H. coronarium) into India, a fact probably due to the large number of indigenous fodder plants already available.<br>HELIANTHUS, Linn. / Gen. PL, II., 376.<br>A genus of coarse tall herbs (of the Natural Order COMPOSITE,) which has no species indigenous to India. Two, however, are much cultivated, and are very important economically.                                                                                                                                                                                                | 73.                          |

|                                                                                              | Habitat.—An annual herb, bearing large, flat, circular flower-heads;<br>said to be a native of Mexico and Peru, and to have been introduced into<br>Europe about the end of the sixteenth century. It may be of interest to<br>note that the <i>A/tdbt</i> , or sun-flower, is mentioned in the <i>Ain-i-Akbari</i> as<br>a flower cultivated for ornamental purposes during the reign of Akbar.<br>It is largely cultivated in China and Tartary, also in Russia, Germany,<br>Italy, and France, and to a small extent in India, where, however, it is<br>chiefly grown in gardens. It succeeds well in gardens in the plains,<br>flowering during the cold season, and in the hills during the summer; in<br>many hill stations indeed, and markedly so in Simla, it has spread from<br>the gardens to the hill-sides, and, with the <i>dahlia</i> , is rapidly becoming<br>naturalised.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CULTIVA-<br>TION.<br>75                                                                      | Cultivation.—The experimental cultivation of the sun-flower in India<br>was first undertaken at Bangalore in 1873, for the purpose of testing its<br>value in the reclamation of marshy land, and its efficiency in removing<br>malaria from swampy districts. This latter virtue had been drawn atten-<br>tion to in a paper presented to the Soci&e" de Th£rapeutique, which de-<br>scribed the wonderful effects obtained by its cultivation in Holland. These<br>experiments, however, proved that the malaria-dispelling virtues, attributed<br>to the plant, did not exist, though the drainage which had to be employed<br>before it would thrive, naturally improved the climate of the district. Havi ng<br>thus begun, the cultivation of the sun-flower was continued, up to the end of<br>1877, with the view of utilising it profitably in the extraction of the oil, and<br>other economic products to be obtained from its seeds, stem, &c. The last<br>official report regarding the results of this continued cultivation, however,<br>dated November 1877, contains a resolution by the Government of<br>India, to the effect that pending the receipt of reports on the chemical<br>analysis of the oil, it did not seem necessary to continue the experimental<br>cultivation further. This decision was based on the fact, that the results, up<br>to that time, proved that the cost of production of the oil did not permit of<br>prohcable cultivation. Since the date of this decision, no further efforts<br>seem to have been made.                                                                                                                                                                                                                                                                                     |
| DYE.<br>Blossoms.<br>• 76<br>Seeds.<br>77<br>FIBRE.<br>Stalks.<br>78<br>OIL.<br>Seeds.<br>79 | Dye.—According to Balfour "the BLOSSOMS yield a brilliant, lasting,<br>useful dye." Crookes states that the petals are peculiarly rich in the<br>amorphous resinous substance— <i>Xanthin</i> —the base of the yellow pigment<br>from which they derive their colour. The SEEDS contain <i>helianthtc acid</i> ,<br>which, when treated with hydrochloric acid in a current of hydrogen, is<br>resolved into glucose and a violet dye.<br>Fibre.—A useful textile fibre is obtained from the STALKS, (Spons <sup>9</sup><br>Encyclopaedia; Balfour's Cyclopaedia, &c).<br>Oil.—The OIL obtained by expression from the SEEDS is the most impor-<br>tant product of the sun-flower, and is valuable for many purposes. When<br>pure it is said to be equal to olive or almond oil for culinary and table pur-<br>poses; indeed, it is much used for adulterating these more valuable oils,<br>especially in Russia. The oil obtained from the plants grown at Banga-<br>lore, however, was found to be greatly inferior for table purposes. Further,<br>in a report on the subject by the Superintendent of the Experimental Farm,<br>it is stated that the Madras Railway Company condemned it as an<br>illuminating oil, after a series of trials, since they found that its thinness<br>unfitted it for fast running trains; the Superintendent of the Central Jail<br>found that it dried too slowly to be useful in paint; the Ordnance Depart-<br>ment found that it answered all the purposes required in the arsenal, but<br>the price at which it was offered was greater than that of the equally good<br>Kangoon oil. It was found also that four times the quantity as compared<br>with castor oil was required for lubricating machinery, thus necessitating<br>extra attention, and consequently increased expenditure. | LSORA.                                          | duce their sunflower-like blossoms in abundance; these possibly it would<br>be of considerable advantage to remove before they open. When the tubers<br>are taken up they skould be stored away in large flower-pots, well covered<br>with earth, or they will be liable to shrink and shrivel from "exposure to<br>the air." The Director of Land Records and Agriculture, Bengal, how-<br>ever, writing of the propagation of this plant by seed, directs that they<br>should be sown in August so as to allow of the removal of the plants in<br>November without disturbing the roots. The following report regarding<br>its cultivation in Bombay has also been received from the Director<br>of Land Records and Agriculture, Poona : "This vegetable is sparingly<br>grown; it is propagated Dy uiDers and requires ncn 10am. *u «»^ 1+~ t                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| FIBRE.<br>Stems.<br>90<br>FOOD.<br>Roots.<br>91 | part of May the eyes are planted    feet apart in furrows at a depth of<br>about three inches, and are watered every tenth day. As the plants grow<br>they should be earthed up like potatoes. The plants flower by the end ot<br>August, when watering is stopped, and after the plants have dried up the<br>crop is dug out. The tubers for the next year's propagation are kept<br>buried in sard in the shade. The acre yield is at about 3 tons."<br>Fibre.—The STEMS are said by Balfour to yield a rich textile fibre.<br>Food.—The TUBEROUS ROOTS are used as a vegetable. Champlain,<br>in 1603, found the root thus employed by the natives of North America;<br>he wrote, that they ate " roots which they cultivate and which taste like an<br>artichoke."<br>The plant was brought to Europe as already described, thence prob-<br>ably it was introduced into India, where it is much eaten by Europeans and<br>to a small extent by Natives. In Kathiawar it is boiled in milk, and is<br>considered, by the Natives, a strengthening vegetable. It is generally<br>said to be more wholesome and nutritious than the potato, and may be<br>given to invalids when abstinence from other vegetable food is neces-                                                          |

Habitat.—A large arborescent shrub of the dry forests throughout Central and Western India, as far west as Jamu, the Central Peninsula, and Ceylon. (*Fl. Br. Ind.*). According to Stewart and other writers it is found wild in the Siwalik trac for some distance into the Panjáb.

Fibre.—The FIBRE extracted from the bast is strong, thin, silvery, and reticulated, and when combed resembles jute in appearance. In the report on Indian Fibres by Cross, Bevan, King and Watt, the following analysis is given: moisture, io\*8; ash 3\*1; cellulose, 567; and as the result of hydrolosis, a (by boiling for 5 minutes in a 1 per cent, solution of caustic soda) 12\*0, b (by boiling for an hour) 202 per cent, of weight were lost. The length of the ultimate fibre is 1–2 mm. The fibre is very useful for cordage, rough sacking, and canvas, and would appear also to be suitable for paper-making. The following extract from the report of the Madras Experimental Farms for 1884 is of interest: "This fibre, a sample of which was exhibited at the Madras Agricultural Exhibition of 1883, and attracted the attention of the judges, was identified by Professor Lawson as H. Isora, and enquiries were instituted to ascertain its local distribution and the quantity that would be likely to be available for commerce. It is found chiefly in South Kanara, Malabar, Kurnul, Ganjam, and Coimbatore, but there is nothing known as to the quantity that could be made available accurately for trade. A sample was procured from Kurnúl and forwarded to Messrs. Arbuthnot & Company for trial, but from a report that has been recently received from them, it would not appear that this fibre is suitable for weaving. It is probably adapted only for cordage.' The report makes no reference to any trial having been made of it as a paper-making material.

Medicine.—The CAPSULE, which consists of 5 linear, many-seeded carpels, spirally twisted, and terminating in a thick point to form a cone from if to 2 inches long, has long been employed medicinally in India, and is still one of the commonest bazar drugs in most parts of the country. Its use, however, seems to depend almost entirely on the ancient " theory of signatures," the peculiarly twisted carpels being supposed to resemble the folds of the intestine. It is accordingly chiefly employed in intestinal complaints, entering into most native prescriptions for colic, flatulence, diarrhoea, and intestinal strangulation. In the Konkan itJs said to be also used as a remedy for snake-bite, and in diabetes. AinsTie describes its employment also, in powder, mixed with a quantity of castor oil, as an application for discharge from the ear. The authors of the *Pharmacographia lndica* consider that its chief virtue lies in its harmlessness, and they have been unable to discover any therapeutic properties in the plant, beyond those of a demulcent and mild astringent. Moodeen Sheriff, on the other hand, describes it as •' tonic and stomachic, and useful in all the diseases for which gentian and chiretta are ordinarily employed," and recommends it for these purposes in doses from one to two drachms twice or thrice a day. The Revd. A. Campbell describes the ROOT and BARK as also employed medicinally by the Santals for the same purposes as the fruit.

### Heliotrope.

## (J. Murray.) HELLEBORE.

Habitat.—A small annual herb, common throughout India, especially in the moister parts. According to Roxburgh it is most often found in out-of-the-way corners, and amongst rubbish where the soil is rich. Medicine.—Irvine describes the LEAVES as employed in Patna in cases of fever, the dose given being from half a drachm to three drachms. 103 Ainslie, recounting its medicinal properties, says: "The JUICE of the leaves of the plant, which is a little bitter, the native practitioners apply to painful gum-boils, and to repel pimples on the face; it is also prescribed as an external application to that species of ophthalmia in which the tarsus is inflamed or excoriated." He further adds, " I find B rah am tells us that it cleans and consolidates wounds and ulcers, and that, boiled with castor oil, it relieves the pain from the sting of a scorpion, and cures the bite of a mad dog." It thus, in its last given properties, resembles the immedi-a.ely preceding species. Dr. Dymock writes that " in Bombay the PLANT Plant. is used as a local application to boils, sores, and the stings of insects and reptiles." 105 Heliotropium strigosum, Willd./ FU Br. Ind., IV., 75/. In the Flora of British India H. brevifolium, Wall., is reduced to be x06 a variety of this species (var. brevifolia), and H. compactum, Don, is given as a synonym for that variety. VeTn.—Safed-bhangra, chitiphM, tlinn.; Safed bhangra, kharai, tindu, gorakh pánto (chiti phul, gorakh pdnu=ba.zir plant), PB.
References.—Stewart, Pb. PL, IS4; Aitchison, Cat. Pb. and Sind PL, 94; Baden Powell, Pb, Pr., 360; Atkinson, Him. Dist., 314, 739: Indian Forester, XII., app., 17; Gazetteers, N.-W. P., IV., lxxv.; Bombay, XV., 439. Habitat.—A small plant, according to the Flora of British India, common throughout India, especially the variety brevifolia. It appears to be only described as of economic value, however, by writers on the Panj 4b, North West Provinces, and Sind. Medicine.—The whole PLANT has laxative and diuretic properties. MEDICINE. According to Atkinson and Baden Powell, the JUICE is employed as an application in ophthalmia, presumably granular, and gunv6oils, for the 107 purpose of promoting suppuration, and to wounds and ulcers to hasten healing. Like that of the other species already described its juice is 108 supposed to have curative powers in cases of poisonous bites and venomous stings. **H. undulatum,** Vahl.; FL Br. Ind., IV, 130. 109 Syn\*—HELIOTROPIUM PERSICUM, Lamk.; H. CRISPUM, Desf.; H. BRIO-CARPUM, Delile; H. RAMOSISSIMUM, Sieb.; H. AFFGHANUM, Boiss.; LITHOSPERMUM HISPIDUM, Forsk. This species has, according to the Flora of British India, two varieties, one, the typical F. undulatum, the other, var. suberosa, to which H. nubi-CUtn, Bunge, has been reduced. Vern.—Pipat-buti, jati misdk, PB. References.—Boiss., Fl. Orient., IV., 143, 147; Stewart, Pb. PL, 154; ^ Aitchison, Cat. Pb. and Sind PL, 95; Afghan Del. Com., 88. Habitat.—Found in the Panjab, Sind, and the Upper Gangetic plain, reaching a height of 1,000 feet; distributed to Western Asia and North Africa. Medicine.—Stewart describes this PLANT as being, like H. strigosum, of MEDICINE. Plant. value in snake-bite, in which cases it is both administered internally and applied externally to the wound. As an external application it is some-110 times employed mixed with tobacco oil. Hellebore! Green; see Veratrum viride, Aiton; LILIACEJE. H no

It is a native of Central and South Europe, extending eastwards to South Poland and westwards to Dauphiny and Provence. According to Boissier it is also indigenous to Greece.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MEDICINE.<br>Root.<br>112 | "Ainslie says, with a degree of hesitation and doubt, that the plant which<br>yields this drug is met with in Nepal, and he gives the above vernacular                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ſ                         | <b>names for it.</b> Dr. W. O'Shaughnessy, in his <i>Bengal Dispensatory</i> , giver<br>an abstract of Ainslie's information, and is followed by Birdwood in his<br><i>Bombay Products</i> , K. L. De in his <i>Indigenous Drugs of India</i> ,' and<br>later still, Murray in his <i>Drugs of Sind</i> . All these authors have simply<br>compiled from Ainslie, altering the original information only so far as to<br>remove the hesitation with which Ainslie published the statement that<br>Hellebore was produced in Nep4l. But even Ainslie derived his inform-<br>ation from Dr. Kirkpatric, who writes that it is known in Nep4l as <i>kutka</i><br>and that it also reaches India by way of the Red Sea. As a matter of<br>fact, however, the plant has never been found in Asia in a wild state, and<br>if it exists in India at all it could only be in flower gardens at our hil<br>stations, but it is doubtful if it could grow even there much below an alti<br>tude of io£.oo feet. Muhammadan physicians do, however, prescribe a<br>drug which is known as Hellebore, as also many others which neither<br>grow nor are imported into India. Dr. Royle explains this by stating<br>that the Muhammadans obtained their medical science from the Arabiar<br>physicians, who, in their turn, learned it from the Greek authors. Euro<br>pean plants have thus come to be known by name in India, and Royle<br>includes in his list of such, the roots of the black Hellebore, remarking<br>that the druggist, trusting to the indifference of the physician and the<br>ignorance of the patient, substitutes for such drugs others with supposed<br>similar properties. This is remarkable and curious: the symbolic " Recipe<br>being apparently in the eyes of the physician of more importance than th<br>ingredients of the mixture, for one cannot quite believe that he is wholl<br>ignorant of the non-existence of the medicines he has prescribed. It i<br>amusing how persistently even the commonest <i>hakim</i> will mysteriously |
| ۰<br>,                    | mention the almost sacred Greek synonyms for his drugs. A knowledg<br>of such matters seems to constitute his highest credentials.<br>"I have already drawn attention to the fact that Actaea spicata and<br>Cimicifuga foetida (two common Himalayan plants related to Hellebore<br>are apparently not known by the Indian doctors to possess medicina<br>properties. They are largely used as drastic purgatives in adulteration<br>with Hellebore, both in Europe and America, besides possessing certain<br>distinctive medicinal properties." Dr. Watt, revising the above paragraph<br>has kindly, added : « According to Drs. Moodeen Sheriff and Dymock<br>nowever, Muhammadan physicians substitute the root of Picrorhiza Kuroo<br>H. 112                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Structure of the Wood.—Hard, close-grained, resembling boxwood.<br>The longitudinal flutings characteristic of the stem are, in Ceylon, split off<br>and employed to make axe handles. There is no account of this close-<br>grained hard wood being employed for the purposes of turning, &c, for<br>which it would seem to be well suited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | • тімвек.<br><b>11б</b>  |
| Hemicydia sumatrana, MuelL; FL Br. Ind., V., 338.<br>Reference.—R urz, For. FL Burma, II., 365.<br>Habitat.—An evergreen tree, from 30 to 50 feet in height, inhabiting the<br>tropical swamp forests of Martaban and the Irawaddi in Burma, and the<br>Andaman Islands.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 117                      |
| Structure of the Wood.—Heavy, pale greyish brown, coarsely fibrous but^lose-grained though soft. A fine wood. ( <i>Kurs</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | TIMBER.                  |
| HEMIDESMUS, Br.; Gen. PL, II.; no.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                          |
| A genus of the Natural Order ASCLEPIADEJE, having only one Indian species.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                          |

| MEDICINE,          | branched, 7he fresh or fre hl, dried root has colour $< f$ to*** beans or<br>mellit, an.7 sweet b utsh chily acrid taste.: (Dymock.) It was first<br>in troduced to the med brotessit in the British Pharmacopoeia, while in 1831. and<br>in 1864 it was adeofficial in the British Pharmacopoeia, while in 1868<br>i. was include, amongst the drMgs in the Pharmacopoeia of India. Dutt<br>informs us (Hinwd MaA Med) that the roots of Hemidesmus and Ichno-<br>carpus frut TL are oth called Sdr*** in Sanskrit medicine, and are<br>described under the name of Sdrivddvaya or the two Sdrivds. They are<br>often used Aether, StrMe the Hindus consider both as tonic, sweet, demul-<br>cent, And alteratily e, and they prescribe them in dyspepsia, loss of appetite,<br>skin diseases, syphilis, and leucorrhcea. By native practitioners the SMvd<br>informs is cases of gravel and strangury, given in powder, mixed<br>with cow's milk; they also give it in decoction, in conjunction with cummin<br>see as, to purfy the blood and correct the acrimony of the bile.'' Hefur-<br>iner mentions that in his time the decoction was employed by European<br>practitioners in India as a substitute for true sarsaparilla, ''in cutaneous dis-<br>eases, scrofula, and venereal affections to the quantity of Jiii or Xvw three<br>times a day.'' '00                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| c<br>Juice.<br>122 | Roxburgh wrote: "The natives employ them " (the roots) "in medicine<br>more than we do, particularly for the thrush in children. For this<br>disorder the dried bark is powdered and fried in butter, the proportion<br>uncertain as is often the case with Hindu prescriptions, the quantities being<br>" $ff!^{era} \pounds^{ue}$ about a drachm of this is given, night and morning."<br>The medicinal properties of Hemidesmus seem to be either unknown or<br>unappreciated in the more northern parts of India, where it is very seldom<br>employed. Thus Dr. Dymock writes : "In the northern part of the<br>com bay Presidency its medicinal properties appear to be ignored, as, though<br>compon everywhere in the neighbourhood of Bombay, it is never collected<br>qy tne Mtives." In the more southern parts of the Konkan, however, he<br>aescribes it as extensively employed. The MILKY JUICE is used in that<br>region as an application to the conjunctiva in ophthalmia; the root, roasted<br>in plantain leaves then beaten into a mass with cummin and sugar, and<br>mixed with $gh\%$ as a remedy in genito-urinary diseases, and also as an<br>external application or $Up$ for swellings. Great difference of opinion<br>exists amongst European practitioners regarding the efficacy of this plant<br>s an _alterative, but it is generally regarded as at least an efficient<br>substtute for Sarsaparilla. In England it is very little employed except<br>at St. Bartholomew's Hospital, where it has for many years taken the<br>place of Sarsaparilla. There seems to be no doubt that the roots ought<br>to be employed when fairly fresh, and that their medicinal virtues decrease<br>greatly as they become old and dried up. For this reason it appears prob-<br>able, that the specimens sent to Europe may have been inferior to those<br>obtainable in this country: the authors of the <i>Pharmacogra phia</i> indeed<br>observe." the root found in the English market is often of very bad |

| The following are the determined species of the locality in which fodder plant is said to be collected :—<br>H. Jacquemontii, C. B. Clarke; H. Brunonis, Benth.; H. canesce Lindl.: H. candicans, Wall.; and H. nepalense, Don. {Fl. Br. Ind., 711—7/7.) Of these the two last are the most frequent, and it see probable that Stewart's H. sp. may be either the one or the other.<br>Herba Bengalo.<br>Several old writers, amongst others Linschoten, Mandelso, the Ab Guyon, Fitch, and Hamilton, give an account of a fibre obtained fr a plant under the above name, from which hangings, coverlets, &c.f w made. It is impossible, from the confused and contradictory description of these early travellers, to identify the plant referred to; indeed, it see probable that several the plant are plant under the descent of the confused and contradictory description of these early travellers, to identify the plant referred to; indeed, it see | ens,<br><i>II.,</i><br>ems<br>be*<br>om<br>vere<br>ons<br>ems                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| HERITIERA<br>Papilio | butions towards a knowledge of the Burmese Flora); BALANOPTKRIS<br>TOTHILA, Geerin.<br>Vetil.—SUnder, sundri, BENG.; Sundri, BOMB.; Penglai-kanaso, Pinle<br>kanazo, BuRM.; Etúna, SING.; Mawtda, AND.<br>References.—JRoxb., FL Ind., Ed. C.B.C., 506; Kurz, For. Fl Burne,<br>I., 141; Gamble, Man. Timb., 47; Thwaites, En. Ceylon PL, 28; Dale.<br>& Gibs., Bomb. FL, 22; Rheede, Hort. Mai., VI., t., 21; Trimen,<br>Cat. of Flowering Plants, &c, of Ceylon, 12; Mason, Burma and It*<br>People, 536, 753; Indian Forester, II., 174/ VI., 292, #6* V <sup>in</sup> <sub>TY</sub> 4°* \<br>IX., 324; XI., 490; XII., 64, 329; XIII., 126; Balfour, Cyclop., H. 39 ><br>Gazetteers;—Mysore and Coorg, I., §8; Burma, I., 127.<br>Habitat.—A small, gregarious tree found on the coasts of Bengal,<br>the Eastern and Western Peninsulas, and Ceylon, extending inland as tar<br>as the Khasia Hills and Cachar. It is known to Europeans in some parts<br>of India as the Looking-glass tree, owing to the dense silvery 'hairs witn<br>which the under-surface of its leaf is covered.<br>Oil.—This TREE is reported to be the source of an oil in the Antilles,<br>the use of which is not known.                                                                                                                                                                                                                                                                                                                                                                                      |
|                      | It is the chief timber of the Sundarban forests. Its reproduction is most<br>favourable. On all lands flooded by ordinary flood tides, a new growth<br>of jungle springs up immediately; but on land ordinarily above high-<br>water mark, it only establishes itself by slow degrees. It soon spreads<br>on newly formed islands on the sea edge of the forests. The Sundrt<br>forests are generally very well stocked; thus valuations made by Morri-<br>in 1873-74 gave the average amount of material per acre of forest, as<br>follows :—seedlings and saplings under 3 feet girth, 2,487; trees above<br>3 feit girth 182'' (Gamble). The above description resembles that given by<br>Kurz for the wood of H. Fomes, while his account of that of H. littoralis<br>differs considerably- He writes: '' Wood brown, rather light and close-<br>grained.'' This account is confirmed by the Burma Gazetteer, /., 127*<br>where it is reported ''Peng-le-ka-na-tso (H. littoralis) is found in the tidal<br>forests, and yields a brown, light, and rather loose-grained wood, used<br>locally for house posts and rafters and for firewood by salt boilers.'' It<br>seems probable that some mistake exists as to the exact botanical source<br>of the Sundri wood of the Sundarbans. Both H. Fomes and H. littoralis<br>seem equally frequent; they appear to have the same vernacular names,<br>and have almost exactly the same habitat, all of which circumstances<br>would render confusion very possible.<br>It is worthy of notice that Mason, in his Burma and Its People, fully |
| trade.<br>140        | describes H. Fomes under the vernacular name of <i>Sundri</i> , and, on the other hand, leaves the timber of H. littoralis, with which he seems unac-<br>quainted, undescribed. It is impossible with the present literature on the subject to determine where the error lies, but it is to be hoped that further information may be forthcoming.<br>Trade.—In the Forest Progress Report for Bengal, 1881-82, it is men-<br>tioned that <sup>u</sup> niore than a lakh of rupees was received on <i>Sundri</i> wood (H. littoralis)." This indicates a very large consumption, which its highly useful event                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 141                  | useful qualities would seem to warrant.<br>Heritiera Papilio, Beddome, Fl. | Habitat.—A very lofty tree in the evergreen forests of Travancore<br>and the Southern Carnatic. at Courtallam and Tinnevelly.<br>Structure of the Wood.—Red, very hard, similar to that of H. littora-<br>lis, but pores less numerous and smaller. It weighs 631b per cubic<br>foot, and is used for building, cart poles, and agricultural implements. In<br>Vol. III. of the <i>Indian Forester</i> it is given in a list of the most valu-<br>able timbers of the Tinnevelly District.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | TIMBER.<br>14.2                            |
| [1873, 61; Trim. Journ. Bot., 18J4, 66, f. 7.<br>Heritiera macrophylla, Wall.; Kurz in Journ. As. Soc, Beng.,<br>Habitat.—Upper Tenasserim and Martabs.n. No information exists re-<br>garding the timber of this tree, nor of its economic uses, but as it has up to<br>a recent^date been confused with H. littoralis, <i>Lryand.</i> , it seems probable<br>that its wood may resemble the timber of that tree in structure and qualities.<br>HermodactylllS, see Colchicum sp., Vol. II., 501.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 143 ·                                      |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                            |

|------------|---------|

the plains and on the hills of the Panjab and North-West Provinces. It grows in light soil about Banda, attaining a height of about 3 feet; in soil mixed with kunkur (*rakar*) it reaches 55 feet in height (*Miller*). It is coirmun on the rock tablelands of the hilly country south of Allahabad (*Benson*). Abundant also on the warm lower slopes of the Himalayas, and up to an elevation of 7,000 feet in some parts."

Fibre.—The grass is used as a fibre in the manufacture of coarse mats, &c.

Fodder.—It is largely used as fodder both before and after it nas flowered, but chiefly when it is young and tender. In Rajputana and Bundelkhand, where it constitutes the principal fodder grass, it is cut ana stacked after the rains, and will, it is said, keep good in stack for twelve years. On Mount Abu the people consider it the best fodder grass tifey have (*Duthie*). Symonds mentions that it is good fodder, when green, for cattle and horses, and Maiden, in his Useful Native Plants of Australia,  $wp^{1} \wedge, ^{1}$ , "A splendid grass for a cattle run, as it produces a great amount of feed: In the Settlement Report of Nursingpore, on the other hand, the grass is said to be "almost useless, as even horned cattle object to it when they can get anything else." This observation probably refers, however, to trie plant which has been allowed to seed before it has been cut, in which condition its hard spear-like awns are naturally objectionable.

DOMESTIC.

167

Domestic Uses.—It is much employed in many parts for thatching. Hevea braziliensis, *Müll. Arg.*, see India-rubber, p. 365.

