AL-I C-N-H

have been only to the Cape. His declining state of heal ever, induced him to proceed as far as St. Helena. During in that island, he, ever attentive to the in of science, ed the opportunity by describing most d

oblige he entertained considerable 1, opes of bei to put this work to the press; and once wrote to the Editor, preparing it for this purpose he hoped to procure the assistance of the first botanists of the present day, Mr. Robert I Death !, o; eVersoo, prevented his accomplishing this object he had so at heart.

The Editor had been permitted by Dr. Roxburgh to to the manuscript after it had received the latest alteration tions which he made to it while he remained in India, the last of it being returned to him after he had gone on board the ship to the view of leaving the to the view of leaving the to the with and described a few to the kindly sent thence to the view of leaving the to the leaving the to the leaving the to the leaving the to the leaving the leaving the to the leaving the le

"•e Edi_{tor at} Setampoie

at^putitlopjj •>*'o«,<hclidsili India, heimi

The l'i'iifipal motives which urged him to this step, were the He in the first instance wished to secure lo an old aild ligr, liv va ed Friend Hie Uell-earned reward of upwan of t!.irly , ea « 'lab in the description of more than Two Thousand Plants, natives of E tern Asia; a work in which none had anticipated him to an equal

Lue most pompous inscriptiou engraved on tablets of imiss; but uhicli i:e would have been, completely and unjustly deprived, had work Lee'u suffered la remain unpublished. This, was likewise, in'ilinitied i>j his desire to promote ihc interests of a science to cli he lius been attached from the earliest period of his life, and icb miiat Lave suffered an almost irreparable loss had the hbors of the lius been attached to die willi him.

Tu this measure the Editor felt eucouraged by another circunilaiice which lie esteems it his duty to me.iiion particularly. On ris communicating his wish to publish the Manuscript of his deceased iiieml, to Dv. Nathaniel WalUch, the present Superintendent of the 1. uorable Company's Bulati c Gardeiij whom lie iVeU houorn numbering among bis most intimate friends, and whose ability indefatigable zcA in conducting that Institution are so well becoming lie nut oiilj consented to assisi in superiuteuding this work of Ida eiteerned predecessor and frieiul, as it passed jLuruugh the presi; bul in the most generous maunet promised lo insert therein, flidse ftumerous plautawiiich have since been communicated to him ""u"all paits of Asia, and particularly from Nepalo, a country the »roducliona of which arc as yet scarcely known to ihe European 'vdld This will prove such an addition to the original work of the luteMV. Roxburgh, while it H fully congenial with its nature, that it cannot but form ;t most desirable acquisition to every lover cl* this pleasing science, both in A^ia and in Europe.

In thus publishing the work of his deceased friend, the Editor assured tbatnoone will impute to him motives of a mercenary 'liits.', who considers the espeuse and labor of printing a work, of is nature, the limited sale il must necessarily have, and the little irobability there is of a *second* edition of it bein' called for either in ndia or E;noj»e: as in every neu systematic work on general botany, the collision of preceding oijes, all the plitted described in parti-

6

cular Floras published in the intel mediate lime, are invariably inset. Hence no work of this kind can be published, at least in IIK with any well-founded expectation of its being a profitable speou tion. Should any of the relatives of his late friend have an idea its being made such in this instance, howe'ver, the Editor will challed give up to them the whole edition, on their defraying the peases attending its printing and publication.

To those acquainted with Botany, it is well known that ma changes have taken place in the nomenclature of plants, since th late Dr. Roxburgh added the final touch to his manuscripts. many instances whole orders have undergone a complete revision genera have been frequently divided into two or three; specific names have bem changed; and plants have been removed from one genus to another. The Editor however thought it best to wnblkN his late friend's manuscript in the state in which he left it- and to add in notes such alterations as have been made by botanists with whose improvements the author was unacquainted, or who have written since his death. The whole work therefore, corresponds exactly with Dr. Roxburgh's manuscript after it had received his last correc. tion, wilhlhe exceptions just mentioned, and of such corrections of the language as were necessary, which in no instance have been suffered to make any alteration in the sense.

The Editor feels gratified in bearing testimony to the disinterested and highly liberal manner in which Dr. Wallich has contributed bis assistance throughout the whole of this work; and to his creneJ rosity in enriching it with a number of plants described by himself and easily to be recognised by the initials N. W. in the first volume'. The amount of these, especially among scitamineje and grasses would have been much more considerable *had* there been time to insert the recent vast accessions of plants, which the Garden has received frontall parta of India, and which from his earnest solicitude to promote the interests of this pleasing and important science, may be reason.

PREFACE. 7

:• expected to bear a far greater proportion *to the whole in each -ceding volume. It is intended to terminate the work with an jditionul volume, uhich shall include all the plants which may be covered during the progress of it through the press.

Die Editor now submits the work to the relatives of his deceased it-iid, as the best tribute of respect he is able to show to his me
ory — and to the candid consideration of all who are attached to the interests of the science both in India and Europe, remaining,

RESPECTFULLY THEIRS,

W. CAREY.

Transfers the Indian Asset

MONANDRIA MONOGYNIA.

CANNA Schreb. gen. No. 1.

Anther single, attached to the edge of the petal-like filament. Style f patulate, growing to the tube of the corolla, Utigma linear. Cap* ale 3-celled: seeds several, naked.

f'. indica. Linn, sp.pl. ed. mild. 1. 3.

.caves o\ate-lanceolate. Segments of the inner border of the core*
<)olate, and bidentate.

vans. वनकें बाँt, Vwim-kelee, सन्वेजया, Surva-juya.

Beng. Lai Swrva-jt^ya, the red variety, and Shweta Surva-juyz, the yellow.

Teling. Kristma-tamara.

"itu-bala. Rheed. mat. U.p. 85, f. 43-

Cannacorus. Humph, amb. 5. p. 177, f. 71. fig 2.

Common over *India*, and in flower and seed most part of the year.

Observation. The parts of the corolla are exactly alike iu both varieties. C.lutea of Roscoe, must therefore be different; as in tha ner limb of the corolla is bifid.

PHRYNIUM. Willd.

either single, terminal on a short erect filament. Style growing lot tube of the corolla. Stigma uifondibulifomi. Capsule 3-cell
M J, S alved. Seeds solitary, arilled at the base. Embryo uwcinete, and furnished with a pexisperai.

1. P. dichotomum. R.

Shrubby, dickotomous. Leaves cordate.

Thalia cannaformis. Linn, sp.pl. ed. Willd. 1. 16.

Arundastrum. Tonchat seytam. Humph, amb. 4. p. 22. t. 7.

Donax Arunda&trum. Lourier. Coehin-ch Id.

Sans. ?m, Vu\a, ftl^CTOl Godunika, *PTi, Bliwdra, Wi^ift Bhwdroudwnee, *K3ITfe^T, ShMrakasthika,^rifsH?, Kulyaninee' *R^T, Bhadra-btda, *HST, Ghata, THfct, Patee, TO^T, Vula_hwa.

Bewg. Moocta-patee, Pattee-patee,* or Madar-patee.

This elegant shrub, is a native of *Bengal*, as well as of various other parts of *India*, &c. Flowering time the hot season; seeds ripen in the rains.

Smt ramous, woody, perenniaL-SfeTM straight, tapering and simple to the branches, about as thick as a man's thumb, and fru a three to five, or six feet high, of a beautiful, highly polished green Branches numerous, dichotomous spreading in every di_ colour. lection, smooth like the stem, but jointed at every division.-X*^ alternate, petioled, ovate-cordate, smooth, entire, acute, from 4 to 8 inches long; veins numerous, very fine and parallel—Petioles sheathing, except a small portion, one tenth, or less, at the apex which is round, and may be called the proper petiole.-itocmej terminal, generally solitary, jointed, a little flexuous.—Bractes glumaceous, in pairs on the jomts of the raceme, each pair embracing between them a two-flowered pedicel—Hoa*TM pair'd, on a com' mon pedicel, from the alternate joints of the rachis, l,f'e Dure ^'-Pedicels clavate thick, white, and fleshy, near the a J e x L parted; divisions unequal, with two glands at their ends hke the rudi ments of flowers.-^* above, three-leaved; leaflets oblong-conic,' ' "M» to "fde of the split sfems of taU plant, bem? smoothed particularly cool

plant itself u ^dtobear the same name. Suiting, however, this to be a misat propnafcon of the term, I have enquired of natives of the eastern parts of BeJal

tapering to an acute point, and much shorter than the tube of the corol.—CoroZ one-petalled, irregular. Tube funnel-shaped* Border double; exterior of three, equal, linear-oblong, recurved segments. Inner elevated far above the exterior on a continuation of the tube, and consists of five very unequal portions: the exterior two are larger, obcordate, with waved, expanding margins; the third or middle one stands opposite to the first two, is broad, obcordate, deeply emarginate, and of a middling size between the two exterior, and two interior segments; on the inside near the base a semilunar body which projects inward between the anther and stigma; the inner two small, and crown the mouth of the tube, closely embracing the stigma, and anther.—Moment shore, attached to the margin of the smallest segment of the interior border of the corol. Anther erect, simple, ovate-oblong. In this species, as well as in P. capitatum, the pollen •:->T^ts of remarkably large round grains.—Germ inferior, villous, 3celled, with one ovulwn in each, attached to the bottom of its cell. Style growing to the inside of the tube of the corol, and does not appear until above its mouth, when it enlarges, into an infundibuliform, hooked stigma, surrounded with a lobate, callous margin, and directed in an oblique maimer toward the faceof the anther, as if in search of it, though separated by a callous projection from the base of the middle division of the inner border of the corol.—Capsule broad-turbinate, size of a cherry, rugose, somewhat 3-lobed, 3-celled, 3-valved, opening from the apex.—Seed solitary, round, resting on a small, partial, scaly aril. Integuments two '.exterior soft and spongy; inner x\uciform.—Perisperm conform to the seed, horny, tinged blue; a fissure penetrates from the base pretty far up, separating the two extremities of the embryo. Fitellus; none has been discovered in any of the simple-anthered scitaminese which have been examined by me* -Embryo pure white, hooked, with th* convexity upward, which corresponds with the periphery of the seed.

2. P. virgatum. R.

Stem? simple. Leaves bifarious, lanceolate. Spikes terminal filiwan compound.

A native of *Malabar*, from thence sent to the late Dr. Anderson of *Madras* for the *Cardamom* plant, and by him presented to the Botanic Garden at *Calcutta*, where it blossoms during the rainy season.

Root a stout, crooked, tough, fibrous, horizontal main body, with numerous, thick, strong fibers therefrom; every part void of odour. —Stems numerous, erect, 6-8 feet high, slender, jointed, lower joint or two much swelled; invested in the sheaths of the leaves, fistulous; the largest are about as thick as a slender walking cane near the base, and at the top as thick as a common quill.—Leaves bifarious, ghort-petioled on their sheaths, lanceolate, polished; length from 6 to 18 inches.—Sheaths and petioles smooth and even* except the inside of the petioles, where there are a few long, soft hairs.—Spikes. terminal, two or three together, and they are very generally two, or three cleft, very slender, and often near a foot long, jointed, with a two flowered pedicel at each joint.—Flowers pure white, inodorus.— Tirades two or three at each division; and also embracing the twoflowered pedicels, size very various, but the shape ensiform, and channelled.:— Caiyx of three, small, distinct, acute, conic, leaflets,—Corol with a very short tube *% exterior* border of three, nearly equal, oblong, reflexed segments; within are two which are unequal, and much larger; they form the conspicuous portion 'of the flower, one is obcordate, the other is obovate; inner segments 3, and smaller, the two longcat of them form yellow margined hoods for the Anther and stigma. —Filament inserted between two of the inner segments of the corol, Anther one-celled, ovate.—Germ inferior, hairy, 3-celled, erect. with one ovulum in each, attached to the base of the axis. Style growing to the short tube of the corol, above free, and uncinate. Stigma funnel-form.—Capsule oblong-obovate, size of a field-bean, rugose, when ripe pale yellow, 3-celled, 3-valved. Partitions opposed.—Seed solitary, oblong; a small lobate aril round the umbilicus at the base of the seed. Integuments two; exterior brown, and

glossy, *interior* membranaceous.—*Perisperm* conform to the seed, and as in P, *capitafum*, &c. a brown substance runs up from the base, into -the arch of the embryo.—*Embryo* simple, hooked, with the convexity upwards.

Obs. It is almost needless to observe that this plant has no relation to that which furnishes the *Cardamom* of *Malabar*, viz. my *Alpinia Cardamomum*.

3. P. spicatunu R.

Stemless. Leaves radical, hilarious, oblong. Spikes radical, shorter than the petioles, subcylindric, bifariously imbricatetL

Plants of this small species, were sent by Mr. Felix Carey from *Pegu*, to the Botanic Garden at *Calcutta*, where they blossom in ipril and May.

Root perennial, flexuose, creeping horizontally deep in the earth, !.irk as a ratan; //ires numerous from the main body, and spread in >U directions.—Stem none, the sheathing petioles unite from 6 to 12 iiches in extent, and resemble one, as in the Curcumas.—Leaves in tetle radical tufts, of three or four each, sub-bifarious, petioled, linearculong; base broad and rounded; apex tapering, and sharp, both surges quite smooth; position nearly horizontal; length 6-10 inch-* ct by 2-S broad.—*Petioles*, the most exterior of the tuft sheathing, with their upper part round and smooth, those in the centre, (one or two) have no sheath, and are from apex to base round and smooth; geera! length of the whole from 6 to 12 inches, which is nearly the ^«ght of the whole plant, the position of the leaves being nearly hcizontal.—Spikes solitary in the centre of the petioles, 'or lateral frm their base, short-peduncled, sub-cylindric, acute, apex elevated > little above the soil, imbricated on opposite sides, with 4-8, al* teilate, bifarious -bractes, or sheaths; each embraces a small spikeletrf four or five pairs of sessile, small, nearly white flowers, on theback, or interior side of the spikelet, which expand in succession eginning with the lower pair. Rachis fiexuose, smooth.—Brae-' *** exterior, ox common, one at each joint of the spike, sub-cylind'' < sheathing, smooth, and rather obtuse; interior, or proper OLS

to each pair of flowers.—Calyx S-leaved; leaflets lanceolate, smooth.
—Corol with a long, very slender, smooth tube. Border; exterior of three reflexed, oblong, obtuse segments; within these are two larger, round-obovate, erect, curled portions. Interior, or nectarhim small, and like the other species unoqually 3-lobed.—Anther one-celled, attached to the inner boid6i oi the corol.—Germ inferior, 3-celled, with one ovulum in each, attuu: feed to the bottom of the cell.—Style blended with the tube of the corol, as in the other species described by me.—Stigma uncinate, thick, and fleshy.—Seed vessel (not seen.)

4. P. imbricatum. R.

Stemless. Leaves radical. Spikes simple, petiolar, solitary, short-peduncled; bractes imbricated, truncate, many-toothed.

Pitf a/i-pata the vernacular name in *Chittagong*, wheie it is com¹-mon in its wild state. flowers in March and April and the seed; ripen in August.

'- Root tuberous, &c. as in other scitamineous plants.—Stem none. —leaves radical, long-petioled, from oblong, to broad lanceotar, ts pering nearly as much at the base, as at the apex, smooth, entire, fin- •ly acuminate; 12-24 inches long, by 4-8 broad.—Petioles longer th in the leaves, cylindric, smooth, the flower-bearing ones have a hairy jo nt near the middle, and from the joint up, a slit of between 2 and 3 'tidies in length opens on one side for the spike, its margins thin, < ud hairy.—Spike solitary, short-peduncled, simple, linear-oblong.. '-4 inches long, imbricated.—Bractes; exterior oval, truncate, with the transverse apex many-toothed, smooth, each embracing several su all, pale, pink flowers, which expand in succession. *Inner bractes* snail, and membranaceous.—Calyx, corol, and stamen, as in P. pare ftoturn.—Cerni 3-celled, with one ovulum in each, attached to ihe Style, as in the other species, it grows to, and bottom of its cell. is blended with the tube of the corol, its apex free, thick, and hoc ted. Stigma gaping obliquely toward the anther.—Capsule oblong, she of a large field bean, rugose, 3-celled, 3-valved, opening from the '>ex. —Seeds solitary, sitting on a partial aril, and attached to the oc'torn of the cell; external tunic hard, brown, and polished.—Ferisperi

form to the seed.—*Embryo* erect; simple, the apex hooked. *Radicle* inferior, close to the umbilicus of the seed.

Obs. The simple, short-peduncled, imbricated, linear-oblong spike, bursting from the middle of the petiole, readily points it out.

5. P.parviflonim. R.

Stemless. Leaves radical. Heads of flowers petiolrry; bractes acute.

A native of the eastern parts of *Bengal*. With *P.capit tum*, it blossoms about the beginning of tl*e rains.

Root tuberous, horizontal, pereruial, hairy, in other respects as in P. capitatum, &c.—Leaves long-petioled, elliptically-oval, polished, entire, short, acute-pointed —Heads of flowers sub-globular, sessile, always bursting from the ianer side of the petioles, near, or above their middle, composed of many, imbricated sessile, distichous, compact, simple, or compound spikes.—Bractes,- the exterior two are broad* tfvate, and common to the whole head; the rest withiu smaller; all are smooth, and end in a small, rigid, acute point.—Flowers in pairs, small, nearly inconspicuous, yellow.—Calyx, coral, and tfamen, as in capitatum.—Germ short pedicelled, smooth, but hairy round the insertion of the calyx, 3-celled, and in this species 1 have only found one of the cells fertile, in it is one avulum, attached to the bottom ≪f the cell. In *capitatum* all the three cells are fertile. Style as in the otlier species, it grows to the tube of the corol, its apex free and hooked. Stigma infundibuliform.

6. P. capitatum. Linn, sp.pl. ed. Willd. 1. 17.

Stemless. Leaves radical, long-petioled, oblong. Heads of flowers petiolary and terminal, glomerate. Bractes truncate, incurate.

Naru-killa. Rheed. mal. \l.p. 67. t. 34.

Phyllodes Placentaria. Lour. Cochin-ch. 16. 17.

Kudali. Beng. which also signifies a Plantain.

A native of *Chittagong*, and of various otlier parts of India. From flie former place it was sent to the Botanic Garden at *Calcutta*, by Dr. Buchanan in 1797. Flowering time the rainy season, the seed* ripen in the cool season,

Root perennial, tuberous like ginger, with long, fleshy fibres from the crown,, and various other parts.—Stem none.—Leaves radical, long-petioled, oblong, entire, smooth on both sides; length from 6 to 18 inches, and broad in proportion. Veins numerous, line and pa* rallel.—Petioles longer than the leaves, slender, round, smooth, taper a little from the base, and are there expanded into a sheath for those immediately within; such as are destined to bear the flowers have a joint a little above the middle; immediately above this joint there is a swelling, which in due time is forced open on the inside by the growing flowers exactly as in our Indian species of Pontederia. It however sometimes appears, and even in the same plant, that some of the petioles, now scapes, extend no further than the flowers.—Flowers numerous, collected into a pretty large, sessile head, which bursts from the anterior margin of the jointed petioles, small, and nearly hid among the large bractes; when they first expand in the morning rosecolour'd, gradually becoming purple by the evening.—Bractes, v. lyxof Louriero's *Phyllodes*, several, collecting the small sessile flower* into several fasciculi of two, three, or four pair, each of which ex-The exterior one of each fascicle is large, subpand in succession. cylindric, of a firm texture, and reddish colour; apices truncate, with scariose, incurved margin; the rest are smaller, and more or less pointed.—Calyx superior, three-leaved; leaflets ensiform, length of the tube of the corol, hairy about the points.—Corol one-petalled. Tube funnel-shaped, scarcely perforated. Border double; exterior of three, equal, purple, spatulate, recurvate segments; interior more elevated on a continuation of the tube, and consists of five, very unequal segments; the exterior two larger, round, curled, and of a p ^ e rose colour; the innermost one small, and running down the side of the filament like a wing.—Filament solitary, short, inserted on the mouth of the tube close by the free, curved end of the style. Anther simple; grains of the pollen white, large, and spherical.—Germ inferior, oblong, very short pedicelled, hairy, S-celled, with one ovulum in each, attached to the bottom of its cell. Style growing to, cr blended with the tube of the corol. Stigma large, funnel-shaped, ob» likely-incurved or booked toward* the anther.— Capuk short, turbinate, three-sided, pretty smooth, size of a gooseberry, three-celled, three-valved, opening from the apex.—Seed solitary, nearly round, smooth, dark grey, resting on a small, squamiform aril, which is attached to and surrounds the short umbilical cord which unites the seed to the bottom of the partition. Integument double; exterior spongy; inner thin and rather hard, adhering to the exterior, and to the perisperm.—Perisperm conform to the seed, horny, tinged with pale blue; a fissure replete with a brown substance penetrates from the base to a considerable distance upwards.—Embryo pure white, hooked, with the couvexity upwards, which corresponds with the periphery of the seed.

HEDYCHIUM. Kön.

Corollaxvith. a long, slender tube; both borders three-parted; inner resupiuate. Anther double, naked. Capsule three-celled, three-valved. Seeds numerous, arilled. Embryo simple, and furnished with both perisperm and vitellus.

1. H. coronarium. Linn, sp.pl ed. Willd. i.jp. 10. Konig in Retz. obs. 3.73'.

Leaves lanceolate. Spikes compactly imbricated; segments of the cleft lip of die corol semi-lunar.

Gandsulium. *Rumph. amb. 5. t.* 69./• 3.

Goruk-nathha of the Bengalees, also by them called Doolak-cham-pa.

A native of various parts of *Bengal* and the neighbouring provinces. Flowers during the rains; and the seeds ripen in the early part of the cool season.

Root horizontal, perennial, round, fleshy, marked with annularcicamces, about as thick as a man's thumb, fleshy, with fibrous ramifications issuing from the cicatrices; taste simply herbaceous.—Stems erect, 3-4 feet high, round, every where covered with the sheaths of the leaves—Leaves sessile, alternate, bifarious, lanceolate, tapering XQ an evanescent point; above, a deep smooth green; below, striated, pale,

and slightly covered with depressed, soft, white hairs; 9-12 inches long, and about two broad.—Sheaths smooth on both sides, striated, terminating in a ligulated process, (as in many of the grasses) which is often two-parted.—Spike terminal, solitary, erect, linear-oblong, about the size of the thumb, .compactly imbricated with many large, oval, concave, green, common, permanent bractes.—jF/oomlarge, pure white,* very fragrant. 2-4 to each common bracte, but seldom more than one or two expand at the same time.—Bractes: besides the common exterior ones, already mentioned, there are as many interior as there are flowers in the fascicle; the largest of which is about half the length of the common bracte, and envelopes not only the most foreward (exterior) flower, but all those of the same fascicle, gradually diminishing in size; all have a sheathing base, are membranous, and striated.— Califx superior, one-leafed, a little inflated, contracted at the mouth, a little hairy, striated, half the length of the tube of the corol. —Corol one-petalied. Tube long and slender, from the apex of the Border flat, double. exterior bractes recurved. 'Exterior threeparted; divisions equal, lanceolate, acute, membranaceous, striated. *Interior* resupinate, three-parted; *lower* two divisions obliquely oval, short-clawed; upper division broad, obcordate, banner-like, with the fissure deep, and the lobes roundish; margins waved; towards the base tinged yellow.—Nectary (of Kiinig and Retzius) two short, fleshy, subulate bodies embracing the base of the style.—Fila*ment* from the lower margin of the mouth of the tube, between the insertions of the inner border of the corol, ascending; upper side channelled for the style, and inserted into the anther a little above its base. Anther linear, sub-erect, two-lobed.—Germ obsoletely three-sided, three-celled, with many ovula- in each, attached to the Style slender, in length sufficient to elevate the large, hairy, axis. perforated, glandular, green *stigma* just about the apex of the anther. —Capsule oblong, three-celled, three-valved, opening from the apex; inside orange coloured.—Seeds many in each cell, invested in their proper, multifid, crimson aril. Integuments two.—Perisperm and

[•] A variety deeply tinged with yellow, is found in iome of the interior provinces; and another of a pale yellow colour: all are equally fragrant.

vitellus together conform to the seed; the former occupies the lower and exterior portion; and the latter the upper and interior portion, and is in immediate contact with the embryo.—*Embryo* simple, subcylindric, nearly as long as the seed.

Obs, This, to me, is the most charming of all the plants of this natural order that I have yet met with; the great length of time it continues to throw out a profusion of large, beautiful, fragrant blossoms, makes it particularly desirable.

£. H. angustifolium. JR.

Leaves linear-lanceolate. Spikes open; fascicles of flowers subtern, segments of the cleft lip oblong; the other five segments of the corol linear.

Beng. Bhoo-ada.

Native of *Chittagong*, *Silhet*, and the eastern parts of *Bengal*, where it flowers about the beginning of the rains, in June.

Root tuberous, horizontal, jointed, &c. as in the other scitamineous plants.—Stems erect, 3-6 feet high, entirely invested in the sheaths of the leaves.—Leaves bifarious, sessile on their smooth sheaths, narrow-lanceolate, very fine, I may say filiform, pointed, smooth on both sides; length 10-14 inches, by 1-2 broad.—Spike terminal, erect, rigid, 6-18 inches long, smooth. Fascicles of flowers generally threefold, and spreading out considerably from the rachis.—Bractes, exterior of the fascicle cylindrical, linear; interior, one to each flower, and smaller.—Flowers rather small, dull red (lateritius,) generally about four in the fascicle, and expanding in succession.—Calyx superior, cyhndric, length of the tube of the corol; mouth equally three-toothed.—Corol; tube slender, cylindric, about an inch long; 5 segments of the border linear (sub-filiform,) variously revolute. Lip lateral, with linear, channelled and two-parted *lamina*; the *segments* thereof semi-oval.— Filament opposite to the lip, and twice its length, nearly straight, filiform, grooved for the style. Anther two-lobed, naked.—Germ oval, a little hairy, three-celled, with many ovula in each, attached to the axis. Style filiform, its base embraced by the usual two subulate bo-Stigma funnel-form, projecting from the apex of the anther. dies.

3. H. gracile. R*

Leaves lanceolar. Spikes terminal, open; flowers solitary, scat* tered; segments of the bifid, sessile, lip, semi-lanceolar, the other five segments of the corol linear.

Khasee name, Kattia Laphya.

Obs. This is a slender species, about three feet in height, a native of the mountains on the North-East border of Bengal. Like the preceding two species it flowers in the rainy season. Its solitary-flowered spike of white* corols with their scarlet filament, and its lanceolar leaves, distinguish it from *H. angmtifoliwn*.

Note. The following fwo species, discovered since the Author of this work left the Botanic Garden, are added by Mr. N. IVallich, the present superintendent of that institution.

4, H. villosum. Wall.

Spike elongated, villous, open. Fascicles approximate and copious, scattered or paired, three-flowered; lip short-clawed, bifid, of equal length with the five linear segments of the corol.

'A native of the mountains North-East of Bengal, from whence our indefatigable collector of plants, *Mr. Matthew Robert Smith*, sent specimens to me in 1815. Flowering time the rainy season-

Khasee name, Kattia Ram Rait.

Stems upright, slender, smooth, as well as the leaves, from two to three feet.—Leaves flat, lanccolar-oblong, elevated from the back of the sheaths by a very short petiole; glaucous underneath. Sheaths terminated by an oblong, obtuse, closely adpressed, long ligula.—• Spike terminal, erect, cylindric, obtuse, from 10-12 inches long; all its parts covered with a short, sericeous down,—Bractes oval, much shorter than the tube, of a reddish tint; exterior or com* mon, three, seldom two-flowered, flat; interior, one to each Rower, the base of which it embraces.—Flowers delightfully fragrant even when dry, less succulent than those of if. coronarium and angusti-

^{*} There is a variety of this species with cream-coloured flowers, Ed,

folium, of a pale yellow colour.—Calyx very slender, somewbat shorter than the filiform, inch and half-long tube; mouth tfbliquely bifid.'—Border smooth; segments linear, sub-clavate, spreading, half the length of the tube; divisions of the claw, or superior segment of the interior border, linear-oblong, obtuse.—Filament as long as the tube, filiform, smooth, of a scarlet colour; Anther very short, ovate, two-lobed.—Germ densely villous; stigma slightly ciliated. -

Obs. This beautiful species differs from *H. gracile*, *R.* (of which the Rev. Dr. W. Carey has favored me with a living specimen in blossom), in the length and villosity of its spikes, its copious fascicled flowers, and the equal length of all the -segments of the border. It seems altogether to be a larger plant.

5. H. speciosum. Wall.

Spike elongated, open, smooth; fascicles approximate scattered, two-flowered; lip entire sessile, acute. A native of the same country with the preceding, and like all the species flowering in the rainy, season.

Khasee name, Kattia Lung Mutti.

Leaves very large, oblong-lanceolate, attenuate at both ends, long-pointed; margins slightly waved.—Spike terminal, large.—Fascicles spreading and numerous^r-Bractes; exterior very large, obtuse, as well as the others, with a few white hairs at the end.—Interior, two, opposite; that close to the rachis obtuse, with a few lobthlets at the end; the other much smaller, linear-lanceolate, acute.—Flowers pale yellow, fragrant.—Calyx cylindric, half the length of the tube; mouth obliquely bifid, with two or three ovate, bearded teeth.—Tube upwards of two inches long, filiform.—Exterior segments linear, very long, of a greenish colour; 'tjtfmor'dmte. Lip of equal length with the interior segment*','ovate, acute, tapering downwards¹.—Filament filiform, scarlet, somewhat longer than the tube; Anther elongated, arched.

Ohs. My examination of this stately phot has hitherto been confined to a well preserved spil^ aqi'ifew. Jeaves only, which howr

ever point it out as the largest of the genus. The sessile, undivided, and acuté lips distinguish it from the other species.

Sans. ^ 5 ^ ^ , Bhoo-chwmpttca. See Asiat. Res. iv. 242.

Beng. and Hind. Bhooi-champa or Bhoo-champa.

This'elegant plant is very generally found cultivated in gardens on account of the beauty aifd fragrance of its flowers, and though no doubt a native of various parts of India, yet I cannot say where it is indigenous. Flowering time in our gardens March and April, at which period the plant is totally destitute of leaves.

Root biennial, tuberous.—Stem none.—Leaves radical, petioled, oblong, waved, smooth, generally coloured underneath; about a foot long in a good soil, and 4-6 inches broad.—Petioles sheathing, united into a short stem, as in Curcuma.—Scapes just sufficient to elevate the flowers above the earth, embraced by a few common sheaths, of a greenish purple colour.-r-Flowers sessile, from 4 to 6 to the scape, or spike, very large, fragrant; colour of various shades of purple, and white.—Bractes two to each flower, surrounding the base of the germ; the inner one has its apex two-parted; the exterior, or longest is here

only about half the length of the calyx.—Calyx above, one-leaved, as long as the tube of the corol, somewhat gibbous; apex generally two-toothed, and of a dotted, purplish colour.—Corol. Tube\ong, slender, cylindric, nearly erect, obliquely funnel-shaped towards the mouth. Border doiible, both three-parted. Exterior divisions drooping, linear, with margins involute, pure white. Interior border, the two uppermost divisions erect, lanceolar, acute; colour also white, with the margins slightly tinged with purple; the remaining inferior one is divided into two broad, obcordate, deflected lobes, of a deep purple colour, particularly towards the centre, and base.—Nectarial filaments of König as in K. Galanga.—Filament short, erect, broad, inserted on the base of the uppermost two interior divisions of the corol. Anther linear, and enlarged with an ovate, two-forked, coloured, somewhat recurved crest.—Germ ovate. Style filiform. Stigma funnel-shaped.

06*. Woodville observes, at page 362 of his *Medical Botany*, that the roots of *Zedoaria longa*, and *rotunda* are both produced by the same species of plant, and are indiscriminately used in the shops: the former, he says, are brought to us in oblong pieces, about the thickness of the little finger; two or three inches in length, bent, rough, and angular; the latter are roundish, about an inch in diameter, of an ash colour on the outside, and white within. I Jiave never met with any of the roots of this plant that agree with his description of the long sort, and they are too small for the round; so that I must conclude they are the produce of some other plant: at the same time Dr. Woodville's observations on the same page, give me reason to think my *Curcuma Zedoaria* may be the plant, which yields this round sort of *Zedoaria*.

3. K. angustifolia. R'.

Leaves radical, linear-lanceolate, waved. Spikes hid in the centre of the leaves. Upper two segments of the inner border of the corol linear, oblong, obtuse.

Hind. Kunjan-boora, also Madu-mrbisha.

A native of *Bengal* Flowering time the rainy season.

Root biennial, tuberous, with numerous ramous fibres from every part.—Stems none.—Leaves radical, numerous, sessile, linear-lanceolate, keeled; margins entire, and much waved; striated lengthways with darker and lighter coloured green, smooth in every part; 6-8 inches long, and about one broad.—Spikes hid in the centre of the leaves, bearing from 4 to 6 large, beautiful flowers in succession.—Bractes two or three to each flower; one or two interior'embrace the germ laterally, the exterior one is larger, all much pointed, and of nearly the same length.—Calyx superior, one-leaved, half the length of the tube of the corol, opening obliquely, (spathe like,) near the apex, which is a single acute point.—Corol; Tube very long, and slender, elevating the border about two inches above the earth; border double, &c. as in if. rotunda. Nectarial filaments of König, stamens, and pistil as in the last quoted species/

Obs. The root is used as a medicine for cattle, by the people of Bengal.

4. K.pandurata. R.

Leaves petioled, broad-lanceolate, smooth. Spike central. Corol; with the upper segments of the inner border obovate, the inferior one much larger, and panduriform.

Zerumbet claviculatnm. Rumph. amb. 5. p. 172. t. 69* f* 1; and I could almost wish to quote Manja~kua, Rheed. mal. 11. j>. 19-1. ii. although referred to already by Linneus for Curcuma rotunda, a plant I have never met with, if this be not it.

From *Sumatra*, this beautiful plant was sent by Dr. Charles Campbell to the Botanic Garden at *Calcutta*, where it blossoms during the rains; chiefly in August.

Root perennial, tuberous like ginger, but of a tolerably bright yell? w colour; from this, straight, slender, fusiform, paler coloured portions descend deep into the soil.—Stems scarcely any; height of the plant about a foot and:a half. ««r*Leaves bifarious, petioled, oblong, acute, smooth; deeper green on the upper surface; veins parallel, and pretty conspicuous; length from, 6 jto 13 inches,—Petioles above

the bifid ligula, deeply channelled, and from 2 to 6 or 8 inches long; Ilie lower portion sheathing, and forming something like a stem.—* Spike hid in the centre of the sheaths of the leaves, unilateral, being imbricated on one side, (say the anterior,) with many, sessile, slender, lanceolate, colourless, one-flowered pairs of (exterior and inte~ rior) scales or bractes.—Flowers pretty large, expanding in succession, and rarely more than one at a time.—Calyx superior, membranaceous, irregularly three-toothed.—Corol; Tube long, and slender. Border double; Exterior of three, slender, lanceolate, nearly equal* straight, pale pink-coloured segments. Inner of three unequal portions; the two superior, or lateral, obovate, the colour and length of the exterior three; the lower, or lip, somewhat panduriform, much broader and longer than the former, and of a much deeper colour.— Filament very slender. Anther two-lobed, and crowned with an emarginate, recurved helmet.—Germ three-celled, each cell contain' ing many ovula, attached to the axis. Stigma large, with a semilunate opening, which has the straight portion of its margin threetoothed, and the semicircular one even.—Nectarial scales long, and slender.

5. K. ovalifolia. Roxb.

Leaves oval. Spikes central, crest of the anthers laciniate.

A native of the peninsula of *Malacca*, and from thence sent, by Major Farquahar, to the Botanic Garden at *Calcutta*, where it blossoms in July. It is aii intermediate species, both with respect to size and habit, between *K. Galanga* and *rotunda*, and ought to be placed between them in the system.

Boot tuberous, as in the other species, and about biennial.—Stems very short. I may say scarcely any.—Letnu f_{ew}, bifarious, patent, oval, with a short acute point, smooth on both sides, about 6 inches long, by 4 broad.—Spikes central, hid by the short sheaths of the leaves, few flowered; the flowers expand in succession, all pure white except the purple lip.-,Coro/ nearly as in rotunda and angustifolut* the upper two segments of the inner border are obtusely lanceolate, 1

as in the latter; the lip or nectarium of a deep variegated purple colour, the shape cuneate-ob cor date, and divided from the apex nearly half the length into two long emarginate lobes.—*Filament* short.. *Anther* two-lobed, and crowned with a large, laciniate, erect, white crest.—*Germ* three-celled, &c. as in the genus.

The following species added by Mr. N. Wallich.

Dried specimens of the following two plants were sent to me from the mountains North-East of Bengal under the *Khasee* name, *Kattiajonoig*. Flowering time the rainy season.

6. K. secunda. Wall.

Caulescent. Leaves petioled, ovate, sub-falcate. Spike terminal, gently curved, unilateral. Crest of the filament entire.

The Root appears to send a number of simple fibres from its upper part.—Stems simple, slightly ascendent, entirely invested with long, membranaceous, striate, rather loose sheaths; 8 or 10inches long, like the leaves andbractes, smooth.—Leaves acute at the base, tapering from the middle into a very long linear point; finely striated, from 3 to 4 inches'long.—Petioles short, channelled; within their base an oblong, membranaceous slightly hairy, entire ligula.—Spike scarcely longer ttiao: ,the uppermost leaf, few-flowered.—Exterior trades large, two or three-flowered, imbricating at the back of the spike; *interior*, two, small, embracing the base of the flowers.—Flowers about as large as those of K. Galanga, expanding successively. —Califx short, cylindric, hairy.—Exterior segments of the coi ol shorter than the interior; all are lanceolate, acute, spreading. Nectary or inferior segment of the interior border, large, obcordate.—Filament short, linear, expanding above the anther into a lanceolate, acute crest.—Anther two-lobed, linear, scarcely marginated by the base of the filament.—Germ, style, stigma and glands at the base of the tube as in the genus.

7. K. linearis. Wall

Caulescent. Leaves sessile, linear-lanceolate, stipuled. Flowers terminal, few. Crest entire.

Differs from the preceding species in being a slenderer plant* Leaves scarcely one-third of an inch broad, tapering into a filiform point.—Ligula divided to their base into two linear spreading segments, which give the leaves the appearance of being stipuled.—Sheaths close.

Obs. In the structure of their extremely thin and inembrauaceous flowers these two plants are so much like Kampferia, that I have not considered myself warranted in separating them; thougli 'the character of that genus as it now stands differs in the shape of the crest, which in our plants is perfectly entire, and on this account, resembling that of Costus. Their general habit partakes of that of Globba* If future examinations, especially of living specimens, should confirm them as species of Kampferia, the generic character of this genus, as well as of Costus, might perhaps be advantageously modified in respect to the shape of the filament, and the species of the former arranged in the following manner.

* Stemless, with a divided crest. 5.—angustifolia.

1.—K. Galanga. ** Caulescent, with an entire

2.—ovalifolia. 6.—secunda^ [crest.

3.—rotunda. 7.—lineariafr '

4.—pandurata.

CURCUMA. Linn.gen.pl ed. Schreb. No. 8.

Zerumbet, or Cachora of Garcias.

The plants from which the following description was taken, were sent by E>r.F. Buchanan, from *Chitlagong*, where they are indigenous, to the Botanic Garden at *Calcutta*, in 1798, where they grow freely, and blossom in the month of April. Others have since been procured from thence under the Bengalee name *Kuchoora*. From that place the native druggists in *Calcutta*, are chiefly supplied with the root or drug.

Root consists, as in all the other species of this genus, of ovate bulbs, giving support to the parts above ground; from their opposite sides spring the palmate tubers; these two sorts are inwardly of a pale yellow, or straw colour, and possess an agreeable camphoraceous smell, and warm bitterish, spicy taste. From the bulbs chiefly, the proper fibrous roots issue: some of these are thicker than others, penetrate deeper into the soil, and end in an oblong, peari-ccjoured, solid tuber; which is more spongy and less fragrant when cut, than ie bulbs and palmate tubers.—Sterns no other than the united eaths of the leaves, surrounded by two or three obtuSe, smooth, green, faintly striated, appressed scales. Height of the whole plant about three feet, or three and a half.—Leaves from four to six together, j>ub-bifarious; in general a pretty long, somewhat winged petiole intervenes between each and its stem-forming base. The leaf itself is broad-lanceolar, fine-pointed, and smooth on both sides; constantly a dark purple cloud runs down the centre; veins numerous, fine and parallel; length from 1 to 2 feet.—Scape rises distinct from the leafy stems, and rather before or with them, stout, 5 or 6 inches Iong, and surrounded with a few, obtuse, lax, green sheaths,

of various length. —Spike tufted, 4 or 5 inches long, (so that its apex is elevated nearly a foot above the surface of the earth;) covered with imbricated, oblong, concave bractes, connected by the lower half of their inner margins to the backs of those immediately above, forming as many sacks, or pouches as there are bractes; the lower hali of these are broad, shorter, scarcely tinged with red, containing each about three or four, beautiful, yellow, sessile flowers, which expand in succession, and are embraced laterally by their own proper, smaller, short, colourless bractes. The superior half of the large coloured ones, which form the tufts, are generally sterile, and of a deeper crimson, or purple colour, than those which contain flowers.—Calyx superior; scarcely one third the length of the corol, irregularly threetoothed, pellucid.—Corol funnel-shaped. Tube a little curved. Border double; exterior three-parted, the two lateral segments equal; the third or upper one vaulted and crowned with a subulate point; colour Interior three-parted; lower segment, or lip, a very faint yellow. broad, deep yellow, projecting, recurved, bifid; upper or lateral segments obovate, equal, pale yellow, nearly as long as the lip.—Filament short, 4/tfAer ''double, the lower end of each lobe terminating an a long, sharp, subulate spur.—Germ beneath, hairy, three-celled, with many ovula in each, attached to the inner angle*)f the cell. Style slender at the base, embrace*! by the two nectarial filaments. Stigma two-lobed, crowning the anther.—Capsule oval, smooth, of a pale straw-colour, thin and nearly pellucid; three-celled, but without any regular division into valves : when the seeds are ripe the ela $\ddot{**}$ ticity of the segments of the arils bursts the vertex into various portions, from whence the seeds are soon expelled.—Seeds several in each cell, arilled; shape various, but the most prevailing is oblong. Aril cut to the very base into several slender, unequal, white, fleshy segments, which are united to the seed round the umbilicus. teguments two; exterior spongy, with highly polished slippery, lightbrown surface; interior membranaceous. Perisperm pure white, hard but friable, and occupies the lower half of the seed. Vitellus clearer, but less white and of a tougher consistence than the albumen; it forms or occupies the upper half of the seed, *Embryo* nearly as

long as the seed, tending to be clavate, both ends truncate, the upper half lodged in the *vitellus*, and the lower in the *albumen*, or jperisperm.