## HIBISCUS, Linn.; Gen. PL, /., 207, 982.

A genus of MALVACEAE, including some 33 Indian indigenous, and several introduced, cultivated species, many of which are of considerable economic value, while nearly all might be utilised for the fibres they contain. Regarding the confusion which at present exists owing to the indiscriminate application of th&name HEMP to plants of this genus, Dr. Watt, in the "Selection-, from the Records of the Government of India, Revenue and Agricultural Depaitment, Volume 1., "states: "So much confusion exists in the writings of Indian authors regarding the word \* Hemp' that it has been deemed desirable to make an effort to establish a more trustworthy mode of expression. It would, indeed, have been to the advantage of Indian commerce at the present day had Dr. Royle's remark on this subject, made nearly half a century ago, been carefully observed. He wrote : 'We should avoid calling every new fibre *Hemp*, when one only can properly be so named. In the same way, the Southsea Islanders called every new animal they saw a pig, because that was the only one with which they were acquainted.' The true hemp of European commerce is of course Cannabis sativa, a plant allied to the nettle, but having a leaf deeply cut into the shape of a hand (palmi-partite). The flowers of the hemp plant are small, green, and insignificant-looking—the males appearing on one individual, and the females on another. The Sunn-hemp of Indian commerce, sometimes called Brown-hemp, is Crotalaria juncea—a plant that belongs to the pea-family, and has large showy yellow flowers. Bombay-hemp and Deccani-heinp (and also, as sometimes, though incorrectly, called Rosellehemp—the true Roselle being Hibiscus Sabdariffa), are terms often used loosely, but which should, in all probability, be restricted to Hibiscus cannabinus, the hemp-leaved Hibiscus (ambdri). In point of foliage this plant\* closely resembles the true hemp (hence its botanical specific name), but in no other respect. The stems are slightly prickly, as also the sepals, and the flowers are large and yellow, with a deep purple centre. Any one who has seen a cotton plant in flower, or the common garden shoe-flower, could never for a fibres obtained from these plants is so disfigured through the application to all three of the  $p^{opu}[$ <sup>ar</sup> word 'hemp,' that it is often qi te impossible to discover to which ai! KII  $V^{\wedge}$  alluding. These plants not only differ materially from each other ?i'. 'He<sup>ir more</sup> f,'<sup>re</sup> entirely different, and any attempt to sell the one in place of the other would have serious effects on the development of bade. H. 167

|                                         | arrived at the conclusion that the cultivation of Hibiscus had no advantage<br>over that of Jute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PERFUME <sup>1</sup> .<br>Seeds.<br>170 | Odorous Principle.—The SEEDS yield about 6£ per cent, of an odorous principle and resin. The former is a light green non-volatile fluid having a strong odour, resembling that of a mixture of musk and amber, hence the Arabic name hab-ul-mushk. Owing to their possessing this principle, the musk mallow seeds are used in perfumery, and are known to the trade in Europe as "Grains d'ambrette." Piesse, in his Art of rer. fumery, writes: "Musk seed, when ground, certainly reminds our $^{STM^e}$ ing sense of the odour of musk, but it is poor stuff at best, " and no recommends it only for making cheap sachet powder. According to nor the most valuable seeds are imported from Martinique.—(See Article "Mush," Vol. III., 58 to 62.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MEDICINE.<br>Seeds.<br>171              | Medicine.—The aromatic brown SEEDS are employed medicinally by<br>the natives of Northern India. They are kidney-shaped, with a hilum<br>in the concave border, slightly compressed, striated, about two lines in<br>length, and have a feeble odour of pure musk, which becomes more<br>powerful on rubbing them together or between the fingers. By attention<br>to these characters they may be distinguished from the seeds of Psoralx'<br>corylifolia, which are used as an adulterant or substitute in Madrass<br>Arabic and Persian writers regard their therapeutical properties as cold<br>dry, tonic, and stomachic, an opinion which is still held by the Hinduss<br>The author of the <i>Makhzan-el-Adwiya</i> recommends a mucilage made from                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Root.<br>172<br>Leaves,<br>173          | the ROOT and LEAVES in gonorrhoea. Though no part of the $pl^{ant}j$ recognised as of value by the Pharmacopoeia of India, Moodeen Sheriff in his <i>Materia Medica of Madras</i> , regards the seeds as stimulant, stomachic and antispasmodic, and recommends their exhibition in cases of $nerY^{ol}Y$ debility, hysteria, atonic dyspepsia, and a few other conditions in whic musk is indicated. He writes that the best and most efficacious metho of usisg the drug pharmaceutically is as a tincture, an account of the section o |
|                                         | preparation and usage of which will be found in his short note below<br>SPECIAL OPINIONS.—§*• The seeds of Hibiscus Abelmoschus or <i>Mushi</i><br><i>ddnah</i> contain albumen, oil, and a peculiar principle on which their odou<br>depends. They are stimulant, stomachic, and antispasmodic, and prove use<br>ful in some nervous affections in which musk is indicated. The seeds at<br>best administered in tincture, which is prepared as follows :—Take of th<br><i>Mushk-ddnah</i> in powder, two ounces and a half; rectified spirit, one pin<br>Macerate the seeds for forty-eight hours in fifteen fluid ounces of th                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                         | spirit, in a bottle, agitating occasionally; then transfer to a percolate<br>and, when the fluid ceases to pass, continue the percolation with the<br>remaining five ounces of spirit. Afterwards subject the contents of the<br>percolator to pressure, filter the product, mix the liquids, and add sufficient rectified spirit, to make one pint. Dose, from one drachm to two<br>drachms. In more than three drachm doses it produces headache or gide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| FIBRE.                          | "This plant yields a soft, white, silky fibre, eminently suitable for<br>the coarser textile purposes to which jute is applied. It is largely<br>grown by the natives of India and employed for agricultural purposes-<br>ropes, strings, and sacks being made of it. Were, however, a demand to<br>be created for this fibre as distinct from that of Sunn-hemp or other fibres,<br>the cultivation of the plant might be indefinitely extended, and with<br>profit to many needy cultivators who are unable to produce either jute or<br>cotton. But so long as there exists the risk of a supply of the fibre being<br>ejected through a purchaser thinking he was ordering Sunn-hemp and<br>rhad this fibre thrust on him, a healthy trade in the fibre as an article of<br>export is never likely to be developed. It is, therefore, of the first import-<br>ance that <i>Ambdri</i> fibre should have its properties independently investi-<br>gated ; and that a place be established for it separate and distinct from<br>all the other fibres with which it has been confused in modern commerce,<br>or for which it has been employed only as an adulterant. Messrs. Cross,<br>Bevan, and King, in their table of the Chemical Analyses of Indian Fibres,<br>Jace Hibiscus cannabinus in their second list, which comprises such as<br>are of less textile value, because of lignification, as for example, Jute, Sid <sup>3</sup> .<br>Abroma, Pavonia, &c. Under Hydrolysis (i.e., boiling in one per cent,<br>caustic soda, Na <sub>2</sub> O) for five minutes, they show it to have lost H <sup>*&gt;</sup> And<br>after continued boiling for one hour, 19-5 of its weight, and that under<br>the same treatment, jute lost considerably less, viz. (a) 13 <sup>23</sup> , and (6) 18'0.<br>Further, that it contains 73-0 of cellulose, in other words, only 3 per cent,<br>caustic soda, Na <sub>2</sub> O) for five merit than any other single feature that can<br>be cited. The facts of hydrolysis and cellulose give, therefore, to this<br>fibre a considerably superior chain 60 recognition flaw most of the fibre. A<br>enumeraited above. It falls far short, however, of Sunn-hemp, a fibre tha<br>posesses 30 per cent, of ellulose, and of 313 |
|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

HIBISCUS cannabinus\*

(J. Murray.)

Under jute in the same work it is stated that—'Slips of sized paper, FIBRE weighing 39 gr., made from this fibre, bore 60lb, as against Bank of England note pulp, 47ft.' And in another passage the measurements of jute filaments are given as max., 0\*196 in.; min., 0\*057 in.; mean 0\*078 in.; diameter : mean, o«oooS in. \* The shortness of the filaments explains their inability to withstand long exposure/ According tp the method of hydrolysis described in *Spons' Encyclopaedia*, the fibre of Hibiscus cannabinus is fully six times as durable as jute, whereas by Cross<sup>1</sup> method of hydrolysis it is slightly less durable than jute. Reducing the measurements given by Cross to inches so as to admit of comparison with those published in Spons\* Encyclopedia, the writer in the latter work gives the maximum as 0\*08 in. greater, and the minimum o-o? in. also greater than the measurements obtained by Cross. This ma: be due to some error in the instruments used by the two investigators. But should it be found that Hibiscus does actually possess longer filaments than jute, this fact should give to it a higher commercial position than it has as yet attained. It could be produced at the same price and be grown over a much wider area, hence some hopes of a greatly extended trade in Ambari fibre might be anticipated with the possession of a more thorough knowledge of its properties. In a Report recently issued by the A.gri-Horticultural Society of India, on some experiments performed with 'Hibiscus, Abutilon, Sansevieria, and Sida,' the Committee came to the conclusion that these fibres possess 'no advantages over that of jute.' But may it not be said that this conclusion was influenced by local necessities? It might not be of any special advantage to the jute-growers of Bengal to substitute for jute any of the fibres named; but from an imperial point of interest the question suggests itself whether it would not be advantageous for cultivators, in parts of India where jute cannot be grown, to adopt as a substitute or competitor either Hibiscus, Malachra, or Sida. It might, for example, be suggested that the effurts to cultivate jute in Madras could with advantage be abandoned in favour^pf Hibiscus cannabinus, and that the sacking trade of Bombay might, as once before suggested, be met by the organisation of a new industry in the fibre of Malachra capitata. Sida seems destined for a higher position than jute has as yet attained. "To turn now from chemico-microscopic examinations to the results of the practical tests performed by Dr. Roxburgh. Two specimens of this fibre were experimented on by the Father of Indian Botany, viz., (a) prepared from plants ' cut when in blossom and steeped immediately/ {b) 'the same cut when the seed was ripe.' Of (a) a line when dry broke with a weght of 1151b, when wet, of 1331b-the wet line gaining a tension represented by i8Ib; of (b) a dry line broke with nolb, a wet one with 1181b, gaining a tension of only 7lb by the process. According to these experiments the Ambari fibre deteriorates by the plants being allowed to grow beyond the flowering season. With Sunn-hemp (Crotalaria juncea), Abroma augusta, and several other fibres, the mature or stronger fibres are obtained when the plants are in fruit. Thus comparing with the above figures, a line of Sunn-hemp prepared from plants in flower broke when dry with 1301b, when wet with 185ft, cut while in fruit

the dry line broke with 160ft and the wet line with 209ft, the latter gaining 35ft in weight. Royle commenting on Roxburgh's experiments remarks :— 'So in Dr. Wight's experiments, the fibre of Hibiscus cannabinus, which is sometimes called the jute of Madras, broke with 290ft, when Sunn (Crotalaria juncea) broke with 404ft. Both these, like Dr. Roxburgh's specimens, were probably grown in the same climate. But in the author's experiments, Sunn broke with 150ft, when Brown-hemp broke with 190ft;

| FIBRE-                                              | but the Sunn was from Bengal, and the Brown-hemp from Bombay. There<br>is, however, some uncertainty about this, because, though no fibres can yei'<br>appear more distinct than these two, yet the author has in his possession<br>fibres of a Crotalaria which are hardly to be distinguished from Hibiscus,<br>Brown-hemp, 'lhe Sunn fibre of Bombay was, even in Dr. Roxburgh,<br>time, remarkable for its dark colour. But some specimens <i>oi Arnoart</i><br>fibre, sent by Dr. Gibson as those of Hibiscus cannabinus, and which closely,<br>resemble those of some kinds of ordinary Brown-hemp, were favouraoiy<br>reported on by a Mr. Enderby, then of the rope-manufactory at Ureen-<br>wich. Brown-hemp is and has always been the peculiarly P <sup>r</sup> *P <sup>ared</sup><br>Sunn-hemp of Bombay, otherwise known as Salsette Hemp. Roxburgn<br>gave his own results of experiments with this, and admits that it is' A <sup>BNI</sup><br>tinctly superior to Bengal Sunn-hemp, is of a dark colour, and the fibres<br>more easily heckled because of being peeled off. Far from Royle's experi-<br>ments upsetting therefore the experiments of Roxburgh and of Wight, they<br>simply prove that Royle was comparing Bengal with Bombay Sunn-hemp,<br>and not, as he affirms, Bengal Sunn-hemp with Bombay Ambdri. Royle<br>may thus be viewed as having seriously laid the foundation of much of<br>the confusion in modern literature which has so materially retarded any<br>possible formation and growth both of a Sunn-hemp and an Antbdrt-noTe<br>industry.'' For Salsette or Brown Hemp the reader is referred to the<br>article on Crotalaria juncea, Vol. II., 595.<br>'' Dr. Buchanan-Hamilton wrote that the natives of Bhagulpur in nis<br>day considered this fibre stronger and more durable than jute. Mr. Hem<br>Chunder Kerr says that, «It is employed in Bengal for all the purposes<br>of jute and also for making fishing-nets and paper. <sup>5</sup> In a further para-<br>graph he gives an account of the process adopted in making paper from<br>this fibre with lime—20 seers of fibre to 3 of lime and 20 of water being<br>the proportions used.'' |
| TION.<br>Bengal.<br><b>179</b><br>NW.<br>Provinces. | O THE AMBARI-FIBRE PLANT.<br>"In Bengal.—Roxburgh, in his Flora Indica, says this plant is cultivated in the rainy season. Most writers affirm that it is grown as <sup>a mixed</sup> crop, only forming belts through or along the borders of <i>ddl</i> fields and other such crops. Dr. Buchanan-Hamilton alludes to having observed is cultivated in Bhagulpur nearly as extensively as jute. In Purneah h found it grown by itself and not as a mixed crop.<br>In the North-Western Provinces -Messrs. Duthie and Fuller admit that it is impossible to arrive at a definite knowledge regarding the extended of the sector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 180                                                 | of cultivation, * but it is believed to be grown on a much smaller scale tha<br>Sanai. It is very rarely cultivated as a sole crop and most common<br>occurs as a border to fields of sugar-cane, cotton, and indigo. 'i<br>ordinary Doab Districts it is only met with as a sparse bordering to som<br><i>kharif</i> fields, and is merely grown for the domestic uses of the cultwaion<br>• Its cultivation will necessarily be similar to that of the crop with which<br>is associated, and thus it will be sown in February if as a border,<br>sugar-cane, in May if a border to <i>jomowa</i> indigo, and in July it a Dora<br>to cotton. 'When ripe the plants are cut down close to the ground or, a<br>pulled up by the roots. It is important that none of the lower part of the<br>submerged in water for a period varying from six to ten days according<br>the weather, when the bark can be easily pulled off by hand in long co<br>tinuous strips. The method of extraction is, therefore, much simpler mat<br>that of Sanai. If the stalks are kept too long in water, the fibre loses<br>greatly in strength, although gaining in colour.' The outstalling of the stalks are then is a<br><b>H. 180</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Ambari Fibre. (7. Nutray)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | HIBISCUS<br>annabinus. |
| between 125 seers and 20 seers an acre according to the thickness of the sowings and the degree to which the belts of fibre-plants are overshadow-<br>ed by the other crop. In the Azamgarh Settlement Report $\{p.u8\}_{g}$ it is stated of this plant that' it is grown throughout the district by culti-<br>vators of all castes round the edges of their sugar-cane fields. The seed is put into the ground at the beginning of the rains, and the plant is cut in October.'                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | TION.                  |
| <i>IK the Pan jab</i> —Stewart writes: 'It is generally raised in narrow<br>strips along the deegs of the fields of cotton or pulse, being sown either<br>about April and irrigated up to the rains, or sown during the latter, the<br>former giving much the best result ( <i>Edgewortk</i> ). Its fibre is used for the<br>manufacture of ropes, twine, and sacking. In Sind its fibre is considered<br>the best for nets and ropes, but it is rarely used for cloth.'<br>In the Kangra Settlement Report and also in the Montgomery Report<br>the plant is described as an autumn crop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 181                    |
| <i>In Bombay</i> —Lisboa says : <sup>a</sup> The fibres of this plant—which are pre-<br>pared by steeping the stems in water, are hard, and more remarkable for<br>strength than for fineness—might be considerably improved by care. A<br>line made of them, 4 feet long, sustained, when dry, a weight of 115ft; in<br>the wet state its tenacity was greatly increased, and it bore a strain of<br>I33tb. Is only adapted as a mixture for the commoner description of<br>paper.' The <i>Gazetteer of Bombay (Vol. XII., 153)</i> says the plant is sown<br>in June and reaped in October.''<br>In the Reports of the Director of Land Records and Agriculture,<br>Bombay, it is stated that the area under cultivation in that Presidency<br>was, in 1885-86, 53,488 acres, in 1886-87, 87,957 acres, and in 1887-89,                                                                                                                                                                                                                                                                                                            | 182                    |
| 71,588 acres.<br>In Madras—Roxburgh gives in his Coromandel Plants a full account<br>of this plant. He says: * The usual time of cultivation is the cold sea-<br>son, though it will thrive pretty well at all times of the year, if it has suffi-<br>cient moisture. A rich loose soil suits it best. The seeds aresown about<br>as thick as hemp, but generally mixed with some sort of small or dry<br>grain, rendering it necessary to be sown very thin, that the other crop<br>(which is one of those grains that does not grow nearly so high) may not<br>be too much shaded. It requires about three months from the time it is<br>sown, before it is fit to be pulled up for watering, which operation, with<br>the subsequent dressing, is similar to that hereafter described for Crotalaria<br>juncea.'<br>The most complete account of the cultivation of this plant which the<br>writer has had the pleasure of reading is that given by Mr. F. A. Nichol-<br>son in his Manual of the Coimbatore District (p. 238). He says :—'/'«/*<br><i>rnanji</i> is grown everywhere in gardens and on dry lands, but especially | 183                    |
| <i>rhangt</i> is grown everywhere in gardens and on dry lands, but especially<br>in red loams and gravels; in the former with various crops, such as tur-<br>meric, $ragi_y$ kambu, &c, in the latter with <i>cholam</i> and <i>kambn</i> . In gardens,<br>as a mixed crop, it is planted on the ridges of the beds and watercourses,<br>not indiscriminately; on dry land the seeds are mixed and sown broad-<br>cast. Occasionally it is grown as a separate crop in gardens, and is then<br>sown thickly about two or three inches apart in beds, and watered twice<br>a week.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                        |
| 'The fibre is prepared by bundling the stalks, which, after a few days, are steeped for nearly a week in water under stones; when sufficiently retted they are cleaned by beating them on the ground, the fibre stripped off, washed, and dried. Five hundred stems, about eight feet high, as grown <i>en masse</i> in gardens, were recently taken at random and the fibre removed and cleaned in the usual way; the result was 5Jib clean and good fibre. The stems when carefully dried weighed nearly 20ft.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                        |

| CULTIVA-<br>TION.                                                                                                   | Assuming the acre to be 40,000 square feet, after allowing for waste patches, the number of stems at three inches apart would be $640,000$ ; hence the yield in clean fibre at lib per 100 would be $6,400lb=:2f$ tons; the stems would yield also 11 tons of poor fuel. The yield of three fine stems grown along the ridges in turmeric plantations, and measuring 16 to 17 feet hi>h, was 3} ounces of clean fibre, or somewhat over one ounce each, instead of £th of an ounce. The dried stems each weighed 5 ounces instead of less than $  hs $ of an ounce. The fibre is very well spoiten of; in some experiments it was stronger, in some weaker, than sunn-hemp. This fibre appears to offer a splendid field for agencies either for cordage, or more especially for paper stuff; it is grown with the greatest ease and abundance and on dry land it never fails, though less productive than when grown in gardens. At present, when produced only in small quantities and rudely extracted by hand, it is sold retail, including the rayat's profit, at Ri per 251b, and could certainly be produced far cheaper by the new machine. |
| Area.<br>184                                                                                                        | new machines. Any quantity could be grown to order.' "<br>"AREA OF CULTIVATION AND TRADE IN AMBARI HEMP.—No informa-<br>tion other than is conveyed by the above passages can be procured. It,<br>therefore, seems desirable that all future reports on the so-called hemp<br>fibres may deal with that of Hibiscus cannabinus separately from the<br>sunn-hemp and the true hemp."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

In all these districts it seems to be cultivated entirely for local demand, as the fruit is a important article of diet with all classes of Burmans.<br>In the North-West Provinces? Atkinson writes: "Cultivated in gam                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <ul> <li>201 Bombay. 202 it as one of the principal vegetables, grown all over the district. <i>In Bombay.</i>—The Acting Director of Land Records and Agricult Poona, writes:—" Though it is grown in garden lands at other times of year, the habit of the <i>bhendi</i> plant is adapted to the rains. From form of its fruit the vegetable is divided into two kinds, one bearing ribbed fouits, and the other eight-ribbed. Besides this main division, sub-divided into "early" and "late" <i>bhendi</i>. The early variety is s in June and bears from early August to December. The plant g about 2 feet high, the leaves are large, and the pods short and th The late variety is sown in June or July along the edges of, or am <i>bajri</i> crops. It begins to bear late in September and continues till the of November. The plant reaches 6 to 7 feet in height. The lea small and the pod thinner than in the other variety, and prickly. acre rate of seed varies from 5 to iolb. It is sown on ridges 3 feet af Two or three seeds are put in holes one foot apart. The seed spr within a week. When the seedlings are a span high, they are man with fish manure, farm yard manure or ashes, with a view to favour growth; the plants are topped when a cubit high. Insufficiency of wat the plants are flowering causes an insect pest which is destroyed sprinkling ashes over the plants. The acre yield varies from 0,00 6,500a." <i>In Madras.</i>—The Collector of Cuddapah writes :—<sup>w</sup> The area under crop is not available. It is sown in July, and the plants survive for a y The soil requires to be richly manured. Cost of cultivation is per cawny, and profit R40. No fibre is taken from the stem. The ripe fruit is sold at one anna a túk." The Collector of Bellary gives following information : "The area of cultivation is giver only in a taluks where it is estimated at 73 acres. There are two crops in the y one, sown from 3rd to 15th March and gathered from 3rd to 15th and ther sown from 15th to 30th July, and gathered in the see <b>Pafit</b> N<sup>D</sup>?D mber, The cost of cultivation is about R5 per acr</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                         | In the Panjab.—Stewart mentions it as grown by natives and Euro                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <ul> <li>Bombay.</li> <li>202</li> <li>In Bombay.—The Acting Director of Land Records and Agricult Poona, writes:—" Though it is grown in garden lands at other times of year, the habit of the bhendi plant is adapted to the rains. From form of its fruit the vegetable is divided into two kinds, one bearing ribbed f&gt;uits, and the other eight-ribbed. Besides this main division, sub-divided into "early" and "late" bhendi. The early variety is s in June and bears from early August to December. The plant gr about 2 feet high, the leaves are large, and the pods short and the the variety is sown in June or July along the edges of, or am bajri crops. | but in some places as Hadagali and Harpanapally it is grown as a garden<br>crop. Red and black soils are both adapted for its growth. After ploughing,<br>the land should be divided into beds wherein the seeds are sown and watered<br>twice a week. It is eaten as a vegetable." In still another report, from<br>the Madura District, it is stated that "The <i>vendai</i> is grown in backyards<br>and gardens. The extent of cultivation is about 150 acres. Sowing begins<br>in July said continues almost throughout the year, and the plant begins to<br>yield in October. There are two varieties of this plant known in this dis-<br>trict, one of which is taller than the other. The former is said to live for<br>about six or seven months, the latter a month or two less. One acre is said<br>to produce about 60 basketfuls of fruits, costing about R15, while the expense<br>of cultivation is estimated at Rio. Seeds of 100 fruits will sow one acre.<br>Three {>loughings are made to prepare the land ; then the soil is manured<br>and ploughed again. Plots are formed and the seeds buried one by one<br>at a distance of 3 or 4 feet. Weeding is required after one month, and<br>the plots are watered once every two or three days."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                          |
| Dye.—Roxburgh mentions that the STIGMAS are replete with a very<br>beautiful deep purple juice which they communicate to paper, and which is<br>tolerably durable. Murray, in his <i>Plants and Drugs ofSind</i> , confirms this,<br>and adds that the stained paper forms a substitute for litmus paper. The<br>writer can find no further record of the employment of this colouring<br>matter as a dye.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Stigmas. 204                             |
| Fibre.—The bast yields a strong useful fibre of a white colour, which is<br>long and silky, generally strong and pliant, and composed of very fine in-<br>dividual fibres. It is employed economically in some parts of India, but in<br>many districts where the plant is much grown as a vegetable the excellenco<br>of the fibre seems to be unrecognised. It is undoubtedly valuable and seems<br>to possess qualities specially fitting it for the purposes of paper-making.<br>According to Roxburgh its breaking strain is 79A when dry, 95ft vjien wet.<br>It contains 74 per cent, of cellulose, and in Messrs. Cross, Bevan, and King's<br>experiments it was found to lose 9*8 and 14*2 per cent, of its weight, when<br>boiled in 1 per cent, solution of caustic soda for five minutes and one hour<br>respectively. The AgriHorticultural Society of India, in the experiments<br>referred to under H. Abelmoschus, found H. esculentus to yield a poor crop,<br>sparse in low lying places. The average acre yield of fibre by Death and<br>Ellwood's process was only 84 Jib, while by retting, even from this poor<br>crop, it amounted to 6 maunds and 17 ssers. Liotard, in his <i>Paper-mak-<br/>ing Materials of hidia</i> , notices the fibre, mentioning that it is very fine and<br>well suited for paper-making, and in another passage says that paper has<br>been made with it, though only on a small scale, in the Lucknow Central<br>Jail. In France, the manufacture of paper from this fibre is the subject of<br>a patent; it receives only mechanical treatment, and affords a paper called<br><i>banda</i> , equal to that obtained from pure rags. In Burma, Madras, and<br>other parts of India, the stem is allowed to rot unused. This valuable<br>fibre, which could thus be obtained very cheaply, does not appear to have<br>attracted the attention that it merits. | 205                                      |
| Medicine.—The mucilage from the FRUIT and SEEDS is used medicinally<br>as a demulcent in gonorrhoea and irritation of the genito-urinary system.<br>Muhammadan writers describe it as cold and moist and beneficial to<br>people of a hot temperament. Roxburgh considers the fruit nourishing as<br>well as mucilaginous, and views it as one of the best of esculent herbs in India.<br>The WHOLE PLANT, but particularly the CAPSULES, is replete with much<br>mild mucilage, and might with advantage be applied to all diseases requir-<br>ing emollients and demulcents Roxburgh strongly recommends its use<br>in irritating cough. Waring, in his <i>Bazar Medicines</i> , calls this plant Abel-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 206<br>Seeds*<br>207<br>Capsules.<br>208 |

| HIBISCUS<br>ficulneus.                     | Another Hibiscus Fibre.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Root.<br>209                               | moschus, and recommends a syrup composed of Abrus root, Abelmoschus<br>and sugar.<br>The fresh immature capsules have a place amongst the officinal drugs<br>of the Indian Pharmacopoeia, in which the fruit is described as a valuable<br>emollient and demulcent, and as diuretic. It is there recommended as a<br>drug which " may be resorted to with confidence in catarrhal affections<br>ardor urinae, dysuria, gonorrhoea, and other ca^es requiring demulcent and<br>emollient remedies." O'Shaugnessy's <i>Bengal Dispens dory</i> contains a pre-<br>scription for a Hibiscus lozenge which is recommended as highly soothing<br>in irritable conditions of the pharynx. Both the fruits and leaves are also<br>employed externally as an emollient poultice. The U. S. Dispensatory<br>contains the following information regarding the ROOTS : "They are said<br>also to abound in mucilage, of which they yield twice as mucn as the<br>Althaea root from the same weight, free from any unpleasant odour. Their<br>powder is perfectly white, and superior also to that of marsh mallow."<br>SPECIAL OPINIONS.—§ " Is sometimes used for dysentery " (Surgeon'<br>Major C. 7. McKenna, I.M.D., Cawnpore). *'Used as a laxative and<br>diuretic in dropsical affections'' (Surgeon-Major J. J. L. Ratton, M.D.,<br>Salem). "The mucilage is used in Mysore for gonorrhoea, and it is also<br>said to be aphrodisiac'' (Surgeon-Major y. North, Bangalore). "This<br>vegetable may be allowed where others are inadmissible in bowel com-<br>plaints, owing to its demulcent properties" (Assistant Surgeon Shib<br>Chundra Bhattacharji, Chanda, Central Provinces). "Demulcent, diure-<br>tic, doses Jii to 51V, used in catarrhal attacks, irritability of the bladder.<br>kidney, and gonorrhoea" (Chuna Lall, Ist Class Hospital Assistant, Jub-<br>bu/pore). "The fruit is useful in gonorrhoea and dysentery. The bark<br>of the stem is made into ropes, the stems being treated in the same<br>manner as hemp. The young pods are eaten by the natives when suffer-<br>ing from spermatorrhoea" (Narain Misser, Hospital Assistant, Hoshna- |

| <ul> <li>Atkinson, Him. Dist., 7W i Royle, Fib. PL, 260; Cross, Sevan, and King, Report on Indian Fibres, 40; Watt, Hibiscus in Selections from the Rec. ofGovt. of Ind., Rev. and Agri. Dept., 1,272 / Balfour, Cyclop. Jnd., II., 44; Journ. AgriHort. Soc, New Series, VII., 224,229; Indian Forester, XII., app. 7; Gazetteer, NW. P., IV., Ixviii.</li> <li>Habitat.—Indigenous in the hotter parts of India from the Pan jab, North-West Provinces, and Bengal to Madras. A small, herbaceous, annual bush, which should be sown at the beginning of the rains. Roxburgh recommends a little earlier date for sowing, namely, in May, the plants being transplanted (from the seed-bed) in rows nine inches apart when about six inches high.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                          |
| Fibre.—Dr. G. Watt, in his exhaustive account of Hibiscus, writes :<br>"Like most other MALVACEAE this plant yields a valuable fibre. Roxburgh<br>says : '^n none have I found so large a quantity, equally beautiful, long,<br>glossy, white, fine and strong as in this. To these properties may be added<br>the luxuriant growth and habit of the plant, rendering it an object of<br>every care and attention, at least until the real worth of the material is<br>fairly ascertained.' Like many of Roxburgh's valuable economic discover-<br>ies, this has remained for nearly a century without a single fact having<br>been added, or any progress made towards utilising the tons upon tons of<br>valuable fibre lying useless on our waysides. Roxburgh planted 40<br>square yards in the manner above described, and obtained 'thirty-three<br>pounds weight of the naturally very clean fibres.' In his experiments<br>with this fibre he found that a dry line of it broke with a weight of ro4lb,<br>and a wet line with 115ft, <sup>three</sup> fibre having gained I2lb in weight by being<br><b>wetted</b> . <b>1 1 1 1 1 1 1</b><br>"This was one of the fibres recently experimented with by the Agri-<br>Horticultural Society ; and by the Death and Ell wood Machine, they ob-<br>/ tained from 20 seers of green stems 2*81 per cent, of clean fibre and <b>1*41</b><br>waste fibre. Commenting on this experiment they say: * Even the <i>haw</i><br><i>dhenras</i> , with its large amount of mucilage, was worked out with the<br>^reatest ease' Mr. Atkinson, in his <i>Himalayan Districts</i> , says of this<br>plant that it 'affords a very large proportion of strong fibre of a white<br>colour, useful for twine and light cordage.'''<br>Oil.—Lieutenant Hawkes mentions this plant as yielding one of the | FIBRE.<br>216            |
| oils of South India.<br><b>Food.</b> —The SEEDS are often put in sweetmeats, and are employed in:<br>Arabia for giving perfume to coffee.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | ECOD.<br>FOOD.<br>Seeds. |

| Habitat.—A prickly-stemmed shrubby plant, found in the hotter parts<br>of India from Bengal to Ceylon.<br>Fibre.—Like most other species of this genus, this plant yields, from<br>its bast, abundance of strong, white, flaxen fibres, which Roxburgh found<br>to have a breaking strain of 89ft when dry and 92ft when wet. Owing,<br>however, to the strong sharp spines with which the stem is covered, it is<br>not so easily manipulated as other species of Hibiscus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | FIBRE.<br>220            |

| Dye.—Dr. Bidie reports that an infusion of the FLOWERS produces a purplish hue. Dr. McCann, in his <i>Report on the Dye-stuffs of Bengal</i> , writes that, "It is mentioned from Hugli that a red dye is obtained by children from the flower which is used in colouring paper. If the flowers are rubbed on paper they give at first a reddish colour, turning immediately into a pretty purple or lilac; the addition of a little acid turns this at once into a bright red." Roxburgh states that the petals are used to blacken shoes, hence the English name of the plant. The Chinese are said to utilise them in the same way, and also to make a black dye for their hair and eyebrows from the petals.                                                                                                                                                                                                                       | DYE.<br>Flowers.<br>228                                                  |
| Fibre—The BARK yields a good fibre.<br>Medicine.—The FLOWERS are considered emollient, and an infusion of<br>the petals is given as a demulcent. Moodeen Sheriff reports favourably<br>of an infusion or syrup of the petals as a demulcent and refrigerant drink<br>in fevers, and as a demulcent in cases of ardor urinae, strangury, and irrit-<br>able conditions of the genitourinary tract. He also recommends an oil,<br>made by mixing the juice of the fresh petals and olive oil in equal portions,<br>and boiling till all water has evaporated, as a stimulating application for<br>the hair. O'Shaughnessy considered the LEAVES to be emollient, anodyne,<br>and laxative. Murray { <i>Plants and Drugs of Sind</i> }, and Taylor ( <i>Medical<br/>Topography of Dacca</i> ), both mention the employment of the flower by the<br>Natives in the treatment of menorrhagia, the former describing it as ad-               | FIBRE.<br>Bark.<br>229<br>MEDICINE.<br>Flowers.<br>230<br>Leaves.<br>231 |

| method of preparation of the fibre is furnished, and it appears that even<br>at that time the commercial value of Rozelle was recognised. The reports<br>then called for show, however, that the plant was grown only to meet the<br>local demands for the fibre and fruit; but of several districts the remark<br>was made that should a demand arise, any quantity could be produced<br>on waste lands, as the crop grew with little care or attention.<br>The following recent reports may be quoted :—In the <i>Madura District:</i><br>"The extent of cultivation is probably 50 acres. It is not cultivated sepa-<br>rately but mixed with <i>cholam, ragi,</i> onions, &c, in gardens. No expen-<br>diture is separately incurred on account of this cultivation. It is sown in<br>August and March, and reaped in November and December. One acre is<br>said to yield one maund of fibre costing R1-4. <i>In Cuddapahi</i> "It is<br>grown in the western parts of the district, is a nine months crop, and is<br>sown in January. The cost of cultivation is R5 per <i>cawny,</i> and the<br>profit is Rio. The extent of cultivation cannot be given."                                                                                                                                                                                                                                                                                                           |                                |
| The following account is quoted from the Report of the Madras Experimental Farms for 1875 :—'' A plot of land, 1,210 square yards, was sown with rozelle seeds. The soil was a free sandy loam. It was prepared for the crop in the following way: twice ploughed, once harrowed and ridged then manured with 3J cart-loads of farm manure, and again ridged over the manure; on the 1st February 6fb of seed was sown on the ridge. During the growth of the crop the land was once hand-hoed, once bullock-hoed, and eighteen times irrigated. The seed germinated well and the plants grew with great vigour; they were straight and almost without side branches, and averaged between 5 and 6 feet high when ready for cutting, about three months after being sown.'' Fibre.—The stems yield a good, strong, silky FIBRE, the Rozelle Hemp of Commerce, obtained by retting the twigs when in flower. The process is described as follows in a statement from the N el lore District of Madras : ''After the plants are supposed to be properly dried, they are r>ade into bundles and soaked in water, in which state they are allowed to remain for a period varying from 15 to 20 days. After that time the bark is separated by the hand, and well washed to free it from any impurities; it is then allowed to dry, and becomes available for use.'' It is employed by the natives for the purposes of cordage, being twisted into a rope of varying thickness. | FIBRE.<br>240                  |

for the purposes of cordage, being twisted into a rope of varying thickness called *ntlaka*. The thinner varieties of rope are substituted for tape and rattaning for cots, the thicker is generally employed as a strong rope, for agricultural purposes, tying up cattle, &c. The fibre is also said to be employed in the manufacture of gunnies in certain districts of Madras.