Obs. The dry root powdered and mixed with the powdered wood of the Casalpinia Sappan makes the red powder called Abeer by the Hindoos, and Phag by the Bengalees. It is copiously thrown about by the natives during the Hooli, or Hindoo holidays in the month of March. The root is also used medicinally amongst the natives.

In 1805,1 gave some of the sliced and dried bulbous, and palmate tuberons roots of this plant to Sir Joseph Banks, %vhich he gave to Dr. Comb, who found that it was the real Zedoaria of our Materia Medica, and by the same means ascertained that the root of my Curcuma Zedoaria, is Zedoaria rotunda of the shops.

£. C. Zedoaria. R.

Bulbs small, and, with the long palmate tubers, inwardly yellow-Leaves broad-lanceolar, sessile on their sheaths, sericeous underneath; the whole plant of a uniform green.

Amomum Zedoaria. Linn. sp. plant, ed. Willd. \.p. 7.

Sans. 'RffC'ir, Vwna-hwridra, ilnfl', Sholee, ^«Hf*35T, Vmiarista, VT^SRT, Shoh'ka.

Beng. Junglee, or Ban Huldi, (wild turmerick.)

Arab. Jedwar, or Zadwar.

This beautiful species is a native, not only of *Bengal*, (and common in gardens about *Calcutta*) but is also a native of *China*, and various other parts of *Asia*, and the *Asiatic* islands. Flowering time the hot season, the leaves appear about the same period, or rather after; for it is not uncommon to find the beautiful, large, rosy, tufted spikes rising from the naked earth before a single leaf is to be seen.

Root biennial, tuberous, &c. as in the last, and inwardly of a pretty deep yellow colour, approaching to that of turmeric.—Stem no other than the sheaths of the leaves.—Leaves petioled, broad-lance* olar; entire, underneath covered with soft sericeous down, which is

particularly conspicuous when the leaves are dry.—The Scape rises distinct from the leaves during the dry season, and often not only at some distance, but also sometime before them; it is round, as thick as a man's foire finger; length a few inches, and embraced by its own short, proper, green sheaths.—Spike from 6 to 12 inches long, &c. exactly as in the last species.—Bractes and Calvx as in the beforementioned species.—Corol one-petalled; at the base tubular. Tube short, widening a little; its mouth shut with fine vellow pubescent glands: Throat ample. Border double: exterior of three pale pink-coloured, erect, oblong divisions; the upper one more pointed, and incumbent over the anther and part of the two upper divisions of the inner border. Interior somewhat ringent, three-parted, fleshy, yellow; the lower lobe or lip longest, obovate, entire, projecting with a crown and erect margin, while a broad elevation of a deep yellow colour runs along its middle; upper two divisions obovate, and with the upper segment of the exterior border, forming a complete covering or dome over the anther.—Filament short, inserted between the two upper divisions of the inner border of the corol. 'Anther twp-lobed, each ending in a long, sharp spur at the base.—* Germ inferior, &c. as in the last. Style filiform. Stigma three-lobed, with a perforation in the centre.

Obs. The plant when in flower is highly ornamental, few surpassing it in beauty; at the same time it possesses a considerable degree of delicate aromatic fragrance.

Dr. Woodville's observation and quotations, at page 362 of his *Medical Botany*, induce me to think that the roots of this plant are not only the longer species of the Zedoaria found in the shops; but also the shorter or roundish, their form and size depending on the manner in which they may have been cut for drying: and I have lately learned from Sir J. Banks, that the dried root of this species agrees well with Zedoaria rotunda.

The Hindoos use the roots as a perfume, and also medicinally; they are sold in their shops, under the Arabic name *Judwar*, or the Bengalee one of *Bun Huldi*. When fresh as well as when dry, they

are of a pale yellow colour ^{an(*)} possess at all times an agreeable fragrant smell, and warm, bitterish, aromatic taste, whereas the roots of *Kampferia rotunda* possess little or nothing of these sensible qualities, and are withal too rare in every part of *India*, where [have been, to allow me to think, any quantity of them can ever be collected for exportation,

3. C. zanthorrhiza. R.

Bulbs ovate, with both palmate and pendulous tubers deep yellow* Leaves sessile on their green sheaths, broad lanceolar, a permanent purple cloud down the middle.

From Amboyna, this remarkable species was brought to {he Botanic Garden at Calcutta, in the year 1798, and only flowered for the first time in April and May, 1310. It is the only kind I Lave yet met with, which has its pendulous tubers inwardly of a deep yellow colour, like that of the bulb and palmate tubers. The sheaths of the scapes and leaves are green. The coma large, and of a deep purple, or crimson colour. Exterior border of the corol red. Leaves broad-lanceolar, and oblong; there is a narrow purple cloud down the middle of them, which penetrates to the underside; the whole height about fourfeet.

4. C. elata. II.

Bulbs oblong, obovate, and with the numerous, large, incurvate, palmn.te tubers, inwardly of a pale yellow. Leaves sessile on their sheaths, oblong, villous underneath; the whole of an uniform green.

A native of *Burma*, and from thence introduced by Dr. \V. Carey, into the Botanic Garden at *Calcutta*, where it flowers iu March and April.

A full description of this species is unnecessary, as it resembles the other species already described, in every respect, except in such as are pointed out in the definition, viz. its immensely large and numerous *bulbs* and *tubers*, which are inwardly of a pale yellow colour; the latter run very near the surface of the ground, and are much are four feet high, or more; a very faint ferruginous tinge runs down the middle, which is very conspicuous in those that appear first in the season; whereas it is scarcely to be observed in the latter. The fowers are large, few in number, with the exterior border red, and the interior deep yellow. The trades to the fertile part of the spike ferruginous, those of the coma few, and of a pretty bright crimson col ur.

8. C. rubescens. R.

Bulbs ovate-lanceolate, and with the palmate tubers inwardly pearlcoloured. Leaves broad lanceolate, on red winged petioles, above the sheaths; rib red. Scape and scales red. Flowers longer than their bractes.

A native of Bengal. Flowering time the months of April and May, soon after which the leaves appear; and decay about the beginning of the cool season, in November. Every part has a strong, but pleasant aromatic smell when bruised, particularly the root.

Root of several, erect, solid, conical, pale straw or pearl-coloured, powerfully aromatic bulbs, which gave support to the former years foliage, and are strongly marked with the circular scars thereof; from their opposite sides the scapes, and stems of the succeeding year spring, which form similar new bulbs when those of the former year decay; but during their existence, there issues found their lower half, a number of strong fleshy fibres, many of which end in ovate or sub-cylindrical, pale white, slightly aromatic tubers, which also perish with the original parent bulb.—Stems, as in the other species, no other than the united sheaths of the leaves, which like them, decay annually about the month of October, and appear again when the flowers begin to perish in April.—Leaves bifarious, (six or eight of them forming the above-mentioned stems, of about three, or four feet in height, leaves included,) petioled on their sheathing base, broad-lanceolate, cuspidate, smooth, strongly marked with parallel veins; of an uniform dark-green, with the nerves or ribs red, fr^{oin} twelve to twenty-four inches long, by five or six broad.—Petiokh and

sheaths channelled, smooth, and of a deep red colour; a projecting process ou the inside marks, in all this natural order, the limit of the sheath, and the beginning of the petiole.—Scape, radical, lateral, cylindric, r.bout six inches long, invested in several, dark reddish sheaths*

•—Spike tufted, five or six inches long, erect; Conia less deeply coloured than in Zerumbet.—Bractes, or scales of the spike exactly as in the other species, each embracing four or five flowers, which expand in succession.—Flowers small, bright yellow, rather longer than their bractes, fragrant.—Tube of the corol slender, its mouth completely shut with three villous, yellow glands.—Fruit not seen in a ripe state.

Obs. The ovate oblong, pendulous tubers of several species of Curcuma, yield a very beautiful, pure starch, like the Arrow-root, produced from Maranta arundinacea and Tacca pitmatijida, which the natives of the countries where the plants grow, prepare and eat. In Travancore, where some of these species abound, this flour, or starch, forms, I am told, à large part of the diet of the inhabitants. My C. angustifolm is another Species which yields the same substance; and I have no doubt but the pendulous tubers of this species yield it also, and equally good.

Since writing the above, I have received from *Chittagong*, *Bhagulpore*, and *Mirzapore*, plants of three other sorts, all employed for the same purpose.

9» C. comosa. I?.

Bulbs large, oval, inwardly pale ochraceous. Spikes clavate; fertile bractes of a pale pink colour; coma copious and rosy. Leaves broad-lanceolar; a faint ferruginous cloud above the middle of the earliest ones; every other part green.

A uative of *Burma*. From *Rangoon* Mr. Felix Carey sent plants to the Botanic Garden at *Calcutta*, where they thrive well, and blossom in May, at Mhich time it is by far the most beautiful, and the largest of the genus, I have yet seen.

Bulbs very large, oval, inwardly of 9 pale ochraceous colour. Palmate tuhm scarcely any. Pendulous tubers lanceolar, and connectbifarious, petioled on their sheaths, lanceolar, smooth, and green in every part, except in those which appear first in the season, which have a faint, ferruginous cloud on the centre of the upper surface beyond the middle; length two to three feet; the petioles with their sheathing bases measuring about as much more, making the 'ahote height of the plant five or six feet.—Sipikes lateral) appealing rather before the leaves, short-scaped, large, clavate. Fertile bractes, of a beautiful pale pink. Barren ones of ihe coma a deep, lively, rosy red; on account of the beauty and sue of this part, 1 have 'yveiul ii.« trivial name c w o s a · - t W with the extvhr border piukj i.av' pale yellow.

10. C. kucorrhha. R.

Bulbs ovate; palmate tubers long and far-spreading, like the .Ormer they are inwardly of a pale straw colour. Leaves peticbd* broad-lanceolar, smooth, of an uniform green in every part. Spite* few-flowered, with a coma as long as the fertile portion.

A native of the forests of *Bahar*. From *Bhagulpore* Mr. John Glass, the surgeon of that station, sent roots to this Garden, under the name *Tthr*; and observed that the plant is not cultivated, but giow in the jungles, to the southward of that place. The process, e say,, for obtaining the starchy substance called Tikor, is as follows. « The root is dug up, and rubbed on a stone, or beat in u mortur, and afterwards rubbed in water with the hand, and gained through a doth; the fecula having subsided, the water is poured off, and the Tikor, (fecula,) dried lor use."

This plant grows freely in the Botanic Garden, and floweis in. May. Here the *palmate*, or *horizontal tubers*, are particularly straight, and often near a foot long; they run deep in the earth, *md* far- Their inward colour, as well as that of the bulbs, is a very pale ochraceoug yellow, almost pure white. *Pendulous tubers* numerous, oblong, inwardly pearl white. / *leans* broad-lanceolar, uniformly pew, about two feet long j whole height of the plant from three to

. »r feet. *Spikes* lateral, the inferior fertile portion not lortger than the rosy coma. *Flowers* the length of the bractes; *exterior* border slightly tiaged with piuk; *inner* yellow. In the structure of (lie fruit it agrees perfectly with that of C. *ZerumLet*.

11. C. angustifolia. It.

Bulb oblong, with pale, oblong, pendulous tubers only. Leaver petioled, narrow-lauceolar* Flowers longer than the bracks,

Ttkor of the Hindoos.

Found by H. T. Colebrooke, Esq. in the forests from the banks of the *Sana* to *Nagpore*_{\$} and by him introduced into the Botanic Garden at *Calcutta*, where it blossoms in July. Tltf leaves make their appearance at the same time with those of the other specie*, and decay about the beginning of the cool season, in November.

.Roof, from a fusiform biennial crown issue many fleshy fibre?, which end in smooth, oval, succulent tubers.—Stem, consisting of a few pale-coioured, leaiBess, surrounding sheaths.—Leaves petioled, ivariow-lunceolar, most acute, striated with fine parallel veins, smooth on both sides; length from one to three feet, (petiole and sheath included,) which is in fact the whole height of the plant.— Petioles from six to twelve inches long, the lower half or more of which, expands into a sheath to embrace those within; the upper half or prope: petioles slender, and channelled.—Spike radical, fron four to six inches long, separate from the leaves, crowned with ,1 . luft of oval, lively purple, neuter bractes.—Bractes common bilovt the coloured neuter ones, ovate-cordate, obtuse, expanding recurvedly, each embracing three or four flowers, which open in succession.—Bractes proper boat-shaped, embracing the pioier perianth, and germ of each flower.— Flowers large, lunger than their bractes, bright yellow, expanding at sun-rise, and decaying at sunset of the same day.—Calyx above, three-toothed, somewhat inflated.—Coro/, tube somewhat gibbous, contracted at the mouth; and there shut with short hairs; throat campanulate; exterior border pale-yellow, consisting of one large, vaulted, upper segment and two lower, oblong, smaller, concave ones; *inner border* ihree-parted; lower segment or *lip* with its exterioi pare sub-orbicular emarginate, or bifid; *upper segments* obovate, cuneate, wilh the filament, cr short antheriferous segment, between them.—*Anther*** in the genus, double, with a spur from the lower end of each lobe. —*Oerm* beneath, villous, three-celled, with many seeds in each. *Style* slender, at its insertion are the usual two nectarial bodies. *Stigma* globular, gaping on the anterior side.

O65. From the oval pendulous tubers, Mr. Colebrooke observe*, a sort of *Starch* or *Arrow rooUikefecula* is prepared, which is soid itt the markets of Benares, and is eaten by the natives.

Sect. 2. Spikes central.

12. C. longa. Linn, sp.pl. ed. Willd. 1. 14. Retz. obs. 3. 72.

Bulbs small, and wifh the numerous, long, palmate tubers, inwardly of a deep orange yellow. Leaves long-petioled, broad-lanceolar, of an uniform green.

Hulud, or Huludee. Mahrat.

Is much cultivated about *Calcutta*, and in all parts of *Bengal*-Koeni's description published by ReUius,is so very exact and complete, that there is nothing left for me to-add.

Cultivation* ...? ...? ...?

The ground must be rich, friable, and so high as not ta Tie over-flowed during the rainy seasoir, such as the Bengalees about Calcutta call Danga. It is often planted on land where sugar-cane grew the preceding year, and is deemed b meliorating crop. The soil must be well ploughed and cleaici of weeds, &c. It is then raised, in April and May, according* as the rains begin to fall, into ridges, nine or ten niches high, and eighteen or twenty broad, with intervening trenches nine or ten inches broad. The cuttings or sets, viz. small potions of the fresh root, are planted on the tops of the ridges, at about eighteen Itches, or two feet asunder. One acre requires about &c) such sets, aiid yields in December and January, about 20001b. wuight of the licsh root.

13. C. Amada. R.

Itulb* conic, aad.vyitU the palmate tubers, inwardly pale-yellow. Ix'a\esloiig-), etioled, broad-lanceolate, smooth. Spikes scanty, few-tk>Aued. i'he whole plant uniformly green.

Amada of the Bengalees, which means mango-rginger the ifesh root possessing the peculiar smell of a green mango, ".ti: is used medicinally by the natives. It is a native oihengal. Flowering time the latter part of the rams.

Root coinisiiug of horizontal, palmale, sessile tlivers united to the sitics ui\,u ovate-conic bulb of the same colour, \fmch gives existence and suj)port to the leaves, and spike: from its sides and base long il-sliy iiGres issue, which penetrate deep into, the soil; some of which eud iii obloiig, paier (pmiduious) tubers.—Stems no other than the uiited sheaths of tile leaves.—L^iiWi'rhdical, bifafious, petioled above tiicir sheuths, ventricose, lanceijiar, cuspidate, smooth on both sides; length from six to eiglueui inches, by three to six bro: d'; they decay aboui the i nd of October, and appear again with the first showers of April or Muy.— riie.j)cf/iii/es I divideinto two portions: the lower of sheathing part froiii^ix.to twelve inches long; and the upper or

proper petioles, from three to nine; the whole measuring in general, from one to two feet.—*Scape* central, about six inches long, invested in several alternate sheaths.—*Spike* shorter than the scape, cyliudric, crowned with a tuft of loose, coloured, pale rosy, abortive bractes.—*Bractes* oblong, imbricated, the lower half of their margins united to the backs of the two next above, forming a pouch, for a fascicle of four or five, rather small, yellow flowera, which expand in succession; these have each a proper bracte, which embrace the tube of thftflower only, and may be called an inferior calyx.—*Calyx* superior, unequally three-toothed.—*Corol* with a slender *tube*; *ts .mnuh shut with three yellow hairy glands; *JauJ*(^b^am^i]\xh^' *Borda* double, both three-cleft, &c. as in the other species.—*Ger*^ oVal, hairy, three-celled, with several seeds in each attaclied to their central receptacles.

14. C viridiflora. R.

Bulbs oblong, and with the palmate tubers inwardly of a deep y<* low. Leaves long-petioled, broad-Ian.eolar. The whole plant, (even the spike and coma,) uniformly green.

Tammon Giring seu Giri. Rumph. amb. 5. 169.

A native of *Sumatra*, and the other eastern islands; from *Bencoolea* Dr. Charles Campbell sent plants to this garden, where they grow luxuriantly, and blossom in July and August.

Root consist" hike that of the other species, of bulbs, and palmate pendulous tubers; aromatic, and bitter, and emplo)ed by the Mala V^s of Sumatra to dye with,—Leaves petioled, broad-lanceolar, smooth; length from one to three feet; the petioles, and sheaths thereof about as long.—Spike central, large.—Bractes, even those of the cotna, uniformly green; the latter only paler.—Flowers small* \ery pale yellow.

15. C. montana. Corom. pi. 2. N. 151.

Buibs couic, with pale-yellow palmate tubers. Leaves short, **P** tioied, oblong. The whole plant uniformly green, except the **rosy** coiua of the spike.

It grows in moist places, amongst the *drear* mountains.—Flow, ering time the rainy season.

Root perennial, consisting of conical bulbs enveloped in the remaining sheaths of the leaves, and also of horizontal tubers, as in ginger, 8cc. with large fleshy fibres from their h-dse.—Leaves radical, three or four, petioled, their petioles from eight to twelve indies long, enveloped in a few sheaths, forming something like a stem; the leaves themselves are oval, pointed; beautifully veined, smooth, from eight to twelve inches long, and from five to si£- broad.—Spfkds rise from the centre of the petioles; their peduncle is of their length, and involved in its proper sheaths.— Bractes numerous ; the inferior roundish, the superior oblong; the lower half of the base of the two inner are united to the margins of the next without, forming a sack, which contains from two to four flowers, each of which has a sn.all* er wedge-formed membranaceous proper bracte. The coma or supt* rior bractes large, waved, rose-coloured, and (generally) without flowerg.—Calj/x as in the two former species.rr-Tufre of the CQWwidening, somewhat campanulate; border double.-*-*Exterior three* parted; divisions equal, entire. Interior two-lipped; upper lip erect, three-cleft; under lip entire, roundish, border waved/ and a little notched.—Filament no other than the middle segment of the upper lip of the interior border of the corol; anther two-lbbed, linear, the under point of each lobe ending in a long sharp spur.—Germ below. Base of the *style* embraced with the usual two nectarial bodies, which in this species are laiger; stigma large, glob u lay two-lipped, somewhat marked.