Liotard (Paper-making Materials of India) mentions the Rozelle as yielding a fibre likely to be valuable to paper-makers, but no account exists of its actually having been so employed. On the whole, considering the easy growth of the plant and the cheap rate at which it could be procured, the fibre seems worthy of more attention than it has hitherto received.

Oil.—An OIL is prepared from this plant at the Allahabad Jail, of the preparation and economic uses of which, however, the writer has no information.

Medicine.—The SEEDS of the Rozelle are used medicinally, and have MEDICINE Seeds. demulcent, diuretic, and tonic properties. A decoction of them is recom-mended by Moodeen Sheriff as a draught, in doses of from one to two drachms, three or four times a day, in cases of dysuria and strangury, and also in some mild forms of dyspepsia and debility. The authors of the Pharmacographia Indica observe: "In this plant we have the emollient and demulcent properties of the Malvaceae, combined with a large amount

Patna, 123 ; Hunter, Orissa, II., 17 S* App. VI; Lisboa, U.<br/>PI. Bomb., 75, 194, 227 ; Christy, Com. Pl. and Drugs, VI, 33 / Royle,<br/>Fib. PI., 261; Watt, Hibiscus in Sel. from Rec. ofGovt. of Ind., Rev. &amp;<br/>Agri. Dept., 1889, 273 / Indian Forester, XII., 329 / XIV., 269.</li> <li>Habitat.—A much branched bush of the Coasts of India, Burma, and<br/>Ceylon. Particularly plentiful in the Sundarbans, and on the rivei banks<br/>of Burma. The ease- with which this plant might be propagated over<br/>wide tracts of swampy country, where little else will grow, should afford a<br/>powerful incentive to an effort being made to utilise the fibre it affords.<br/>Fibre.— Dr. Watt, in his paper on Hibiscus already referred to, writes<br/>of this species that it "yields a useful fibre, extensively employed locally<br/>for cordage. It is said to gain in strength when tarred. Roxburgh's<br/>experiments with this fibre gave the following results :—A line broke when<br/>white with a weight of 41ft, after being tanned with 62ft, and after having<br/>been tarred with 61 ft. A similar line macerated in water for 116 days<br/>broke when white with 40ft, tanned 55ft, and tarred 70ft. These obser-<br/>vations are of great interest, for, of the other fibres experimented with by<br/>Roxburgh, the majority were rotten after macerated in the same manner, were<br/>found to be rotten, and Sunn-hemp broke with 65ft, and Jute with 60ft.<br/>The power of endurance under water is, therefore, a point of great im-<br/>portance.</li> </ul> | FIBRE.<br>256                                                                                                         |
| The fibre is readily separated from the green or unsteeped branches,<br>the work of preparation being less tedious than applies to the other fibre-<br>• yielding plants of this genus. It appears to be well adapted for making<br>ropes, mats, and possibly paper ( <i>Cameron</i> ). The fibre seems highly suit-<br>able for the paper trade, and immense quantities of it might be conveyed<br>in boats to the paper mills of Bengal."<br>Medicine.—The BARK is used in medicine. The ROOT is also said by<br>Irvine in his <i>Materia Medica of Patna</i> to be febrifuge, and employed in<br>the preparation of embrocations.<br>Food.—Forster states that the BARK is sucked in times of scarcity when<br>the bread fruit fails.<br>Structure of the Wood.—The wood is only employed in India as fuel.<br>If is said to be used in Tahiti, however, for planking and building light<br>boats.<br><b>H. tricuspis</b> , <i>Banks; Fl. |                                     | Habitat.—A common, herbaceous bush, in the jungles and brushwoods<br>of the hotter parts of India, from the North-West Provinces to Ceylon. It<br>bears large yellow flowers having a deep rose purple eye at the base of the<br>corolla. The leaves are often much perforated by insects. Kurz, in the<br>paper quoted in the references, describes it as common along borders of<br>helds, in shrubberies, rubbishy places round villages, 8rc, also in dry<br>forests, all over Burma from Chittagong and Ava down to Pegu.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| FIBRE.<br>Bark.                     | Fibre,—I he BARK yields a strong silvery fibre.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| poison, and these beasts represent an actual loss to the country which out-<br>weighs the value of the whole number of hides put together. " There is<br>little doubt that the same state of things still prevails, and as the trade<br>has much increased, it is to be feared that it must exist to a still greater                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | TRADE.                            |
| extent.<br>On referring to the Inter-Provincial trade returns it is found that much<br>the largest exporters, as far as hides are concerned, are the North-West<br>Provinces and Oudh, and that next to these come the Pan jib and Central<br>Provinces, trom the two former numerous dressed hides are exported,<br>owing to a considerable and increasing tanning industry, especially at<br>Cawnpcre. The Panjab and Central Provinces, on the other hand, supply<br>principally the undressed material. The hides (raw and dressed) exported<br>from Jhe North-West Provinces are nearly all sent to Bengal; the skins<br>which are for the most part undressed are sent to Madras. Bombay<br>imports the greater part of its hides, both raw and dressed, from the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Inter-Pro-<br>vincial Trac<br>269 |
| Central Provinces, its raw skins from Rájputana and Central India, and<br>its dressed skins from Madras, the Panjáb, Rájputana, and Central India.<br>The following quantities of hides and skins, dressed and undressed, con-<br>veyed by road, rail, &c, from the provinces named, in 1886-87, may be<br>given for the sake of compaiison:—North-West Provinces and Oudh,<br>">79*7 <sup>1</sup> 3 mounds, Panjab 1,69,086 maunds, Rajputana and Central India,<br>^7>7°5 maunds (principally skins), Mysore 62,511 maunds, Nizam's<br>territory 51,036 maunds, Central Provinces 42,351 maunds (principally<br>undressed hides), Sind 21,148 maunds, Berar 17,738 maunds. Besides<br>these sources of supply, Bengal, Madras, and Bombay yearly send large<br>consignments to their respective capitals and ports, Bengal alone supply-<br>ing 3,33,446 maunds of dressed hides to Calcutta. During the same year<br>the following were the imports by road, rail, and river, of hides and skins<br>into the principal shipping towns: Calcutta 8,24,459 maunds, Madras<br>4,19,094 maunds, Bombay 74,423 maunds, Karachi 51,261 maunds. Of<br>its hides Calcutta obtained 25,32,412 in number from Behat. 23,97,199<br>from Bengal, 11,48,864 from the North-West Provinces, and smaller   | By road ar<br>rail, &c<br>270     |
| numbers from the other districts above named.<br>A review of the coasting trade for the same year shows that Calcutta<br>imported 40,637 cwt., and exported 47,671 cwt. Madras imported 55,598<br>cwt., and exported 48,450 cwt. Bombay imported 33,274 cwt., and ex-<br>ported 4,441 cwt. Sind imported 1,032 cwt, and exported 25,089. Burma<br>imported 3,765 cwt, and exported 7,52s. On analysing these figures it<br>will be found that the principal part of Calcutta's imports consists of raw<br>hides from other ports within the Presidency, the greater part of those of<br>Madras also consisted of raw hides from British ports within the Presidency,<br>but it also received 17,353 cwt. of raw skins from Bengal, presumably to<br>be tanned and re-exported as the more valuable Madras article. Of Bom-<br>bay's total import of 33,274 cwt., 26,422 cwt. consisted of raw skins from<br>Sindh. The greater part of the coasting exports of Calcutta were 27,337<br>cwt., to other British ports within the Presidency, and the raw skins to<br>Madras already referred to. Madras also sent 22,910 raw hides to other<br>ports in the Presidency, while Sindh exported the large number of raw<br>skins above mentioned to Bombay. The coasting exports of the latter port |                                   |
| were unimportant.<br>The Trans-Frontier trade has considerably increased during the past<br>few years, the largest source of hides being Upper Burma, of skins<br>Kashmir and Nepal. The total Import trade of hides for 1886*87<br>was 95,186 pieces, 59,866 cwt., valued at R17,73*241, a very great<br>increase on the imports of 1881-82, which only amounted to 5J lakhs of<br>rupees. That of skins for the same year (1886-87) was 71,103 pieces,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | ]                                 |

| HIDES.                       | Trade in Hides and Skins.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRADE.<br>Imports.<br>273    | 5,04.0 cwc, valued at 82,11,796, while the value of this import in 1884-8 was only 81,27,541. The very great increase in trans-frontier trade is mainly due to the large imports from Upper Burma, the Burmans havin evidently discovered that, with increased facilities for intercourse and trade, their formerly valueless cattle hides might form an article of larg and profitable commerce. In 1881-82, the imports from Burma valued only 3! lakhs of rupees; last year they amounted to 13} lakhs, or mor than \$rds of the total trans-frontier hide imports-                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Exports.<br>274              | The Trans-Frontier export trade in hides appears to be decreasing<br>thus in 1884-85 it amounted to 1*24,093, in 1887-88 it was only Ri4.033,» <sup>0</sup><br>little more than half. The export trade in skins is a small and fluctuatin                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| xports from<br>India.<br>275 | one, and amounted to only R 19,599 in 1886-87.<br>A review of the statistics, relating to the exports of hides and skin<br>to Foreign countries, shows that a marked increase has taken place during<br>the past ten or twelve years, due principally, during the last few years, to<br>greatly increased activity in the skin trade, while that in hides appear<br>to be falling off. Thus in 1887 the total value of exports amounted to<br>84,85,23,818, an increase of more than 100 lakhs of rupees on that o<br>1877-78, which valued 83,75,68,878. The greatest increase is seen to b<br>in the export of dressed skins, which has risen in value from 92 lakhs in<br>1877-78, to 192 lakhs ten years later. The value of undressed hid<br>exports increased 30 lakhs, and that of raw skins 10 lakhs, while the<br>exports of dressed hides decreased 30 lakhs.                                                                                                                                     |
| •                            | Analysing these statements it is found that during the same ten year<br>the value of exports from Bengal, increased from 81,72,13,905 to<br>R2,07,68,574; from Bombay it decreased from 856,75,427 to 846,17» <sup>1</sup> *°j<br>from Madras it became during the same period very greatly augmented<br>namely, from 81,46,59,521 to 82,07,26,638, the total value having thus<br>become very little short of that of Bengal; from Sind it increased from 4 <sup>t</sup><br>to 9! lakhs, and from Burma it rose from   lakh to ui lakhs of rupees<br>Bengafoppears to have almost a monopoly of the export trade in raw<br>hides and skins, while Madras, as might be expected from the excellence<br>of its tanning, exports nearly all the dressed hides and skins. With<br>reference to this, the most important export trade of Madras, the following<br>passage from the Madras Manual of Administration, Vol. I., may be<br>quoted : "The tanning and export of skins have become of late years very |
|                              | large industries in South India, and Madr&s dressed skins are well known<br>and highly appreciated both in European and American markets. In<br>fact, South Indian skins fetch so much higher a price than those shipped at<br>other ports in India, that salted hides are sent from Bengal to be tanned<br>and exported from Madras. The superiority of the Madras article is<br>partly due to the fine quality of the bark used for tanning it, and partly to<br>the superior methods of manipulation. The bark is obtained from a<br>small shrub, Cassia auriculata (see Vol. //., 2/5), which grows wild all<br>over the country and is in great demand."                                                                                                                                                                                                                                                                                                                                               |
| Foreign<br>markets.<br>276   | Turning to the markets to which these exports are shipped, it is found<br>that by far the largest importer of Indian raw hides is the United Kingdom<br>which, in 1887-88, imported to the value of 81,21,57,552. Next in import-<br>ance is the United States with an import valued at 24 lakhs; then Italy with<br>19 lakhs, followed by Austria with i6£ lakhs, and the Straits Settlements<br>with 11 lakhs. Regarding the Italian export trade, Mr. O'Conor, in his<br>Report on the Trade of India for 1888-89, writes: "The British Consul at<br>Venice reports that there was a decline there in the price of Calcutta<br>hides, 'which are alleged to be of inferior quality and are gradually losing<br>favour with merchants.' In this case the matter is of some importance,<br>for the exports of hides to Italy has been a large trade, and it seems to be                                                                                                                                    |

| The Sea Duckthorn. (J. Marray.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | IPPOPHAE<br>amnoides            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| declining." The statement is confirmed by statistics, for, since 1885-86, the exports to that country have decreased from 36-96 lakhs of rupees, to 19*27 lakhs in 1887-88, ahd 1914 in 1888-89. Smaller quantities are shipped to many other countries, including France, Germany, Belgium, Greece, and Egypt, but doubtless a great proportion of the immense consignments to the United Kingdom are reshipped to continental ports. In the case of dressed hides the only direct importer of any consequence is alsotfie United Kingdom, which receives an amount valued at R60,40,222 out of a-total export valued at {(60,58,092) On the other hand, Indian raw skins are imported in much the greatest quantities by the United States of America, which, in the year under consideration, imported a quantity valued at 1^27,22,314 out of a total export of 30^ lakhs. Or dressed skins the United Kingdom again receives much the largest proportion, valued R 1,52,07,141, out of a total of R 1,92,08,570, and the United States of America comes next with an import valued at 19 lakhs. Thus in the year under consideration the United Kingdom alone imported Indian hides and skins, dressed and undressed, to the value of R3×3 <sup>6</sup> ×5 <sup>5</sup> × 9 <sup>9</sup> ut of the total export of 84,85,23,818. The foregoing short account of the present state of the hide and skin trade in India shews that a steady increase is taking place, especially in the industry of dressing skins. There seems certainly to be a large and profitable field for this branch of Indian trade, and it is to be expected that the acknowledged expertnees in manipulation of the tanners of Southern India may enable them, with improvements in the methods or preparation, to supply skins of such a quality as to still further increase the present great demand. | TRADE IN<br>HIDES AND<br>SKINS. |
| For a description of the methods of preparation and respective eco-<br>nomic values of various SKINS, the reader is referred to the article on that<br>subject, and for similar information regarding hides to that on LEATHER.<br>Hing, see Ferula alliacea, <i>Jtoiss.</i> , Vol. III., 333.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | ,                               |

|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FOOD.                      | <b>Food.</b> —The small intensely acid FRUIT may be made into a good jelly                                                                                                                                   |
| Fruit.                     | which Aitchison describes as really excellent when prepared with half it                                                                                                                                     |
| 279                        | weight of sugar. It is, however, only eaten by the natives in certain localities                                                                                                                             |
|                            | thus Longden mentions it as eaten by the natives of Kanawar as a sort of <i>ckatni</i> , while Aitchison remarks that in Lahoul it is not employed                                                           |
|                            | at all as an article of food. Smith, in his Dictionary of Economic Plants                                                                                                                                    |
|                            | erroneously describes it as acrid and poisonous.                                                                                                                                                             |
| TIMBER.<br>Fuel.           | Structure of the Wood.—Heartwood yellowish brown, mottled, moder                                                                                                                                             |
| 280                        | ately hard, close-grained. Weight 38 to 54ft per cubic foot ( <i>Gamble</i> ). In the dry almost treeless tracts of the Inner Himalaya it is very valuable as                                                |
| 200                        | a fuel and charcoal-supplying plant; indeed, so much is it esteemed in these                                                                                                                                 |
|                            | districts, that, as Cleghorn mentions of Lahoul, it is considered village                                                                                                                                    |
|                            | property. The thorny branches are also employed, piled up,^to form                                                                                                                                           |
| 281                        | hedges or fences.                                                                                                                                                                                            |
| 201                        | Hippophae salicifolia, Don.; FL Br. Ind., V., 203.<br>Syn.—H. CONFERTA, Wall,                                                                                                                                |
|                            | A considerable amount of doubt may be entertained as to whether this species is                                                                                                                              |
|                            | really distinct from the former. The vernacular names of the two are identical, and the parts of the plant are similarly employed for accommis surpass. Thus Starward                                        |
|                            | the parts of the plant are similarly employed for economic purposes. Thus Stewar<br>only recognises H. rhamnoides, while Atkinson and Baden Powell describe                                                  |
|                            | only H. salicifolia, giving the same vernacular names, habitat, and uses. Hooker                                                                                                                             |
|                            | though acknowledging the two species, remarks, "different as this plant looks in its<br>ordinary condition from H. rhamnoides, I expect that it will prove a form of that                                    |
|                            | plant, due to the moister climate which it affects," an opinion which was also pro                                                                                                                           |
| 1                          | mulgated by Brand is in his Forest Flora. As most modern writers, however, have                                                                                                                              |
| ł                          | agreed in separating the two species, the following facts may be given as most prob-<br>ably referable to this form :—                                                                                       |

Kurchi or Conessi Baxk. <y. *Murray.*)

# HOLARRHENA, Br., Gen. PL, II, 708.

A genus of trees or shrubs with white flowers, belonging to the Natural Order APOCYNACEJE, comprising seven or eight tropical Asiatic and African species, of which two are allowed, Dy the *Flora of British India*, to belong to India and Ceylon.

**Habitat.**—A small deciduous tree, with a pale bark, native of the Tropical Himalaya, from the Chenab westwards, ascending to 3,500 feet, extending throughout the dry forests of India to Travancore and Malacca. Great confusion existed for years as to the identity of this plant, and in India the drug was adulterated with, or mistaken for that obtained from a species of Wrightia, a plant medicinally inert. For this reason the very valuable medicinal bark and seeds have fallen into undeserved disrepute. In the *Pharmacopceia of India*, p 455, an interesting account by Wight of the origin of this confusion between Wrightia and Holarrhena, will be found. From this it appears that the mistake was originally due to Linnaeus who, in preparing his *Flora Zeylanica*, found a specimen of what was then known as Nerium indicum siliquis angustis, in Herman's Herbarium. To that plant he subjoined^as a synonym Rheede's **Codagapala**, a continental and widely different plant, reported even at that

HOLARRHENA

antidvsenterica

## HOLARRHENA

antidysenterica.

Kurchi or Conessi Bark.

early time to be possessed of great medicinal virtues as a remedy in dysentery. On the strength of this report he named the double, or spurious, species, Nerium antidysentericum.

This formation of one species from types of two different genera was not corrected till Brown in 1809 published his revision of the APOCYNACEA. Herman's Ceylon species was then assigned to the new genus Wrightia, under the name of W. zeylanica, 2?r., and Rheede's Malabar plant fell in \* o another new genus, Holarrhena becoming H. antidysenterica. About the same time Roxburgh, while writing his Flora Indie a, prepared drawings of three Apocynous trees, one Nerium tinctorium, Roxb., which Brown referred to Wrightia, another of Echites antidysenterica, the Codagapalaof Rheede, and the Holarrhena of Brown and the third, Alstonia, which Roxburgh also placed in Echites. In his description of these species he commented on the confusion between these plants, and expressed it as his opinion that the bark of the Nerium (Wrightia) tinctorium was gathered and sold as Conessi bark, and thus had given rise to the disrepute into which that medicine had even then fallen. The distinction between Holarrhena antidysenterica and Wrightia tiuctoria, tomentosa and zevlanica has thus been made for nearly 100 years, yet notwithstanding this fact confusion has always existed between them, and still exists in the works of certain Indian writers, the species of Wrightria being accepted as identical with Holarrhena. To the native drug-collectors these plants are, however, quite distinct, the bark of W. tinctoria being professedly the chief adulterant of Conessi. As the error here indicated is one seriously affecting the reputation of the true drug, and contracting the extent of its employment, the following short account of the distinctive characters of the two genera, may be given 1—

## WRIGHTIA.

- (0 Corolla not more than twice tVe length of the calyx, mouth surrounded by a corona or teeth.
- (2) Stamens inserted within the mouth of the corolla, anthers protruding, twisted and surrounded by the corona.
- (3) Seeds straight, oblong, compressed with a coma of h-'.irs at the base, the apex being pointed and naked.

### HOLARRHENA.

- (1) Corolla three or four times the length of the calyx; moutl. naked.
- (2) *Stamens* inserted at the bottom of the tube and therefore not protruding.
- (3) Seeds linear, oblong, compressed, concave, with a coma of hairs on the apex.

Dr. Dymock, alluding to the confusion of Wrightia with Holarrhena, remarks that the barks may be distinguished pharmaceutically; the stembark of Holarrhena, he says, is thick and dirty white or buff coloured, its root bark reddish-brown and nearly smooth; the stem-bark of Wrightia is reddish-brown, and nearly smooth, the root dark brown or nearly black, and both afe less bitter than those of Holarrhena.

In Alstonia, a genus which has also been confuted with the preceding, the seeds are attached to the fruit in the middle, and have a coma of hairs at both extremities.

Oil.—The SEEDS yield about 30 per cent, of a fixed oil, of a greenish yellow colour and having a peculiar odour, but bland to the taste. The Revd. A. Campbell mentions this seed oil as being used medicinally by the Santals

Dye—"The wood ash is used in dyeing in Chutia Nagpore" (Revd. A. Campbell),

MEDICINE. Bark. Medicine.—The BARK both of the stem and root and the SEEDS are amongst the most important medicines of the Hindu Materia Medica, the **207** Seeds. former being considered a powerful antidysenteric, while the latter have ascribed to them astringent, febrifuge, antidysenteric, and anthelmintic 298 properties. By Arabian and Persian writers the seeds are considered carminative and astringent, valuable in pulmonary affections, tonic, lithontriptic, and aphrodisiac. Both seeds and bark enjoyed at one time a European reputation, but probably owing to confusion with, or adulteration by, the cheaper and comparatively inert species of Wrightia, they are now almost entirely neglected. The Pharmacopeia of India classes Holarrhena amongst the non-officinal drugs, but reports favourably on its therapeutic qualities; indeed, Indian writers on therapeutics and materia medica, generally, are. unanimous in recommending the drug. U. C. Dutt, in his Hindu materia Medica, gives the principal methods of prescription followed by the Hindus and Sanskrit writers, from which it appears that a fluid extract, an expressed juice, a compound decoction and confection are prepared from the bark; from the seeds a compound powder and a fermented liquor. An oil for external application is also made by mixing a decoction of the bark, a number of astringent and aromatic substances in small quantities, and sesamum oil. The Revd. A. Campbell, in his Econo\* mic Products of Chutia Nagpore, writes: "The bark, dried and ground, is rubbed over the body in dropsy. The fruit is applied in snake-bite to allay swelling and irritation, and the seeds yield a medicinal oil." Mr. U. C. Dutt prefers for administration a watery extract of the root-bark, in doses of about three grains in combination with half a grain of opium. Dr. Dymock mentions that the root-bark alone is employed by the natives of the Goa territory and the Konkan. This selection of the root-bark as the most powerful antidysenteric part of the plant appears to be confirmed by several of the special opinions quoted hereafter. The Indian Medical Gazette, 1886, Vol. /.,  $j_0 j_t$  states that during the cattle plague epidemic at Backergunge the seeds were extensively employed, being supposed to possess certain specific virtues, but\* the results are not given. As both the bark and seeds contain a basic substance (Wrightine or Conessine), which seems to be the important therapeutic constituent, it appears desirable that a careful quantitative analysis of the different medicinal parts of the plant should be made, so that it might be finally decided which is the most valuable. Such an analysis might result in the discovery of a cheap method of separation of an antidysenteric, and possibly antipyretic and antiperiodic alkaloid of very considerable value. Dr. Warden. in a short account of the qualitative analysis of the barks and seeds, writes that a solution containing the partly purified alkaloid has been used with success in the treatment of fevers and dysentery. Should it, even in a smaller degree, possess the specific properties of Quinine and Ipecacuanha a most valuable drug would be added to our remedies for tropical diseases.