16. C. reclinata. R.

Bulbs fusiform, with scarcely any palmate tubers, but many straw* coloured, oval, pendulous ones. Leaves petioled, oblong, reclinate.

Discovered by H. T. Colebrooke, Esq. in the interior parts of *India*, where it blossoms during the rains.

Root a bulbous head, from which descend many fleshy fibres, ending in large, smooth, oval tubers.—Stem none, but the height of

the whole plant (viz. the spike) is about six inches the leaves, being * reclined, add nothing to its height.—Leaves radical; (in the only plant at present in my possession, from which this,, description n taken), four in number, two on each side of the spike, embiacing it closely, with the lower sheathing part of their pet;oje\$%recliued, oblong, acute; margins slightly vvuve,d; smooth on both sides; length, exclusive of the petiole, about, nine inches, and about four or five broad.—Petioles, including the sheathing base, from iluee td four inches long, deeply channelled, and smooth.—^ite from.ljie centre of the leaves, its short scape entirely hid by tlpK .sluatlis, the rest loosely iinbficated, with large, ovate, obtuse, expanded coloured bractes: tlie superior sterile, and more deeply coloured as in the tother species of this family; but here, and in wo olLtr tliat 1 have yet seen, are the whole deeply coloured.—Flowers small, of a liull dark pink colour, except the lower segment of tile iiifter border, which is tinged with yellow.—Ca/yv inflated, obscuiely threetoothed, scarcely half the length of the tube of the corol.—Tube of the corol sub-cylindric; throat, campanulate. The bolder, ita/nei', and pistil, as well as the mctarial scales of Kucnig, us in the uJitf species, ajre y described.

17. C. petiolata. R.

وأعدين

Bulbs and palmate tubers few and small; iawaid colour pale yellow; tubers numerous, pendulous on short fusiform fibres. Leave' long petioled, oblong, ovate with the base rounded, (this is the only species, known to me, in which they have this form.) Ilie \Vhole plant uniformly green, except the lilac-coloured coma of the* spike-

A native, of *Pegu*, and from thence sent by JJr, F. Carey to the Botanic Garden at *Calcutta*, where it-blossoms in August.,

Colour; the bructes very perfectly united a) mos^te^fbroad, replaced to the colour.

form apex, forming uncommonly deep pouches for the snuli yellow Jtowers*

 $A^{\text{`}}_{t}u-i'ii/jA. \quad o_{t} \ll re6. \ \ \textbf{g.t.*.} \ \ \textbf{giant.} \ \ \textbf{N. 3.}$ Corolla with the interior bolder unitebiate.. 1. A. cardamomum. Linn, spec.p!. ed. H'itld. 1. \(\si\).

Leaves short-petioled, lanceolar. Spikes half immersed in- the earth, loosely imbricated wijtli.villous, lanceolate, acute, one-ric\vered bn.ctes. Lip with the anterior margin tlnee-lobed. Crest ihiee-lobed.

Cardaniomum IUUJUS. Humph, amh. \vec{a} . p. 15''i. t, (id, $j \mid 1$. . .

A native of Sumatra, and other islands to the castwaidoi' the Bay of Bengal, and sent by I)i: Charles Campbell from lieiuoole*i, to the Botanic Garden at *Calcutta*, where it blossoms in April.

Hoot perennial, creeping under the surface of the soil, like that of ginger; butsinaller, less fleshy, more ligneous, and white; from which descend, and spread, many fleshy tibres.*-r-&em\$ about biennial, several rising obliquely to the height of from two lo four feftt, about as thick as a stout ratan, invested in the smooth, deep green sheaths gf the leaves.—leaves alternate, bilarious, short^ttiolcd ou thtii' smooth stem-clasping sheaths; from broad-IanceoUue below, tg uarrow-lauceolate at top, entire and smooth ou both sides; point long; and very line; length from si\ to twelve, inches.— Spikes radical, sessile, oblong, appearing ampugst the steins, half immersed in the earth, loosely imbricated with que-flowered, lanccolute, acute, yillous, nervous, sicariose, aih-colqured bractes j when old thor brittle tops arc often broken off.—*Jijuctes*. Besides the exterior oueflowenad ones, jusi mentioned, there is an inner, striated, tlowuy, pcariose, two-toothed, tubulai one, (which I have sometimes coti*U dered an exterior and inferior ca/yx, and which Koenig sometimoi called an iav.olucrey) inserted round the basiR of the germ.—Mowers

opening in succession, and not very conspicuous.—Calyx, davate, tubular, downy, three-toothed, length of the tube of the corol.—Tuht of the corol, slender, and slightly incurved. Exterior border of three mb-equal pellucid divisions. Lip, or inner border, rather longer than the exterior great border, somewhat three-lobed,\vith acreuate, cuiled margin; middle lobe yellow, with two rosy lines leading up to it from the mouth of the tube.—Filament scarcely half so long as the border of the corol, incurved over the mouth of the tube. There is a slend subulate horn on each side of the base of the filament, and ugaily u* length. Anther double, large, fleshy, with a large, three-lobed, concave crest; {he infuudibuliform stigma rising through a dee; gr;;o\e between the two polliniferous lobes.—Germ beneath, downy, and crowned with the twonectaiial scales, within the base of the tube of the corol; in this species they are short, and truncated.

06s. The seeds are to the taste agreeably aromatic, and are we'd by the Ma/ays as a substitute for the true Cardamotunm of Mulcour.

2. A. angustifolium. Linn. spec, pi cd. Wiild. 1. p. 8.

Leaves broad-lanceolate. Spikes elevated, linear-oblong, compact; davate bractes oblong, rather pointed. Lip obovate, cuneatei entire. Crest three-toothed.

Amomum angustifotiurti. Sonnerat it. 2. /. 137.

A native of *Madagascar*. From the island of *Mauritius* Captain Tennent brought plants thereof to the Botanic Garden at *Calcutta*, i» 1802; where they grow freely, and blossom at various times of the year. Every part of the plant, wher. bruised, or wounded, diffuse* a strong, but pleasant aromatic smell.

Root perennial, tuberous, horizontal 5 strong fleshy fibres, together with runners, issue from the crown, or bulb; by these runners the plant soon spreads, and by these it is easily multiplied.—Stems numerous, straight, round, smooth, rising to the height of from six to ten feet.—Leaves alternate, bifarious, sub-sessile on their sheaths* broad-lanceolate, fine-pointed, smooth on both sides; length from twelve to eighteen inches, and fram about four to six broad-*"

Sheaths embrace about three quarters of the stem, are smooth, and rise in an obtuse process, (ligula,) above the insertion of the leave*. —Scapes from the bulb, or base of the stem, where it unites with the root, rather slender, from six to twelve inches long, and closely imbricated with many, mucrouate, smooth, sheathing scales.—Spiket linear-oblong, about the size of a man's thumb, imbricated with similar, but larger scales than those.*>f the scape; the inner more deeply coloured.—Flowers few, pretty large, and possessed of a strong spicy fragrance.—ISractes; proper two to each dower, linearoblong; inserted round the base of the germ, like an inferior peri* anth.—Calyx superior, deep blood red, smooth on both sides, slit two thirds on the outside, apex obscurely three-toothed.—Corol. clavate, about as long as the biactes. Exteriw border red, consisting of one large, erect, obloug, concave segment, which protects the anther and stigma; and of two inferior, ven narrow segments. Lip obovate-cuueate, entire, or slightly three-lobed, yellow, and about as long as the exterior border.—Filament broad, particularly toward the base, where it has a small, coloured hornleton each side. A/U/ier double, surmounted with a large, three-toothed coronet.—Germ clavate, obscurely three-sided, three-celled, with many ovula in each, attached to the partitions. Stigma funnel-shaped, somewhat bilabiate. Nectarial bodies of Koem's are here larger, and longer than in the other species.

3. A. aculeatum* JR.

Leaves sub-sessile, cordate-lanceolate. Spikes obovate, lax, even with the ground. Lip oval, ventricose. Crest amply three-lobed. Capsules echinate.

A native of the *Malay Archipelago*. It was raised from seed seat to the Botanic Garden at *Calcutta* by Mr. W. Roxburgh, in 1802, where the plants blossom in April and May, and ripen their seed in October and November.

Root perennial, tuberous like ginger, with many, thick, fleshy . fibres.—*Stems* a little recurvate_r; he thickness of a walking cane,

aiightly pubescent; from five to ten feet high.—-Iwivs alternate, biftrious, very short-petioled, cordate-lanceolate, inucronate, smoot:, dark green; genual length from uvelve to eighteen inches, and from •three to four inches hr*nd.—Sheaths half stem-clasping, villuus on the outside. X/'^/fl short, and of a semi-lunar shape.—Stapes issuing ftoni the baae of the stem, uuder the suiface of the vrouml, vltf' it joins the root, diverging a li|tl« || av under the surface of the earii'i invested iu oval, fleshy scales; those next to the spike longer, and. more pointed.—Spikes obovate, rising obliquely among, or near Utf stems, just so much as to elevate its flower-bearing apex above the surface of the earth.—J'7oarei'« numerous, and expand in succession; prevailing colourdeep oran»e.—iJrccteva/morone-rlowered, linearoblo&g, length of the tube of the corul; inner tubular with two-toothed margin, aud 'inserted round the base of the germ, like an inferior perjumiu—Cuii/x abo\t, uUn^ar, two o^.three-tgothed.—Carol, tub* slightly ^LMvcd, ...JiAUrmfaborder thice-parted; segments unequal, erect, oblou^, obtuse, the nuiidle one larger, concave and incumbent over tiiC iisbunj of liic inner border, together forming u caaipanulate Lip, sub-rotund, with crenulate, curled margin, and marked with beauuiul crimson .spots down tLe middle, on the inside.—lila* went erect, with a hurulet on each side of its base. Anther two-lobed; 4>6<tflmear«ublong, and surmounted with a broad, three-Iobed crest.—Girtn »ni'erior, tliree-celk-d, with many ovula in each, attached to the muer angle. Stigma funnel-shaped.—Capsule the size of a large nutmeg, oval, (uot sulcate as in Koenig'tf Amomum or Globba crispa, Rrtz* obs. 3. p. 50.) but thickly beset with numerous, stout prickles, three-celled, three-valved; valves fleshy (not nuciform as m Globba crispa, Ruraplt amb. 6./>. 137). Par/tfommemhnmaceous. —Seeds, many in «aoi cell, oval, smooth, bybwi»;-surrounded with * paie, gelatiuoiii, Awcetuh-acid pulp or aril, intermixed with fi«e woolly filuueuia, and attached to a central receptacle by very slender cords, which are enveloped in the same gelatinous pulp which surrounded the seed. $^{Pm^{r}OT}$ white, cartilaginous $_{^{\prime}}/to$, **<* ly spheuCHly lodged about il* middle of, the perispevm, and of *

clearer colour, and harder texture.— Emb^u »_u*-cylindric, the inner end, or cotyledon, lodged in the vitellus, which in some seeds it passes entirely through. *Radicle* pointing directly to the umbilicus*

4. A. maximum. R.

Leaves pelioleri, lanceolar, vilioiu underneath. Spikes oval, even •vilh the earth. Brae tea lanceolate. Lip elliptic. Coronet of ark* semi-lunar lobe. Capsules round, nine-winged.

This plant istiow growing in the Company's Botanic Garden near *Calcutta*^ it was introduced from the *Malay* islands Jby the late Colonel Kyd. Flowering time the hot season; the seeds ripen three or four months afterwards.

Hoot tuberous, as in gin $^{\text{r}}$, \rightarrow amch larger, and with large, conical bulb-like bases to fhe oldest stems.—Stems nearly erect, round, and smooth; from six to eight or moie feet high, invested in i|e smooth, long sheaths of the leaves.—LeaCes alternate, petioled, lanceolar, and linear-lanceolar, acute, smooth above; villous underneath, with many large parallel veins; from two to three feet long, and about six inches broad; when div the underside appears to be more closely covered, with most beautiful, soft, sericeous down, than while fresh.—Petiole's, the shealling part long, between each petiole aid its leaf there is a short, somewhat triangular portion, with a stipulary process, or *ligula* at the inside of its base.—Spikes radical, short, ihoir dower-bearing apex being only just above the earth; below the flowers it is covered with large, oval, concave scales.—Bractes solitary, one-flowered, lanceolate, meiubmuaceous, rather longer than the tubes of thi flowers.—Calyx tubular, a little gibbous, length of the tube of the corol; mouth three-toothed.—Corol; Tube funnel-shaped. Exterior border three-parted, as usual; but here they all converge upward into one helmet over the anther aud stigma; as in the Orchidea. ±>ip entire, expanding, oblong, marked, with a vellow stripe down'the middle; margins waved, and crenulate.—Filament short, from the in outh of the tube of the corol, opposite to it's interior border, oo

each fids of its iuseition, is a small hoi ale t. *Anther* double, 01 t abbed, and crowned with a beautiful, bioad, semi-lunar crest* AV«frzi'ta/bodies of Köuig linear, fluted, and truncate.—*Germ* short-pedicelled, striated, three-celled, with numerous <nw/a in each, attached to the inner augle, (axis). Style slender. Sdguut funncl-&hapf but shut trausversely, except during amliesis.—Capsule almost globular, sizeof a gooseberry, three-celled, three-vahed, oinainaiteduiui nine, ffriiij, short, ragged (when old, and dn) meinbranaceuiis wing •

Obs. The seeds possess a warm, pungent, aromatic ta^te, not milke that of Cardamoms, bul by no uieana so grateiul. •

5. A. dealbatuin. R.

Leaves broad-lanceolar, villousunderneath. opiL*;?* rwilK*l, brad*t-lanceolate, obtuse, (very peiishabie.) Exterior bolder willed. Lip K,tmd-ovaL Great of one, broad, truncated lobe. Capsule*, ONatt-ubloog, uiue-win^td.

A stately species, a native of ChiUaoun£, and uihci counui^ *\>-t>mi the eastern frouier of Bengal; from the former it lias been ipuru ijitml iuto the Botanic Gurdeu near Calcutta, where it grows luxun-«nilv» and flowers freely during the months of March and April; and ilu/lee'ds. ripen in September and October.

jRoo/s perennial, tuberous, crooked, joiulcd, creeping, like common ginger, with strong, fleshy fibres; inward colour of the tubers pale 'dull yellow', und when newly cut considerably aromatic.—Stems u¹¹ nierous, erect in the centre, and oblique in the circumference oi the clump, from three to fivt feet high.— ^ai^sub-bitarious, fhe lower sessile on their sheaths and oblong, the superior bhort-petioled aad lanceolar; all *ue very villou^ and paler underneath, length fr<> in six to twenty-four inches, breadth from three to six.—Sheath* smooth, rising in a bitid ligula above the ntoutL—Spikes radical* roundish-obovate. Scape short and imbricated with scales, &c—'' Bracteshoak ovate to lanceolate, obtuse, very perishable, pale, owe-flowered. In this species there is no inner bracte, like an interior callurated to the base of the germ, 90 general in this natural «"''

dtr.—/fl/oR:er*iiimierous,Iarge, white.— G//y* superior, rather longer than the tube of the corol, three-cleft, and like the bractes very perishable/— C W . 7//Ae short, the three exterior segments of the border form a viult over the unlher, they «re linear-oblong, aud nearly equal. tip broad-oval, einargiuate; ?ruirginscurled; white, with a little yellow in tire $V*I \setminus XM$.—Filamnt short. Anther linear, crowned with an entire, Jiroad, truncate, pure white crest.—Germ short-pedicelled, threecdk'd^&c. as in the genus.—Capuile* ovate-oblong, size of ft nutmeg, nine-win[^] d, three-celled, but I have not observed them separate into valves.—Seeds many, shape various, but oval and ovate are taost common. Integuments besidesllie aril, or its drsed reimuus, a 5.ngk, very hard, da, k coloured, brittle one.—Perispermconloi m to trie seed, uhite, and cartilaginous.—Viteltus lodged in the upper part \prec F the perispenn, of a roundish shape, hard, s u b-hy aline.—£mbryo suo-cyliudjic, its apex immersed in the vitellus, and its base at the umbilicus.

 0 A». 'J'ha seeds of tins plant are insipid, whereas those of Amomum in [1 c | 1 s w | Mly dl]]Qd to if are auxiliard pass for a sut

6- A. mbuiatum. R.

Leaves fauceoltr, smooth. Spikes obovate, echinattd with the 'ong subulate point, sf the bracts, calv,, and npp^r segment of the extmor border of the corol. Lip oblong.

A nation of the plain of h in the plain of

smooth on both sides; from twelve to fifteen inches long, by tbn or four broad. Sheaths smooth, margins coloured and rising abuy the mouth into an emarⁱnate ligula.—Spikes radical, compact, liitle elevated above the soil, obovate, size of a goose-egp, echinat with the long, subulate, jmle yellow points of the bracte4, inner a lyxand upper segment of llie exterior border of the corol.—Viz ar-· numerous, the exterior imbricated upward, obo vale, dark-red,\£jnootlong-subulate, pointed, one-flowered; the inner, or inferior cil}> spathiform, Opening on one side.—Timers large, yellow.—Coir superior, thue-cleft, segments subulate, and much longer lliau tl tube of the corol.—Corol; exterior border of three nearly equal ailments, the upper one endssubutately. Ltp oblong, often emargiusiti margins a little curled, deeper yellow than the exterior si>ginei>i Anther two-lobed and crowned with an euti¹ —Filament flat. crest.—Gwm three-celled, with many ovula in each, attached to *! thick partitions, a little removed from the axis; Style, stigma . • ^ nectarial scales qfKohig as in the genus,

7- A. aromaticum, R.

Beng. Morung Elachi.

A native of the vallies on the eastern frontier otBewra?, where, well as in the Botanic Garden neai Calcutta, it blossoms during thhot-season, before the periodical rains begin; and the fruit ripens i-September; the capsules are then carefully gathered by the native-and sold to the druggists, who dispose of them for medicinal am other purposes, where such spices are uniiteri, under the name v $Morung\ eiachtjorcarrfamon$; though the seed vessel of this species defers in form from all hitherto described sorts of this drug; Low^* the seeds are similar in their $s^{\#}$ hape and spicy flavour.

Root tuberous, running for a small extent at a small dep'il uodt. the surface of the soil, Sec. as iu the order—&*«* iu tufts, erect or more or less oblique according to their situation in the tuft, tho* in the centre being nearly erect, while 011 the, outside thty bend out considerably, all are covered with the sheaths of the leaves, general!

height t«o ^ three feet, .uu-««w» k^.:i one to two years.—Leave* bifarious, lanceolar, acunimfete, smooth; from ten to twelve inches long, and from two to four broad.«—S/M&*5 radical, imbricated, at first clavate, afterwards becoming roundish as the fruit advances. Scap^ from one to three inches long, hid under the surface of the earth, and cinbvaced by numerous imbricated, sheathing scales.—Flatters of a r.i:ddliug:uze, pale yellow.—Bractes; exterior one-flowered, obloifg, conceive, smooth. Interior, or inferior perianth, tubular, sheathing the germ, and lower half of the proper perianth.— Calyx superior, rviiudric, entire, or dentate, villous.— Carol with a long, slender tube; segments of the exterior border sub-lanceolar, out usé, the upper ouc tomewhat vaulted over the stamina, and stigma. Up nearly round, and undivided, tinged with red down the middle; no spurs', or projections between jt and the base of the iilani«ii:.— Filament liuear.

*Proced. Anther crowned with a hree-lobrd oicst.—Uerm villous,

celled, with mam¹ crcula in each, uttached to the axis.—Capsule o*'ate, &ize of a large nutmeg, rather ilcshy; flurtac^ sennewhat rugose, thycc-valved, three-celled.—Seed* several in each cell; oval, and obovate are the most prevailing farms.—Verisperm conform to the *u*d.—FiteUu\$ncnr\\round, occupying a considerable portion of the upper part of the perisperm.—Embryo davate, length of the teed, ifs apex passing through th^ centre of the vildlus.

^., \. senceitfn.\ 12.

, Leaves lanceolar, sericeous underneath. Racemes radical, sub* globular, ramous. Lip obovate, ¡3iise calcarate.

A native of the mountains on the Korth-Eabt border of Bengal, \\\^\r\her*, it is also called *Dooi Keshy*. It jis a stately plant, with *leaves* about two feet long, and of the colour and appearance of highly policed silver underneath. The inf.orc.scenci a completely compound; sub-giobular raceme with the short, villous, branches therefor two or three-flowered, each *Jlower* pretty long-pedicelled and itnbraced during their early period with villous, oblong, membranaceous 'bractet, which soon perish; the calyx ii move permanent, tu«

bular, viilous, aud.thrce-tooiiied.— Flowers large, white, centre of the^ lip variegated with pink veins on a yellow ground; exterior horder of three, nearly equal, oblong, white segments, the upper one rands wbulalely from au obtuse apex; two large spurs between flie base of the lip and that of the rather long filanieiit; antler of two linear lobes, crowned *iih a very large, curled, ieuii.limar crqst.— Germ villous, ninenbbed, tluewrclle'd, &c. as in the eemw. Capsule long, narrow, ovate-oblong, thrce-celled, three-vahed, surface even and smooth, colour a brownish rod, inside deeper and brighter.—Seeds many, obovate, black, and pretty smooth, aiii white and fleshy. Embryo simple, erect, leuglli ol ihe beed, and furnished with both piTisperm and vitellus.