SPECIAL OPINIONS.—§ " Is a very useful medicine in chronic dysentery. In acute cases is not to be compared with ipecacuanha. Assistant Su-geon Moti Lall Mukerjee (of the hospital here), who uses it largely, tells me that the powder is a more useful preparation than any other, Dose 10 to 20 grains three times daily in a little water for an adult" (Surgeon-Major E. Sanders, Chittagong). "Juse the decoction in chronic dysentery with excellent results" (Surgeon R, l. Dutt, M.D., Pubna). "Useful in chronic dysentery and diarrhoea" (Surgeon-Major E. E. Bensley, Rajshahye). "In fourteen consecutive<sub>ca</sub>ses of dysentery in the jail hospital I have used the decoction of the bark y; th success. The average period of treatment was five days. Ipecacuanha; was given in no case"(CYvt7 Surgeon D. Basu, Faridpore, Bengal). "I have used this drug wuh great

### Kurchi or Conessi Bark.

antidysenterica. advantage in dysentery among prisoners " (Surgeon R. D. Murray, M.D., Bur dm an). " Decoction of bark is very valuable in dysentery " (Bolly Chunder Sen, Teacher of Medicine). " The bark of H. antidysenterica called kurchi is useful in dysentery, given as an infusion in doses of MEDICINE. from I to 2 ounces " (Surgeon E. S. Brander, M.B., F.R.C.S.Edin., Rungpore). "Kcorchee bark is used in cases of dysentery; it may be administered together with opium, ipecac, tannic acid, &c." {Surgeon J. Ffrench Mullen, M.D., Saidpore). "Almost a specific in chronic dysentery even if there be sloughing of the mucous membrane. The decoction is useful in cases of piles, bleeding, or otherwise. The seeds are given in the acute stage of dysentery whether accompanied or not by fever " (W. Forsyth, F.R.C.S., Edin., Civil Medical Officer, Din\_aj pore). "Have used the decoction of the bark largely in dysentery after the acute stage with satisfactory results; also in chronic diarrhoea "(Surgeon C. H. Joubert, Darjeeling). "I seldom use ipecacuanha in dysentery in my practice now. If the decoction of the bark be used in acute dysentery it should be given in 2 oz. doses with a little opium every two hours or so. But the alkaloid *Kurchiene* is very efficacious in the acute stage of dysentery " (Surgeon K. D. Ghose, Bankura, Bengal). " There is nothing to remark, in addition to what has already been noted, regarding this useful remedy except to point out that in a heemorrhagic, sub-acute, and chronic dysentery, it should be prescribed. In ordinary acute inflammatory dysentery this remedy should not be employed; kurchi, in common with every other active astringent, should be avoided in the early stages of the disease. The indiscriminate use of this drug in every stage of dysentery and diarrhcea has, in my opinion, led many practitioners, both European and Native, to doubt the efficacy of this medicine. It is a most useful remedy when prescribed with judgment" (Civil Surgeon R. G. Mat hew, Mozuffer\* pore). "Used in chronic rheumatism " (Surgeon-Major J. J. L. Ration, M.D., Salem). "The seeds in dose: of I to 2 grains are useful in the diarrhcea of young infants, and as a tonic in cases of emaciation and general debility in doses of 4 to 5 grains. A combination of the seeds, old cotton, and honey is used by the natives as a local application to the os uteri in cases of inflammation of the uterus " (*First Class Hospital As-sistant Lai Mahomed, Hoshangabad, Central Provinces*). " 1 can also bear testimony to the effects of this remedy in dysentery, especially in children" (Surgeon-Major P. N. Mookerjee, Cuttack, Orissa). "The decoction of the bark is very useful in acute and sub-acute dysentery. In chronic cases, however, I found it fail, in two instances, like other medicines. The bark must be used fresh from the tree " (Assistant Surgeon Shib Chunder Bhattacharji, Chanda, Central Provinces). \*\* I can with great confidence add my testimony to the value of this remedy in dysentery. I use a decoction of the bark with or without Ipecac.: and I have always found the result most satisfactory. It is specially useful in acute cases after large doses of ipecac, given in the early stage of the disease and is largely used in charitable dispensaries and hospitals" (Civil Surgeon S\* M. Shircore, Moor she dabad). "The decoction in 1 ounce doses, as well as the fluid extract of the bark of the root, in doses of 10 to chronic ·'' (Assisia Lii,  $^{rf}$  (!<sup>uent</sup> y <sup>usec</sup>\*\*<sup>n</sup> dysentery, haemorrhagic as well as employed the decoction. | MEDICINE.<br>Root.<br>330             | for cordage and paper-making. Royle states that it attains its best con-<br>dition after the rains.<br>Medicine.—R heede first drew attention to the medicinal virtues of the<br>ROOT, mentioning its value as an application for ophthalmia and<br>"dimness of vision * (presumably that form due to keratitis). Dymock<br>writes regarding its utilisation in Western India : <sup>ts</sup> The roots areaised as<br>a remedy for scalding in gonorrhoea, and, beaten into a paste, are applied to<br>the eyes in ophthalmia. In diabetes, the root rubbed to a paste, is given in<br>cold milk. In spermatorrhoea the dried root, with an equal quantity ot<br>the root of Eriodendron anfractuosum powdered, is given in 6-massa doses,<br>with milk and sugar, twice daily." The Revd. A. Campbell describes it<br>as employed in decoction by the Santals, as a remedy for cough, an* also<br>for orchitis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| FOOD AND<br>FODDER.<br>Leaves,<br>331 | Food and Fodder.—The LEAVES and FLOWERS are eaten as a vege-<br>table in parts of Bombay. Campbell mentions that the leaves are similarly<br>employed in Chutia Nagpur, and that cattle eat the plant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Habitat.—A small rigid evergreen shrub, found on the rocky and stony river-beds of the Sikkim Himalaya at an altitude of 1,000 to 2,000 feet; also in Assam, the Khasia Hills, and southward to Burma, Tenasserim, the Andaman Islands, and Bundelkhund, and in the Deccan Peninsula from the Konkan southward. It is also common in Ceylon up to an elevation of 2,000 feet.                                                                                                                                                                                                                                                                                                                                                                                                                                     |                        |
| Structure of the Wood.—Grey or greyish brown, moderately hard, close-grained. Weight 40^ per cubic foot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | TIMBER.                |

| <b>.Honey</b> is the saccharine substance obtained from the honeycomb of <b>Apis</b> mellifica and other species of bees, for an enumeration of which the reader is referred to the article " <b>Bees</b> ," Vol. I., p. 434. The saccharine matter is gathered by the bees from the nectaries of many species of flowers and is sucked into the crop, where it undergoes certain chemical changes, the cane sugar or saccharose of the nectar being converted into " invert" sugar, a compound of dextrose and laevulose. According to certain chemists, this conversion of cane sugar is complete, leaving none in the prepared honey, while others contend that cane sugar is always present. This difference of opinion probably arises from the samples examined having                                      |                        |

| SOURCE.          | <i>tore, 5 / Trichinopoly, t6.</i><br><b>Source, Collection,</b> &c—Honey is a very plentiful wild product over<br>the greater portion of India,but is obtained artificially from domesticated<br>bees, only in the hills north of the Panjdb, and in certain districts of Burma<br>The following passages from reports published by the Governments of the<br>several Provinces and Presidencies, also from Gazetteers and other sources<br>may be given, as indicating the annual amount procured, the methods of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MADRAS.<br>343   | <ul> <li>collection, and trade in honey and wax in the different parts of the Empire <i>Madras.</i>—"The hive bee of Europe (Apis mellifica) is unknown in South India. There are four species of wild bee which attach their comb to branches, or place them in crevices of rocks or ruins. A. indica and A floralis are migratory, moving especially to localities where any plants o the Strobilanthes genus are in flower. A. nigrocincta remains in th same spot throughout the year. A small variety of this species is known as the 'Mosquito Bee' frequenting the plains and rocky hills throughout the Presidency The quantity of honey in its nest is small and not co good quality. The fourth species, A. dorsata, or the' Rock Bee,' is twice as large as A. indica. The honey is collected by jungle tribes who an familiar with the localities which the swarms frequent and refuse to leave. Regarding the Cuddapah district, the Collector writes: "Honey is collected in the forests in almost all the taluks and is sold at R2  to R4 a maun. The wax is here sold at R15 a maund. The right to collect honey is either farmed out or managed under <i>amdne</i> by the Forest Department. In 1888 and 1888, 243ft valued at R35 were collected by the Department, an 840ft valued at R29 by license." The Collector of Trichinopoly report that honey is generally collected in the mountainous and thick jungle such as those of the Pachamalais, the Marnagapuri, and the Korlavt hills. In the District Manual it is mentioned as one of the princip products of the Pachamalai hills.</li> </ul>                                                                                                       |

| Honey and Bees'-wax. (J. Murray.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | HONEY.                      |

| In a memoir by the Revenue Department on the Madura District the following occurs: "Honey is collected to a large extent in the Saduragi and Varshanad hills, and to a small extent from the trees on the plains. A measure of honey costs between 12 annas and Ri. The Conservator of Forests, in an interesting report furnished in July 1889, writes : • Honey and wax are forest products, and are either farmed out or collected departmentally, but in reality only a small portion of the quantity actually produced ever reaches the market <sup>f</sup> The following return has been furnished for South Arcot: I. <i>Collected by Department.</i> —In 1884-85, 1,484ft of honey valued at R76-12-7, 840ft of wax at R360, or a total of R436-12-7. In 1885-86, 171ft of honey, R21-4-5; 29ft of wax, Ric-3-0,—total R31-7-5. In 1886-87, 793ft of honey, R82-3-8; 209ft of wax, R80-i-!i,—total R163-1-7. In 1887-88, 244ft of honey, R35-1-8; 61ft of wax, R26-11-0,—total R61-12-8. In 1886-87 the sum annually realised by leasing out the right of collecting honey and wax was ft80; in 1887-88, R47 was obtained from this source for 1,120ft honey and 560ft of wax. The total amount realised by the Department during five years for honey and wax was thus R985-15-8."                                                                                                                                                                                                                                                                                                                             | MADRAS.<br>344              |
| produce collected by the Department itself very greatly exceeded propor-<br>tionately that obtained by the system of leasing out the trees.<br>The quantity collected in South Coimbatore in 1888-89 was 1,192 small<br>measures, and the revenue realised R264. The District Forest Officer of<br>Tinnevelly reports : * Three descriptions of honey are found in the forests, of<br>which one is said to be used only for medicinal purposes. The cost of<br>collection of the other two kinds is eight annas per Madras measure, and<br>the selling price Ri*4, for the best quality. The total yield varies consi-<br>derably, but including that from Zamin forests, it might amount to about<br>1,800 measures in a good year.' In South KanSra, 'bee-keeping is<br>unknown; wild honey and wax are collected from the jungles, the combs<br>being generally on large trees. The honey of the small bees is preferred<br>for medicine. Honey is collected by Government agency at a cost of R1-6<br>to Ri-14 a maund of 28ft. The quantity annually collected is 29 maunds,<br>and is generally sold at R2-10 a maund. <sup>1</sup> "                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Coimbatore<br>345           |
| In the Central Provinces.—The Report on the Settlement of the Upper<br>Godaveri District contains the following : "There are four different sorts<br>of honey produced in the jungles of this district: (1) <i>Kurra teneh</i> , (2)<br><i>Moosur teneh</i> , (3) <i>Tonudee teneh</i> , (4) <i>Pitwar teneh</i> , (5) <i>Kunagole teneh</i> ,<br>of which 1 and 5 are the most delicate, and the bees' nests of the same<br>(the former being found on branches, the latter in holes in the trunks<br>of trees) yield good wax. 2 is also found in holes in trees, 3 in holes in<br>the ground and ant-hills, while 4 is the honey of the large bee the nests<br>of which are found suspended as large combs from lofty trees and rocks.<br>The wax of all is good and is collected by <i>Gottehs</i> and <i>Kays</i> , and sold or<br>bartered to traders; and turmeric is sometimes employed to dye it yellow.<br>The honey is not exported." A similar account is given in the Settlement<br>Report of the Chanda District, in which it is, however, stated that the<br>honeys above described as Nos. 3 and 4 are alone of importance. A<br>comb of the former is said to yield on an average about one seer of honey<br>and two chittacks of wax; that of the latter, 10 seers of honey and 4<br>seers of wax. The Report on the N imar District describes the Ratgurk<br>hill as a "perfect hive of bees' nests," and further states that the honey<br>and wax are collected by a class of people called <i>Dhanook</i> and <i>Nahal</i><br>who perform their dangerous work with great dexterity. Honey is also | CENTRAL<br>PROVINCES<br>346 |

| HONEY.                                         | Honey and Bees'-wax.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| BENGAL.<br><b>347</b>                          | reported to be plentiful and good in the Jubbulpore, Bhundara, and<br>Hoshungabad Districts. No information is available of the total yield of<br>honey and wax in the Central Provinces, but from the foregoing accounts<br>the production would appear to be very great.<br>In Bengal—The Director of Land Records and Agriculture, in an in-<br>teresting report on honey, states that the bee is never domesticated, but that<br>a large amount of honey is gathered in the jungle and fields, especially of<br>Chutia Nagpur and the Sanderbans. The men who collect it belong to<br>the Bagdee caste, and are called moulays or "honeymen." The principal<br>honey season commences in January and lasts till the end of March, but                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                                | <ul> <li>there" is another less important season in April and June. The honey obtained in February is considered the finest, is known as <i>dinhar m^dhu</i>, and fetches a high price, while that collected in June is the worst.</li> <li>The average amount collected and sold by the hill tribes of Chutia Nagpur is about 150 maunds at R4 a maund; while about 5,000 maunds are sold annually at Naluah, Khorumpara Ghât, Khari, and Harwa, at prices ranging from R8 to Rio per maund. The preparation and sale of wax are incidentally referred to in the report, but no information is given as to the extent of trade in that article.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| BURMA.<br><b>348</b>                           | <i>In Burma.</i> —Honey is found in large quantities in the jungles, and is<br>collected and much used by the natives. No reports of the annual amount<br>gathered are available. In the Amherst District, as in Madras, licenses<br>are granted for the right to collect honey and wax. In the Tongu District<br>wax is mentioned as being used in the manufacture of candles, and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| e                                              | probably it is similarly employed in other parts. The report from the<br>Chief Commissioner shows that in the greater number of the Burman<br>districts bee-keeping is not known, but it appears that in the Thongwa<br>District bees are domesticated and honey collected from their "> <sup>ves</sup><br>Strettell ii» his Narrative of Travels in Upper Burma describes a with                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                                | bee, which builds large nests suspended from ledges of rocks. The nest<br>is conical in shape, 3 feet long, and as broad at the top. From these<br>hives, he says, large quantities of honey are collected. For the curiou<br>wax-like POON-YET of Burma,—see the articles on "Dammar," Vol. III.<br>p. 17; also" Poonyet, Vol. VI."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30MBAY.<br><b>349</b><br>Kanara.<br><b>350</b> | In Bombay.—The Gazetteers contain very few references to this product, from which it may be presumed that it is not collected by any mean to the same extent as in Madras and the Central Provinces, Kanara however, appears to differ markedly in this respect from the rest.a the Presidency, for not only is honey collected to a large extent in that district, but a rudimentary form of becfarming is carried on. The $\pounds *$ ".*"                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                                | teer contains an interesting description of honey and wax $g^{a^{T}M'}$ ng from which the following has been compiled: Kanara; bees; are said t be of four kinds, named in the vernacular <i>togar-jetnu</i> , $to_{a^{*}}^{*} t_{a^{*}}^{*} t_{a^{*}$ |
|                                                | either on the upper limbs of the tallest trees (as many as twenty to thirt<br>sometimes occurring on a single tree), or attached to precipitous clifts<br>the sides of high bridges or houses, and similar inaccessible positions.<br>This bee is specially fond of the nectar secreted by the flowers of the<br><i>kárvi</i> , a species of Strobilanthes, and always abounds in the neighbour<br>bood of these plants. Oning to the inaccessible position of the combe                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| . `                                            | hood of these plants. Owing to the inaccessible position of the combe<br>collection is an attended decomposition of the comber. It<br>effected during dark nights twice a year,—once just before the setting is<br>of the rains, in April-May, and again in October-November, the hone<br>of the latter period being known as the "grass harvest," and that of tr<br>former as the "main harvest." The combs are obtained from high trees D                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Honey and Bees'-wax. (7- Murrry.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | HONEY         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| means of bamboos, the branches of which are lopped off to serve as steps;<br>while from cliffs, bridges, &c, the honey is generally collected by a gatherer<br>let down from the top in a basket or net suspended from a long rope.<br>Though the method of collection is doubly dangerous from the inaccessible<br>positions of the combs and the fierce nature of the bees, the harvest is a<br>plentifulr-one, and well repays collection. One comb is said to yield on an<br>average eight to fifteen " beer bottles " of reddish-brown honey, and from<br>one to two and a half pounds of wax.<br>The second or <i>tudabi</i> bee is much smaller, and builds a small comb,<br>only yielding from one to three " beer bottles " of honey, which, however,<br>is of superior quality and flavour. The combs of this variety are found in<br>the hcMows of trees or old walls. The third or <i>kol</i> bee is still smallar, and<br>its comb, which is built on thorn bushes or small plants, yields only about<br>a tea-cupful of honey. The fourth or <i>misri</i> bee is said to be about the<br>size of an ant, and to collect a honey much prized in medicine. It seems<br>doubtful if this is in reality a true bee. | BOMBAY        |
| The right to collect honey and wax is farmed out as in Madras, and is<br>productive of a fairly large but varying revenue, since higher bids are made<br>in years when the Strobilanthes plants are in flower. In the four years<br>ending 1880-81, R19,140 were thus obtained, or an annual average of<br>84,780. The estimated yearly outturn is about 568 cwt. of honey and<br>290 cwt. of wax : the latter is nearly all sent to Goa, where it meets a ready<br>sale for the manufacture of wax candles for the Roman Catholic churches ;<br>while the former is nearly all sent to Bombay, selling at 1 to 4 annas the<br>ordinary quart bottle according to quality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | •             |
| The system of bee-keeping pursued in Kan ara, though rudimentary<br>and not extensive, is interesting as forming the only instance of its being<br>even attempted south of the Pan jab Himalaya. It is carried on only in<br>some of the small hill-villages, and the method is very crude, ^n empty<br>earthen pot is placed mouth downwards in a white-ants' nest, or, more<br>rarely, in a hole made for the purpose, a small opening is made at one<br>side, and the hive, thus completed, is left to take its chance of becoming<br>the selected quarters of the bees. If bees do come and build, they are left<br>unmolested for some time, after which the comb is extracted as carefully<br>as possible, every endeavour being made not to disturb the parts contain-<br>ing the young. By these means the bees are not frightened, and generally                                                                                                                                                                                                                                                                                                                                                                     | 3             |
| stay on for a year or two.<br>The honey thus obtained is principally employed for home medicine.<br>A report recently received from the Acting Director of Land Records<br>and Agriculture contains the information that the honey collected in<br>Kanara and sent to Bombay is purchased by grocers, who adulterate it<br>with treacle, or syrup, and that Mahableshwar honey is much prized on<br>account of its purity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |               |
| In the Punjab.—Bee-culture is extensively carried on in the Murree<br>hills, in thetahsil of Rawalpindi, in Hdzara, in the Simla hills and in Kulu.<br>In Hazara and the Pindi District the hive is constructed of mud, moulded<br>in & cylindrical shape, about 8 inches in diameter at one end and 16 to 20<br>inches at the other, and some 15 to 20 inches in length. This is inserted<br>by the bee-keeper into a hole in the wall of his hut, made to fit the larger<br>end. He then closes it up from the inside of the house, with a sort of<br>door made of grass and mud, and stops the smaller end also with mud,<br>leaving only a small entrance hole, about 1 inch in diameter. Having thus<br>prepared a hive, he, during the month of April, smears honey, green<br>bangh, or a mixture of ghur and milk, over its mouth. This generally<br>attracts occupants, which flying away return with a swarm, or should this<br>means fail, a captured swarm is shaken into the previously smeared hive.                                                                                                                                                                                                             | PANJAB<br>351 |

| hives. It is believed that the Yung " (the bee domesticated in the dist<br>"extracts honey and pollen from almost every flower, except the Jee<br>mine {chumbili}; that the honey from Plectranthus rugosus (pehi<br>the best and purest, and that after a rainy night, if the bees return la<br>with honey from the flowers of Pyrus Pashia (shegul), numbers of t<br>eat it and die; but no precaution appears to be taken by the villa<br>against this happening. It is also said that, when the bees have<br>lected honey and pollen from the male catkins of the Deodar, two-th<br>of the honey in the comb is quite bitter and useless, and that the ho<br>made from April to July is watery and of a yellow colour, but that<br>autumn store is of good quality. The honey is taken either at night of<br>the day-time by smoking out the bees, and to induce them to return v<br>is sprinkled about, and a noise made by whistling and rapping on I<br>plates; but if this plan does not answer, the queen, with the bees which<br>ter around her, is swept into a cloth or basket and returned to the hive,<br>which, however, all the combs on the outside of the recesses have<br>removed, leaving those in the recesses for the support of the bees, and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | · · · · | Bee-keeping is carried on on a still larger scale in the Simla hills. W-Q. Minniken, Esq., Deputy Conservator of Forests, Bashahr Division, in an interesting communication on this subject, writes : "The management 01 the bee is carried on in most villages as far up the valley" (of the butlej) "as Zipe and the Runang pass. The largest returns of honey and wax are obtained from the side valleys on the north and south of the river below Wangtu, where the rainfall is about 66 inches. In these valleys, houses—one, two, or three stories high—are especially kept for rearing bees, —small recesses, 1 foot by 1 foot by 9 inches, being let in along the yams at 2 feet apart and closed on the outside by a wooden panel in which an entrance hole is made. A man is usually in charge of each house, whose duty it is,/ <sup>TM*</sup> , to prevent excessive swarning, which is done by giving each colony ample room, and sometimes by clipping the wings ot me queen bee; <i>second</i> , to keep the apiary well stocked with early swarns and to guard it against the attacks of bears, martins, hornets, wasps and caterpillars. Stocking is effected by rubbing the inside of the recessee with a paste prepared from honey, white wild rose, roots of the Junnee macrocgphala" ( <i>dhup</i> ) "and the petals and seed of the Pleurosper mum Govanianum ( <i>espouse</i> ), which is said to be most attractive to the queer bee; but as sufficient swarms are not caught in this way, cylindrical boxe formed of two or three lengths of holow trunks, 2 to 3 feet in circumference covered at the top, and with an opening on one side, are rubbed with the paste, and set out in different places, 2 to 3 miles away, in order to catcle with honey from the flowers of Pyrus Pashia ( <i>shegul</i> ), numbers of their houses resorved for the bees, and the boxes are sometimes used as permanen hives. It is believed that the <i>Yung</i> " (the bee domesticated in the district" extracts honey and pollen from almost every flower, except the Jessis mine ( <i>chumbili</i> ); that the honey from Plectranturs rugosus ( <i>peh</i> ) the bee |

| Trade in Honey and Wax. ( <b>7.</b> Murray.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | HONEY.                          |
| whose store has failed have to be fed during winter on a mixture of honey<br>and fine buckwheat flour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | FANJAB.                         |
| •• The honey is extracted by squeezing the combs 'over a fine bamboo<br>sieve, through which the honey drips into a vessel placed below, and the<br>wax is obtained by boiling the comb, and whilst boiling skimming off the<br>wax, anjj further refining it by straining, while it is liquid, through a thin<br>cloth. The refuse is about one quarter of the whole and is of no value.<br>The yield of honey from an apiary is from 30 to 50 pucka maunds, and<br>from a single hive 5 seers to 1J maunds, and from J seer to 5 seers of wax.<br>About one-fourth of the annual produce is exported, and three-fourths<br>consumed by the people.''<br>In+Kulu, bees are kept in the upper verandahs of houses in bee-hives                                                                        | Kulu.                           |
| formed of short lengths of the hollow trunks of trees, covered at the top, and<br>with an entrance hole at the side. The insects thrive best in the highest<br>villages, from which the flowery slopes above the forests are accessible.<br>Honey is also obtained in many parts of the Panjáb from the different<br>varieties of wild bee, but no returns of the total amount annually collected<br>are available. In Davies* <i>Trade Report of the Countries on the North-</i><br><i>Western Border of India, 1862,</i> it is stated that more than 100 maunds were<br>then exported from Kangra and Kulu to Ladakh and Yarkhand, and that<br>a large quantity was also annually exported from Afghánistan to Turkish<br>China where it was used in making "Goolkund" or Preserve of Rose flowers. | 353                             |
| It seems possible that should such a system of bee-keeping as that<br>just described be introduced into Bengal, Madras, and the Central Prov-<br>inces, the amount of wax and honey collected in India might be very<br>greatly increased, and bee-culture become an important industry. The<br>demand for wax for several manufacturing purposes is very large, and not-<br>withstanding the large amount produced in this country, the imports are<br>considerable. It may be interesting in connection with this to give a short                                                                                                                                                                                                                                                                   | ,                               |
| review of the trade during the past few years.<br>Trade-in 1875-76 the exports of wax were valued at R6,21,890, in<br>1880-81 at R5,45,no, in 1885-86 at R4J7,230, and in 1888-89 at R4,20,959.<br>The trade would thus seem to be falling off, but, perhaps, a larger amount<br>of wax produced in India is now being used up within the country. The<br>imports of foreign wax (excluding wax candles) were valued in 1875-76 at<br>R2O,oio, in 1880-81 at Ri,45,4.67, in 1885-86 at R34,244, and in 1888-89 at<br>R99,272, showing a marked increase. The exports of foreign wax are<br>unimportant.                                                                                                                                                                                               | TRADE.<br>Wax.<br>354           |
| The trade in honey is small and local. For the prices, &c, in different parts of the country, the reader is referred to the part of this article dealing with SOURCE, COLLECTION, &C                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Honey.<br>355                   |
| Preparation.—Honey is sold either in the comb, as "comb honey" or<br>as "run honey" after extraction. This is ordinarily accomplished by<br>cutting the covering off the cells, and allowing the honey to flow from the<br>comb into a receptacle beneath, or by some method of compression and<br>straining. With improved methods of bee-keeping, which have lately<br>greatly developed in Europe and America, it is possible, by a simple adapta-<br>tion of the principle of centrifugal force, to completely empty a comb n a<br>few minutes, without destroying the fine structure of the cells. The<br>empty comb is then returned to the hive to be refilled.                                                                                                                                | PREPARA-<br>TION.<br><b>356</b> |

ı.

Commercial bees'-wax is of two principal kinds, yellow and white Yellow commercial wax is obtained by melting the combs after expression of the honey in boiling water. It rises to the surface, leaving a great part of the impurities behind, and is either skimmed off or allowed to cool in the form of a cake. This process is repeated till the desired degree of purity

| PREPARA-<br>TION.                                          | is obtained. The addition of nitric acid to the boiling water accelerates<br>the purification. White wax is manufactured from the yellow by rolling it<br>into sheets or ribbons and exposing these to the bleaching action of the sun.<br>By this means the surfaces of the ribbons are whitened, after which they<br>are again gathered together, remelted and again made into ribbons, in<br>order to expose a fresh surface, and this is repeated till the bleaching is<br>completed. The same result may also be more rapidly effected by treat-<br>ing the wax with sulphuric acid and bichromate of potash, when the liber-<br>ated chromic acid bleaches the whole mass in a few hours.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| FOOD.<br>357                                               | Food.—Honey is highly appreciated by the natives of many parts of<br>India as an article of food. There seems to be little doubt, however,<br>that certain kinds of honey, or honey collected from certain flowers, is more<br>or less poisonous. This fact has long been recognised in India; thus Ainslie<br>writes of a peculiar dark greenish coloured kind, "which, according to the<br>Vytians, cannot be eaten with impunity." In the <i>Madras Quart. Journ.</i><br><i>Med. Sc, Oct. 1861, jgg,</i> Dr. Bidie also gives an account of a small<br>quantity of honey, obtained from the jungle of Coorg, having produced<br>symptoms of urtication, headache, extreme nausea, prostration, and in-<br>tense thirst. Again, Hooker, in his <i>Hintalayan Journal</i> , alludes to<br>poisonous noney, mentioning that honey is much sought for in Eastern<br>Nepál, except in spring, when it is said to be poisoned by rhododendron<br>flowers, just as that eaten by the soldiers in the retreat of the Ten Thousand<br>was by the flowers of R. ponticum. Strettell also mentions that at certain<br>seasons the honey obtained in Burma is poisonous. In the Panjáb Hima-<br>laya honey is principally used in the manufacture of an alcoholic liquor,<br>which the natives prepare by mixing one part with an equal quantity<br>of water, and leaving it to stand for a year in a closed earthen vessel. The<br>resulting liquor is very potent, a cupful is said to be sufficient to produce<br>intoxication. |
| MEDICINE.<br>358                                           | Medicine.—Honey forms the basis of several very popular preparations<br>and has long been an important vehicle for other medicines in the Hindu<br>Materia Medica. By Sanskrit writers new honey is considered to be<br>demulcent and laxative, while, when more than one year old, it is said to be<br>astringent and demulcent. Applied externally it is supposed to be a useful<br>detergent. The Koran also, in the chapter on The See, contains the fol-<br>lowing; "There proceedeth from their bellies a liquor of various colour,<br>wherein is a medicine for man. "In European medicine, however, it is em-<br>ployed only as a flavouring agent in cough mixtures, gargles, confections<br>and in the preparation of oxymels.<br>Wax, like honey, is supposed to be emollient and demulcent, and the<br>white variety is sometimes prescribed in doses of 10 to 20 grs. Its prin-<br>cipal value, however, is in the preparation of ointments. A useful substitute<br>for lard or simple ointment in India (where the latter is not only objected<br>to from caste and religious principles, but also rapidly becomes rancid)<br>is Ceromel, a mixture of one part of yellow wax and four parts of honey.                                                                                                                                                                                                                                                                                                      |
| DOMESTIC,<br>NDUSTRIAL,<br>& SACRED<br>USES.<br><b>359</b> | <ul> <li>Is Ceromel, a mixture of one part of yellow wax and four parts of honey. Domestic, Industrial, and Sacred Uses.—Honey is valued in India as an antiseptic, for the preservation of fruits, and for making cakes, sweetmeats, &amp;c, which are required to keep for some length of time. A curious adaptation of this property is mentioned by Hooker as employed by the Khásias. He writes, in describing their method of disposing of the dead : "The body is burned, though seldom during the rains, from the difficulty of obtaining a fire; it is therefore preserved in honey (which is abundant and good) till the dry season, a practice I have read of as prevailing among some tribes in the Malay Peninsula." The reader will remember its extensive employment in ancient Egypt for the same purpose. Honey plays an important part in many of the ceremonial customs of the Hindus. Thus H. 359</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| HOPEA<br>odorata                                           | Rock Dammar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>odorata.</u><br>RESIN.<br>365                           | tively scarce in Pegu, but plentiful in Tenasserim, and large specimens<br>are common east of the <i>Trit-toung</i> .<br>Resin.—This species is the principal source of thecopalline resin known<br>as Rock Dammar (see III., 17). The first mention of this resin, the writer<br>can discover, is that in the <i>Proceedings*of the AgriHorticultural Society</i> ,<br><i>August 1858 {Jour., Vol. X.</i> } in which it is recorded that a sample of the<br>resin of the <i>Thengan</i> of Burma (Hopea odorata) was presented by the<br>Rev. C. 8. Parish. In an accompanying letter that gentleman com-<br>mented on its resemblance to Dammar, and remarked, " this seems such a<br>nice, pure, white resin that 1 cannot but think that it might be turned to<br>many useful purposes," and further," as every third or fourth large tree<br>is a <i>Thengan</i> , the resin might be got, I believe, in any quantities.'' The<br>resin was examined and reported on very favourably by Dr. Barry, who<br>wrote, " although not soluble in spirits of wine, it is perfectly so in benzole<br>or turpentine. The varnish afforded by both reagents is clear and limpid,                                                                                                                                                                                                                     |
|                                                            | and dries almost instantaneously. It should take very well at home." Very little has been done during the last thirty years in investigating the methods of collection and preparation, or in developing the trade in this resin. Dr. Cooke, however, in his report published in 1874, described its properties as follows: "The resin derived from this source occurs in nodules about as large as a walnut, rounded, of a pale straw colour, sometimes almost colourless, brittle, with a shining resinoid fracture, scarcely distinguishable in appearance from the East-Indian dammar of the London markets. We have found it to dissolve with equal freedom in spirits of turpentine or benzole, producing a clear bright solution, which, when used as a varnish, dries rapidly and smoothly. In all essential qualities it seems to equal East-Indian dammar, even for microscopical purposes, and hence gives good promise of taking a similar place and rate. Externally it has a\sosuffic ent resemblance to make it difficult to discriminate the one from the other. The advantage in hardness is rather in favour of the <i>Thengan</i> . The London brokers class it as a copal, and value clear pale samples at a rate equal to that of East-Indian dammar, <i>vie.</i> , about 40 per cwt." There is no record of the employment of this <i>Thengan</i> resin for economic pur- |
|                                                            | poses by the natives of Burma, but it is probable that, like others of the<br>same class, it is used for caulking boats, and as a rough varnish to wood-<br>work, &c Major Protheroe, however, states that it is employed by the<br>Andamanese, mixed with bees wax and red ochre, to make a wax used<br>to fasten their spear and arrowheads. East-Indian Dammar, which appa-<br>rently this product ought to rival in commerce, is extensively employed<br>in the manufacture of varnishes for coach-builders and painters, in mount-<br>ing microscopic objects, and for other similar purposes, while inferior qua-<br>lities are employed in the locality of production for caulking boats and<br>making torches. For an account of the interesting honey-combed black<br>resin of Burma, called locally <i>poon-yet</i> or <i>pwai-nget</i> , which is supposed to<br>be mainly derived by a peculiar bee from this, and other allied species, the<br>reader is referred to the article on Dammar (Vol. III., 17), and to Poon-yet<br>in Vol. VI.                                                                                                                                                                                                                                                                                                                                         |