ZISGIBER.

Corolla with the interior border imilabiate. Anther double, trownfd twith a single, horn-shaped, cuived beak» Capsule lliree-wlled, tl.ice-valved. Seeds many, arilied. Embryo simple, and furnished whh bothperisperm and vitellus.

Sect. i. Spikes radical.

Is a native of the northern *Circars*, where it flowers in the rabj lesson.

Root biennial, horizontal, jointed, and white; with many largo, fibres, —SLw siYeral, invesUd *0 the sheath? of UK *'?v>«y 8r,c. a* in tli<

other scit&minecus plants, about two or three feet high, leaves iuclucU ed.__Leaves somewhat petioled, bifarious, lanceolate* acute, tending to cue side, smooth, finely veined; about twelve inches long, and from threeto four broad.—Spikes remote from the steins just appearing above, the ground when in flower, imbricated with lax, lanceolate, red* dish, one-flowered bractes.—Flowers solitary, colour 3 mixture of red ami yellow.— Bractes, besides the exterior one already mentioned, there is an interior one for each flower between it and the rachis, which is linear, with an obtuse, notched apex.—Calyx one-leaved, tubular, ^bove, membranaceous; mouth toothed.—Corel\ Tube cylindric, erect, considerably longer thaji the bractes. *Border* double. *Exterior* three-parted; in this phut the two approximated divisions* are above, lineur, pointed, anc} recurved, sometimes revolute; the lower division Stund* single, and is like the superior two, linear and revo, ute; all are. of a. bright red colour. *Interior*, or *Up* single, broad, obtuse, reflexcd over the superior two divisions of the exterior border.—Fihment_% and anthers as in the other species.—Style lather longer tjiau tiie horn of the anther. Stignia perforated, and cilute. Two similar awl-shaped nectaiial bodies at the base of the style, 're aldo present here.

Obs. I have not found that the natives make any **e of this plant,

5. Z. ligulatum. R*

Leaves, approximate, sessile, iauceoiate. Spikes lax, more than, half hid in the earth, obovate. Bractes cuneiibrm. Lip sub-hastate.

A native of *Hindoosthan*. Flowering time in the Botanic Gaiden the rainy season; the seeds ripen in November and December,

 length from three P/i xv. eive inches, &n ibrc'UUhi;bCmt zout . - Sheaths •smooth, from the zc&uth of each rises a remarkably large long strap, or ligula, which by the growth of the plant becomes bifid, and by age scariose.—Spike: ladicai, half hid in the earth, oblong, loosely imbricated with cuneiform, pink-coloured, one-flowered, exterior scales or bractes; and the dame number of inner colourless, tridental diorter byactes; or, as they thay be called, inferior perianths.—CalyS tfuperior, one-leaved, spathiform, about half the length of the tube df the coioii irregularly tridentate.—Corol. Tube slender, the length of the exterior scales of the spike, incurved. Exterior border of three, yearly equal, lijiear, acute, smooth, reddish divisions. Lip oblong, obtuse; majgins much curled, with two expand:ngomore or less acuU; lobes at the very base; colour a palfe yellow.—Filament short; below the two-lobed anther, linear, ending above in the usus J long_v taper, curved, grooved beak.—Germ oval, viilous, three-celled, $e^{\Lambda}U$ containing many *ovule* attached to a central receptacle. slender, and so long as to elevate the funnel-s^liaped, ciliate stigma to tin equal height v/ith the apex of the filament.—Svctariul scales long. and slender, erabrj/wiug the base of the style within the bottom of the tube of uis corol.—Capsule ovate, size of a large olive, three-sided^ three-celled, three-valved, opening from the apex down the angles; inside of the cells crimson.—Calyx leathery, striated, pale, dull yellowish straw colour.—Seeds many, oval, blackish brown; a little rugose, arilled. Aril white; nearly complete, and ragged at the upper end.—Perisperm conform to the seed, cinereous.—JSffii/ye cyiindric, central, nearly as long as the perisperm.

6. Z. rubta*. JR.

Leaves lanceolar. Spikes lax, half iaifcersed in the earth. Bractes linear-lanceolate, straight. Lip narrow-ovate, entire.

A ttative of the Ulterior of *Bengal*; from the district cf/t«*gpc-r« Dr. Buchanan sent the plants to the Butauw Gardex», where they blossom in August.

Root tuberous, lc it the other *pec^* --Stem* l*erbactoi'.*,

32

iwhat dcclin-ate, from two to four feet high.—Lecves alternate* Trious, sessile on their sheaths, smooth on both sides; genera :; about twelve inches, and from four to five broad.—Slieaths with i targe, membranaceous, stipulary process at the mouth.—Spikes several from the base of the stems, where they join the root, halfiinnierscd in the eaith, sub-obovate, feaiigiate, laxly imbricated with numerous straight, prect, linear-lanceolate, acute, involute, red, slightly villous, exterior trades. Inner bractes, or inferior perianth the length of the tube, but shorter than the exterior bractes, and irregularly tri-dentate.—Calyx superior, sub-cylindric, membi anaceous, peilu* cid, most slightly villoits; mouth, three-toothed.—Cvrol with a long, slender, cylinclric tube; segments of the exterior border linear-lanceolate, acute, red. Lip ovate-oblong, r.tire/speckled |x|/h red and yellow.—Filam?tit sealery any. Anther of two long lobes, crowned with the loug, characteristic, curved horn, which is incumbent on and reaches to the apex of the lip.—Nectarial filament a of Kouig, blong, and obtuse.—Germ hairy, three-celled, wiin nury ovula in each, attached to the axis. Stigma funnel-shaped, and ciliate.—CapsuU

7. Z. squarrosum. It.

Leaves lanceolar. Spikes scjuarrose, half immersed in the earth. Tiradės linear, with long, taper, waved, recurved apices. Lip three-lobed, apex bifid.

A native of *Burma*, where it ripens its seeds *in* December. From *Rangoon* Mr. F. Carey sent the fresh roots, entire cap&ules, and ripe seeds to this garden, where the plants from both the seeds and roots, grow freely, and the latter blossomed in August.

Root tuberous, as in ginger, &c.—Stems herbaceous, considerably recurvafe, from two to three feet high, entirely hid in the sheaths of the leaves.—Leaves bifarious, sessilejauceolar, smooth above, slightly villous underneath, cuspidate.—Sheaths with two large conical processes rising from their mouths, oue on each side.—Spikes from the base of the stems, three fourths hid in the earth, ovate, laxK imbricated, size cf a goosp-egg,-—Bractvs greeu,- the exterior solitary, one*

flowered, linear, concave, long, taper, waved, recurved, inner> one or two, (generally one), as long as the tube of the corol, with a threetoothed apex.—Flowers pretty large, inodorous*—-Calyx superior, 8cc> as iu the other species.—-Coroi with a slender tube. Exterior border of three, pink-coloured, lanceolate, acute segments. *Inner*, or *lip* twolobed at the base; apex bifid, colour a speckled mixture of purple, red, and yellow. Filament short, anther and beak together nearly as long as the lip.—Germ villous, three-celled, with maity ovuJa in each. Style and s/igma as in the genus.—Ca/WKfeshort-pedicelled, ovate, conic, three-celled, three-valved, opening from the apex, inside of the .valves bright scarlet while fresh. (Those sent from Rangoon by Mr. F. Carey, were, when they reached ice, perfectly dry, and then mea* sured three inches in length, and one in diameter.)—Seeds nnny in each ceil, arilled, arranged in two rows, and attached to the ianet edge of the partitions. Aril complete, fleshy, white.—Verisperm conform to the seed. Vztellus covers every part of thee7n6fj/3,whic& is clavate, and nearly as long as the seed.

8. Z. panduratum. JR.

Leaves petioled above their sheaths, broati-taftceokr, smooth; ligula large and scariose. Spikes radical, half immersed in the earth, tex. Bracles lanceolate. Lip p&nduriform, with oval, emtrginafe lamina.

This middling sized species is a native of the country about *Rengoon*. From thence Mr. F. Carey sent seeds to die Botanic Gardes in 1803, and in July, 1310, the plants raised from them bl. abundantly.

Root; numerous, long, fieshy, fibrous fibres, 3ome of which swell into lanceolar tubers, a^* in *Curcuma;* no palmate tubers, us in that genus. It possesses but little taste and no fragrance.—*Stalks* erect, herbaceous, about three feet high.—*Leaves* bifarioua, petiolei above their sheaths, bronManceolar, acute, smooth on both sides; fros* six to twelve inches $U(>_{\aleph}>$ % three to four broad.—*Sheath* smooth •hove ilieir respective leaves • each end* in a very lonj, scariw?.

smooth ligiite'—Spikes radical, the lower half immersed in the suiï* oblong, and rather loosely imbricated with lanceolate, coloured, concave, one-flowered, interior and exterior bractes.—Flowers rather aaiall, exterior border of three, nearly equal, lanceolate; acuminate, pale red segments; inner or lip very pale yellow, pauduriforiu, iVit is with two, pretty large, rounded lobes at the base, and the lamina nearly oval, retuse, truncate, or emarginate.—Filament broad, ami short. Anther double, and crowned with the usual beak.—Germ three-celled, with many ovula in each, attached to the inner angle of the cell. Stigma infuiulibuliform.

Observation by JV. W. The Burman name is Toukta.—Capsule ripening in November and December, ovate, triangular, acute, with flattened sides, smooth, pale, retuse at the base, and surrounded with numerous withered bractes, as large as a walnut.— Valves thick and fleshy, three-cornered, inner surface waved; shining, scarlet; skin leathery; flesh spongy, pallid.—Dissepiment oblong, ventricose, triangular, scarlet, at the bursting of the capsule adhering to the inner angle of one of the valves.—Seeds obovate, horizontal, in each cell about twelve, attached by small white fleshy placentas to the sides of the dissepiment, faintly aromatic.—Arillus milkwhite, leathery, loosely surrounding the seed, perforated at its topf with a small toothed openiug.—Integument simple, dark-purple, smooth and shining, porous within and replete with a violet-co~ toured juice: it enters the umbilicated base of the seed and receives the apex of the radicula.—Albumen white, amygdaloid, conform to the seed and occupying chiefly its lower half, sub-obliterate above.—bVitellus white and fleshy, turbiuate, constituting almost entirely the upper part of the seed, euding below in a very thin sheath which covers the substance of the embryo.—Embryo cyliudric-veu* tricose, as long as the seed, erect.—Cotyledon sub-cylindric, almost naked.—Radicula thick, soXY?*,vLa~. enlarged at its r*pex, ceutiipctal.

Sect. estermin&L

9. Z. capitatnm. R,

Herbaceous, *leaves* linear lanceohte, stem-ch*progv *Spihc* ter-Tniual, erect, stroWU'crjjn. *bracUs* huceohte,

A native of the forests of *JLohHcwid*, from tlicr.ee Cotant! Thomas llardwicke sent plants to the Botajiic Garden, under the vernacular flame *Junglec Admit*. Here it flowers duilog the rains; and the seeds ripen in September and October.

Root composed of many, long pedunded, oval, smooth, pale*co* loured, insipid, watery tubers, issuing from the base and sides of the bulb, and palmate tubers, which are of a pale yellow colour, aud somewhat spicy taste*— Stems erect, round, enveloped ia thfe heaths of the leaves, winch are often a little hairy; height of the whole plant when in blossom, from two to three feet.—Leaves sab* bifurious, alternate, sessile on their sheaths, uarrow-lanceciace, acute, smooth ;ibove, a little hairy underneath; about twelve inches long; mid about two broad.—Spike terminal, sessile on the mouth of the *hcaihd of the superior leaves, linear-oblong, somewhst strobiii* form, many-flowered.—Flo^en sessile, large, pure yellow in every part.—tirades in pairs, one-flowered, permanent; exterior lauceolate, f onwve, erect, longer than the tube of the corol. Inner ovate, shorter, immediately enveloping the germ, calyx, and ueaily the whole of the tube of the corol.---Perianth superio; one-leaved, about half tlie length of the tube of tliecorol, xnenibranaceous, white, two or three-toothed*—Carol. ftffecyliudiic, narrow. Lip with two, oblong; very distinct, expanding, lateral lobes; middle lobe very large, and nearly round. Anther with a very long curved beak.—Stigma (as in most plants of the order), funnel-shaped, with ciliate margins—IV*r-. torial scales (of K'wig), or hornlet conical—Capsule oval, three-sided, with the angles rounded, pretty smooth, size of a small olive, three-celled, three-valved; each cell containing several, black, shin* iiig seeds, enveloped in a deeply jagged, white zril.--Periaperm conform to the lower half of the seed which it occupies, pure white, cartU luginous. Vitellus above the perisperm, occupying nearly the upper iwdf of the seed.—*Embryo* vertical, passing through the centre of boti* verisperm and vit^{lius}, aub-cj-liudric, both ends obtuse, 5cc. in every ...pert şu txactly like ?'. Hind. Koolinjan.

Arab. Kholinjan or Khoolunjan.

Dr. Charles Campbell, at *Bencoolen*, sent the roots of these species from thence to the Botanic Garden near *Calcutta*, where the plants thrive remarkably well, and are in blossom during the latter half of the hot season, April and May. Seeds ripen, though rarely, in November.

Root perennial, tuberous as in ginger, Sec. possessing a faint aromatic smell, and strong pungent taste, like a mixture of pepper and ginger, accompanied with some degree of bitterness, and now ascertained to be the real Galanga major of the shops.—Stems perennial, or at least more durable than those of herbaceous plants, nearly erect, round, smooth; general length, when in flower, about six or seven feet; and as thick as a slender walking cane. Leaves occupy from the middle of the plant upward; the lower half being inverted in leafless sheaths only; they are short-petioled, bifarious, lanceolar, margins white and somewhat callous, both sur

faces smooth; length from twelve to twenty-four inches, and from four to six broad.—Sheaths smooth, with a short, rounded, ciliate, stipulary process above the insertion of the leaf.—Panicle terminal, erect, oblong, crowned with numerous, spreading, simple dichotoinous branches, each supporting from two to five, or six, pale greenish white, somewhat fragrant flowers.—Involucre of Kbnig, in our plants generally two-leaved, lanceolate, first withering, then falling before, or while in blossom.—Bractes concave, solitary at the divisions, and subdivisions of the panicle—Calvx superior, sub-cylindric, smooth, white, scarcely the length of the tube of the corol, mouth one-toothed.— CoroL Exterior border of three, nearly equal, linear, recurved, smooth, pale greenish divisions. Inner border, or lip unguiculate, somewhat ascending, so as nearly to meet the slightly declining anther; oval or ovate oblong, concave, apex divided into two lobes by a pretty deep, straight fissure; margins incurved, curled, minutely laciniate, white, with here and there a small reddish speck, and two recurved fleshy; coloured hornlets at the base of the claw.—Filament rather longer than the claw of the lip. Anther double, apex deeply einarginate, projecting horizontally over the middle of the lip.—Germ beneath, smooth, oval, three-sided, three-celled, with only two ovula in each cell, attached to the middle of the partition. Style filiform. Stigma funnel-shaped, fringed; while the flower is in vigorous blossom erect between the lobes of the anther, afterwards recurved under the anther.—Nectarial bodies (of Kbnig) nearly square, fluted.— Germ oblong, smooth, three-celled, with two ovula in each, attached to the axis.—Capsule the size of a small cherry, obovate, smooth, deep orange red, three-celled, but entire, as no separation seems to exist, the thin dry cortex crumbles, or breaks to pieces, without any tendency to separate into Valves.—Seed one, rarely two in each cell, much compressed, size of a grain of black pepper. Aril nearly complete, there being only an opening at the apex, thin, rather fibrous, and of a dull white color. Integuments two, or three; exterior, tough, fibrous, polished, of a dark chesnut colour, a little wrinkled, utfierhard, dark brown; between the two is a spongy lamina of the same colour, and I cannot well say to which it most properly belongs.—*Perisperm* white, friable, and very hard.—*Embryo* simple, dull white, (canus,) roundish in the body of the perisperm, and with the narrow, conic *radicle*, passing through it and pointing to the umbilicus.

Note by Mr. Colebrooke. "The root of this plant being ascer" tained to be the Galanga major of the druggists, comfojmably with "what has been said of it by Rumplnus, there is no doubt of its being "Kholmjan of the Arabs, termed in Hindee Culwjan. In Sanskrit it "is called Culanjana, according to one authority, (the Rajnighantu;) "but Su<randha-Y&ch2L, sweet-scented Acorus; as also Mahabhari-"vacha, according to another Indian treatise, (the Bhavapracasa.) "If the first name be genuine Sanskrit, which is however doubtful, "the similar names in other languages, including the European, must be derived directly, or immediately from it."

2. A. Allughas. Roscoe in Trans. Linn. Soc. 8. 346.

Leaves lanceolar, polished. Panicle terminal. Lip bifid; lobes retuse. Capsules spherical, (black,) one-valved, many-seeded.

Hellenia Allughas. Linn. Sp. PL ed. mild. I. 4.

Mala-inschi-kua. Rheed. maL 11.p. Qg.t. 14.

Sa)is. m ^ t:, Tarwkfl.

JBeng. Tarwka, orTara.

This plant is common near *Calcutta*, in low moist places, among brush wood. Flowering time the beginning of the rainy season.

Root tuberous, biennial, or perennial, horizontal, brownish, with many pretty thick fibres, considerably aromatic.—Stem erect, slightly compressed, entirely covered with the sheaths of the leaves; from three to six feet high.—Leaves alternate, bifarious, petioled, oblong, ending in a fine twisted point; both sides smooth, and glossy; the under side paler colour; veins numerous, straight, exceedingly fine, going off at an acute angle; generally about a foot long, and four inches broad.—Petioles sheathing with a stipulary rounded process rising above the insertion of the leaf.—Panicle terminal, bending slightly to one side.—Flowers numerous, in succession, large, of a beautiful rose colour, inodorous.—Calyx superior, gibbous, fleshy, generally two or three-

toothed.—Coral one petalled. Tube short. Border double; the tx« terior three-parted; divisions nearly equal, outwardly downy, concave, particularly near the ends, pale greenish rose colour; the superior one more remote. Interior horde*, or lip two-cleft, with two fleshy protuberances near the base; divisions with two-toothed apices and waved margins, colour a beautiful mixture of deep, and pale rose.—Nectary (of Kbnig and Retz.) two oblong, compressed, fleshy bodies, embracing the base of the style.—Filament shoft, wad, much flattened. Anther double, each lobe ending hi an obtuse orillet.—Germ inferior, globular. Style lodged in the grove of the filament. Stigma clubbed, somewhat three-sided, obtuse, with a crescent-like fissure, and ciliate margin.—Capwle globular, inclining to be tl.ree-sided, smooth, when ripe black, and friable, not opening by sutures, but crumbling to pieces, crowned with the permanent, withered calyx, and coral, lhree-r.el!td.

3. A. bracteata. II.

£ e a m lanceolar, villous underneath. Raceme terminal, simple; pedicels, one-flowered. Bractes green.

A native of the Eastern parts of *Bengal*. In the Botanic Garden near *Calcutta* it flowers in March. This is one of the smallest of our East India *Alpivias*; this circumstance, and the green bractes, immediately distinguish it from *mataccani*, which is not so easily done in a specific definition.

Root biennial, or perhaps, perennial.—Stem* erect, about three feet high, entirely in\ested in the smooth sheaths of the leaves.—Leaves bifarious, petioled, from ovate-oblong below, to lanceokr above, fine-pointed; the upper surface smooth, polished, deep green, villous and palei und« ineath; len-ih from six to eighteen inches.—Petioles proper about an inch long, and deeply channelled. Sheaths smooth, rising a little above the insertion of the proper petioles on the inside.—Raceme terminal, erect, simple, about a span long, slightly villous; before expansion embraced, by one or two caducous sheaths.—Pedicels throughout one-flowered, round, short, and villous*—Bractes (or inferior perianth) solitary, one-flowered, more per-

xnancnt than in the other species, and of a dull green colour, hiding the calyx.—-Calyx shorter than the bracte, open on the underside, bidentate.—Corol; exterior border of three oval, nearly equal, white segments; lip somewhat three-lobed; lateral lobes large and incurved into a tube round the stamina; exterior narrower, with a bifid apex, colour a beautiful mixture of crimson and yellow, with a paler belt on each side.—Filament short, with two curved spurs at its base. Anther double, linear.—Germ oval, three-celled; with many ovula in each, attached to the inner angle. Stigma funnel-shaped, sub-ciliate.

4. A. malaccensis. Roscoe in Trans. Linn. Soc. 8. 345.

Leaves lanceolate, petioled, villous underneath. Raceme terminal, simple. Lip obscurely three-lobed, with two spurs at the base, lateral lobes incurved. Capsules obliquely spheriodal.

Maranta malaccensis. Linn. Sp. PL ed. Willd. 1. 14. Galanga malaccensis* Rumpk. amb. 5. p. 176. t. 71-/. 1.

A most beautiful and stately plant, a native of *Chittagong*, and from thence sent, by Mr. W. M. Maddern, to the Botanic Garden near *Calcutta*, where it blossoms in April and May, the very hottest time of the year; and ripens its seed in the rains.

. Root perennial.—Stems numerous, (within four years, a single root encreased so much, as to produce about fifty,) from six to ten feet in height; those in the centre erect, in the circumference bending out; in two, three, or four years, the stoutest blossom, ripen their seed and decay.—Leaves bifarious, petioled, lanceolate, acute; margins often waved, and slightly fringed with short brown hairs; upper surface smooth; under downy; length from two to three feet, and from three to eight or nine inches broad.—Sheaths smooth, embracing the stems completely, ligula ovate, obtuse, entire, villous. Petioles (I mean the space between the ligula and leaf), about three inches long and channelled.—Racemes terminal, solitary, erect, always simple; from six to twelve inches long. Peduncle round, aud villous. Pedicels short, villous, one-flowered, the largest sometimes droop a little from the weight of the flowers.—Involucre of two, or

three, caducous, boat-shaped leaves embracing the raceme.—Flowers very large, a pure smooth shining white, except the inner border, or labium, which is a beautiful mixture of orange and crimson.—Brae* tes, (or inferior calyx), gibbous, bursting on one side to the base, and partially on the other.—Calyx superior, one-leafed, gibbous, length of the bracte, splitting into various portions.—Corol; exterior bor* aer of three, oblong, obtuse, entire segments, of which the upper is largest. Inner border or labium, very large; when expanded, three inches broad, and two and three quarters long, somewhat three-lobed, the two lateral semi-circular and incurved into a tube; the middle one smaller, more projected, curled, and sometimes bifid; from the base on each side an incurved, sharp spur.—Filament about as long as the large, broad, deeply bifid, obtuse, two-lobed anther.—Nectary of Kbnig; in most of the other plants of this order, I have found this part to consist of two distinct bodies here it is of one, very thick, and short with its truncated, apex tuberculate.—Germ inferior, obovate, hairy, three-celled, with many avala in each, attached to central Style toward the apex hairy. receptacles. Stigma rising erect through the bifid apex of the anther, funnel-shaped, hairy.—Capsule obovate, spheroidal, size of a very large gooseberry, armed with short, sharp, stiff, slender bristles; when ripe nearly dry, and yellow, three-ceiled, three-valved.—Seed numerous, ovate, oval, or obovate, immersed in a large portion of a soft pulpy matter, which in the immature state form distinct arils; on each side, and round the apex a groove. Integuments two, brown, and rather thin.—Perisperm cartilaginous, cloven at both ends by a brown spongy fissure, but deep* est from the apex.—Vitellus, the centre of each of the superior limbi of the perisperm, is occupied by a small, thin, oblong body of a clearer colour; and widely distinct from both embryo and perisperm. *Embryo*, the upper part crescent-shaped, with its horns projecting into the limb of the perisperm, and in some degree into the vilellus. Radicle inferior, projecting straight from the convex, or under side of the crescent, with its base to the umbilicus.

Obs. This is the most beautiful plant of the whole genui, even

surpassing A. nutans, which I believe the Botanical Repository considers a species of Rtnealmia.

5. A. nutans. Roscoe in Trans, of Linn. Soc. 8. 346.

Leaves lauceolar, suorUpetiolul, smooth. *Racemes* compound by the lower pedicels being two or three-tloweied, drooping. *Lip* broad, three-lobed, the lateral incurved into a tube; the exterior railed and bifid. *Capsules* spherical, opening ou the sides. *Heeds* lew.

Beng. Poonnag-champa.*

Reneahnia nutans. Andr. Hot. Repos. 6. t. J60.

Globba nutans. Linn. Sp. PL ed. H'illd. 1. 15. 3.

This very elegant plant, a native of the Eastern Islands was introduced by the Rev. Dr. Carey, into the Botanic Garden near *Calcutta*, where it blossoms in April and May.

Root perennial, tuberous, &c. as in the other species.—Stems moic or less bent to one side, (a direction common to most of the plants of this order;) from four to six feet high.—Leaves hilarious, subsessile on their sheaths, occup)ing the upper half of the steins; the lower are broad lauceolar, the upper much narrower, all are entire, and remarkably smooth on both sides; while young the margins villous; length from one to three kti.—Sheaths of the leaves smooth, with a stipulary bearded process, rising above the insertion of the leaf#—Racemes terminal, compound, variously curved, villous, about a foot long, drooping under the leaves.—Involucre of generally two, caducous, lanceolate, boat shaped sheaths.—Flowers numerous, Urge.—Pedicels two or three-flowered.—Braces large, cpneave, pure white, with a pink-coloured apex, smooth; a common one to the two or three flowers, and a proper, smaller one ^o the second and third

• From this name, which Dr. Roxburgh mentions as the Bengal name, it is natural to suppose this plant to be the Poonnaga of the Sungskritu Materia Medica. If so the following Sungskrita Synomina should stand before the Bengalee name, firttf, Poonnaga, *r^a», Poorwsha, tftl, Toonga, *arfa, Poonnan. "ttfos, Patula, 33Ptf, Rukta-pooshpa, •fttarf, Poonnama, ?^rq_f Rukta-renoo, «8F«i«, Urwu*. It is ktwever doubtful whether this plawt is the Pwnuaga. £d«

flowers, which expand in succession- for a long time after the first. —Calyx superior, colour of the bractes, three-toothed. CVo/with a double border; exterior three-parted, pale pink, with deeper rosy apices; upper division oval, incumbent; lower two linear-oblong, levolute, with the apices rounded. *Inner* lip large, ovate-cordate, obscurely, three-lobed, lateral lobes incurved into a large companulate tube; apex of the interior lobe bifid, margins curled; ut the base are two spurs which embrace the base of the style, colour of the whole a mixture of deep orange yellow, with a dark crimson ground, and veins.—Germ beneath, oval, hairy, three-celled, with many ovulain each, attached to the inner edge of the partitions. Stigma on the iirst expansion of .the flower erect through the fissure of the apex cf the anther; afterwards, as the style lengthens, its.apex becomes involute, and throws the *stigma* under the anther.:—Nectaries (of König) two, square, fluted, fleshy bodies within the tube, on the apex oi tle germ, embracing the base of the style.

Ota. This is no doubt one of the most gaudy of our East *Indian Scitqminea*. It multiplies itself by the root very fast, grows quickly, and continues to produce its numerous, large, elegant, drooping panicles, of beautiful flowers for two mouths, and' more or less the whole year roun[^]...

6. A. mulica, R.

Leaves shprt-petioled, uarcow-laiiceolas, polished. Race?ne\$ erect, compound. Lip three-lobed, base spurless. Capsule buried. Seeds numerous. angular. Aril evanescent.

Found indigenous in the forests of *Prince of Wales* Island by Mr. W. Roxburgh, and from thence introduced into the Botanic Garden near *Calcutta*, where* it flowers about the beginning of the rains, and ripens its seed from October till January.

Stems numerous, erect, involved in the sheaths of the leaves, from four to six feet high, generally biennial, as they do not peYish till after the seed is ripe.—Leaves alternate, bifarious, short-petioled, narrow-lauceolar, acute, polished, and entire, from ten to twenty-

four inches long. Sheaths smooth, ending in a rounded ligula, above the insertion of the leaf.—Racemes terminal, erect, compound, conical many-flowered: peduncles a little downy. Pedicels alternate, short, villous, two, three, or even four-flowered.—Bractes of the pedicels, and pedicelli solitary, oblong, caducous.—Flowers numerous, large, drooping.—Calyx longer than the tube of the corol, widenin* from the base; mouth irregularly three-toothed, with the lower fissure (Jeepest, pure white. Corol. Tube much recurved, much shorter than the calvx; border double. Exterior three-parted; superior divisions incumbent, oval, concave, inferior two smaller, linear oblong, narrower than the superior one; all are obtuse and of a pure glossy white colour. Lip or inner border; large, elegantly variegated with crimson and vellow, surrounded with an orange-colouied edging; three-Iobed; the two lateral lobes simi-lunar and incurved into a large sub-campanulate tube under the upper segment of the exterior border; exterior lobe smaller, curied, and bifid. In this species there are no spurs between its base and the filament, as in most of the other species of this genus.—Filament nearly as long as the broad double anther, which projects over the middle of the lip.—Germ round, villous, three-celled, with many *ovula* in each attached to the partitions near the axis. Style filiform, embraced at the base by a single, truncate, dentate, glandular body, (nectary of König, Retzius, and Wilidenow.) Stigma funnel-shaped, ciliate, rising with a curve through the bifid apexofthe anther.—Capsule berried, size of a large gooseberry, deep orange, or yellow, according to their state of maturity; not opening spontaneously as in A. nutans, when dry, wrinkled, and a little hairy. - Seeds numerous, angular, aiilled. Aril complete, but thin, and when perfectly dry scarcely traceable. Integuments two; exterior thin, inner dark brown, and spongy.—Perisperm cartilaginous, a deep pit at the base, and a deep cleft from the apex down to near the middle. Vitellus as in Alpinia malaccensis; in the centre of each of the superior lobes of the perisperm, is a somewhat clearer, distinct body, as if a continuation of the horns of the crescent of the embryo, but perfectly distinct, and readily separable from them, and the perisperm.— *Embryo* an invested crescent, with the cylindric radicle descending from the convex side through the pit at the base of the perisperm to the umbilicus.

Obs. This is also a very elegant species, and holds a middle rank between nutans and calcarata.

7. A. calcarata. Roscoe in Trans. ofLinn.Soc 8. 347-

Leaves linear-Janceolar, polished. Spike compound, erect. Lip ovate-oblong, apex curled, and bifid.

Renealmia calcarata. Andr. Bot. Repos. 6. f. 421.

A native of China, and from thence introduced by Captain J. Gar* nault, into the Botanic Garden near Calcutta in 1799; where it thrives luxuriantly in the common soil of the garden, and blossoms in March, April, and May, but more or less all the year.

Root perennial, horizontal, somewhat woolly, crooked, pale-coloured, stoloniferous, fragrant, enveloped while, young in short, alternate sheaths; when old.marked with their cicatrices; and furnished with many fleshy ranious fibres.-*-Stems oblique, smooth, from two to four feet high.—Leaves alternate, bifarious, short-petioled on their sheaths, tiarrow-lanceolar, fine-pointed, entire, smooth on both sides; length frequently twelve inches, and the breadth from one to two. - Sheaths of the leaves stem-clasping, smooth, with a stipulary process projecting above the insertion of the leaf.—Racemes terminal, solitary, erect, compound.—Flowers numerous, largfe* generally in pairs or more, but expanding at different periods.—Bracies solitary, boat-shaped, white, one-flowered.—Perianth superior, three-toothed, white, smooth.— Corol with double border. Exterior three-cleft; divisions equal, linear, expanding, pellucid, white. Interior, or lip ovate-oblong, large, deeply coloured with dark purple veins on a yellow ground, apex twolobed, lobes rounded and curled; there are no lateral lobes in this spécies, nor are the sides much incurved; but two, incurved, sharp, subulate horns project from its two posterior angles and embrace the base of the filament.—Filament single, opposite to the lip.of the cord/projecting, 8tc. as in the genus.—Germ spherical, hairy, threecelled, with rtany *ovula* in each, attached to the inner angle of the cells. *Stigma* funnel-shaped, ciliate.—*Nectarial* scales nearly four-sided, with apices crenulate.

8. A. spicata. 2?.

Spike terminal, oblong, compactly imbricated with narrow lanceolate, acute bracles.

, ^ A native of *Sumatra*, from thenco introduced by Mr. KoxburgU into the *Calcutta* Botanic Garden in 1803. Is the slowest growing and smallest of the genus in this garden. Flowering time the close of the rains.

Root as in the other species—Stew arising ia an oblique direction to the height of about two fret, when from two to three years old the flowers appear, and after their functions are performed, the stems decay.—Leaves bifarious, sessile on their sheaths, broad lanceolar, fine-pointed, surfaces and margins smooth, length from six to twelve inches.—Sheaths of the leaves smooth, ending in a Ion*, bifid, or simple ligula.-fytftes terminal, strobiliform, compact -Bractes, the exterior imbricate, ensiform-lanceolate, one-flowered outside slightly villous. Interior or inferior calyx, one-leaved, subcylindric, length of the perianth proper, mouth obliquely truncate outside villous.-C*/^ superior, like the inner bracte, and of the same length, &c.-Coro/, exterior border of three, very acute, linear lanceolate segments. Inner or lip uncertain, as the only two spikes I have yet seen did not expand sufficiently, to allow me to ascertain its form.—Filament short, anther large, of two, long linear lobes with the style sunk between them.—Germ oval, very hairy, three-celled,/ with numerous ovula in each, attached to the axis. Style lender. Stirma large, consisting of two, gaping unequal lobes.

Cardomum. Buck, Journey, ^. 336—510, 538, and 3, 225,

A native of the mountainous part of the Coast of Malabar.

Hoot tuberous, with numerous fleshy fibres.—Stems perennial, erect, smooth, joined, enveloped in the spongy sheaths of the leaves; from six to nine feet high.—Leaves bifarious, sub-sessile on their sheaths, lanceolate, fine-pointed, somewhat villous above; and serireous underneath, entire; length from one to two feet.—Sheaths slightly villous, with a rounded stipulary process rising above the mouth.—Scapes several (three or four) from the base of the stems, resting on the ground, flexuose, jointed, ramous, from one to two feet long. Branches or Racemes alternate, one from each joint of the scape, sub-erect, two or three inches long.—Bractes solitary, oblong, smooth, membranaceous, nerved, sheathing, one to each joint of the scape, which embrace the insertion of the raceme, or branch; and one at each of their joints.—Flowers alternate; short-pedicelled, solitary at each joint of the racemes, opening in succession for a length of lime, as the racemes lengthen.—Calux above, widening tothethreetoothed mouth, about three quarters of an inch long, striated with tine nerves, permanent.—Corol withering., Tube slender, as long as the calyx. Border double, exterior of three, oblong, concave, nearly equal, pale greenish white divisions. Liner lip or nectary obovate, much longer than the divisions of the exterior border; margins somewhat curled, with the apex slightly three-lobed, marked chiefly in the centre, with purple violet stripes; at each side of its insertion and close by the

base of the filament is a small acute hornlet, as in most of the plants of this genus, and in several of the other genera of our other *Indian* Scitamineoe.— *Filament* short, erect. *Anther* double, emarginate.— *Germ* beneath, oval, smooth. *Style* slender. *Stigma* funnel-shaped. — *Nectarial* scales of Kbnig, subulate, almost half the length of the tube of the corol.— *Capsule* oval, somewhat three-sided, size of a small nutmeg; three-celled, three-valved.— *Seeds* many angular.

Obs. The following account of this interesting plant has lately been transmitted to me by Captain Dickson, the commanding officer of the district of *Wynaad* where the *Cardomum* is cultivated, viz.

"The *Cardomum* shrub is found in great abundance amon the western mountains of *Wynaad*, and scalled by the natives of Malabar *Ailum chedy* (the *Ailum sftnib*). I cannot obtain any satisfactory derivation of the true import of the word *Ailum*, unless, as is alleged, it implies in the Sanskrit language, celebrity, and eminence.

"The shrub is said to be produced as follows. Before the commencement of the periodical rains, in Jude, the cultivators of the Cardomum ascend the coldest, and most shady sides of a woody niQuntain; a tree of uncommon size and weight is then sought after, the adjacent spot is cleared of weeds, and the tree felled close at its root. The earth shaken, and loosened by the force of the fallen tree shoots forth young *Cardomum* plants in about a month's time. I have repeatedly enquired of the natives the means by which the *Cardomum* plants are first produced, and have invariably been told as already stated. They attribute no other effects to the falling tree, which may be selected from any species, than such as are derived from its weight and strength, added to the shade and shelter which its branches afibrd to the young plants. I have heard it by some asserted that the Cardomum like the famed Phoenix, would emerge from the ashes of any large forest tree; but these stories were uttered only by the ignorant, and are too absurd to require comment.

." The shrub continues to grow in this manner until after the early rains of the fourth year, in February, when it has reached its ut*

^{*} It is undoubtedly corrupted from **n, the Sungskrit name of the plant. Ed.

most height, which varies from six to nine feet; four or five tendrils are now seen to spring from its stem near the root, and afterwards the fruit is produced, which is gathered the following November; and requires no other preparation, than drying in the sun. The fruit is anually collected in this way, until the seventh year, when it is usual to cut it down, and from the trunk other sprouts arise, in the course of the next monsoon; which grow, flourish, and are cultivated as before. The h&sk with the seed I have called the fruit, as it corresponds with the native name. The seeds are termed the rice, and the tendrils the threads of the, plant.

"I do not hear of any varieties in the species, and now enclose you a specimen of some just given to me by the person who farms "the collection, and accounted of an inferior growth. It may not be unnecessary to mention, that this commodity yields to Government from 25, to 30,000 rupees per annum. The inhabitants use it as a general condiment to their food, and it is likewise held in sacred estimation for the purposes of sacrifice. It is constantly chewed with betle, and some medicinal properties are ascribed to it when used in decoction for complaints of the bowels. I am assured, by all, that the seeds of the Cardomum will never produce plants, and that it is only to bew propagated as alréady stated, or by cuttings."

10. A.punicea. R.

Leaves lanceolate. Spikes radical, compact, imbricated. Lip en* tire, sub-parabolic; base spurless.

A stately species, a native of *Sumatra*, from thence sent by the late Dr.C. Campbell, to the Botanic Garden near *Calcutta*, where it blossoms in March and April.

Roots har|J, and bifarious. Suckers numerous, running far under the surface of the earth.—Stems numerous, erect, or oblique, smooth, swelled near the base; general height about six or seven feet, and as thick as a slender walking cane.—Leaves sub-bifarious, short-petioled on their sheaths, lanceolate, rounded at the base, both sides smooth; from six to twenty inches long, by from three to six broad,—

Sheaths smooth on both sides, rising into a short, ciliate ligula, above the insertion of the short, semi-cylindric, proper petioles.— Spikes radical, half immersed in the earth, sub-cylindric, pretty compactly imbricated with from oblong to lanceolate, coloured, smooth, one-flowered hiactes.—Flowers large, colour a bright red, like the finest carmine.—Bractes interior, or inferior petianth, tubular, leugthof the tube of the enrol; with an unequally two, or three-toothed mouth. —Perianthproper superior, tubular, length of the tube of the corol; mouth generally bifid.—Corol with long, slender tube hid within the bractes, and perianths.—Exterior border of three, small, paler coloured, lanceolate segments. Lip highly coloured, large, entire, horizontal, sub-parabolic, the lower part broad, and encurved round the stamina; lamina linear, with entirely rounded, or slightly murginale apex.— *Filament* short, base spurless. Anther double, apex bifid, and naked.—Germ three-celled, with numerous ovula in each, attached to their respective receptacles, a little removed from the axis. Base of the Style embraced by Lvo subulate nectaries. Sligma a lamella I c, ciliated gape.

11. A. Cardamomum medium. R.

Leaves lanceolar, villous underneath. Spikes radical, lax. Lip ovate lanceolate. Capsules pedicelled, of an ovate oblong, conical shape, and nine-winged.

A native of the hilly countries in the vicinity of *Silhet*, where the plant is called Do-Keswa. It blossoms about the beginning of the rains, in June, and the fruits ripen in September, wijen they are gathered, and sold to the dealers in drugs.