|                     | A beardless variety, having, like the preceding, only two rows of spike-<br>lets, an£ presenwhg further the curious character of having the flower-<br>scales non-adherent to the grains. These scales drop off in threshing,<br>leaving the grains naked like those of the wheat. Three sub-varieties are<br>said to be largely culivated in Tibet, a dull green, a white and a dark or<br>chocolate brown. It is said to be largely grown in the hills near Kotgarh,<br>but is rare in the plains. With regard to the origin of this variety, Oap-<br>tain Pogson communicated a report, at the meeting of the Agri -Horticul-<br>tural Society in January 1886, in which he stated that Indian wheat-<br>barley, as he termed it, was introduced into the Panjab and North-West<br>Provinces during 1881, by se«d obtained from Poo in Tibet. In Baden<br><b>Powell's</b> <i>Panjab Products</i> *however, written in 1868, <i>paighambrijau</i> , both<br>white and black, are mentioned as having been obtained from the inun-<br>dated lands west of the Sutlej, from the Lahore District, from Gujranwala,<br>Gugaira, Dera Ghazi Khan, and Kashmir. The description of the grain<br>there given appears to coincide with that of this variety. In 1884 Mr. |

| This supposition is confirmed by the intimate connection of the grain with several of the rites and beliefs of the Hindú religion. Thus the God Indra is called, "He who ripens Barley." and the grain is employed in the ceremonies attending the birth of a child, weddings, funerals, and in certain -sacrificial rites. It is further supported by the antiquity of the Sanskrit name, Yava, which in the earliest times was probably applied as a general term to any grain or corn-yielding plant, and was only at a later date restricted to what, at that time, must have been probably the most important cereal.<br>In Glad win's translation of the 'Ain-i-Akbári the crop is said to have been one of the most important in Afghanistan and Kashm'r, and a large part of the revenue from these countries was obtained from barley, by exacting the usual two out of every ten kherwars produced.<br>CULTIVATION.<br>AREA.—It appears from the Agricultural Statistics of British India, that by far the largest quantity of this cereal is grown in the North-West Provinces and ihe Panjáb; Ajmere-Merwara, Bombay, the Central Pro* vinces, and Madras following on the list very far behind the two first, but in the order given. For the sake of comparison the following statements of the acreage under cultivation in these Provinces, during the last three years, may be here given :— | Cultivation of Bar                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | ley in India                                                                                                                                                                                                                                                   | (J. Thus, excluding Bengal, and the Native States—tracts from which reliable statistics are not forthcoming—the total area averages about 7 million acres under barley, mixed or unmixed, of which more than three-fourths belong to the North-West Provinces. In these Provinces, Benares, Allahabad, Agra, and Rohilkhand are the most important barley-growing districts; in the last the grain is grown mixed with wheat, in Allahabad ancl Agra it is generally mixed with gram, while in the first it is most commonly/ grown alone. Barley, mixed and unmixed, occupies about 20 per cent. of the total calculated area in the thirty temporarily-settled districts of these Provinces, or 42 per cent, of the total area under spring crops.

these Provinces, or 42 per cent, of the total area under spring crops. METHODS.—In the North-West Provinces.—The method of cultivation in this, the most important barley-growing region, may be taken as typical and will accordingly be fully described. Barley is a rabi or spring crop, being sown in October and reaped in March or April. As already men. tioned it is not only grown alone, but also mixed with wheat, when the crop is called *gojai*, or with gram, peas, or lentils, when it is known as *bijra*, or (in the tracts below the hills) gochin. Messrs. Duthie an<1 Fuller state that the areas under barley alone, barley-gram, and barley.

| vulgane.          | Cultivation of Barley in India,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CULTIVA-<br>TION. | wheat stand in the relative proportions of 15, 22, and 10. One of these crops is usually the <i>rabi</i> accompaniment of indigo or rice, since it is considered much better adapted than wheat alone, for growth on a soil which has not been allowed to recuperate itself by even six months' fallow. Rape (Brassicacampestris), Indian mustard (Brassica juncea), and <i>dudn</i> or <i>tara</i> (Erucasativaj are also commonly sown in barley fields either as a border, or in rows some 15 feet apart; linseed is also occasionally grown as a border. The soil (which is generally light and sandy, and but sparsely manured, except when the wheat-barley mixed crop is to be grown) is prepared In <i>Assauj</i> (September-October; by ploughing and cleaning, and when practicable the fields are irrigated by turning a stream into them from some neighbouring river. The amount of ploughing necessary seems to vary * <sup>nuCAA?</sup> different districts; thus in Rohilkhand. the operation is frequently performed as often as twelve times, while in Bundelkhand two or three are considered sufficient. Probably four ploughings is the average throughout the Provinces. Sowing in the irrigated fields takes place in October-November, and in the uplands in November-December, a little later than the sowing time of gram, and earlier than that of wheat. The seeds are sown in plough furrows either by hand direct, or down a hollow bamboo fastened to the plough stilt, to the average amount of about ioofc an acre. After the sowing is completed the seeds are covered in by the plough, the coarse clods of earth are broken by the <i>dalaya</i> , and kept steady by a man standing on it. Irrigation may or may not be employed, according to the amount of winter rainfall, and in districts which enjoy a tolerable certainty of these rains, it is but rarely carried out. A comparison of the total irrigated and unirrigated crops of the several divisions of the province show that irrigation is carried on to the greatest extent in Agra and Benares, to the smallest in Meerut and Rohilkhand, while the total i |
| cost.<br>386      | exception of possible irrigation, the crop is left very much to itself, till the season of ripening in March-April when it is reaped like wheat, by being cut in the middle of the stalk with a sickle, tied in sheaves, and stacked near the homestead to dry. When quite dry these sheaves are unbound and threshed out by a flat board with a short handle, termed a <i>mungra</i> , or in some of the north-eastern parts of Kumdon by a primitive form of flail, consisting of a long pliant stick. The grain thus separated is said to be mixed with the ashes of cowdung before being stored, to prevent the attacks of insects. In the case of mixed crops the barley and gram, or barley and wheat, are reaped, stored, and eaten as one.<br>COST AND AVERAGE OUTTURN.— Messrs. Duthie and Fuller give the following estimate of the total cost of growing an acre of barley :—                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Murray.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | vulgare.                                    |
| The outturn of barley is, under similar conditions, from one-fourth to<br>half again as much as that of wheat. When irrigated the average may be<br>taken as 16 maunds to the acre of unmixed barley, 15 of wheat-barley,<br>and 14 of barley-gram, while on unirrigated soil the average is from 8 to 11<br>maunds for unmixed barley, from 7 to 10 for barley-wheat, and from 6 to 9<br>for baiJey-gram, the amount varying with the winter rainfall of the district.<br>The average outturn of straw is about one and a half times that of the<br>grain. In mixed crops about three-fifths of the total produce is barley.<br>(Duthie and Fuller, Field and Garden Crops.)<br>Experiments were conducted in the Government Experimental Farm<br>of the North-Western Provinces and Oudh at Allahabad in 1872 for the<br>purpose of introducing the English two-rowed barley into that province. In<br>the report on these experiments it is stated that the country barley, H.<br>hexasticum, gave a yield of nearly double the English grain. These results<br>discouraged further attempts, but they appear strangely at variance with<br>the outcome of later experiment carried out in the Nilghiris, and described<br>below in treating of Madras.<br>The average price realised for Barley during the past twenty years in<br>this province has been 1 rupee for from 27 to 28 seers.<br>In the Panjab.—The largest areas are in the districts of Peshawar,<br>Sirsa, Ferozepore, Hissar, and Gurgaon. The system of cultivation is very<br>similar to that already described as pursued in the North-West Provinces;<br>but the practice of topping an over-leafy crop, which is never followed in<br>the latter region, is said to be common, and the crop is generally grown un-<br>mixed, gojai and bijra being almost unknown. As in the North-Western                                                                                                                                                                                                  | OUTTURN.<br>387<br>Panjab,<br>388           |
| Provinces the crop in this province receives very little special attention.<br>Thus in the <i>Kamal Gazetteer</i> the system is described as follows: " Men<br>may be seen sowing barley at the very end of the season on the edges of a<br>swamp, still too wet to plough, with the intention of ploughing it as the<br>soil dries. The limit to sowing is expressed by the proverb ' <i>boy a Po</i> ,<br><i>diya kho</i> , '^ 'Sow in Po, and you lose your seed.' The field is ploughed two<br>to four times, the <i>sohagga</i> is passed over it, and the seed sown broadcast.<br>Manure is given if there is any to spare, which there seldom is, and water is<br>given if the needs of the other crops allow of it. It is seldom weeded<br>unless the weeds are very bad."<br>In 1876 an important and interesting official correspondence was carried<br>on regarding the quality of Panjab barley, which arose from complaints<br>made regarding it by the Veterinary Department. From this correspond-<br>ence it appears that the quality of the grain, at least at that time, suffered<br>severely from its being cut before it was quite ripe, and from its being<br>carelessly stored while damp, or in a damp place. One firm of brewers<br>who were applied to for an opinion reported that, by buying the barley<br>immediately after it was reaped and threshed, and storing it themselves,<br>they obtained a most excellent grain; while two other firms who seemingly<br>bought the barley when required for use in October, had great difficulty<br>in obtaining even fairly good barley, a large percentage being dead,<br>mouldy, or weevil-eaten. These facts point to careless and ignorant<br>methods of storing as the principal cause of the frequently inferior quality<br>of the grain, and to this being the point requiring attention in endeavour-<br>ing to improve it.<br>I he outturn per acre varies greatly in different districts, but the average<br>agrees with that in the North-West Provinces. The average price of the |                                             |
| grain during the past twenty years has been between 31 and 33-seers per<br>rupee.<br>In Central India and Raj put ana.—Barley is largely cultivated both in                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>C</b> lentral India<br>and<br>Rajputana, |

| CULTIVA-<br>TION.<br>Rajputana.                              | portion. The system of cultivation is, on the whole, similar to that pre-<br>viously detailed, but the crop appears to be generally ploughed about six<br>times, manured, weeded at least once, and irrigated; in fact, to receive<br>altogether more attention than in many other parts. The cost of produc-<br>tion is about R28, the value of the crop about R34, and the consequent pro-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Bombay.<br><b>390</b>                                        | fit about R6 per acre. , *<br><i>In Bombay.</i> —It is principally grown in Gujarat. In an interesting<br>report on the subject the Acting Director of Land Records and Agriculture<br>writes: "In 1887.88 Gujarat alone had more than three-fourths of the total<br>"area of barley-cultivation in Bombay. It is less important in the Deccan.<br>In Gujarat it is generally an after-crop in garden rice lands or in soils too                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Central<br>Provinces.<br><b>391</b><br>Madras.<br><b>392</b> | sandy and open for wheat. It is irrigated and manured. The garc/sn rice<br>land is, previous to cultivation, manured to the extent of 12 cart-loads,<br>watered on the stubble in December, then ploughed twice and levelled.<br>The seed to the extent of 80 to 100ft is immediately thrown by hand into<br>the furrows, the sower following the plough. It is then rolled and watered<br>six or eight times, and harvested in April. The estimated acre yield is<br>from 1,020 to 2,270ft. According to experiments conducted on this crop,<br>the cost per acre comes to about R2O, and the value of produce to about Rai-<br>The fact that it is not subject to the wheat blight renders it a favourite<br>rain crop in the light lands of Ahmadnagar and Kaira. In the Deccan it<br>is grown as a garden crop, and rarely as an after-crop in rice fields.'' <i>m</i><br><i>In the Central Provinces.</i> —The crop of barley in these provinces is so<br>insignificant that during the past two years no returns of the area under<br>cultivation have been made.<br><i>In Madras.</i> - A s might be expected from the climate of this province,<br>barley is a very unimportant crop, only from 3,000 to 4,000 acres being<br>cultivated on the spurs ai.d slopes of the Nilghiris and Pulneys, fe-n-<br>deavours' were, however, made by the Agricultural Department in 1885-80,<br>to improve the quality of Nilghiri barley, and to increase the extent of its<br>cultivation, by introducing good seed both from the Panjáb and England,<br>and distributing it to the <i>rayots</i> . To ensure success and to help the people<br>with advice and instruction, these experimental trials of foreign seed, though<br>conducted by the <i>rayats</i> themselves, were placed under the supervision of an<br>agricultural inspector. In the report of the Department for 1886-87 it is<br>stated that the results with English barley (H. distichum) were very satis-<br>factory, a good crop having been, obtained which was purchased by the<br>Nilghiri Brewery Company. Panj ab barley on the other hand, was found to be |
| Bengal.<br>393                                               | <ul> <li>interior to that already grown in the district, and accordingly attempts to introduce the latter have been stopped. English barley is further favourably commented on in the last report (1887-88), in which it is mentioned that during 1887 nearly 5,000 bushels of seed were sold at an average price of Ri-12 per bushel. Every endeavour is being made to increase the cultivation of this important malting grain, for which there is great demand, and, as a consequence, a considerable augmentation of the area under cultivation and yearly outturn in the Presidency may be expected.</li> <li>In Bengal.—No returns are available of the area under cultivation, and the crop as a whole is unimportant. The Director of Land Records and Agriculture mentions that it is cultivated in the Bhagulpore Division and to a limited extent in Chutia Nagpur. As in other districts, it is a rabi crop, being sown in October-November and reaped in March-April. The ground is prepared by three or four ploughings, at intervals of four, or five days. The seed is then sown, and the soil harrowed, and ploughing and harrowing are repeated after three days. No mention is made of any further attention, in the form of irrigation or weeding, being paid to the crop.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Production and Consumption of Indian Barley. (J. Murray,) HORDEUM<br>•ulgare.<br>In Burma.—The Government of Burma reports: '* In Mandalay it is<br>the margin paddy of the district. It is sown in the month of January,<br>and reaped in the month of May, averaging 120 days; the cost of cul-<br>tivation being about R12 per acre, and the proceeds about R25. It is an<br>inferior kind of grain and only eaten by the poorer classes. In the<br>Thongwa District it is grown in a very small area, there being not even 50<br>acres in all. It is cultivated indiscriminately, and at little cost. In the<br>Yamethin and Meiktila Districts margin paddy is grown extensively. No<br>returns are available regarding the total area under cultivation."<br>TOTAL PRODUCTION AND CONSUMPTION.—By far the greater pio-<br>portion of barley grown in the country is consumed locally, a very small<br>quantity being exported. An attempt has been made by the calculations<br>shown in the adjoining table to arrive at a fairly accurate estimate of the<br>actual total outturn of the grain in India during the year 1887-88 excluding<br>Bengal, Native States, and tracts from which no reports are available.<br>The result is necessarily (from the number of averages which had to be |                                                                                                                  |                                                                                                                |                                                                                                    |                                                                                                       |                                                                               | •ulgare.<br>CULTIVA-<br>TION.<br>Burma.<br><b>394</b><br>PRODUCTION<br>and CON-<br>SUMPTION. |

EXPORTS—Are also very small in comparison with the approximate annual production.

The grain prior to 1887-88 was considered, in the Annual Reports of Trade and Navigation, under the heading of " Other sorts of grain," hence it is only possible to give the figures for last year. From these it ap-pears that the total exports by sea to foreign countries during that period were 29,575 cwt., valued at R89J76, of which Bombay shipped 18,688 cwt.

| _vulgare                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| MEDICINE.<br>Seeds.<br><b>398</b> | Bengal 6,873 cwt., and Sind, 4,014 cwt., valued at (£58,632, £20,^56, and R 10,588, respectively. The country which imported most largely was Persia, with 10,358 cwt., following on which were Arabia with 7,675 cwt., Ceylon with 7,539 cwt., and Aden, the United Kingdom, Zanzibar, and "other countries," with insignificant quantities.<br>Medicine.—The husked SEED of H. distichum occupies a place <sup>0</sup> in the Pharmacopoeias of England, the United States and India, under the name of HORDEUM DECORTICATUM or Pearl Barley. The grains of this variety of prepared barley are sub-spherical or ovoid, about two lines in diameter, of a white farinaceous appearance, and have the peculiar taste and odour common to most of the cereal grains. An account of the preparation of                                                                                                                                                        |
| Chemistry,<br>399                 | "pearl barley " will be found under the heading FOOD.<br>CHEMISTRY.—The grain of H. hexastichum is frequently used in this<br>country instead of that of the officinal plant, and is exactly similar in medi-<br>cinal properties. Chemically the grains contain (along with the food-<br>forming constituents, which will be discussed hereafter) from 13 to 15 per                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                   | cent of water, and after drying they yield about 3 per cent of fat oil, with insignificant proportions of tannin and bitter principles, residing chiefly in the husks, and 2*4 of mineral ash. The oil, according to Hanamann.is a compound of glycerin with palm'uic and lauric acids, or less probably with a provide fatty acid. The was found by Lowmon to contain 2g per                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                   | a peculiar fatty acid. The ash was found by Lermer to contain 2g per<br>cent, of silicic acid, 32*6 of phosphoric acid, 227 of potash, and 37 of lime.<br>Besides these constituents Lintner in 1868 demonstrated the presence of<br>a little cholesterin in the grain, and still later Kuhnemann extracted from                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                   | it a crystallized dextrogyrate sugar, and an amorphous laevogyrate mucila-<br>ginous substance, sinistrin, and demonstrated the absence of dextrin<br>( $Fla'kiger$ and $Hanbury$ ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                   | MEDICINAL PROPERTIES.—Barley is demulcent, and easy of digestion,<br>and is for these reasons much used in the dietary of the sick. In India                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Grains.<br>400                    | <i>saktu</i> , or powder of the parched GRAINS, is much employed in the form of<br>a gruel in cases of painful and atonic dyspepsia. In European practice<br>Barley water, a decoction of the grain, is principally prescribed, and is                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Leaf.<br>401                      | valuable in cases requiring demulcent treatment. Dr. Irvine states that<br>in Patna the ASHES OF THE LEAP are employed in the formation of cooling<br>sherbets; and Stewart writes that the ASHES OP THE STALKS are pre-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Stalks.<br>402<br>Malt.           | scribed for indigestion in the plains of the Panjab. Preparations of MALT<br>have acquired some reputation of late years in Europe and America, since<br>they are more demulcent and nutritious than those of the unmalted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 403<br>Wort                       | barley. Malt extract may be prepared by boiling Iwo to four ounces of<br>the germinated and dried grain in a quart of water and straining. When<br>hops are added, the decoction becomes WORT, and acquires tonic pro-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Anatomically the\ are of very various structure, and, according to Professor Owen, " belong to two organic systems as distinct from each other as both are from teeth. Thus the horns of deer consist of bone, and are processes of the frontal bone; those of the giraffe are independent bones, or epiphyses, covered by hairy skin; those of oxen, sheep, and antelopes are *apophyses " (or direct processes) " of the frontal bone, covered by the corium " (or skin) "and by a sheath of true horny material;" those of the pronghorned antelope, consist at their bases of bony processes covered by hairy skin, and are covered by horny sheaths in the rest of their extent. They thus combine the character of those of the giraffe and ordinary antelope, together with the expanded and branched form of the antlers of the deer. Only the horn of the rhinoceros is composed wholly of horny matter, and this is disposed in longitudinal fibres, so that the horns seem rather to</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                   | CHARACTERS.<br>409 |

| <b>410</b><br>, | Horns of the 1st class—Are largely exported from India, which is<br>the principal source of the supply of Great Britain. The antlers principally exported are those of Axis inaculatus and Rusa aristotelis. 'I hose<br>of the latter rarely exceed 40 inches in length, and are generally under<br>three feet, but four feet along the curvature has been recorded. They com-<br>sist of a basal antler springing directly from the burr or base of the horr<br>and pointing forwards, upwards and outwards, the beam bifurcating a<br>the extremity, and a snag separating posteriorly and pointing obliquely to<br>the rear. The h-rns of Axis maculatus are about 30 inches in length<br>have a long antler sweeping upwards and backwards, with one basal and<br>one subterminal snag, the former projecting forwards and upwards from<br>the beam. 'The whole horn is pale and somewhat smooth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                 | These antlers and other bony horns are extensively employed in Europ<br>for the manufacture of handles for cutlery, umbrellas, and sticks, &c. Th<br>Gazetteers of Ratnagiri and Kánara in Bombay, and the Madras Manua<br>of Administration treating of Vizagapatam, contain accounts of the antler<br>of Samber and other deer, being employed locally in the manufacture of<br>small fancy articles, such as those mentioned above, but the industry seem<br>to be a very poor and unprofitable one.<br><i>Horns of the 2nd class</i> — Are employed principally in the manufacture of the manufacture of the manufacture of the section of the sectio |
|                 | facture of "horn " for the purposes of comb-making. The keratin, of which<br>the commercially valuable part is composed, is eminently suited to a number<br>of purposes, owing to its elasticity, flexibility, and toughness, together with<br>its physical property of softening under the application of heat, and it<br>capability while in this condition of being moulded and welded into various<br>forms under pressure. The horns of sheep and goats are whiter and more<br>transparent than those of other animals, and are, therefore, most valued for<br>comb-making purposes, while of the Indian horns, those of the arna but<br>falo (Bubalus ami) are the handsomest and best for more ornamental work<br>According to the authors of <i>Spons' Encyclopaedia</i> about one-fifth of the total                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| -               | imports of horn into England are employed in comb-making, while a sma<br>portion is converted into shoe-horns, scoops, cattle-drenches, drinkin<br>cups, &c. The solid tips and the hoofs of cattle (which like horn consis<br>largely of keratin) are made into buttons.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| combs.<br>411   | In the preparation of horns for comb-making, &c, the following is th<br>process usually adopted :<br>"Horns which are to be manufactured are first thrown into water h<br>which means slight putrefaction is caused, ammonia is liberated, and th                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| horn.<br>V The manufacture of combs is by far the most import<br>horn. The laminatory character of the horn, its very<br>grain, and the raising up of the fibres by the use of the var<br>it very difficult to apply machinery in its conversion, and<br>of hand labour required helps to cause the proportionate<br>the manufactured article. The softened horn is first s<br>the direction of the grain; it is then warmed in hot wa<br>between cold iron plates, and pressed level. If the go<br>sequently stained, the slices are further placed between<br>and very strongly pressed, to reduce the thickness and of<br>ficial grain. The prepared slices are next stamped out by<br>to form as many combs as possible, of various sizes and<br>fully economize the material. | USES.<br>Combs.           | methods and want of machinery, the Natives of districts even in which the<br>industry is an old and well known one, cannot compete with the cheap<br>horn articles of European manufacture, now so easily obtained in every<br>bazdr, at least of the larger towns. A small quantity of horn is also<br>utilised in most parts of India by the <i>kangi-saz</i> or comb-maker, who em-<br>ploys, amongst other materials, the horn of the buffalo in the manufacture<br>of his wares. Mr. Hoey, in his description of this industry, as carried on in<br>Northern India, writes: "Buffalo horns of the description used for combs<br>are usually sold at R25 per 100. If a horn be a seer in weight it will make<br>20 combs, <i>viz</i> , ten 1st class combs, which sell wholesale at R3-8 per hundred,<br>and five 2nd class combs, which sell wholesale at R3-8 per hundred,<br>and five 3rd class combs, which sell wholesale at R3-8 per hundred,<br>and five 3rd class combs, which sell these combs at 1 anna each, first<br>quality, 9 pies each, second quality, 6 pies each, third quality." In a<br>further passage he writes that ebony combs are preferred by all classes, but<br>that they are too expensive for general use; and that, of other kinds, women<br>prefer horn combs, and men those made of wood. "This is so to such an<br>extent," he remarks, " that <i>Banana kanghis</i> (which are made with teeth on<br>both sides) are made of horn exclusively, and <i>mardana kanghis</i> (made with<br>teeth on one side only) are constructed of wood." Near Hugli, in Bengal,<br>a small trade also exists in locally-manufactured combs, some half a dozen<br>families being so employed. It is probable that throughout India, here<br>and there, a few comb-makers still practise their art, though it would<br>appear that the European-made combs are rapidly displacing those of<br>home manufacture.                                                                                                                                                                                                                                                                                         |
| TRADE.<br>Exports.<br>412 | Trade.—The export trade in horns is large and important and appears<br>to remain fairly stationary. During the past five years the total amount<br>has varied from 48,000 to 68,000 cwt., and the total value from 12 to<br>16 lakhsbof rupees. The average during that period was 58,568 cwt.,<br>value R 15,00,933 ; the minimum export was in 1886-87, 48,435 cwt., value<br>R12,27,082, and the maximum was in 1887-88, 68,018 cwt., value<br>R>i6,43,937. The countries which form the chief markets for Indian horns,<br>are France, the United Kingdom, and the Straits Settlements, but<br>returns shew a small though fairly steady trade with Belgium, Italy,<br>EgyP^ Germany, Austria, Ceylon, and China, named in order of import-<br>ance. The average amounts imported by these during the period under<br>consideration were, France, 26,253 <sup>c</sup> wt, value R7,33,528; United King-<br>dom, 25,205 cwt., value R5.72.624; Straits Settlements, 4,899 cwt., value<br>R 1,26,107-8; the others are unimportant, and need not be enumerated.<br>The provinces from which the horns thus exported are principally<br>obtained are Bombay, the North-West Provinces and Oudh, the Central<br>Provinces, the Panjáb, Bengal, and Madras, of which the first appears to be<br>the most important. Thus in the returns of the total quantities carried by<br>rail and river in 1886-87, it will be found that Bombay exported 10,531<br>maunds, the greater part of which went to its own seaport town; the North<br>West Provinces and Oudh, 7,859 cwt. ; the Central Provinces, 7,374, cwt.<br>the Panjab 5,223 cwt.; Bengal (excluding Calcutta) 3,570 cwt?, and<br>Madras (excluding Madras Ports) 3,387 cwt. By far the largest quantity<br>thus collected goes for exportation to Bombay; thus the average tota<br>exports from Indian ports during the four years under consideration were<br>from Bombay, 31,766 cwt.value R8,29,289; from Bengal, 14,328 cwt., valu<br>$\Re_3^*,5.374$ ; from Madras, 9,195 cwt., value R2.14.397; from Burma4,93<br>cwt., value R 1,34,070; from Sind, 466 cwt., value R3.702; and in every yea<br>the exports from these ports retained much the same relative pos |

| Agriculture and Revenue Depamnent for 1886-87 as follows: Madras<br>R17-12; Bombay R20-7; Sind Rio; Bengal R10-12; North-West Prov-<br>inces and Oudh R8; the Panjáb K4; the Central Provinces Rig-4; Berar<br>R15, and Assam R11-5.<br>The writer of the article on horns in <i>Spons' Encyclopaedia</i> records that<br>the approximate value in England of the different classes of horn, were<br>in 1879.' deer, East Indian, 40-120 s. a cwt.; buffalo, East Indian, 20-60 s.;<br>tips, East Indian (consisting of solid horn for the manufacture of buttons                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | TRADE.                           |
| &c.,) 18-40 5.<br>IMPORTS FROM FOREIGN COUNTRIES AND RE-EXPORTS.—On review-<br>ing the trade returns of imports by sea it will be found that the quantity<br>thus annually received in India is a very fluctuating one. Thus in 1883-84,<br>2465 Owt. were imported; while in 1887-88, only 368 cwt. came into the<br>country. The average for the past five years has been 1,116 cwt., valued<br>at R62,oi4. The countries from which these have been principally obtained<br>are Ceylon, from which the average imports for the same period was 725<br>cwt., valued at R28,652; Zanzibar 283 cwt., valued at R35,645; and<br>Mozambique 37 cwt., valued at R4,507. The horns obtained from Eastern<br>Africa are thus evidently much more valuable than those from Ceylon.<br>The trade returns of re-exports shew that only a small proportion of<br>this import has been re-exported, at least as foreign merchandise, since the<br>average during the same period is found to be only 321 cwt., valued at<br>R38,022. The whole of the re-exports are shipped from Bombay, and<br>nearly all go to Hong-Kong, the average for the past five years being 296<br>cwt., value 1*37,683. In 1884-85 a small consignment was sent to Great<br>Britain, while in 1883-84, Aden, and in 1886-87 the Straits Settlements,<br>received 6 and 2 cwt., respectively. The greater part of the horns imported<br>by trans-frontier trade comes from Kashmir, but the quantity thus recorded<br>is small. In 1887-88 it amounted to 147 cwt., valued at R 1,973. There<br>is no record in the trade returns of any exports to trans-frontier Countries. | Imports ft<br>Re-exports.<br>413 |
| HORSES, ASSES, & MULES.<br>The Horse and its near allies, the several species of Ass and Zebra, form the<br>genus Equus of Linnaeus, fhey are all indigenous to various parts of the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 414                              |
| Old World, though fossilised remains of an animal about the size of a fox or . sheep, but unmistakeably belonging to the genus Equus, have been found in the Eocenes of North America. They are very distinct in structure from other genera of Mammalia, and in the old systems of classification constituted a separate Natural Order under the name of MONODACTYLA or SOLIDUNGULA. Researches in comparative anatomy have, however, disclosed the fact that their structure, seemingly so singular and exceptional, is in reality nearly allied to that of the rhinoceros and tapir, a result which has been confirmed by numerous palxontological discoveries, and restorations of extinct species forming intermediate stages between a remote many-toed ancestor, and the present onet<>ed type. It is not proposed in this article to enter into the Anatomy, Physiology, and Pathology of the Horse and Ass, for accounts of which the reader is referred to the many works of authors who deal with veteiinary science. Nor is it necessary to discuss the extensive and complicated subject of G jvernment Horse Breeding in India, since the numerous and valuable reports issued on the subject are accessible to the public. The species of the genus which present features of economic interest are only two—Equus caballus, <i>Linn.</i> , The Horse; and H. asillUS, <i>Linn.</i> , the domestic Ass. Four species of as and three of zebra have, however, been described by naturalists. <i>via</i> . E. toenionus. <i>Heuglin</i> .                                                                                         |                                  |

and H. ashros, *Linn.*, the domestic Ass. Four species of ass and three of zeora have, however, been described by naturalists, *via.*, E. toeniopus, *Heuglin.*, the Wild Ass of Abyssinia; E. hemionus, *Pallas.*, the Kiang or Dzeggetai of the high tablelands of Tibet; E hemippus, *Geoff.*, the Syrian wild ass, and E. onager, *Pall.*, the Onager of Persia, the Panjab, Sind, and the desert of Cutch. The first of these is undoubtedly the ancestor of our domesticated animal, while the other three here here here severel Zeologicta reduced to one

animal, while the other three have been by several Zoologists reduced to one species. The zebras have by Hamilton Smith been separated as a genus

|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | <ul> <li>Hyppotigris, but they only differ from the a9ses in their colouration, and one of them E. qilagga, Gmel., the Quag&amp;a, is intermediate between the 'zebras and true asses. The other two species ate E. burchelli, Gray; the DauW, and E zebra, Linn., the Mountain Zebra. All three species are natives of South Africa. Though there are thus seven distinct species, or species considered distinct by the majority of naturalists, they will all, at least in a state of captivity, breed with perfect freedom with any of the others. Thus the writen of the article "Horse " in the Encyclopaedia Britannica states that cases of fertile union are recorded between the horse and the quagga, the horse and the dauw, the domestic ass and the zebra, the domestic ass and the hemionus or Asiatic wild ass, the domestic ass and the dauw, the domestic ass and the zebra, and the dauw. As is well known, also, the horse and the ass, perhaps the two most widely distinct of the species, produce the mule, which in many useful qualities excels both its progenitors. These hybrids or mules do not breed inter se, and only very rarely nave instances been recorded of a fertile union between a female mule and a male horse or ass.</li> <li>Vern.—Ghora (g*dda — ass), (ghur-khur=Equus onager), HIND. 5 A** KIRGHIZ; Kudri (kalda**2iss), TAM.; Guramu [gardhi=zss], IEL.; Son, hnyet, myen, (mvaz^ass) BURM.; Asu, hya, aswa, furg, vag, vaji, ghotak, piti, SANS.; His dn (khamar =*a.ss), ARAB.; Asp, (ghour=E.qu/l3 onager), PERS.</li> <li>References.— Wallace, India in 1887, 127 f Darwin, Animals and Ph. under domestication, I., 49; Jerdon, Mam. of India, 236 ; 1st Yarkhand Mission Rep., 70 ; Lahore to Yarkhand, 135 ; Adams, Naturalist in Income, 579 ; UPER, Yammu arta nusammer, Sor; voyage of Joon rawgr henVa an Linschoten, Ed. 1885, I., 54 ; Ain-i-Akbari, Blochmann's Trans., I., 144, 196, 207 ; JL.</li> </ul> |

| 415      | pre-historic times, which renders it difficult to determine its original habitat.<br>No aboriginal or truly wild horse is krlWn positively to exist, though<br>many authors assert that the wild horses of the East are not descendants<br>of escaped domestic horses, but are in reality of aboriginal origin. Thus<br>Prejevalski described in 1881 a wild horse found by him in the deserts of<br>Central Asia. It, of all others, appears to have the strongest claim to being<br>a genuine wild horse. In colour it is whitish grey, paler and whiter beneath<br>and reddish in the head, which is also large and heavy in proportion to the<br>small body. It approaches the ass and zebra in the structure of the tail<br>the hairs of which begin half way down from the base. The ears, how<br>ever, are horse-like, and it has warts on the hind, as well as on the fore<br>legs, which characteristics are sufficient to classify it as a true horse.<br>Intense heat and extreme cold appear to be equally well borne by the<br>horse, which readily becomes acclimatized and suited to the most diversis<br>fied surrounding conditions. Thus wild horses (horses which have hecom<br>wild from a state of domestication) are found in Siberia at lat. 56° N.<br>while, on the other hand, in Arabia, with its intense heat, the horse abound<br>in the highest state of perfection and with great powers of endurance.<br>There seems to be little doubt that all the varieties of horse, domesticate<br>and feral, existing at the present day, are descended from one common<br>stock, which Darwin, in his very interesting chapter on " Horses and Assess<br>( <i>Animals and Plants under Domestication</i> ), has proved to have been pro-<br>bably dun-coloured and more or less striped. In the Neolithic or Polishee<br>Stone Period, wild horses were certainly abundant in Europe, as is ev                                                       |

HORSES.

denced by the discovery of theinremains, associated with those of men; and the rude representations of the animal on reindeer horns, &c, found in lake dwellings, tend to prove that the chase of the horse must have been one of the chief occupations of pfe-historic mart. Bones, and the rough etchings above alluded to, show that the horse of that period must have been a small, heavy animal, with shaggy hair, mane, and tail, and a large head.

That these horses were domesticated or partly domesticated in prehistoric times is proved by their remains having been found in the lake dwellings of Switzerland. It appears probable, however, that the greater number of breeds of horses now existing in Europe are not direct descendants of these European pre-historic races, but are derived from horses imported through Greece and Italy from Asia. These Asiatic ancestors were, on 'heir part, probably the outcome of a still earlier domestication, accompanied by long continued attention to breeding and selection, which resulted in a great improvement in the qualities which render the animal so valuable to man. As these qualities have always been the points towards the improvement of which the breeding of horses has been directed. all existing breeds present some peculiar character, specially fitting them for their surroundings and work. The process of artificial selection has thus resulted in the production of such various types as the English thorough-bred, which may be called a highly perfected gallopping machine, the English draught horse, with its enormous power and working capacity, and the little Shetland, or to take an Indian example, the Manipur pony, so admirably fitted by its small size, strength, and powers of endurance, for work in mountainous countries. Horse-breeding, or the artificial selection of stallions and mares having certain qualities or peculiarities which it is desired to perpetuate, together with careful rearing of the foal, is historically of very ancient date. Thus Solomon imported horses for breeding purposes from Egypt at high prices, and the Arabs have for centuries been extremely careful in their breeding operations, and have takin every pre-caution to keep certain strains of blood pure and unmixed. There is abundant philological evidence that the horse was known to the Arvans before the period of their dispersion, and it appears probable that the Semetic peoples as a whole ai# indebted for the horse to the lands of Iran. Thus the earliest Egyptian monumental record of the animal dates from about the eighteenth century B.C. the earliest Hebrew reference is not older, and Hehn has pointed out that literature affords no trace of the horse in Arabia before the fifth century B.C. The present Indian breeds of horses have probably been derived, for the most part, from Arabian, Persian, and Turkoman ancestors, and present, as in other countries, many distinct races. They are, as a rule, small, lightly built, and possess many of the characters of the Arab. As the horse is never employed in India for heavy draught work, like the dray or farm horse of England, no simi-The question of the origin of existing lar strong, heavy breed exists. races, owing to the want of records and literature on the subject, is one of extreme difficulty. There seems little doubt, however, from the earliest reports we possess that the Arabian horse in this country, as in Europe, has always been the mainstay of breeders. Thus John van Linschoten, in the account of his travels in India in the sixteenth century, mentions that, "out of Arabia diverse goodly horses are imported, that are excellent for breeding," and Abul Fazl, in a long and accurate description of Akbar's stables written about the end of the same century, writes : " His Majesty is very fond of horses, because he believes them to be of great importance in the three branches of the government, and for expeditions of conquest, and because he sees in them a means of avoiding much inconvenience. Merchants bring to court good horses from 'Irdq i 'Arab and 'Ir£q i 'Ajam, from

| <b>HISTORY.</b>            | Turkey. Turkestan, Badakhshán, Shirwán, Quirghiz, Tibet, Kashmír, and<br>other countries. Droves after droves arrive from Turán and Irán, and there<br>are now-a-days twelve thousand in the stables of His Majesty. Skifful expe-<br>rienced men have paid much attention to the breeding of this sensible ani-<br>mal, many of whose habits resemble those of man ; and after a short time<br>Hindustan ranked higher in this respect than Arabia, whilst many Indian<br>horses cannot be distinguished from Arabs or from Trafq breed* There<br>are many fine horses bred in every part of the country, but those from Cutcn<br>excel, being equal to Arabs. It is said that a long time ago an Arab snip<br>was wrecked and driven to the shore of Cutch ; and that it had some choice<br>horses from which, according to the general belief, the breed of that country<br>originated. In the Pan jab horses are bred resembling Traqis, especially be-<br>tween the Indus and the Bahat (Jhelum); they go by the name of $S^{*thjf}$<br>(or <i>Satajift</i> "so also in the district of Pati Haibatpar" (near Moonuk),<br>"Bajwarah, Tahirah" (Patiala), "in the Siibah of Agra, Mewát, and in<br>the Sabah of Ajmir where the horses have the name of <i>Pachwariya</i> . In the<br>northern mountainous district of Hindustan, a kind of small but strong<br>horse is bred, which is called <i>tuft inar</i> , they are strong and powerful."<br>The writer then goes on to eulogise the efficient means taken by the Emperor<br>to secure good breeding, from which and many other passages it is evident<br>that Akbar wat not only a keen admirer of horses, but a careful and com-<br>petent horse-breeder, and it seems certain that the general breed of horses<br>in India must have considerably improved during his reign. In his further<br>detailed description of the various provinces of the Emperor's territory,<br>Abul Fazl again comments on the fine breeds produced in Cutch, Patf,<br>Haibatpur, Bajwarah, Taharah, Agra, Mewat, and Aimir, and also men-<br>tions the horses of Delhi as being good, those of Lahore as resembling<br>'Iraqis and very fine, those of Kashmir as small, hardy, |
| BREED OF<br>HORSES.<br>416 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                            | and Sikhs rendered almost unavoidable. Up to the beginning of the nineteenth century, several horse fairs were periodically held in Rajputana, especially those of Bhalotra and Poshkuf, to which the horses of Cutch and Kaihiawar, the Lakhi jungle, and Mult an were brought in great numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Valuable horses were then bred also on the western frontier, on th<br>those of Rafdurro being especially esteemed. But with the conquest<br>British the steeds of Rarduiro, Cutch, and Lakhi, became almost<br>and the horses from the west of India were carried to the Sikhs. T<br>pression of the predatory system, which had been such a large sourc<br>mand* lessened the supply, and the superior Lakhi and Cutch breeds<br>for centuries were famous, became almost if not altogether extinct. I<br>sible, also, that the demands of the British for a larger class of animal t<br>country naturally produced, led to a system, at least in some cases, of<br>cial breeding, in which size was the object mainly aimed at, an objec<br>resulted in the deterioration of the original small, hardy breed, and th<br>duc' ion of badly-formed and weedy animals. Within recent years, he<br>the constant endeavours of the Government to improve the breeds of<br>horses, by importing stallions which possess in a marked degree th<br>ties wanting in the country-bred mare, and by encouraging breeding<br>part of the zamindars, have resulted in great improvements in the<br>carrying powers and endurance of the country-bred of the present of<br><i>Panjdb.</i> —Horse-breeding, in this, once upon a time the chief pr<br>province of India, has greatly fallen off, owing to several reasons,<br>at the time of the annexation, many of the best brood-mares were with<br>extensive demands were made on the province both for horses and<br>during the mutiny; and breeding from mares in the ranks," a system<br>carried on by the Sikhs, has, under British Government, "been<br>owing to the necessity of every horse in a regiment being always re<br>service. Owing to the last cause many well-bred and tractable<br>which would have been invaluable for brood purposes, have been los<br>province. The best brood-mares are probably those in the Rawa<br>Jhelam, Gujerat,Gugaira, and Lahore districts, and many ver<br>animals are also to be found in the frontier districts, such as<br>Kohat, Dera Ismail Khan, and Dera Ghazi Khan. The average I<br>country-bred is small, but fairly well-bre | ts of the<br>extinct,<br>The sup-<br>ce of de-<br>s, which<br>It is pos-<br>than the<br>of artifi-<br>ct which<br>the pro-<br>nowever,<br>f Indian<br>ne quali-<br>ig on the<br>weight-<br>day.<br>roducing<br>. The horses of the Jhelam district have long been held in high esteem, especially those of the Dhan. The Gazetteer of the district contains the following interesting paragraph regarding them: "In former days the greater part of the Sikh cavalry was horsed from the Dhanni plains north of the Salt Range, and even now large numbers of remounts are drawn thence by the British Army; but the fall of the rich Sikh chiefs has removed the incentive for breeding large and powerful horses, such as the native gentleman delights in. Although the Dhan is best known for its horse-breeding, yet very good animals are to be found all over the district. Some of them are fast, and nearly all remarkably enduring and able to go over the stoniest ground without shoes. It may be doubted whether the Dhani and Talagong breeds are not deteriorating. Owing to the spread of cultivation and other causes the animals are allowed much less liberty than formerly, and the method of tethering them up is very bad." In 1884 there were eight Government horse stallions, and seven donkey stallions in the district, with 263 brood-marw branded for horse-breeding, and 109 for mule-breeding. The Biloch mares of the Dera Ghazi Khan district are famous for their endurance, some also being very handsome, and the class

horse stallions and 52 donkey stallions. The mules thus bred in Rawal Pindi are perhaps the best procurable for artillery purposes in India.

| HORSES.                                         | Bombay Hoses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| HORSES.<br>BREEDS.<br>Punjab.<br>Bombay.<br>418 | Bombay Hoses.<br>of remount obtained out of them by Government stallions promises to be a<br>very good one. There were twenty-two of the latter in the district in i8»4»<br>and nine stallion donkeys.<br><i>Bombay.</i> —As above mentioned in recounting the history of <sup>t</sup> ^ e <sup>n0</sup> JC<br>in India, the horses of CUTCH were at onetime perhaps the best bred in the<br>country. With the increased ease of importing horses from Arabia, <sup>p</sup> * ? <sup>1</sup> ^J<br>and Australia, however, along with the reasons influencing horse-breeding<br>incident on the British successes over the Mahrattas and Sikhs, the value<br>of the breed has much declined. The Cutch horse is generally a little over<br>14 hands, well made, spirited, showy in action with clean limbs and good<br>bone, thin long neck, large head, outstanding ram-like brow, and staal<br>ears <i>{Cutch Gazetteer}</i> . His chief defects are the length of his cannon bone,<br>his ugly heavy brow, and bad temper. As in other districts attempts nave<br>been made by the introduction of Government stallions to improve the<br>breed, but up to date seemingly with indifferent success.<br>The Kathiawar breed was also a famous one, for many centuries, and<br>is closely allied to the former ; indeed, the Persian name applied to the rate<br><i>vis., Kachhi</i> (Cutchi) would imply a common origin. In former days in<br>was the custom of the <i>Subahdárs</i> of Ahmadabad and the <i>Faujdárs</i> of |
|                                                 | was the custom of the Subahdars of Ahmadabad and the Paujaars J<br>Janágad to send presents of horses of this breed to the Emperor. The bes<br>horses of the true Kathf or Káthiawár type are found even to the presen<br>day on the shores of the Ran, and since in former times, the Arabs imported<br>for the imperial stables were landed at Verayal, Somn&th-Patan, Dm o<br>Surat, it appears probable that the superiority of the breed is due to a<br>Arab strain then introduced, the Kdthis having availed themselves of the<br>services of these Arab stallions on their way through the province. <sup>*</sup> R<br>breed, however, like many others of the old Indian country-bred, <sup>*</sup> sa<br>apparently fallen off greatly during the past century. The best h <sup>or</sup> ?<br>breeding region in the district 19 said, in the Gazetteer, to be Panchal, in ti<br>heart of the province, containing as it does every requirement essentia<br>to successful breeding, <i>vis.</i> , favourable soil for the formation of the fee<br>bitty ground for the development of muscle, plenty of good fodder an                                                                                                                                                                                                                                                                                                                                                                                                |
|                                                 | running water, and a hot, dry climate. Thd^uthor of the Gazetteer further remarks: "In spite of neglect, confining the* young stock, and want of calin the choice of stallions, handsome specimens of the Ka*th breed may st be found. The peculiarities of the animal are that it is generally undersized and small-boned; its distinctive marks are a black cross down the bar and black bars on the Ieg9, the colour of the coat varying through every shade of dun. A well-bred Kithi is teachable and honest, free from vie full of spirit, and wonderfully lasting and hardy.*' Mares are most esteem by native breeders, as the horses are noted screamers, and are consequen not liked by the purchaser. The endeavours of Government to improve the breed have not as yet met with marked success, owing to the fact that the success of the success.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                 | Kdthis have shown themselves averse to showing their best mares, and v<br>very rarely sell a first-rate animal. The animal varies greatly in price,<br>much as «3,000 being still paid, according to the Gazetteer, for a horse of<br>best blood, while a serviceable, sound, and good-looking nag of from U<br>144 hands may be secured for from Rioo to R300. Considerable numb<br>of Kathi horses are kept in Ahmedabad, and as that district is one of<br>best for horse-breeding in the Presidency, it has attracted the special att<br>tion of Government, and appears likely to furnish good remounts.<br>The Baimthadi or Deccan horse is the remaining special breed<br>country-bred in Bombay, and probably, like the others, owes much<br>foreign blood arising from Arabian retrision and Turki sires. The fi                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

, )1 to foreign blood, arising from Arabian, rtrsian, and Turki sires. The finest specimens of the breed are reared on the banks of the Bhima and Uira in Poona and Ahmadnagar, but, as in the case of other districts of Bombay,

| Ponies of the Himalayan Regions.(J. Murray.)HORSES.well-bred animals are neither so common, nor is the general breed so good as<br>in former times. The \u00ed l-bred Deccan horse is of middle size (rarely over<br>14-2 hands high), strong, rather handsome, generally of a dark bay colour<br>with black legs, and has the fine limbs, broad forchead, and much of the<br>docility and endurance of the Arab. The great mart for this animal is<br>malligeam, about 25 miles from Ganga Kheir, on the Godavery. This<br>breed is certainly one of the best in India, and is deservedly held in high<br>esteem, a regard which is fully warranted, when the long marches of the<br>Mahratta and Pindari horsemen, mounted on Deccan and Kathi horses,<br>are remembered. Government, consequently, as in other places, is at<br>present making great endeavours to encourage the development of the<br>breed. The ponies of the same district are also much valued on account<br>of abric strength, endurance, and frequently surprising speed.<br>The Deccan<br>pony was much more bred, however, 30 years ago before the days of rail-<br>ways when he was of great value for carrying malis, than now. They are now<br>principally in demand as hacks and <i>longd</i> ponies, and a good one will<br>fetch RISO to R200. The Deccan ipony is thick-set, short-legged, and<br>hardy, varies from 12 to 13% hands or a little more in height, and is gener-<br>ally bay, brown, or cheanut, seldom grey, and still less often dun. Of all the<br>Deccan breed the best pony is the Dhangar or Khildri. They were ge-<br>merally hough to be a special breed, but the general belief of authorities in<br>the present day is that their superior excellence is due to the D hangar's<br>practice of castrating them. A small but hardy breed of ponies is also raised<br>by the Thildris, a tribe of wandering herdsmen chiefly inhabiting the west of<br>Khándesh. Dhárwar in the Karn&tak was also once famous for its breed<br>of ponies runni                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | well-bred animals are neither so common, nor is the general breed so good as<br>in former times. The i ell-bred Deccan horse is of middle size (rarely over<br>14-2 hands high), strong, rather handsome, generally of a dark bay colour<br>with black legs, and has the fine limbs, broad forehead, and much of the<br>docility and endurance of the Arab. The great mart for this animal is<br>Malligaum, about 25 miles from Ganga Kheir, on the Godavery. This<br>breed is certainly one of the best in India, and is deservedly held in high<br>esteem, a regard which is fully warranted, when the long marches of the<br>Mahratta and Pindari horsemen, mounted on Deccan and Kathi horses,<br>are remembered. | BREEDS.<br>Himalayan<br>Regions. | wealthy inhabitants. The pony in Yarkand, unlike that in India, is not<br>only employed under the saddle or pack, but is also used in the ploughf<br>and in harness. The natives have distinctive names for the several<br>colours of pony, and have preferences for certain sorts, " <i>tunk</i> " or chesnut<br>being considered the best and most hardy. At the time of the Mission                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Kashmir.<br>422                  | <sup>m</sup> 1873, <sup>m</sup> price varied from R40 to R150.<br>The KASHMIR pony has long been known and appreciated foT pack<br>and riding purposes in the hills. Drew mentions those of Baltist&n as<br>being particularly good, writing—° They stand about 12*3 or 13 hands<br>high; for their size they are rather large boned; they are compact in<br>make; they have a broad chest, a deep shoulder, a well-iormed barrel well<br>ribbed up, and good hind quarters, and a small, well-shaped head. T <sup>ne</sup> X<br>are good at hill climbing and at polo they are very active; they are ot<br>good heart, going long without giving in."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Bhutia.<br><b>423</b>            | The BHUTIA pony is a strong-boned, powerful, and very useful, hardy breed, largely employed as a hill pony in North-Eastern India. It is larger                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Burma.<br><b>424</b>             | than those of the more Western Himalaya, reaching a height of 14 hands.<br>BURMA.—The ponies of Burma, which are small, hardy, and exceedingly<br>tractable, are said to be all importations from the Shan States, from<br>whence large numbers are exported to Burma every year. They are,<br>however, generally known as Pegu ponies, presumably because they are<br>exported thence to India. In Burma they are generally employed for<br>drawing carriages, which, however, are only used in towns with roads.<br>Their characteristic pace is an unbroken run, in which the shoulders seem<br>to roll from side to side. A few of the officials and richer people ride                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                  | to roll from side to side. A few of the officials and richer people, ride<br>and the common people are all fond of pony-racing, not because they ride<br>or are fond of horses, but because a race meeting affords them an oppor<br>tunity of indulging their inveterate gambling propensities. About 100<br>are exported to India and the Straits yearly, where they are valued fo<br>their wonderful weight-carrying and enduring powers, and make good har<br>ness ponies. Burman stallions have been introduced into Ahmadnaga<br>and Poona with the view of improving the breed of Deccan ponies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Manlpur.<br>425                  | The MANIPUR pony is generally considered the best of all Indian<br>breeds under 13 hands. It is a small, mostly dun-coloured, animal, rarely<br>exceeding 12 hands in height, but possessed of wonderful powers of endu-<br>rance and weight-carrying capabilities. It is probable, however, that the<br>breed has deteriorated since the beginning of this century, at which tim<br>the Burmans, during their invasion of the country, made every endeavou<br>to exterminate the ponies which gave such powerful assistance in the hi-<br>warfare of the Manipuris. The Manipuris who, at that time took refug<br>in Kachar (many of whom have since settled there), withdrew with then<br>in their flight, as many of the ponies as possible. From that stock ha-<br>been derived the Manipuri pony as met with in India, but the Cacha<br>Manipuri is a very much inferior animal to the more carefully bred pon-<br>in Manipur itself. In Manipur the strictest system of protection again<br>inter-breeding is followed. The Maharaja allows no pony to leave ^th<br>State, and appropriates the best colts and fillies for his own stables, hence<br>the produce of his stud is extremely good. The ponies of the gener-<br>inhabitants, however, are allowed to roam the country in flocks, are ver-<br>much left to themselves, and uncared for, and Dr. Brown, in the annu-<br>report for 1872, lamented the fact that the general breed was deterioratin<br>In 1839 Government sent one Arab stallion and eight stud-bred mar<br>to the then regent, Nur Sing, but they and their descendants have con-<br>pletely died out, and seem to have left no trace of their strain in the prese-<br>breed. Before the Burman invasion at the beginning of this century, the |

| Foreign Breeds of Horses. ( <b>7</b> . Murray.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | HORSES.                          |

| traffic in ponies between Manipur and that country formed a large and<br>important trade, so it is probable that the Bur man and Manipur breeds<br>are closely allied, though now in many points dissimilar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | BREEDS,                          |
| FOREIGN BREEDS.—Besides these different breeds of Indian horses<br>and ponies, many foreign breeds are yearly imported in large quantities, of<br>which the most important are Australians, New Zealand horses, Arabs,<br>Persians, Gulf Arabs (out of Persian mares by Arab horses), Turkomans,<br>Cape horses, and Afgháns or Kdbulis. A few English horses are also an-<br>nually imported for stud purposes, principally thorough-breds, and Norfolk<br>Trotters, the latter of which are extremely popular with native breeders.<br>As an outcome of the large and general importation of these different<br>brteds, the foal at present reared by the zamindar contains a mixture of<br>many bloods, with the natural consequence that the old characteristic<br>breeds of various parts of the country are dying out. For accounts of the<br>results of this cross-breeding, and the relative values of the English<br>thorough-bred, Norfolk Trotter, Arab, or Australian as a sire, the reader<br>is referred to the numerous and valuable Government Reports on horse-<br>breeding.                                                                                                                                                                                                                                                                                                                                                                      | Foreign.<br>426                  |
| Domestic Asses exist in all parts of India, and are largely employ-<br>ed as beasts of burden, especially by the <i>Dhobis</i> or washermen, potters,<br>and tinkers. As a rule the Indian donkey is badly cared for, and ab-<br>solutely no attention is paid to its breeding, with the natural consequence<br>that it is small and unfit for saddle work. It is, however, cheap (costing<br>from R15 to R50), hardy, and readily picks up a sustenance from the<br>most unlikely ground, and consequently forms a valuable pack animal for<br>the poorer classes of itinerary merchants, such as those above enumerated.<br>A specially fine breed occurs in Kathidwar, of which the Hdlar or Jhalavdd<br>white variety is one of the strongest and largest. The Bhujias, who come<br>down from the higher Himálaya to seek employment during winter at<br>Simla and other hill stations, bring with them a very small, dark or almost<br>black donkey, with long shaggy hair. These appear to be useful animals<br>for load-carrying, but as they are not much larger than a good sized goat,<br>the <u>y</u> can only carry small loads.<br>The donkey stallions employed by the Government in mule-breeding<br>are not country-bred, but of the much more valuable Arab, Persian, Italian,<br>and Spanish breeds, which may cost as much as R300.                                                                                                             | ASSES.<br>427                    |
| Mule-breeding has been very extensively carried out by the Govern-<br>ment, since large numbers are required for use with transport and moun-<br>tain artillery. Considerable difficulty is, however, experienced in many<br>parts of the country in inducing the zamindar to employ his mares for mule-<br>breeding purposes, owing to the fact that rearing mules is considered<br>a degrading occupation. With good prices and every encouragement from<br>those in authority, this objection is, however, beginning to lose its force, and<br>large operations are now conducted, especially in the Rawalpindi and<br>Jhelam districts of the Pan Jab. An interesting paper on mules was re-<br>cently read by Mr. J. A. Steel, A.V.D., before the Bombay Natural<br>History Society, in which he contended that mules should be obtained for<br>Government by importation from abroad rather than by mule-breeding<br>in districts where valuable races of horses are bred, but that it might be<br>encouraged in places such as Madras, Bengal, and Burma, which supply<br>no horses and few ponies. Of late years a considerable number of mules<br>have from time to time been imported by the Government from Persia,<br>the supply from India not having proved sufficient for the demand. This<br>demand has steadily increased, and will in all probability continue to do<br>so, owing to the superiority of the mule as a strong, hardy, surefooted, | MULE-<br>BREEDING.<br><b>428</b> |

| HORSES.                                           | Trade in Horses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 430<br>hair.<br>431                               | also Leather.<br>Hair—Is apparently little employed in India, nor does the Indian<br>article form part of the commercial supply in Europe. The hair employed<br>in trade is derived from the mane and tail only. In Europe the long<br>hair is used chiefly in making hair-cloth for purposes of upholstery^&c,<br>also for the manufacture of straining-bags and cloths, seives, plumes,<br>wigs, fishing-lines, and ropes. The short hair is curled for stuffing seats,<br>mattresses, &c, while medium coarse hair is sometimes used in brushes<br>( <i>Spons' Encyclopaedia</i> ). The market price varies from 4 <sup>^</sup> . to 45. a pound in<br>England, depending on the cleanness, quality, and length of the hair.<br>Horse-hair is employed by the natives of parts of India in ornamental<br>embroidery of leather work, and for the manufacture of the commoner<br>sorts of fly flapper or "chauhrt."                                                                                                                                                                                                                                 |
| FOOD.<br>Flesh.<br><b>432</b>                     | Food.—The FLESH of the horse is largely utilised as food by many<br>castes in various parts of the country, and is considered specially good by<br>the hill tribes of Northern India.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 432<br>MEDICINE.<br>Milk.<br>433<br>Urine.<br>434 | Medicine.—The MILK both of mares and she-asses is recommended<br>in Sanskrit literature, as slightly acidulous, easily digested, and specially<br>suitable for the dietary of dyspeptics and convalescents. U. C. Dutt, in<br>his <i>Hindu Materia Medic a</i> , also mentions the URINE of the horse as being<br>employed medicinally by Hindu practitioners, but does not describe its<br>supposed vivtues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DOMESTIC<br>& SACRED<br>USES.<br>435              | Domestic & Sacred Uses.—Horse sacrifice is considered one of the<br>most efficacious of propitiatory offerings in Hindu religion. Thus in the<br>ordinances of Manuit is laid down as one of the methods of purification or<br>the part of one of the Hindu castes, alter unintentionally slaying a Brahman<br>Ancient Sanskrit literature relates that the gods killed a man for their<br>victim, but from the man the part fit for sacrifice went out and entered<br>a horse, after which the horse became an animal fit for sacrifice. In<br>like manner the ox, sheep, and goat in turn became sacrificial animals<br>and according to Hindu belief the specially sacrificial part remained longes<br>in the last. Sir Monier Williams, commenting on this subject, writes<br>"The Asva medha or * horse sacrifice' was a very ancient ceremony<br>hymns 162 and 163 in Mandala I of the Rigveda being used at the rite<br>It was regarded as the chief of all animal sacrifices, and in later times it<br>efficacy was so exaggerated that a hundred horjfe-sacrifices entitled th<br>sacrificer to displace Indra from the dominion of heaven." |
| TRADE.<br>436<br>Imports.                         | Trade.—A large and important import of horses takes place annually<br>principally of Australians (called "Waters"), Persians, and Gulf Arabs, and<br>Cape Horses, from which the remounts for British Cavalry, and Horse and<br>Field Artillery are derived. The number of animals thus brought int<br>the country has steadily increased up to 1887-88, in which year there was<br>a slight falling-off. Thus the average number imported during the five<br>years ending 1882-83 was 4,22 <sup>^</sup> value R 14,90,458, while in the perio<br>ending 1887-88 the average was 0I202, valued at 1*23,14,148. The count<br>tries which form the source of supply are Australia, Persia, Turkey in<br>Asia, Cape Colony, and the United Kingdom, and to a very small exter<br>Ceylon, South America, Arabia, Austria, Italy, and Aden. As an exam                                                                                                                                                                                                                                                                                                     |

Trade in Horses; The Horse-radish. (J. Murrav.) HORSE-RADISH.