Leaves petioled above their sheaths, linear-Ianceolar, downy underneath, from two to three feet long, by two to four h^hes broad.—

Sheaths villous, rising in an obtuse ligula above the insertion of the leaf.—Spikes radical, oblong, laxly imbricated, rising but little above the earth; lower part, or scape hid in the soil, and clothed with dhorter scariose bractes.—Flozcevs numerous, large, red, fragr;> -
Bractes exterior, one under each flower, lanceolate; ribbed, snage(!).

vellowish pink, interior or inferior perianth tubular, length of the proper perianth — Calyx superior, length of the tube of the corol, tubular, with three-toothed, coloured apex.—Corol; Tube cylindric, long and slender; segments of the border linear-oblong, obtuse. Lip with pretty broad cordate base, from thence tapering to its entire obtuse point, much louger than the segment of the exterior border; margins curled. —Filament,-anther, germ, style, stigma, and nectarial bodies, as in the gem\s.—Capsules pretty loug-pedicelled, ovate-oblong, while fresh above an inch and a half long, and nearly one in diameter, somewhat three-lobed, each angle marked with a larger vertical wing, and two smaller on the flatter sides, between the large ones, thiee-celled.— Seeds numerous, obovate, with a groove on one side. Integuments two; exterior soft, while fresh it may be called the succulent aril; interior white and rugose.—Perisperm conform to the seed, white, and friable, perforated by a spongy, brown substance above the embryo.—Viteltus somewhat hyaline, rising on each side of the perforation like two horns.—*Embryo* subclavate, its small end lodged at the umbilicus.

Obs. The form of the Capsule, which resembles that of Gaertner's Zinziber Ensal, and the acrid, aromatic taste of the seeds, induce to conclude that this is the plant which produces the *Cardamomum medium* of the writers on Materia medica.

12. A. luigidjjorme. R.

Spikes radical, linear, rather open. Lip linguiform, bifid; base broad, and spurless; tides incurved.

A native of the interior parts of *Bengal*, where it blossoms during the rains.

Root perennial, throwing off numerous suckers, which run both above, and ugder the surface of the earth, by which this species is soon multiplied.—Stems many, erect, or nearly so, as thick as amaja's fore-finger, smooth, from four to six feet high.—Leaves bifarious, sessile on their sheaths, lanceolate, smooth on both sides; length, from twelve to twenty-four inches, by from four to five broad-Sheaths smooth, rising little above the insertion of the leaf.—Spikes radical, solitary, the apex only rising above the soil, laxly imbricated with oblong, obtuse smooth,

exterior, and interior, one-flowered, green bractes; besides the interior proper, tubular, thin, colourless bractes or inferior calyx.—Calyx superior, tubular, length of the tube of the corol; mouth three-toothed, split quite down on one side; colour from the middle upwards deep red.—Corol; exterior border of three, sub-lanceolate, obtuse, red segments. Lip sub-lingiuform, the base broad, and axis incurved, forming an envelope for the stamen, from thence projecting almost horizontally, into a long linear, bifid lamina, with curled margins; colour yellow, with a little red down the centre.—Stamen as in the genus.—Germ hairy, three-celled; ovula many, attached to one fleshy receptacle in the inner angle. Style embraced at the base by the nectanal bodies, which are in this species bidentate. Stigma large, and red.

GLOBBA. Schreb. Gen. Plant. N. 54.

Corolla with the interior border two-lobed, or none. Filament very long, base tubular, and winged with a cruciform lip. Anther double, with an appendix, or naked. Capsule one-celled, three-valved. Seeds many attached to three parietal receptacles. Embryo simple, and furnished with both perisperm and vitellus.

1. G.rnarantina. Willd. Spec. Plant. 1. 153.

Leaves lanceolar. Spike terminal, sub-sessile, strobiliform, bulbi-ferous. Anther four-horned.

G. marantina. Smith's Exot. Bot. 2.p. 85. t. 103. Roscoe i* Trans, of Linn. Soc. 8 356.*

Lompujum silvestre minus. Rumph. amb. 5. 150. t. 64. f. Q.

A native of the *Moluccas*, and from thence introduced into the Botanic Garden near *Calcutta* by bits of the root found amongst the earth in which nutmeg and other plants were brought from Amboyna. Flowering time, in $Bengal_9$ the rainy reason.

Root perennial, consisting of many, small, oblong, fleshy tubers, united to the base of the stems.—Stems annual, about* twelve or eighteen inches high, somewhat recurved, inveloped in the sheaths of the leaves, the whole as thick as a rattan, and a little compressed.—

^{*} Ceratantheraamomoides. Hornem* Hort- Hafn- p- 5,-N- W-

Leaves bifarious, sessile on their half stem-clasping sheaths, broadianceolate, acute, smooth above, somewhat villous and whitish underneath, margins waved; length from one to six inches, the lower being. very small, and cordate.—Sheaths half stem-clasping, smooth, with semi-Iunate, projecting, bearded mouths, rising above the insertion of the leaves.—Spikes terminal, sessile, solitary, strobiliform, oblong.— •Bractes numerous, ovate-cordate, the lower half, or more, and sometimes evep the whole, have each a single, small, brownish, sessile, pointed, ovate bulb in the axil; the superior are smaller and generally embrace a single flower each.—Flowers slender, bright-yellow, and fragrant.—Calvx superior, somewhat gibbous, three-toothed.— Coro/one-petalled. Tube long, and very slender. Border double; exterior three-parted, nearly equal, oblong, concave, and reflexed; imier of two lobes, which are longer by one third than those of the exterior border, cuneate, and of a deeper yellow, reflected over the anterior two divisions of the outer border. Lip elevated on a continuation of the tube, a little above the former, consisting of two cuneate, reflected segments, united at the middle only. The upper end conti. uuedinto a very long, slender, incurved, grooved filament. Anther double, with two hornsfrom each side.—Gem beneath, round, tubercled, one-celled, ovula parietal. Style slender, as long as the tube of the corol and filament, and lodged in a groove therein. StignUi funnel-shaped.—Pericarp; I have not found it come to maturity. The little bulbs found in the axills of the lower bractes of the spike, readily vegetate, and thus the plant is abundantly propagated.

2. G. bulbifera. R.

Stems bulbiferous. Leaves oblong. Racemes terminal, erect, shorter than the leaves, bulbiferous.

Teling. Conda pooshpoo.

A native of the northern Circars.

3. G. orixensis. R.

Leaves oblong. Panicle terminal. Anther naked. Capsule verrucoae.

Is a native of the moist vallies in the northern *Circars*, and flowers during the rainy season.

Roots biennial.—Stems annual, bending obliquely to one side, as 'n 'he case with most plants of the natural order, about two or three

; : IJJ; lower partienvolved in a few simple sheaths, above with -, ot.tathing petioles of the leaves.—Leaves alternate, bifarious, ,t-y «hort-petioled, oblong, ending in a tapering filiform point, entire, s.i:»oih, finely veined; from eight to ten inches long, and from two to tour b» oad.—Petioles short. Sheaths opening on the side opposite to the ieaf.—Panicles terminal, eiect, oblong, thin, rigid. Flowers sessile, small, deep orange yellow.—Bractes solitary, one-floweied, oval, falling.—Catt/x one-leaved, mouth three-toothed.—Corol; Tube a littie curved, widening gradually to the mouth, twice the length of the calyx. Border double; exterior three-parted; upper division largest, sub-erect, concave; the other two inferior, and ovate. Interior of two, smaller, opposite, ovate lobes.—Filament very long, much curved, base tubular, and ornamented with a large, orange-coloured, two-lobed lip, or apron. Anther at the extremity of the filament, naked, double, or two-lobed.—Style embraced at the base by the two subulate bodies {nectaries ofKonig}; above the tube of the corol, it takes a curved direction like the filament, but is shorter, so that the curve is less; its end passes between the lobes of the anther. Stigma clubbed, half immersed between the lobes of the anther.— Capsule sub-globular, watery, fleshy, one-celled.—Seeds many.

4. G. Hura. 22.

leaves ovate-oblong. Racemes terminal, erect; pedicels ternthree-flowered. Anther with a membranaceous crest.

Hura siamensium. Kön. in Retz. obs. 3. 49.*
Nat* of the peninsula of Malacca.

5. G. pendula. JR-

Leaves lanceolate. Racemes terminal, compound, much longer than the leaves, pendulous. Anther bicalcarate.

• G, versicolar. Smith Exot Bob U« 116. tab. 117. a, &, c—N. W.

Found by Mr. William Roxburgh, on the Island of *Fulu-Pinang*. Flowering time the rainy season.

Root fibrous.—Leaves lanceolate, smooth, fine-pointed. Sheaths a little hairy on the outside.—Racemes terminal, solitary, compound, very long, pendulous.—Pedicels remote, diverging, generally three-tlowered.—Bractes caducous; those of the pedicels solitary, oblong, ciliate; those*of the flowers oval, ciliate.—Calyx campaimlate, three-to)thed—Corol; Tube ascending, long and slender; Border double. Three-parted, of these the upper one is concave; the other two obliquely obovate, expanding, and flat. Interior border of two, opposite, lanceolate, expanding lobes.—Filament very long, curved; base tubular and winged, with a bifid, cuneiform, yellow lip or apron, above it is grooved for the reception of the style. Anther two-lobed; each lobe bending in a long curved spur.—Germ beneath, oval. Style filiform. Stigma funnel-shaped, mouth ciliate.—I have not seen thr fruit.

6. ii. Carey ana. R. .

Leaves ovate-lanceolate, villous underneath. Racemes terminal, compound, bulbiferous.—Corol with the two segments of the inner border as long as the lip. Anther naked, suborbicular.

From *Pegue* this pretty little plant was introduced by Mr. F. Carey into the Botanic Garden *near Calcutta*, where it flowers in August.

Root tuberous, about biennial, perishing at one end, and shooting forth at the other. This may be considered the general habit of all the species—Stem's numerous, oblong, as thick as a slender ratan, about eighteen inches high, and invested in the sheaths of the leaves.—Leaves sessile on their sheaths, alternate, bifarious, from broad-lanceolate to ovate-oblong, very finely acuminate, villous underneath; about six inclies long, by two broad.—Sheaths villous on the outside, scarcely ending in any ligula, but rising a little on each side.—Racemes terminal, erect, composed of little, alternate fascicles, of about three flowers each, supported on very short, common pedicels; each of the lowermost of them produces a small, obovate bulb, and

two or three more between the racemes and the leaves. Flowers numerous, small, of a deep orange-colour.—Bractes concave, acute, one to each fascicle; and a smaller coloured one to each flower; all caducous.—Calyx superior, tubular, three-toothed, coloured.—Corolj Exterior border of three, nearly equal, oval lobes; Interior of two linear lobes, which are as long as the lip; soon after expansion they are reflected, back over the exterior border, but became involute before the flower drops. Lip a little elevated above the five segments of the exterior border, bifid at both ends.— Filament long, incurved, &c. as in the genus. Anther broad, ovate, or nearly round, with. its two polliniferous cells within, projecting at the sides a little beyond its periphery, but without any other kind of appendage, as in most of the other species.—Germ round, rugose, one-celled, containing many ovuia, attached to three parietal receptacles. Style length of the corol and filament, filiform, taking a more direct course to the anther than the groove of the filament. Stigma funnel-shaped, ciliate.—Capsule globular, size of a large marrow-fat pea, wartcd, one-celled, three-valved.—Seeds several, attached to the middle of the valves of the capsule, round-ovate, resting on a large spongy pedicel.—Integuments two; exterior firm, light brown, a little villous; interior membranaceous.—Perisperm conform to the seed, hard, and friable, even while fresh. Vitellus in small quantity, clear, lining the • inside of the upper part of the cavity of the perisperm so as to embrace the upper half of the clavate *embryo*.*

7. G. subulata. R.f

Panicles radical. Filament with a subulate wing on each side near the base; anthers semi-lunar, winged.

Found wild in the forests of *Chit t a gong* by Mr. W. Roxburgh, and by him introduced into the Botanic Garden near *Calcu'ta,in* 1801; where it blossoms in April, May, and June, during which period the new foliage also appears above the ground. There is a constant sue-

^{*} G. raccmosa. Sm. Exot. Bot. ii. 115.1.117, weems to come very near to this species and to G. drixensis.—N. W.

t G. purpurea* Andr. Repos. x. 615. Mantisia saltatoria. Curt. Mag. xxxii. 1929. - N. W.

cession of flowers from the extremities of the lengthening branches of the panicle, for nearly two months, which renders this lovely plant one of the most charming of the whole natural order that I have yet met with. The specific name is taken from the shape of the wings of the filament.

Hoot perennial, composed of numerous, diverging, fleshy fibres, sc;ne fusiform, some columnar .—Stems annual, bending a little to one side; from cue to two feet high.—Leaves alternate, bifarious, sessile ou their slicutha, lanceolate, with a long, withered, filiform point; villous on botii sides; length from six to nine inches, and about one and ahalf broad. Sheaths smooth, keeled; ligula, or stipulary. process truncated.--&ajptt radical, from three to four inches long, often several arise from the same cluster of roots, erect, euveloped in three or four, alternate, smooth, short sheaths *Panicle* erect, about a foot high, including the scape, and expanding nearly as much, the whole a very lively blueish purple. Ramifications alternate, long, simple, diverging, bearing in succession numerous, alternate, sessile, small, lovely purple and yellow flowers.—. Bractes solitary, light purple, smooth; those of the ramifications oblong; those of the flowers cordate.— Flowers solitary, sessile in the axils of iheir proper bractes.—Calyx superior, clavate, smooth, light purple; mouth three-toothed, permanent, with the lower half of the tube of the corol.—Corol; TabeXong and very slender; the lower half, which is inclosed in the tube of the calyx, projecting horizontally; the upper half erect; at the angle, which those portions of the tube make with each other, and which is nearly a right one, the flower drops, leaving the lower half to wither. Border single and three-parted; upper division erect, pressing on the back of the base of the filament, oblong/boat-shaped; lower two divisions obliquely cordate, and retlexed, all the three are of a Lip cuneate, deeply two-parted, much larger light purple colour. than the divisions of the exterior border, deep orange jellow, forming a pretty contrast with the lively purple of every other part of the panicle—Filament very long and very slender, on the first day much incurved afterwards revolute, finely grooved on the underside for the reception of the style; near the base are two, very long, slender, flat,

subulate, diverging, recurved wings. In my other six species with terminal inflorescence, these are entirely wanting, but the inner two-lob-cd border is present. *Anther* double, and enlarged at the sides with two, broad, reuiform wings.—*Germ* beneath oval, with nine longitudinal ridges, a transverse section exhibits one cell only, with numerous seeds, affixed to three parietal receptacles. *Style* most slender. *Stigma* funnel-shaped.—*Capsule* globular, purple, size of a small cherry, six-ridged, one-celled, three-valved, opening spontaneously from the apex. *Receptacle* a longitudinal ridge on the inside of each valve.—*Seeds* many, minute, oblong, villous, connected by a large, white, spongy membrane to the parietal receptacles.

8. G. spathulata. R.

Panicles radical. Filaments with a spatulate wing on each side near the base; anthers simi-lunar, winged.

This second, beautiful species, with large azure coloured, radical inflorescence, is a native of the vallies on the north and eastern boundaries of the province of *Silhet*, and from thence was introduced by Mr. M. 11. Smith into the Botanic Garden near *Calcutta*, where it flpwers in April, at which time the foliage begins to appear. At the beginning of the cold season it perishes down to the root.

Panicles radical, erect, oblong, from eight to twelve inches high; composed of many, diverging, simple, lengthening branches, every part, bracte included, of a pretty, light azure colour.—Bractes oval; and oblong, concave, a larger one under each branch of the panicle; "and one to each flower.—Flowers numerous, produced in a continued succession for several weeks on the same panicle.—Periontk superior, widening to its three-toothed mouth.—Corol; Tube long; slender, curved, and villous. Border three-lobed; lobes nearly equal and equally arranged, shape oblong, and concave. Lip as in G. subulata, but less divided; yellow, as in that species.—Fifanieni long, slender, recurved, &c as in the genus; near the base, instead of an inner border to the corol, there is a spatulate, diverging wing on each side. From its shape the specific name is taken, and readily distinguishes this species from subulate, which it very exactly

resembles when in flower. *Anther* with a similunar wing on each side.—*Germ* one-celled, containing-manjr *ovula*, attached to three. *parietal* receptacles.*

The following plantj which was omitted through an oversight in its* proper place, viz. next after Hedychium coionarium, is here inserted at the end of the natural order of Scitaminetz*

Hedychium jlavuni. R.

heaves broad-lanceolar. Spikes terminal, imbricated. Bractes* about four-flowered; interior two-segments of the coroi linear; lip obcordate, with apex deeply retuse.

A native of the vallies amongst the hills near Silhet, where it is called Rattia-rityam by the natives. Flowering time the rainy season.

Root tuberous, like that of most other Scitaminea. two or three feet high and cathor stout. - Leaves lanced at very life pointed, smooth on both sides. Sheaths mooth, with a very large, smooth membranaceous stipula rising far above the mouth minal, solitary, erect, oblong, imbricated plength six or civil inches. - Flowers numerous, large, vellow, resembling those of Frequence um, fragrant .- Bractes; exterior between evol and obling, obtuse, smooth, finely nerved, three or four-flowered, about two or two and half inches long and nearly one and a half broad. Interior, One to each flower and much smaller. Calyx superior, nearly as long as the tube of the corol, membranaceous, inflated, obliquely but or three-toothed, -- Corol; Tube stender, length of the exterior brackes all the five proper segments of the horder linear, the inner two more deeply coloured and obtuse. Lip or sixth segment, obcordate, deep ly retuse, placed on the enterior or upper side opposite to the file ment. Filament linear, and together with the two-lobed unther about as long as the lip__Germ hairy. three-sciled ovala in each, attached to the inneT angle. Style length of the co-

Receipt,

Vational Heaven

rol. Stirma large, and villous.—Capsade to binate, size of an olive, smooth, when ripe yellow, three-celled, three-valved.—Seeds a few amount, bright deep red, with a partial ragged and of the same colour.

— Embryo simple, sub-lanceolate, furnished with both perisperm and vitellus.*

SALICORNIA. Schreb. gen. N. 14.

Calyx gibbous like an aril lining the inside of the cavities of the fructification in the joints. Coial none. Sppd one.

1. S. brachiala R.

Perennial, erect; branches numerous, decussate, joints clubbed.

Spikes cylindric. Flowers conspirmons.

Teling. Quoiloo.

This seems an undescribed plant; nor can I collect what Dr. Konig thought it was. It is a sman, generally erect, percumial speci-growing plantifully on such low, wer, salt ground as is overflowed by the spring tides. Flowers at the year round. It should be compared with S. herbacea.

though sometimes at the base as thick as the little finger: from twelve to eighteen mehes high. Branches decussate, ascending, very name.

The following quotation should be added to H. Caractifolium 9.1. Fascatiff

Rot. Regis

Notwithstanding the opinion which this distinguished boranist

^^ expressed I am led to suspect that H. coccineum of Sic. I. F. Smith (leave and

Cyclopadia, in loco) is a distinct species, of which I have examined the original

drawing, left by my inestimable Bsa^and^^tatttt^^^^^^^^^^^^^^

[&]quot;In January 1816 I received roots of this most charming species from Mr. Smith at Silhet, which produced blossoms in the Paramie Garden in Detailer the fallowing year. It differs from H. coronarium, in regard to its flavory, which are about one third smaller, having the inner segments of the carol linear clavare, his lissure of the lip narrow with straight sides, and its base contracted into a linear claw. They partake not only of the yellow colour of those of integring Champara, but ossess even the peculiar fraggance of the latter, only in a less powerful and therefore more grateful degree. In stature and leaves both species are alice.

ous, divided, and subdivided in the same manner-, their extreuiitie* are the succulent, cylindric joiated spikes.—Joints of the spikes, or leaves, thick, succulent, annular, cap-like portions, that closely surround the extremities of the filiform-, woody branchtets, like beads strung on a thread; above they are concave, with two opposite elevations, the lower convex end of the next leaf above enters this con* cavity; these, elevations, like the branches, are decussated with those of the next above and below, with a ring.—Flowers conspicuous, ihree-fold, (three on each side of each joint,) opposite.—Calyx, a Aask-like tieshy substance, with a longitudinal sat for the stamen, and style; they adhere firmly to one another, and to the substance of the leaf, till the seed is ripe.—Corol none.—Stamens constantly one. Anther sagittate.—Stigma two-cleft,— Capsule, no other than the calyx now dry, which separates, and drops with its single seed.

2. S. indica. VahL enum.pl 1. 10.

Perennial, diffuse ; jpints gibbous. Spikes cylindric tjbwers hid* Beng. Jodoo Palung. •

Teling. Quoia-pipaly.

This is also very common, and grows with the former on similar ground.

Stems and large branches woody, diffuse over an extent of some feet; the latter sometimes alternate, sometimes opposite, thtise that are young, and covered with the leaves are ascending, or nearly erect.

—Joints, or leaves longer than in the former species, but in other respects the same. Floral joints or leaves, very short.—Spikes-ietmi' nal, cylindric, erect, obtuse.—Flowers inconspicuous, opposite, three-fold, hid Jpy the upper margin of the next floral leaf below.—Calyx as in the former.—Stamen; in the species I have never been able to tiisgdver even the rudiments of one.—Pistil, &c. as in the former.

Ota Cattle will not eat these plants, although their taste is simply saltish. These two species are very plentiful ou ihe coast of *Coio*-

mandel, where large quantities of the fossil alkali might no doubt be made at a low rate. Such manufactures deserve much encouragement, particularly here, where there are many more labouring people* than can possibly find employment. Large quantities of this substance are annually imported into England from the Mediterranean, for making soap, glass, &c. It is worth about twenty-eight or thirty shillings per cwt. and as labour is cheap on this coast, the alkali might be made, I think, at so low a rate as to admit of its bein r sent to r sent to r land, and paying a freight of r loc£. the ton, or more; provided it could be-there importedduty free.

^{*} This was written before the famine of 1791,2, and 3; the case is now (1791) different, as fully half, if not more of the labouring classes were carried off by that deplorable calamity.

* it but in a cultivated state; and it M always raised from seed, which may be the reason we have no varieties of this most delightfully fragrant plant. In our gardens it is found in the state of a large shrub, or small tree. Flowers, on the Coast, nearly the year round; in *Bengal* only during the rains. The seeds ripen in the cold season.

2rw*&erect. Bark scabrous. JBniwcAes numerous, spreading in every direction; tha young shoots alone are four-sided; four ligneous, cord-like nerves, tinder the bark, forming the angles.—Leaves opposite, short-petioled, cordate, those near the flowers oblong, pointed, sometimes entile, sometimes very grossly serrate, and sometimes the

^{*} At Napaul, Baleeja Soah; Soa, Soang and Swa being synonymous terms in that country ${\bf f}_{0r}$ JF/OMKT.-N. W.

lower parts are angular; scabrous; from three to five inches long, and from one to three broad.—Inflorescence a large, terminal, leafy, crossarmed, panicle, composed of small, five-flowered, terminal umbel* lets.—'Flowers numerous, middle-sized, exquisitely fragrant, open at sun-set, and fall off at sun-rise; the tube orange-coloured, and the border white.—Involucre to the umbellets four-leaved, leaflets inverse-cordate, opposite, sessile.—Calyx campanulate; mouth a lit* tic contracted, and lightly live-notched, downy, withering.—Corot. $i \mid ibe$ cylindric, length of the calyx. Border spreading, from five to eight, but generally six or seven parted, contorted; segments triangular, or obliquely lobed, exterior margin scolloped.—Filaments scarcely any-Anthers two-lobed, sitting within the tube.—Germ above, compressed. Style length of the tube. Stigma headed, glandular.—Capsule size of a man's thumb nail, obcordate, or nearly orbicular, compressed, two-celled, two-valved, opening transversely from the apex.—Seed* one in each cell, compressed, &c. as described and figured by GOBI tner; I have not, however, been able to detect any thing like a periffpenn.

Obs. The flowers of this tree are exquisitely fragrant, partaking of the smell of fresh honey, and on that account the plant is much esteemed; for when destitute of flowers it has but an Indifferent appearance.—The orange tubes of the flovveis dye a most beautiful buff ororange colour, with the various shades between them, according to the preparation, and mode of conducting the operation; but unfortunately, no way has yet been discovered of rendering this elegant colour durable,

JASMINOM. Schreb. gen. N. 22.

Carol salver shaped. Germ two-celled, one seeded.* berries one or two, superior. Seed solitary. Embryo erect, without perispenn*

• In ail the species hereafter mentioned, there is a two-lobed, twfiheelled ipmfc with one seed in each, attached to the upper end of the partition; and succeeded by two one-seeded berries, when both come to maturity.

Flos Manor* plenus. · Rumph. ibid.

Septala. As. Res. I. c.

All the varieties flower during the rains chiefly.

The single variety of this plant, (which Is the one described,) is one if the most common in every forest on the Coast'. Birds eat the \mathbf{b}_{er} ries, and drop the seeds, which vegetate. In this way, I account \mathbf{f}_{Or} its being so general. Flowers during the hot season.

Stem and branches woody, twining. Bark scabrous on old plants. "^teaves opposite, short-petioled, cordate-ovate, or oblong-waved, sometimes scolloped, pointed, smooth, except when young; in the Uxil*oftheveinsoin the back of the leaves there are tufts of down,

as in some species of *Gardenia*—Flowers* terminal, generally forming small, trichotomous umbellets, white, fragrant.—*Calyx* boiled with from five to nine, long, subulate, permanent segments, A' *ma* clubbed. *Germ* two-lobed, one *ovulum* in each, attached to lower part of the partition—ifemoLtwin; each round, amooUi, juicy, one-seeded, when ripe of a beautiful shining black.—*Seed* conform to the berry; integument single.—*Perisperm* none.—*Embryo* erect.—*Cotyledons* conform to the seed.—*Radicle* small, inferior.

Obs. From this species we have the common double; and rose, or great flowered, and full *Moogaries*, (Arabian, or Tuscan Jasmines;) these are always raided from layers, and have becu inijjioied by caituve into their present stale a* atyve noted.

The plant tjiat bears *the common double sort still retains its twining habits, but it is lost in the great rose, or full flowered so; here the branches are erect, or spreading, but never twiniiy.

I am inclined to think that *Nyciatilkes undulata*, *Sp. PJ*₉ 2. *p.* S. is only a variety of this species, arising from oil, culture, &<. for with the utmost attention I could never discover any thin fixed specific character to distinguish it from Zambac, as the numb** of petals or divisions of the corol are inconstant, and almost mark. oily the variety,

2. J. sçandens. Willd. 1. 37.

Shrubby, twining, and scandent, smooth. *Leaves* opposite, simple, cordate-oblong, entire, taper-pointed. *Corymbs* terminal, globular, Irichotomous. *Calycine* segments six or seven, bristle-shaped, of the corpl six to eight, lanceolate, very acute, nearly the length of the clavate tube. *Stigma* bilobate.

Nyctanlhes scandens. Retz. obs. fasc. 5. p. 9.

A native of the southern parts of *Bengal*. The plants in the Botanic Garden near *Calcuttawere* reared from seed sent *from Chitta~gong;* which after they were two years old began to blossom in January and February, and continue so to do, but have not produced. good seed.

Trunk none, but many, 1U*J₅; i_{J£>1}..u.^ at first scandent, butfinal-Iv twining, round, smooth branches of considerable extent.—Leaves nple, opposite, short-petioted, cordate-oblong, tapering from near J somewhat re-entering base, fine-pointed, entire, smooth, and rawer lucid on both sides; length from one to six inches, and from half an inch to two inches broad.—Petioles Uattened, channelled.— Corymbs itrujinal, sub-globular, dense, that which terminates the larger branches nu>'>. compound. *Peduncles* short,* with the *pe*dicles still shorter, all ar: viUous.—Flowers numerous, pure white, delightfully fragrant.—Calyx villous, border of six, or seven, brisile-*haped, spreading, villous segments.—Tube of tile coroji widening to the mouth, and more than twice the length of the segments of the cal\x. Border of from six to eight, lanceolate, acute segments, Mrliich are rather shorter than the tube.—Germ turbinate, two-celled, wilh one seed in each, attached to the thickened middle of the partition.

3. J. elongatum. Linn. Spec. PL ed. Wild. 1. 37.

Scandent. Leaves opposite, and alternate, lanceolate, viHous on botli'sides. Corymbs terminal Corol eight or twelve-cleft; segments linear. Sligma bifid.

Nyctanthes elongata. Linn, suppl. 82.

A native of the forests about *Hidgelee*, near the mouth of the ioogly in *Bengal*. Flowering time the beginning of the hot season.

PStem woody, jstraggling to a considerable extent, or climbing.

**wft of the woody parts light ash colour; of the young shoots very

Pilous.—*Leasx** opposite, and alternate, short-petioled, from lan
**eolate-to ovate-lanceolate; very soft with fine down in both sides;

**ength from one to five inches.—*Ftowen terminal, from simply tern

"*£ a large compound corymb, pretty large, pure white, fragrant.—

edicels clavate, villous.—*Bractes** short, subulate, villous.—*Calut**

louis. Short** Short** and subulate.-r-CW. Tube

Aell towards the mouth, greatly much than the calyx. *Bordir**

of from six to twelve, linear, spreading divisions with margins revolute.-7-Fifajnent* short. Anthers lodged just within the mouth of the tube of the corol.—Genn turbjnate. Style so long as to elevate ^{fl} * two-lobed stigma so as 10 make it level with the anthers.

O6s. The species differs from my *arforescens* in being scan, in the shape of the leaves, as well as in the pubescence; he tuttf ere lanceolate, and very villous; there cordate nml *'«'?otE.

4. J.pubescem. Linn. Spec. PI- «rf.-i-«Vu. 1. 37-Leaves cordate, downy. \Umbeh terminal, sessile many-floweredr Katu-Tsjiregam-Mulla.. F "I. 6. p. 95. 1. 54.

nute or wanting. Border of the calyx with five, obscure, glandular teeth. Gorol &:"en-cleft. Berries globular.

Sam- STHreft. Magudhee, Jifrwu, Gwnika, gffcffii, Yoot'hika, Washing Company C

Beng. Jut'hi, or Jui.

Thi9 species is a native of various parts of India, but not common/ Its habit 14 ivw-'ing, with a woody stem, and branches.

Leaves opposite ternate. Leaflets, the pair very small, standing opposite, sometimes w& inf; the terminal one at least ten or fifteen times larger; all ovate, entire, Vith a minute point, smooth, except when young when they are downy.—Corymbs terminal, always three forked, dense.—Flowers small, white, sweet-smelling, though less fragrant than those of the former specks.—Calyx five-notched, with a found firm glandular process on the outside of each.—Corol; border from five to eight-cleft, divisions oblique, obtuse. Stigma clavate.—Berry exactly as in Sambac.

15. J. lanceolaria. R,

Shrubby, erect. *Leaves* ternate; leaflets lanceolar. *Corymbs* terminal.

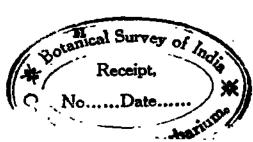

A native of the jungles or copses of Silhet, where it blossoms in May.

16. J. paniculatum. R»

Shrubby, erect, every part polished. *Leaves* ternate; leaflets oval, °btuse!y acuminate. *Panicles* terminal.

Sam-yeip-son-hing of the Chinese.

From Canton in China this fine erect, shrubby, highly polished species was received into the Botanic Garden, where it blossoms curing the rains. The leaflets are from oval to oblong, with an obtus point, polished, of a hard texture. The flowers are small and water but numerous, on terminal pretty large open, brachiate panicles.

17. J. chrysanthemum. R.

Shrubby, erect. *Leaves* alternate, pinnate; leaflets three, fi,ve, or seven, lanceolate. *Corymbs* sub-terminal. *Calycine segments* attenuate.

Hemapushpica, or yellow yuthica. As. Res. iv. 246.

Sans. ^HUftmJj Hema-pooshpika.*

A native of the mountainous countries *north of Hindoo^ap^Colo-*nel Hardwicke found it on his Journey to Sirinagdre, {see As. Res. vi. 349. Jasminum, No. S.) and Dr. Buchaij^a in *tiapauh* In the Botanic Garden it grows freely from 'Killings, and becomes a stout, erect ramous shrub, even a small tree, without the smallest tendency to lean, or twine. Flowers more or less the whole year; but, like the other species, the proper season is April and May, at which time it is the most desirable *Jasmine* I have yet seen.

Stem stout and woody, in plants seven or eight years old as thick as a man's leg. Bark smooth ash-coloured. Young shoots erect, flexuose, angular, smooth; height of the shrub from eight to twelve feet.—Leaves alternate, unequally pinnate; at the base of the young shoots ternate or even sometimes solitary. Leaflets two, or more generally three pair, and a terminal one; opposite, lanceolate, smooth, dark green, but not glossy; length from one and a half to three inches-'—Corymbs generally terminal, from ten to twenty-flowered, as in the figure of Jasminum odoratissimum, in Curtis's Bot. Mag. No. 285. —Flowers large, bright yellow, delightfully fragrant.—Bractes ensiform.—Calycine segments five, alternate, nearly as the tube of the calyx.—Segments of the corol five, oval, obtuse, length of the tube.— Anthers linear, with their apices rather above the Filament short. mouth of the tube of the corol.—Gem two-celled, with two ovula in each, attached to the middle of the partition. Style half the length Stigma clavate. of the tube.

18. J. grandiflorum. Linn. Sp. PI. ed. Willd. 1. 41.

Shrubby, scandent (in India). Leaves opposite, pinnate; exterior three or five leaflets confluent. Peduncles terminal.

Sans, g j j ^ Soonwiia, JH^fcl, Malutee, STRff Jatl-

Beng. Jatee.

This plant I have only found in gardens, where it flowers greater part of the year.

19. J. faterophylfum. R,

Shrubby. *Leaves* alternate, petioled, simple, sometimes ternate, ^vate-lanceolate, waved, lucid, finely acuminate.

A stout shrubby species, a native of *Napaul*. In the Botanic Garden its branches are weak and variously bent; the bark roughened with little elevated gray spots. While the plants are young the leaves are for the most part temate, afterwards they are simple.*

20. J. dispermum. Wall.

Shrubby, scandent, smooth. *Leaves* opposite unequally ternate; *leaflets* ovate-oblong, acuminate, five-nerved. *Corymbs* terminal and lateral, brachiate.—*Calyx* campanulate with subulate teeth. *Segments* of the *corol* oblong obtuse. *Berries* twin, two-seeded!

A native of Napaul, where it is called Gooje-Soah.

It appears to be a ramous rambling shrub, with slender, four-sided, dotted, divaricated branches.—Leases distant.—Leaflets membranaceous, rounded and sometimes slightly retuse at the base, tapering into a long acumen; besides the short five-nerves at the base, there are a few remote subtransversal ones from the rib, which all unite into a waved submarginal vein. The terminal leaflet is about four inches long; the others three-times smaller, subsessile.—Petioles slender-grooved, curved, an inch long, not articulated.—Cofymbs ovate, with opposite, four-sided, three-flowered peduncles; and two opposite subulate bractes at their base.—Flowers large fragrant, white. Tube clavate, about an inch long. Border five-parted,

^{*} This shrub has been in the garden about sixteen years, without bavins as yet Produced any flowers,-N. W.

half the length of the tube.—Berries about the size of a small olive, of a dark purple colour; their skin separating, transparent.

Obs. In March 18181 received specimens with flowers and ripe berries from the Honourable Mr. Edward Gardner, the resident at Katmandu in Napaul, to whose unremitting kindness and exertion? the Botanic Garden owes a very great accession of the most, i ar£ and curious plants, natives of that interesting country. "T&is handsome species is very distinct from the preceding one, bwt seems to approach to J. didymum, Forst. and J. divaricatum, Brown Prodr. i. 521.

PHILLYREA. Schreb. gen. N. 24.

Calyx four-toothed. Corol one-petalled, four-cleft. Germ two-celled, two-seeded. Drupe or Berry superior, one or two-seeded. Embryo inverse, and furbished with a peris perm.

1. P. paniculata. R.

Arboreous. Leaves opposite, ovate-oblong, entire, smooth. Panicle terminal.

A native of *China*, and from thence introduced into the Botanic Garden near *Calcutta*, before 1793. Now, 1802, they have grown to be beautiful small trees, of from fifteen to twenty feet in height, clothed almost to the ground, with numerous, opposite, spreading, and drooping branches, covered with smooth, ash-coloured bark*

Leaves opposite, petioled, drooping, ovate, and ovate-oblong, sides incurved, entire, leathery, smooth on both sides, above a shining deep green, underneath glaucous, with two or more obscure gland's near their base: length four or five inches, breadthfrom two to three—Petioles short, recurved, channelled.—Stipules now.~Panicles terminal from the exterior axills, ramifications thereof opposite, and smooth.-Flowers very numerous, rather small, pure white, somewhat fragrant—Brae^ minute, caducous—Calyx obscurply fotirtoothed—Coro/one-petalled; tube short; segments linear, revolute, tmooth.-Filaments opposite, inserted into the bottom of the tube

ofthecorol, and about as long as the segments of its border. Anthers incumbent.—Germ above, but lodged defep in the bottom of the calyx, two-celled, with two ovula in each. Style short. Stigma elavate, entire.—Drupe size of a small French bean, obliquely obovate, smooth, generally one-celled.—Nut solitary, with the rudiment of a second, but I never saw more than one come to maturity 5 poipted at the base, furrowed on the outside, covered, with a thick, somewhat indurated envelope, though scarcely hard enough to be called a nut. Embryo inverse, lodged in a pearl-coloured amygdaline perisperm-

0.6. Ligustrum Japonicum. Thunb. Flor. Japan. P. 17- F. 1. is a tolerably good representation of this tree; but the one-seeded nut, short style, and elavate stigma of my plant, will not allow me to think they can be the same.

2. P. robusta. R.

Leaves ovate-oblong, entire, acuminate. Panicles terminal, large and spreading. Berries sub-cylindric, one-seeded.

Bhooeimoora, the vernacular name in *Silhet*, where it grows to be a very large tree, and furnishes the natives, &c. with very hard durable wood. Flowering time June and July j the seed ripen in January and February.

Young shoots void of pubescence, but dotted with small whitish specks.—Leaves opposite, short-petioled, ovate-lanceolate, acuminate, entire, smooth; three or four inches long, and one or one and a half broad.—Panicles terminal, large, very ramous; ramifications four, round, and villous.—Flowers oblong, acute, villous.—Calyx bowl-shaped, four-toothed.—Coro/ campanulate. Tube very short; border four-parted_Filaments short, inserted on the little tube of the corol opposite to each other. Anthers oblong.—Gem superior, depressed, two-celled, with two ovula in each, attached to the top of the partition__Style and stigma elavate, apex flat and emarginate.—Berries (for they can scarce be called drupes) sub-cylindric, smooth, succulent, dark olive-purple, size of a large berberry, rarely more than one-celled.—Seed solitary, conform to the berry. Integuments

two • exterior fibrous, and striated: interior rather thick, brown, adhering to the perisperm.—Perisperm conform to the seed, oily.— Embryo straight, nearly as long as the perisperm, inverse. Cotyledons lanceolate. Radicle cylindric, superior.

MILLINGTONIA. R.

Calyx three-leaved, calycled. Corol three-petalled, nectarial scale on the inside of each. Germ two-celled, two-seeded. Drupe with one, or two-celled, two-valved, nut seed solitary. Embryo curved and folded, with little or no perisperm, and with a curved inferior radicle.

Having found it necessary to deprive our countryman the late Sir Thomas MiUington of the genus assigned to his memory by the younger Linneus, (SupL 45 and 201) because, on finding the ripe seed vessel of the only species thereof, I ascertained it to be: i true Bighonia as I suspected; I have therefore restored that respectable name to the system, under a different dress, by giving it to the two trees which at present constitute this strongly marked family, and, which I am inclined to think, have not, until now, been described.*

1. M. simplicifolia. R_m

Leaves alternate, simple, broad-lanceolate.

A large tree, a native of *Silhet*, where it is called *Dantrungee* by the natives; the timber is used for various purpose. Flowers in February and March; seed ripe in July and August.

Leaves alternate, petioled, broad-lanceolar, tapering most toward the base, entire, or very remotely subserrate, in very young plants completely serrate, rather acuminate, smooth; veins simple and parallel; from six to twelve inches long, by three or four broad.—Panicle terminal, large, oblong, rather open, composed of many, alternate decompound, long, patent, brown, villous branches.—Flowers numerous, sessile, very minute, yellow—Bractes obloiig, clothed with

^{*} Millinftonia.Donn. Hort, Cantab, is Roxburgh's JRm*VM.-N. W.

ferruginous pubescence.—Calyx three-leaved, independently of two or three minute, villous bractes, like a *calycle*; leaflets ovate, smooth, permanent.--.Petals three, broad-ovate, waved, twice the length of th© calyx, permanent.—Nectary a variously lobed, smooth scale from the base of each petal on the inside, they form a dome over the pis* tilhim, and round the base of the germ is found a flat, triangular body, with its angles bidentate.—Filaments two, opposite, incurved, inserted without the interior, three-angular nectary; bifid, the in* ner lamina supporting on its apex a patelliform receptacle, on which the two-lobed vellow anther rests. Exterior lamina bifid, segments subulate, rising rather higher than the anther.—Germ superior, twocelled, with two ovula in each, attached to the thickened middle of the partition. Style single, short Stigma obscurely two-lobed.—Drupe size of a pea, nearly round, succulent, smooth, black, one-celled. Nut conform to the drupe, rarely more than one-celled, hard, cell somewhat angular; the second or abortive cell always traceable.—Seed solitary, concave on the side next the abortive cell of the nut, hemispheric on the other. Integument single, membranaceous.—Perisperm none.—Embryo curved, and doubled, as in the Convolvulaeea with a curved inferior radicle.

2. M. pinnata. JR.

Leaves alternate, abruptly pinnate; leaflets from six to twelve pair, sub-opposite, lanceolate.

Batiwa