Of the total number, Bengal imported 2,591, value R 10,41,500; Bombay 2,705, value R 10,31,270; Sind 28, value R 13,000; Madras 1,346, value R4,06,235; Burma 1, value R400.

The re-exports are small and unimportant, the average during the same period having been 98 horses, value R 36,801 ; a considerable fallingoff from the average for the preceding five years, which was 158 horses, value £52\*784. The countries receiving these re-exports were the United Kingdom, Ceylon, Straits Settlements, Zanzibar, and Australia, the former country importing those of greatest value. Thus in 1887-88, though the total export of foreign horses to the United Kingdom was only 10, the value was Ri7,000, or anaverage of RIJOO per horse. The four chief ports of India all take part in this re-export trade, Calcutta having the chief share. While the exportation of foreign horses shows a falling off during the past five years, that of country-breds, though small, has markedly increased during the same period. Thus the average for the period under consideration was 670 horses, value R 1,14,442 in comparison with 362 horses, value was 670 horses, value K 1,14,442 in comparison with 562 horses, value  $\pounds 51.858$  for the five years ending 1882-83. Burma appears to have the largest share of this export trade, having in 1887-88 shipped 510 horses, value R88,I3I, out of a total of 770, value Ri,43,924. In the same year Calcutta exported 207 horses, value ^52,673; Madras 51, value 1\*2,870; and Bombay 2, value R250. The chief importing countries in the same year were the Straits Settlements with 717, value R 1,38,834; Ceylon with 43, value R2,540, and China with 1, value R 1,000, while other countries imported an aggregate of 9, value R 1,550.

It would seem, from these statistics, that the only demand for countrybreds is for low priced, and probably small, pcnies, a demand which is principally met by trie supply from Burma.

Horse chesnut, see iEsculus Hippocastanum, Linn. / Vol. I., 127.

Horse gram, see Dolichos biflorus, Linn.; Vol. III., 175-

Horse-radish, or Cochlearia Armoracia, Linn./ CRUCIFEIUE.

A perennial plant, common in moist places in Europe, and occasionally grown as a vegetable in India. Its root is officinal in the Indian Pharmacopoeia, and is imported for use. Internally it is stimulant, sudorific, and diuretic; externally applied, flpitant and vesicant; when chewed it is sialagogue. It is prescribed for atonic, dropsical, and rheumatic affections, scurvy, &c, internally and locally, chewed in substance, for toothache, and as a stimulant embrocation or cataplasm in paralysis, &c. (Indian Pharmacopoeia, 23).

Habitat.—A perennial, twining, scabrid herb, much cultivated in many parts of the world. A considerable amount of difference of opinion regarding the origin and present indigenous occurrence of the hop appears to exist amongst botanical writers. Thus in the *Flora of British India* it is described as native of North America, and perhaps of Northern Asia, while other authors agree in its being also indigenous to Europe, and certainly to Northern Asia.- DeCandolle writes: "The hop is wild in Europe from England to Sweden as far south as the mountains of the Mediterranean basin, and in Asia as far as Damascus, the south of the Caspian Sea, and of Eastern Siberia, but it is not found in India, the North of China, or the basin of the river Amur." He also mentions in a footnote, and apparently concurs in, the statement of Maximowicz that the plant is indigenous also in the east of the United States, and the Island of Yeso. The learned French writer, in support of his theory against the plant being an introduction into Europe from Asia, points out that its names in the different languages of Europe cannot possibly have been derived from one root, a circumstance which tends to confirm the idea that the hop existed in Europe before the arrival of the Aryan nations. The general consensus of opinion appears to be in favour of DeCandolle's view. With reference to the statement of the *Flora of British India* that it is perhaps indi-genous to Northern Asia, it may be remarked, that the plant was found by Aitchison while with the Afghan Delimitation Commission, forming, with other shrubs, impenetrable hedges over the whole country between the foot of the mountains at Asterabad and the Caspian Sea.

History.—It would seem, from the evidences afforded by philology, that the Hop plant was known and employed for some purpose long before it was used in brewing, but on this subject ancient authors throw very little light. CeCandolle remarks that, judging from the Italian name lupulo, however, it would appear probable that the plant was one of the vegetables mentioned by Pliny under the name lapus salictarius. Hop gardens are first mentioned in an act of donation made by Pepin, father of Charlemagne in 768. In the eleventh century Bohemian and Bavarian hops became famous, and in 1069 William the Conqueror is said to have made a prant of hops and hop lands in the county of Salop. Fluckiger and Hanbury, in their interesting account of the history of the plant, write: "As to the use made of hops in these early times it would appear that they were regarded in somewhat of a medicinal aspect. In the *Herbarium* of *Apuleius*, an English manuscript written about A.D. 1050, it is said of the hop (*hymele*) that its good qualities are such that men put it in their usual drinks; and St. Hildegard, a century later, states that the hop (*hoppho*) is added to beverages, partly for its wholesomeness and bitterness, and partly because it makes them keep." As in the case of several other important plants, the use of the hop appears to have come under local restriction. portant plants, the use of the hop appears to have come under legal restric

| Lupulus.               | The Cultivation of the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| HISTORY.               | tions as it began to be largely employed. Thus in the reign of Henry VI. (1425-26) an information was laid against a person for putting into beer "an unwholesome weed called an hoop," and in the same year Parliament was petitioned against "that wicked weed called hops" ( <i>Flückiger and Hanbury</i> ). Notwithstanding these restrictions and regulations, the degree of utilisation of the plant increased, till in the reign of Edward VI., its cultivation was directly sanctioned by an Act of Parliament. Since that time it has become more and more regarded as an essential constituent of beer, and the cultivation of the plant has steadily increased in extent and importance, till in 1873 the area under the crop in Kent alone was 39,040 acres.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CULTIVA-<br>ION<br>450 | Cultivation.—As already mentioned, the hop is not indigenous in India,<br>and its cultivation is still only experimental. The first trial appears to<br>have been made at Dehra Dfin, with plants obtained by Lord Auckland,<br>presumably about the year 1840. Since then it has been attempted in the<br>Upper Chenab region of the Panjáb, Kashmir, and many other places with<br>more or less success. Owing very probably to ignorance in selecting the<br>best localities for the growth of the plant, and partly also to want of know-<br>ledge of the best methods of cultivation, the attempts made in many parts<br>have not been pecuniarily successful. Thus Dr. Stewart writes: "In 1851<br>Lowther proposed its introduction into Kashmir. It has been successfully<br>cultivated in Dehra Dún for many years, so far as mere growth is con-<br>cerned, but heavy rain at the flowering period prevents the flower from<br>reaching perfection. As to the quantity and quality of the powder on which<br>its value depends, the results have on the whole been unsatisfactory.<br>Within the last few years the plant has been tried at Kyelang and Kilar<br>in the arid tracts of the Upper Chenab, and it has flourished. But, un-<br>fortimately, it has been found out, after several years' care, that the sets,<br>introduced at the latter place, were those of male plants, so that the experi-<br>ment ha'still to get a fair trial there!" Up to the present time the efforts<br>to cultivate hops appear to have been accompanied by the greatest degree<br>of success in Kashmir (which in 1883 exported 15,000%, to one of the<br>Himalayan breweries), and in Chamba, the Administration Report of which<br>for 1883-84 contains the information that the cultivation of hops, recently<br>tried as an experiment, had proved successful, the crop raised having<br>been of such excellent quality as to obtain a medal at the Amsterdam Exhi-<br>bition ; and in 1884-85 it is further reported that efforts continued to be<br>rewarded by success, 63 maunds having been sold to the Murree Brewery<br>Company for ((2,770. Mr. Liotard in 1883 wrote a note on the subject,<br>poi |
|                        | Н. 450                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

at £15 per cwt., in order to make a separate brew with them; and others ask for quantities larger than those sent. The suggestion is that samples should be procured from the vines directly the burr turns a fair straw colour (if left until brown they are spoilt); and they should be lightly packed in cases or bags, the drying to be done within six hours of picking.

" As to future action it is said that if hops, of such quality as the samples must have been before they were spoilt, can be produced in any quan-tity in the Panj&b or in districts in the neighbourhood of breweries, there is no doubt that they would handsomely pay to cultivate.

" Experience has, however, proved the inutility of attempting to grow hops in any part of the Himalayas visited by heavy rainfall at a time of the year when the pollen is exposed to be washed off. But in Himalayan"tracts which escape the violence of the summer monsoon there appears to be a very good chance of success. The question whether any tracts in the Nilghiris are suited to hop-growing is one which is under enquiry.

' There does not appear to be any reason why India should not produce hops for its own breweries in those Provinces in which suitable localities can be found, and European settlers in the hills might be induced to take up the subject. That growers would find a ready market for their hops is sufficiently shown by the large and increasing demand.'

Since the date of Mr. Liotard's paper, enquiries have been made regarding the success or otherwise of hop cultivation in the various regions in which it has been attempted -, in answer to which the following replies have been received.

1. From the Conservator 0/ Forests, Panja'b.—" The cultivation of Hops was tried by Colonel Rennick in Bajaura, but was abandoned on account of the cost of hop poles. The Murree Brewery also made an attempt near Abbottabad, which was apparently successful; but was not continued. Hops were also introduced into Kilar in Chamba by Mr. Elles, where there are now some five acres under white line cultivation; the gardens chiefly belong to the Raja, though some zamindars at Re and Pontu have grown them remuneratively: the chief market is at Dalhousie."

2. From the Director of Land Records and Agriculture, North-West Provinces and Oudh.—<sup>U</sup> Hops have not been grown with any commercial success in any part of these provinces. There are certain tracts in the Raja of Tehri's territory and in the villages of Badrinath and Kedarnath in British Garhwal, where it is believed that hops might be cultivated with success, but until the roads are improved and rendered fit for mule carriage the cost of transport must absorb all profit."

With reference to Mr. Liotard's suggestion that the crop might possibly be profitably cultivated on the Nilghiris, it is disappointing to find in the report of Proceedings of the Madras Board of Revenue, dated 1st June 1889, that several attempts have been made to introduce the cultivation but without success.

It would thus appear that the only districts which have up to this time shqwn any promise of attaining success with hops are Chamba and Kashmir. The present rapid increase in the demand for hops for brewing purposes is likely, however, to induce further endeavours on the part of planters, European and Native, and it is to be hoped that with greater care in the selection of suitable localities, and in methods of cultivation, the crop may yet become a more generally remunerative one.

Medicine.—The officinal parts of the hop are, the dried STROBILES of the female plant called Lupulus or hop, in the British and Indian Pharmacopoeia, and Humulus in the United States Dispensatory; and also in the latter, Lupulina, or the yellow powder separated from the strobiles.

| MEDICINE.          | The strobiles, as found in commerce, are more or less broken up and<br>compressed When fresh they have a pale yellowish green colour, an<br>agreeable, peculiar, somewhat aromatic and narcotic odour, and a bitter,<br>aromatic, pungent, and feebly astringent taste. When handled, or more                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Chemistry.         | especially when rubbed between the fingers, they have a sticky feel, and<br>their odour becomes more evident. But by keeping, their odour becomes<br>less agreeable, or even unpleasant, owing to the formation of a -little vale-<br>rianic acid. At the same time they lose their greenish yellow colour and<br>fresh appearance, acquire a brown tint, and frequently a spotted appearance,<br>and finally become weaker and of inferior value { <i>Bentley and irimen</i> ) <sub>%</sub><br>CHEMICAL COMPOSITION.—Over and above the constituents of the                                                                                                                                                                                                                                                                                                                                                                                                |
| 452                | glands, or lupulina, which will be described below, the scales of the stro-<br>biles contain <i>lupulo-tannic acid</i> in the proportion of from 3 to 5 jrcr cent.,<br>a minute quantity of <i>trimethylamine</i> , and a liquid volatile alkaloid, named<br>by Griessmayer <i>lupuline</i> , and said to have the odour of the opium deri-<br>vative <i>conia</i> . Etti further demonstrated the existence in hops of arabic acid,<br>phosphates, nitrates, malates, citrates, and also sulphates, chiefly of potas-<br>sium.                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                    | The yellow powder separated from the strobiles,—Lupulina-consists<br>of minute, shining, translucent glands, in which the medicinal properties<br>of the plant essentially reside. The powder is obtained by stripping off<br>the bracts, shaking and rubbing <sup>1</sup> them, and then separating it by means of<br>a seive. The product thus obtained is yellowish brown and granular, with<br>the agreeable odour and bitter taste of hops, easily wetted by alcohol or<br>ether, but only gradually by water. Chemically, Lupulina consists prin-                                                                                                                                                                                                                                                                                                                                                                                                     |
|                    | cipally of <i>wax</i> and two <i>resins</i> , one of which is crystalline and unites with<br>bases, while another is amorphous and brown, and is closely associated<br>with the bitter principle. The medicinal virtues, however, appear to reside<br>chiefly in a <i>volatile oil</i> and a <i>bitter principle</i> , both of which may be<br>extracted by alcohol. The latter has been variously named <i>lupulin</i> ,<br><i>lupulite</i> , and <i>humuline</i> , but was first separated in a pure condition by<br>Lermer, who called it the <i>bitter acid of hops</i> . It crystallizes in large brittle                                                                                                                                                                                                                                                                                                                                              |
|                    | and rhombic prisms, possesses in a marked degree the peculiar bitter taste<br>of beer, and is probably the tonic principle of the plant. The volatile oil<br>may be readily obtained by distilling hops with water, the yield varying<br>from 1 to 2 per cent. It contains a substance called <i>valerol</i> , which readily<br>passes into <i>valerianic add</i> (the cause of the disagreeable odour of old<br>nops), and the entire oil rapidly resinifies on exposure to the air. For<br>this reason Lupulina, which owes much of its medicinal properties and aroma<br>to this oil, ought to be used fresh, and when kept for some time ought to<br>be preserved in closely-stoppered bottles.                                                                                                                                                                                                                                                         |
| Properties.<br>453 | MEDICINAL PROPERTIES.—Therapeutically hops possess tonic, seda-<br>tive, and also to a small extent astringent, properties. They are admi-<br>nistered chiefly in the form of tincture, infusion or extract in cases of<br>atonic dyspepsia, nervous affections attended with sleeplessness, hysteria,<br>intermittent fevers, and rheumatism ; while lupulina exercises a marked-<br>ly beneficial influence in cases of spermatorrhoea, chordee, and enuresis.<br>since the narcotic property appears to reside chiefly in the volatile oil, a pil-<br>low stuffed with the strobiles, but wetted with alcohol to prevent rustling, is<br>sometimes employed to prevent restlessness and induce sleep. Advantage<br>has also been taken of the anodyne property of the oil in the preparation of<br>external applications, poultices, or fomentations for painful swellings and<br>inflammation, and an ointment for cancerous tumours. Neither the stro- |
| food.<br>454       | biles, nor the granular powder, are, however, employed extensively alone<br>in European medicine, though they are valued as adjuncts to other drugs.<br>Food.—The chief consumption of hops is in the manufacture of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Habitat.— A common tree of the Western Peninsula from the Konkan along the coast ranges.

Oil.—The SEEDS yield by expression, or on boiling them in water, about 44 per cent of oil, which has a sherry-yellow colour, is devoid of characteristic taste or odour, and has a sp.  $gr_{t}$  at  $85^{\circ}$  Fh., of '9482. Unlike the *chaulmugra* oil (obtained from the seeds of the allied Gynocardia odorata), which it otherwise closely resembles, it does not, at least at ordinary temperatures, deposit a crystalline fatty acid. Treated with sulphuric acid the oil affords the gynocardic acid reaction (see Gynocardia odorata, *p. 192)1* but in a less degree than *chaulmugra {Pharmacographia Indica)\** According to Lisboa it is chiefly employed as a lamp oil in Goa.

Medicine.—The SEED has long been employed as a domestic remedy, by the natives of the Western coast ranges, in cases of skin disease and ophthalmia, and as a dressing for wounds and ulcers. At the present day the OIL is employed as an external application to scabby eruptions, after being mixed with an equal portion of Jatophra Curcas oil, sulphur, camphor. and lime-juice. For scald-head equal parts of the oil and limewater are used as a liniment. In the Konkan also the oil has a reputation as a remedy for *Barsati* in horses. In Travancore half teaspoonful doses are given internally in leprous affections, and the oil, beaten up with the kernels and shells of castor-oil seeds, is used as a remedy for itch (Pharmacographia Indica). The medicinal properties of the seeds depend wholly on the oil they contain, which is much more useful and convenient as a drug than the seeds themselves. Though the seeds of this plant are evidently those described by Ainslie under the name of Neeradimootoo, the medicinal properties of the oil they yield were neglected, till recently, when the oil was again brought to the notice of Europeans as a substitute for the more expensive *chaulmugra* oil. Since then it has been tried and appears to have given satisfactory results. In physiological action it is alterative, tcnic, and a local stimulant, and appears also to have a specific effect on certain skin diseases. It has been recommended for trial as a local application in rheumatism, leprosy, sprains and bruises, sciatica, chest affections and phthisis, ophthalmia, and in various forms of skin disease. Internally it may be prescribed in doses of from 15 minims to 2 drachms in cases of leprosy, various forms of cutaneous disease, secondary syphilis, and chronic rheumatism. It must, however, be employed with caution, as in certain cases it is said to act as a gastrointestinal irritant, producing vomiting and purging.

Trade.—The price of the SEEDS, according to Dr. Moodeen Sheriff, is R2-8 per maund wholesale, and annas 2 per pound retail in the bazaV. The authors of the *Phtir?nacogrnphia* write : "The seeds are not an article

• of trade, but if ordered may be obtained at about half the price of those of *chaulmugra* (R12 per Bengal maund of 80lb). The OIL has been sold in t Madras at 2J annas per seer."

| Habitat.—A submerged leafy herb, forming large masses in the still and<br>slowly running waters throughout India and Ceylon.<br>Industrial Uses.—Along with other water plants this herb is employed<br>•in many parts of India in the process of sugar refining. The surface of the<br>sugar is covered with it, as it is with clay in the West Indies, to ensure<br>slow percolation of the water afterwards applied (see Saccharum officinarum).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | INDUSTRIAL<br>USES.<br>Sugar<br>refining.<br>485 |
| Hydrochlorate of Cocaine, see Erythroxylon Coca; Vol. III., p. 270.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                  |
| <b>HYDROCOTYLE,</b> <i>Linn.; Gen. PL</i> , <i>/.</i> , <i>872.</i><br>Agfeusof prostrate herbs belonging to the UMBELLIFKR^, and comprising<br>about 70 species which are found in wet places in temperate and tropical regions,<br>tmjre, especially of the Southern hemisphere. The generic name is derived<br>from viwp = water and $KOTvXq$ = a cavity or vase, in reference to the pecu-<br>liar rounded concave leaves of the plants. $\pounds$ jtfg, UMBELLIFEEUE.<br><b>Hydrocotyle asiatica,</b> <i>Linn.; Fl. It is also distributed to Malacca.</li> </ul> |                                                  |
| Is also distributed to Malacca.<br>History.—The plant was known to Sanskrit writers'of very remote<br>times, its properties being supposed to resemble those of <i>Brahmi</i> (Herpes-<br>tss Mpnniera), both being regarded as alterative, tonic, and useful in<br>diseases of the skin, nervous system, and blood. Dr. Dymock, however,<br>believes the word <i>Brahmi</i> to refer in Hindu and Sanskrit literature to the<br>Hydrocotyle, owing to the fact that it is applied in Bombay to that plant.<br>The earliest European writers on Indian Materia Medica, Rheede, Rum-<br>phius, and Ainslie, were all acquainted with the medicinal properties of<br>the plant as an alterative, tonic, and astringent, but it was not till Boileau<br>in 1852 made known its virtues in the treatment of leprosy, that the drug<br>came under special attention. In 1885 Dr. Hunter experimented with it<br>for the same disease in Madras, with sufficiently satisfactory results to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                  |

| HYDROCOT          | YLE The Physiology and Therapeutic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| HISTORY.          | bring about its admission as an officinal drug into the Indian Pharma-<br>copocia. Of late years attempts have been made to introduce the plant<br>into European medicine, but up to this time it has not appeared in<br>the Pharmacopoeia of the United States, or that of Great Britain,<br>MedidneThe parts of the plant generally employed are the lea and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| MEDICINE.         | deprived of their periodes, dried by exposure to the air in the shade, hod<br>ground to a powder. It appears that if dried in the sun, or by any meiner<br>of artificial heat, the leaves lose a great part of their medicinal properties,<br>owing to the volatilisation of the oil which is their active P <sup>tmct</sup> P <sup>e</sup> . The<br>powder thus carefully prepared ought to be kept in well-stoppe*d DOTW<br>to prevent the access of moisture. When fresh, Jhe leaves have scarcely<br>any smell, but emit a peculiar faint, aromatic odour when crushed oerwegi<br>the fingers. They have a harsh, bitter, and disagreeable taste, wmcn<br>however, becomes scarcely perceptible after the leaves have been we<br>dried. The powder, 3^ to 4ft of which may be obtained from 30IB or ui<br>fresh leaves, is of a pale green colour, and exhales a slight characterisu<br>aroma. It appears possible that a mistake has been made in on y<br>employing the leaves in the Indian Pharmacopoeia, since Boileau particu-<br>larly mentions that the entire plant (roots, twigs, leaves, and seeds) ough<br>to be used, and as will be seen below, the supposed active principle Vellann<br>is said to exist principally in the roots.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Chemistry.<br>489 | CHEMICAL COMPOSITION.—A careful analysis of hydrocotyle was maae,<br>in 1855, by Lepine, a pharmacien of Pondicherry, who found that it $y^{16''t}$<br>ed a body which he called <i>vellann</i> , from <i>valdrai</i> , the Tamil nam <sup>6</sup><br>of the plant, and regarded as its active principle. This <i>vellann</i> was<br>said to exist in the dry plant to the extent of o-8 to 1 per cent., to DC<br>an oily, non-volatile fluid, with the taste and smell of fresh hydroco-<br>tyle and to be soluble in spirits of wine, ether, caustic ammonfa, and parfuj<br>also in hydrochloric acid. The authors of the <i>Pharmacographta</i> , 1jowwr.<br>remark, "these singular properties do not enable us to rank <sup>1</sup> *''' <sup>1</sup> ''' ? <sup>1</sup><br>any well-characterized class of organic compounds," and, moreover, tneg<br>did not succeed in obtaining anything like it from the dried plant (pre-<br>sumably the officinal parts only, <i>viz.</i> , the leaves, were employed in the<br>analysis), but " simply a green extract almost entirely soluble in warm<br>water, and containing chiefly tannic acid, which produced an abundam<br>green precipitate with salts of iron." In a very recent note on Hydroco-<br>tyle, by Dr. Clement Daruty, however, <i>vellarin</i> is described, and ap<br>plears to have been again obtained. He remarks: " <i>vellarin</i> is an in<br>spissated oil of a pale yellowish colour, with a bitter, pungent, and persist<br>ent taste and a marked odour of Hydrocotyle; but which is subject to<br>variations under the influence of heat, humidity, and even of the atmo<br>sphere, volatilising at 120°C. It is soluble in alcohol. Of this active princi-<br>ple the plant contains 47 per mille. There are also found in it two re<br>sinous ingredients, one green, in the proportion of -085 per mille, the othe<br>brown, in the proportion of 3 per cent., and traces of tannic acid. <i>Vellart</i><br>is obtained principally from the roots of the plant." It would thus appea<br>that as the analysis of the plant at present is understood, it contains <i>Vellaf</i> ,<br>in much smaller amount than that obtained by Lepine, chiefly in the root<br>a part of the plant at present not officinal in India. |

#### Action of Vellarin.

(J. Murray,) HYDROCOTYLE

<del>asiatica</del>. MEDICINE. PHYSIOLOGICAL ACTION.-M. Clement Daruty, in the note above al-Physiological Action. luded to, gives an interesting account of the effects of the drug on lepers, and on his friend, Dr. Boileau, who experimented on himself. The following 490 translation of his remarks may be here given, as his investigations afford the latest and most complete account of the physiological action of the Hydrdcotyle is a sensation of warmth and fingling of the skin, especially that of the extremities, followed after some days by a general increase in the temperature of the body, amounting in some instances to an intolerable itchiness«accompanied by cutaneous redness. The capillary circulation is accelerated and the pulse becomes stronger and fuller. After a week's treatment, the patient's appetite sensibly improves and the functions of the principal viscera are performed more easily. As the result of a more prolonged treatment, the skin becomes more supple and uniform, the epidermis gradually peels of! in small scabs, or, in severe cases, in large scabs, perspiration is restored, the excretory functions resume their normal action, the digestion becomes improved, and the appetite increases. Administered experimentally in small doses to healthy persons, it produces, within a short space of time, diuretic effects, then a general stimulation of the circulation, and eventually intense itching. In doses of i to 2 grammes of the powder it produces considerable giddiness, accompanied by cephalalgia, which sometimes lasts for a whole month, even after the medicine has been discontinued. It has also been known to give rise to dangerous dysenteric symptoms. Thus Dr. Boileau who, in treating himself, progressively increased the dose, found that after two months the drug had produced all the effects of a vio-lent, cumulative poison. He writes,' Yesterday in the morning I was seized with a violent trembling, so severe that I was forced to lie down in bed, and in spite of the many blankets with which I covered myself, it was more than an hour before I could recover the warmth of my body. « But this was unimportant in comparison with what followed. The other symptoms were violent, spasmodic contraction of the larynx, which made me believe suffocation to be imminent, palpitations of such violence and frequency, as to make me fear a rupture of the heart, and tetanic spasms of the trunk and limbs. Towards evening a fit of vomiting and haemorrhagic diarrhoea supervened, which soon abated and finally disappeared. I awoke in the morning free of dangerous symptoms, and with no result of the attack remaining, save a state of intense lassitude and a slight pain in the neck.<sup>9</sup> " To sum up it would appear that Hydrocotyle, properly prepared and administered, is a powerful stimulant of the circulatory system, its action chiefly affecting the vessels of the skin and mucous membranes. In larger doses it is a stupefying narcotic, and in some cases produces cephalalgia or vertigo with a tendency to coma.

APPLICATIONS IN MEDICINE.—The principal value of the drug appears Applications. from its physiological action to be as a stimulant to the cutaneous circulation in skin diseases, and for this purpose it will be found to have been chiefly employed. Though itappears to have no specific effect in leprosy nor iii syphilis, there can be little doubt that by its action in stimulating circulation it is of value in these affections. Dr. Shortt speaks of the drug in high terms, and considers it to have a powerful action in all leprous affections, but later writers agree that its effects are most marked in the preliminary anaesthetic stages of the disease. Drs. Lolliot, Cazenove, and Bert in find it of little value in advanced cases of tubercular leprosy, but extol its virtues in the treatment of chronic and obstinate eczema, the latter remarking : "The eczemas treated by me with the preparations of Hydrocotyle were of the most rebellious type, vie., localised eczemas; nevertheless cures were effected in every case and that within a very brief space of time." It

|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEDICINE.                   | has also been prescribed with excellent result in cases of secondary and ter-<br>tiary syphilis, accompanied by gummatous infiltration and ulceration; in<br>chronic and callous ulcers; as a stimulant to healthy mucous secretion in in-<br>fantile diarrhoea and ozcena; in cases of scrofulous ulceration, enlargement of<br>glands and abscess; and in chronic rheumatism. It has also been em-<br>ployed with success as a diuretic in several diseases, and as an em-<br>menagogue in cases of amenorrhoea. In all cases in which a constitu-<br>tional or general disease is accompanied by a local lesion, the drug<br>ought to be not only administered internally, but also applied locally as a<br>powder, poultice or ointment. Numerous descriptions of cases so treated by<br>practitioners in many parts of the world have appeared of late years, with<br>the result that the use of the plant is becoming daily more wide-sDread,<br>and the belief in its therapeutic value more universal. Under these cir-<br>cumstances it would certainly seem advisable to give the whole plant a care-<br>ful trial, as recommended by Boileau, and more recently again strongly<br>advised by Daruty, as it is quite possible that much of the disrepute into<br>which it has fallen in India may be the result of the Pharmacopoeia recog-<br>nising only the least active part, <i>vie.</i> , the leaves. |
| Preparations.<br><b>492</b> | PHARMACEUTICAL PREPARATIONS.—The <i>Indian Pharmacopoeia</i> describes only two, <i>viz.</i> , POWDER OF HYDROCOTYLE to be dusted on ulcerated surfaces, or given internally in doses of from 5 to 8 grains thrice daily; and HYDROCOTYLE POULTICE, a stimulant application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Powder.                     | Dr. Daruty recommends several preparations; (1) THE POWDER pre-<br>pared from the LEAVES and ROOTS together, by washing the latter, and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ,493                        | drying all in a well-ventilated room, completely shaded from the sun. He                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Leaves                      | advises that a dose of 10 grains be given three times a day. Dr. Boileau                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| P494                        | recommends the following doses of the same powder in cases of leprosy, for an adult of 20 to 40 years of age and proportionately less for a child:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Soots.<br>495               | "20 grains#to be taken daily for two weeks, the dose to be then increased<br>by weekly increments of 5 grains up to 60 grains, at which daily rate it is<br>to be continued for one month. It should then be reduced by 5 grains<br>a week till it is again brought down to 10 grains, after which the treatment<br>should be suspended for an entire month " (to guard against the cumula-<br>tive poisonous action of the drug). •• It should then be resumed and pro-<br>gressively increased and diminished according to the sliding scale detailed<br>above. The powder should be taken before going to bed, in hot wine<br>sweetened, but on reaching 30 grains it is better to divide it into two equal<br>portions, one to be taken in the morning, the other in the evening." (2) THE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Plaster.                    | PLASTER is prepared from the leaves by trituration with <i>cold</i> water in a mortar, sufficient of the latter being added to form a thick paste. A stimu-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| syphilitic skin affections. Its efficacy in these, cases is well marked"<br>(U. C. Dutt, Civil Medical Officer, Serampore). "A very useful alterative<br>in constitutional syphilitic ulcers and skin disease. Dose, 5 to 10 grains of<br>powdered leaves. Externally stimulant" {Thomas Ward, Apothecary,<br>Mndanapalle, Madras). "Much used in the hospital, similar to Calo-<br>tropis; and always combined with it. A valuable alterative tonic used in<br>all cas%s of leprosy and obstinate forms of skip diseases. The following<br>formula is employed here. Pulvis Calotropis, grains iii, Pulvis Hydroro-<br>"tyle grains x., twice a day. At times combined with iron preparations"<br>(J. G. Ashworth, Apothecary, Kumbakonom, Madras).<br>Trade.—Of recent years enquiry for the plant has been made in India<br>which has led to its cultivation on a small scale in gardens near Bombay, in<br>the neighbourhood of which town, Dr. Dymock remarks, the plant is rare in<br>a wild state. Should any increased demand arise, Calcutta, near which the<br>plant abounds as a common weed, would probably become the source of<br>supply. The trade value of the dry herb in Bombay is given by Dr.<br>Dymock as R7-9 per Surat maund of 37£fb.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | medicine.<br>trade.<br>502  |
| Food.—The LEAVES are sometimes made into a soup, which, however, probably serves more as a medicine than as a food.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | FOOD.<br>Leaves.            |

| MEDICINE.<br>Plant.<br><b>509</b><br>Joot.<br><b>510</b><br>Seed.<br>511 | GazetteersBombay, VI., 14; NW. P., IV., Ixxvi.<br>Habitat.—A small spiny bush, common in moist places everywhen<br>throughout India from the Himalaya to Ceylon.<br>Medicine. The WHOLE PLANT, ITS ROOT, and SEED, are the par<br>used medicinally. Their value has been long recognised both by Sanskr<br>and Muhammadan writers, the former classing the plant as cooling an<br>diuretic, and employing the whole herb, or its ashes, and the roots, as<br>cooling medicine and diuretic in cases of hepatic obstruction, drops<br>rheumatism, and diseases of the genito-urinary tracts; while the latte<br>employ it in the same way, but also consider the seeds aphrodisiac. In<br>native practice to the present day they continue to be employed for the<br>same purposes, and the seeds may be found in almost every bazar. The<br>attention of Europeans was first drawn to Hygrophila by Rheede, where<br>wrote that a decoction of the root, in doses of half a tea-cupful twice dail<br>was employed by the natives on the Malabar Coast as a diuretic<br>"dropsy and gravelish diseases." Since that date Ainslie, Kirkpatr<br>and 6ioson have borne testimony to its diuretic properties. The diffe<br>ent parts of the plant appear to have the following therapeutic actions.<br>The seeds are demulcent, diuretic, and possibly tonic, and are therefore indi-<br>cated in diseases of the genito-urinary tract. The roots are cooling, bittle<br>tonic, and diuretic, and the leaves, cooling and diuretic. The seeds ma-<br>be prescribed in doses of 10 grains to 2 drachms in infusion; and the roo-<br>or whole plant in doses of 1 to 2 ozs. daily, of a decoction prepared from<br>the seeds are demulcent. |
| trade.<br>512                                                            | one ounce of the drug and one pint of water boiled down to 14 ozs.<br>SPECIAL OPINIONS.—§" The leaves are boiled overnight and take<br>next morning in cases of dropsy. It is a good diuretic" (Surgeon 'F. Thomas, 33rd Madras Native Infantry, Mangülore). <sup>th</sup> Found usef<br>as a diuretic in dropsical affections. Preparations :—Take of Hygrophi<br>fresh roots one ounce; water ten ounces. Boil for fifteen minutes "i<br>covered vessel and strain. Dose from 1 to 2 ounces. Invariably used<br>combination with other diuretics " (J. G. Ashwortli, Apothecary, Kumb<br>konum, Madras).<br>Trade.— Dr. Dymock states that the seeds alone form an article<br>commerce in Bombay, and fetch Re per maund W <sup>+</sup> ft <sup>+</sup><br>HYGRORYZA, Nees; Gen. | Structure of the Wood.— Rather heavy, of unequal fibres pale brown, becoming red brown on exposure; rather hard and brittle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | TIMBER.<br><b>516</b>           |

# HYMENODICTYON

\_\_excelsum\_\_\_

A Useful Febrifuge and Antiperiodic.

Habitat—A large deciduous tree, 30 to 40 feet high, met with on the dry hills at the base of the Western Himálaya, from Garhwál to Nepál, ascending to 2,500 feet; and throughout Chutia Nagpur and the Central Provinces to the Deccan, Central India, and the Anamalays; also found in Tenasserim and Chittagong.

Dye and Tan.—The Rev. A. Campbell writes that the LEAVES are employed as a dye by the Santals, but he does not state the colour produced. Ainslie mentions that the BARK, which has powerfully astringent properties, is used by tanners, a statement which is repeated by Lisboa.

Medicine.—The inner coat of the bark, like that of the true cinchonas, is bitter and astringent, and has been long employed by the Hindus as a febrifuge and antiperiodic, especially in cases of tertian ague. Roxburgh commenting on this writes: "The infusion of one fresh leaf in water all night had little taste, but struck quickly a deep purplish blue with a chalvbeate. The two inner coats of the bark (the outer light spongy stratum is tasteless) possess both the bitterness and astringency of Peruvian bark, and I think, when fresh, in a stronger degree. The bitterness is not so quickly com-municated to the taste on chewing the bark as that of the former, but is much more durable, and chiefly about the upper part of the fauces." Since the above was written the bark has attracted the attention of many European Chemists and Scientists, who have naturally been hopeful of discovering in it alkaloidal elements similar to those existing in the true cinchonas. The *Pharmacopoeia of India*, published in 1868, contained the name of the plant amongst its non-officinal drugs, and the author of the article recommended that, " in all future inquiries into the subject, this The bark should be one of the first to which attention should be directed." first chemist who appears to have made an analysis was O'Shaughnessy, who found that, notwithstanding the excellent antiperiodic effects yielded by use of the drug in his hands, a specimen obtained from the Calcutta Botanic Gardens contained no alkaloid.

In 1870 an analysis was again made by Broughton, who found that the bitter taste was due to the -existence of *eesculin*, a substance which, when the bark became dry, underwent transformation into asculetin, an almost tasteless compound. Dr. Dymock, commenting on this analysis, suspects that the bark actually examined was that of H. oboyatum, not that of H. excelsum, as the latter, when dry, is extremely bitter. The latest analysis, one which has apparently definitely settled the question of the chemical constitution of the bark, was performed by M r. W. A. H. Naylor in 1883. Of this the following summary is given by Dr. Dymock; " It appears that the bitter principle is not the glucoside *eescultn* nor its decomposition product, cesculetin, but an alkaloidal substance. That as such it is allied to quinoidin, berberin, and paracin. From *qmnoidtn* it differs in being optically inactive, and from its double compound containing relatively less platinum; from bsrberin it differs in that it contains a higher percentage of carbon, while its double compound also yields a larger amount of platinum; and from *paricin* it differs only in the percentage of hydrogen it gives. Mr. Naylor considers it to be a new alkaloid having a composition corresponding to the empirical formula C<sub>%4</sub> H<sub>40</sub> N<sub>3</sub>, and therefore to be an addition to the small class of bases devoid of oxygen. Besides "Hymenodictyonine," which is the name given to the new alkaloid, Mr. Naylor has separated a bitter neutral principle, represented by the formula  $C_M$  H<sub>43</sub> O<sub>10</sub>, which he thinks may be a decomposition product of a glucoside. Mr. Naylor has since succeeded in obtaining hymenodictyo*nine* in a crystalline form, by extremely slow evaporation of its ethereal solution. When placed in contact with cold sulphuric acid the solution by transmitted light assumed a lemon-yellow colour, passing to a wine red, H. 520

### HYOSCYAMUS niger.

Cultivation of Henbane.

Reports/rout:—M. A. Lawson, Esq., Govt. Botanist, Madras; D. Prain, M.B., Roy. Bot. Gardens, Calcutta; Surgeon Genl. with Govt. of Bombay, 1888; Dr. Moodeen Sheriff, J. F. Duthie, Esq., Dir. Bot. Dipt., Northern India; D. Hooper; Esq., Govt. Quinologist, Madras; Govt. of Madras, 1882 j Gazetteers: - N.-W. P., 173; 11 •> /7J. Habitat.—A herb of the Temperate Western Himálaya from Kashmir to Garhwál, from 8,000 to 11,000 feet, distributed over Western and Northern Asia, Europe, and Northern Africa. CULTIVA-Cultivation.—The first record of the cultivation of Hyofcyamus in TION. India is made by Dr. Royle, in his Illustrations, I. c, in 1839. That author 526 remarks that Henbane, Datura Stramonium, and Nicandra indica(? Physalis minima, Linn., VAR. indica) were at that time successfully grown and converted into extract for the medical depots, in several stations in the plains of Northern India and in the Himalaya. He concludes his remarks as follows : " The extract of Henbane particularly was highjy approved of By several medical officers, and was pronounced by Mr. Twining, after trial in the General Hospital of Calcutta, to be of most excellent quality." Later records exist of its more or less successful cultivation in Calcutta, at the Royal Botanical Gardens, Saharanpur under Dr. Jameson, in the neighbourhood of Agra and Ajmere, in Bombay at Hewra and Dapuri, and in the " Nilghiris. The crops thus produced seem to have been almost entirely used in supplying the Government Medical depdts with leaves and extract, and no market with European druggists appears to have been formed. Thus in a report furnished by the Superintendent of the Botanical Gardens, Saharanpur, on the cultivation of Hyoscyamus during the past ten years, extract to the value of R 1,939 and leaves to the value of 62,186 are said to have been supplied to the Government Medical dep6ts, and an entry occurs to the effect that in 1882-83 leaves to the value of R4.0, and extract to the value of R30, were supplied to an European firm in Bombay, but since Chen no extension of trade with commercial firms has been made. The seeds^ of the bazar also appear to be principally imported from Persia and Afghanistan, so that at the present day all Hyoscyamus employed in European medicine, except by Government, comes from Europe, and even the seeds offered for sale in bazars are not obtained in this country. It is difficult to understand why this should be tli3 case. The plant grows wild abundantly on the Himalaya; it is fairly extensively cultivated, apparently with a considerable amount of success in various parts of the country, and the supply ought to more than equal the demand. It seems possible, however, that the plant artificially cultivated, as it is in the hot climates of Saharanpur and parts of Bombay, where the surrounding conditions are very different to those which the wild plant enjoys, may be deficient in some of the properties which render it medicinally valuable. It is, therefore, highly desirable that an accurate analysis of the Indian plant, in comparison with the European, and of the cultivated plant of the plains in comparison with the wild Himalayan stock, should be made. Such an analysis would definitely determine the relative values of each, and should it prove favourable, might afford a stimulus to the employment of the native drug, not only in India, but in other countries. The plant can be grown and the extract prepared so that the product may be sold much more cheaply than that imported from Europe. Thus the average rate at Saharanpur during the past ten years has been R1-4 per flb for the extract, and annas 4 per fl> for the leaf, while the last quotations in England for the latter is from *jod*. for foreign to 8s. per fij for English biennial, and for the former 6s.  $d. pf_r$  ft.

Oil.—The SEEDS are mentioned by Dr. Cooke as yielding an oil.^ Qr. Dymock describes a specimen he obtained from the Poona  $Boj_{an}|_{ca}I$ Gardens as bright yellow and rather thjcfc It is apparently not  $enJ_{D}|_{o}yed$  for any purpose.

| The "Magic Barlow" (I Murray)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | rforating.                 |
| Habitat.—A low, annual weed of cultivation of the drier parts of the Panjab and the Salt Range, distributed to Western Asia and the Mediterranean Region.<br>Medicine.—Murray, in his <i>Plants and Drugs of Sind</i> , describes the horned-cumin as yielding a juice which has the same effect as opium, and its leaves as diaphoretic. The authors of the <i>Pharmacographia</i> are of opinion that it is the <i>VTTHKOOV</i> of Dioscorides and Hypecoum of <b>Pliny</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | MEDICINE.<br>Juice.<br>538 |

| A genus of herbs, shrubs, or small trees, belonging to the Natural Order<br>HVPERICINE/E, and comprising 160 species distributed over the temperate<br>regions of the globe. Of these about 20 are Indian, natives of the hills,<br>especially the Himálaya, but very few are at present known to possess properties<br>>f economic importance. The writers of the <i>Pharmacographia Indica</i> state<br>that a plant exists in Persia described by Muhammadan writers as a species<br>of Hyelárikún (Hypericon) which is locally named <i>Dddi</i> and <i>Jao-i-jddú</i> , or<br>" magic barley," to which is ascribed the medicinal properties formerly attribut-<br>ed to the St. John's worts of Europe, namely, the power of expelling the demon<br>of hypochondriasis, and of acting as a charm against witch-craft. The red juice<br>of the flowers of Hypericum was also considered by ancient classical writers<br>to be a signature of human blood ; it was called <i>ayhpógaijiop</i> by the Greeks,<br>and was employed as an application to wounds. Several species are cul-<br>tivated as ornamental shrubs. [ <i>Jc.</i> , /. 9^0/ HYPERICINE2E. |                            |

| MEDICINE.<br>547 | Ish-red colour to wool, slik, &c.<br>Medicine—The herb is bitter and astringent, and was recom is a dynamic writers as a detersive, resolutive, anthelmintic, diuretic and emmenagogue and externally as excitant, but it does not appear to be use in modern medicine. The authors of the <i>Plwrmacographia</i> ^**^t J^JPL; the following account of the chemical composition of the flowers : *'"?fj the flowers of H. perforatum freed from their calices and dried are exhaustea with absolute alcohol and the tincture is evaporated, a soft residue is let of a red colour (hypericum red) together with volatile oil. If the flowers are exhausted with water, then with dilute alcohol, well dried after exhaustion, and the colouring matter extracted from them by ether, itreraiijs on evaporation as a blood red resin, having an odour of chamomile. I* melts below xoo° and does not yield ammonia by dry distillation. I*'j* insoluble in water and in dilute acids. By aqueous ammonia, potash, and soda, it is coloured green and dissolved; the saturated solution is red by reflected light, but exhibits after dilution a green colour by transmitted light. The ammoniacal solution leaves on evaporation a neutral blood-red resin having the odour of hypericum, soluble with yellow colour in water, and giving off ammonia when treated with potash. The red combines also with the alkaline earths, earths proper, and heavy metallic oxides, its alcoholic solution precipitates the alcoholic solution of chloride of calcium, also neutral acetate of lead, and ferric chloride. It dissolves in alcohol, more readily in ether, with wine-red to blood-red colour, also in volatile oils, and in warm fixed oils ( <i>Buchner</i> ). According to Marquart the colouring matter of the fresh flowers is a mixture of anthocyan and anthoxanthin separable by exhausting with alcohol and treating the residue with water.''                                                                                                                                                                               |

| FIBRE.<br>Bark.<br>2<br>Medicine.<br>Root.<br><b>3</b><br>Stalks.<br><b>4</b><br>Leaves.<br>5 | Fibre.—The BARK yields a good fibre.<br>Medicine.—The ROOT possesses alterative and tonic properties, an<br>is employed as a substitute for Sarsaparilla <i>{Co/if</i> . with Hemidesmus ind<br>cus, p. 219}. The STALKS and LEAVES are used in the form of decoction<br>in fevers. An INFUSION is recommended to be prepared from 2 oz. of th<br>root in a pint of boiling water: of this the dose should be 2 or 3 oz. twi<br>daily. Taylor in his <i>Medical Topography of Dacca {p. 55}</i> says : "Th<br>plant, which derives its name from its creeping stems, abounds with an acr<br>milky juice. The stalks and leaves are used in the form of decoction<br>fever." Dymock <i>{Materia Medica of Western India}</i> discusses this dru<br>conjointly with Hemidesmus indicus. He writes: "They are used togeth<br>and are considered to have similar properties. When, however, <i>sdrivd</i>                                                                                                                                    |
|                                                                                               | used in the singular number, it is the usual practice to interpret it as meaning Ichnocarpus frutescens ( <i>Dutt, Hind. Mat. Med., p.</i> 975). Ichnocarpus frutescens is common in the southern part of the Presidency. The Hi dus consider its roots and those of Hemidesmus to be demulcent, alterati and tonic, and prescribe them in dyspepsia, skin diseases, syphilis, & They are generally combined with bitters and aromatics." The wide ar over which a knowledge of the medicinal properties of this plant occu argues actual merit. Thus from the extreme southern parts of India the north and east, the people use a decoction in the treatment of few In the Journals of the AgriHorticultural Society, for example, repeat mention is made of this property; even the wild N aga tribes, on the nort eastern, frontier of Assam, are familiar with it. The Rev. J. Long ( $A_{i}FC^{-V_{in}}A^{-1} \circ f^{*en}S \ll D$ states that the roots are commonly employ in hospitals under the name of country Sarsaparilla. |

PL, I., 356, 997.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                      |
| Ilex°Aquifolium, Linn.; ILICINER.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 7                                                                                                    |
| THE EUROPEAN HOLLY.<br>ReferencesO'Shaughnessy, Beng. Dispens.,271; U.S. "ispens. {Ed-<br>XV), p. 1668; Indian Forester, V., 4*5; XIII., 60, 68; Clarke, Linn-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                      |
| <i>bc. ur., XXV., 11.</i><br>Habitaf—/"small tree, native of Europe; introduced into India and<br>commonly' found in gardens within the temperate tracts. According to<br>Mr. C. B.Clarke, it may also be a native of the Naga Hills on the frontier<br>of Assam, for he collected a holly, not in flower or fruit, but which possessed<br>leaves that matched accurately those of the common holly. The writer<br>found in many parts of Manipur and the Naga Hills, bushy, sterile forms<br>of what he took to be Ilex dipyrena, but possessing very thorny, broad<br>ovate leaves which much resembled in form and texture those of the true<br>holly. Manipur is peculiarly a country of hollies, no less than five species<br>having been -collected, all of which in their higher limits were seen to<br>become flowerless and form stunted bushes with very spinose leaves. Of<br>these five species three are undescribed. The Manipur hollies are: I.<br>dipyrena, <i>Wall;</i> I. Thomsoni, <i>Hook./.;</i> I. sikkimensis, <i>King,mss.j</i> I.<br>Duniana, <i>Watt, mss.;</i> and I. monopyrena, <i>Watt, mss.</i> |                                                                                                      |
| Dye.—The common holly contains the principle <i>litxanthine</i> , a yellow colouring substance soluble in concentrated hydrochloric acid. With alum it dyes yellow and with ferric chloride green.<br>Medicine.—O'Shaughnessy ( <i>Bengal Disp.</i> ) remarks that according to Dr. Rousseau the LEWES and BARK form a useful remedy in intermittent fever; they are also said to be emollient and diuretic. The United States Dispensatory gives an interesting account of this remedy which formerly enjoyed in France a high reputation. Its property was said to depend upon a bitter principle <i>ilicin</i> . A yellow colouring substance called <i>ile-xanthin</i> and a peculiar acid known as <i>Hide acid</i> have been obtained by Dr. F. Moldenhauer. The BERRIES are said to be purgative, emetic and diuretic, 10 or 12 being enough to act on the bowels.<br>Structure of the Wood.—White and hard, much used for ornamental purposes and for calico-printers' blocks.                                                                                                                                         | DTE.<br>8<br>MEDICINE.<br>Leaves.<br>9<br>Bark.<br>10<br>Berries.<br>II<br>TIMBER.<br>12<br>DOMESTIC |
| Domestic—The inner bark affords a viscid substance used as BIRD LIME. The juice is boiled and mixed with a third part of nut-oil.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | DOMESTIC.<br>Bird-lime.<br>13                                                                        |

| FODDER.<br>75<br>TIMBER.             | A remarkable Ilex, which the writer provisionally accepts as a form $ci$ this species, runs to a large wide spreading tree, the leaves being sparingly spinescent. A good example of this exists in Simla, which is peculiar in forming minute yellow seedless fruits in March (as the flowers of next year appear) instead of producing the large orange coloured fruits of Ilex dipyrena which in December constitute a striking feature of the winter vegetation of many parts of the Western Temperate Himalaya. <i>in</i> s may be but the staminate condition of the species, a condition which Darwin ( <i>Origin of Species, p. 73</i> ) describes as observed in I. Aquifolium—the $E^{ur0}$ . pean Holly. But It is worth adding that, in the Simla neighbourhood, an the other examples of I. dipyrena (so far as the writer has observed), with the single exception of the tree here described, are hermaphrodite. $\sqrt{Con} f$ : with <i>Darwin, Forms of Flowers, p. 297</i> , where the English holly is stated to be dioecious or as having only imperfect stamens in the pistilate flowers.) Fodder.—The leaves are occasionally given as fodder for sheep. Structure of the Wood.—White, hard, close-grained. Weight $4^{oTB}$ per cubic foot. Is not much esteemed. |
| 16<br>17<br>TIMBER.<br><b>28</b>     | <b>Ilex Godajam,</b> Colebr.; $Fl_{\sharp}'Br. Ind{t} I., 604.$<br>Structure of the Wood.—Kurz remarks that this species yields a whitish wood, which turns grey, is rather heavy, fibrous and tough, but close-grained.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| FOOD.<br>24                          | PARAGUAY or MATE TEA; JESUITS' TEA.<br>Habitat.—A native of Brazil and of Paraguay, now extensively cultivated experimentally in most countries.<br>Food.—From time immemorial, the inhabitants of Brazil and Paraguay have been in the habit of drinking a beverage prepared from the leaves of this holly much after the fashion of the use of tea in China. These leaves possess a pleasant aroma and a principle analogous to that in tea and coffee. They have the advantage of cheap and easy preparation, since it has been found unnecessary to cure and roll them by so expensive a process as that adopted with tea. They are scorched and dried while still attached to the branches; then removed by being threshed, ground to a powder and packed in skins or leathern bags. The leaves are collected from the bushes every two or three years from December to August. Although originally and even now to a large extent collected from the wild plant, this holly is also cultivated to afford a more accession the wild plant, this holly is also cultivated to afford a more accession. The wild plant is stated thas 8,000,0008) of leaves were used m South America (the bulk being exported from Paraguay) in place                                                  |

| of tea, which though gaining ground has by no means displaced the inn<br>genous article. In the Argentine Republic it is stated the consumption<br>amounts to 27,000,000ft per annum, or about 13ft a head, while of col-<br>and, tea only 2lb a head are consumed.<br>The use of <i>mate</i> leaves has been long' known and various attempts has<br>been made to introduce this cheap tea into Europe with little or no pre-<br>tical results. It has even been cultivated in France and other parts of t<br>Continent, but interest is if anything lessening, a result doubtless large<br>due to the cheapening of tea. The first mention apparently (by an Indi<br>writer) of <i>mate</i> is that given by Dr. Ainslie ( <i>Mat. Med., I., 436-437</i> ), the<br>only refers to the substance in an account of tea substitutes. St. Hilai<br>Dr. Ainslie remarks, urges that there is a great difference between t<br>Brazilian and the Paraguayan <i>mate</i> , and he further states that Lamb<br>figures and describes the plant in an appendix to the second volume of<br>1/description of the GENUS Pinus. In the writer's copy of that work the a<br>pendix in question is not given, but there can be no doubt the Paragu<br>Holly was experimentally cultivated in England at the beginning of<br>century. The first plant grown in Isl i a was apparen by is bo bashed<br>the Agri-Horticultural Society of Madras from Kew in the year 1870-<br>may now be seen in most public parks and gardens, and in Lucknow is<br>said to flower and fruit. It is thus probable that the plant could be cu<br>vated in any of the provinces of India, and afford a cheap and wholeso<br>beverage to the millions of people who for generations will most probable<br>be too poor to purchase tea. Various reports have appeared, and an<br>tensive correspondence been conducted, but as yet the cultivation of <i>mu</i><br>in India has not passed beyond the experimental stage, and the plant is oo<br>grown for ornamental purposes. <i>(Con.,</i> with Johnston's Chemistry<br><i>Common Life (Church*s Ed.), pp. 135-140.</i> )<br>The decoction is prepared by pouring boiling water over a small qua-<br>tify of the powder. | One of the earliest notices of the Indian trade in Star Anise occurs in <i>Milburn's Oriental Commerce (Ed. 1813, Vol If., p. 499).</i> The fruits are there said to be the produce of a tree growing in China and the Philippine Islands. The East India Company's sales of imports are given as follows:—                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | trade.<br>28 |

| Mibburn adds that 8 cwt. of aniseeds are allowed to the ton, and that the permanent duty thereon is $\pounds 1-8-6$ , and the temporary or war duty $0*$ for making $\pounds 1-18$ non aut                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |              |
| <ul> <li>9*. 6rf., making £1-18 per cwt.<br/>The earliest European mention of Star Anise (<i>Pharmacographia, p. 21</i>) is connected with the voyager Candish who brought it from the Philippines about A.D. 1588. Clusius purchased the fruit in London in 1601, and<sup>0</sup>during the seventeenth century it reached England by way of Russia, hence known as <i>Cardamomum Siberiensis</i>. In 1690-92 Kaempfer figured and described the Japanese plant Somo or Skimmi, which, as the learned authors of the <i>Pharmacographia</i> say, was, by subsequent writers, assumed to be the source of the Star Anise. Thunberg was the first to point out that the fruits of the Japanese plant were not so aromatic as those met with in trade. Von Siebold made the same observation and maintained that the Japanese plant was distinct from the Chinese species described by Loureiro. It was left, however, for Dr. Bretschneider to point out that the same time to Mr. Ford (of the Hong Kong Botanic Gardens) to establish the independence of the true Star Anise of South China—to which Sir J. D. Hooker has given the name of I. verum- from Loureiro's Chinese plant and Siebold's Japanese species.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |
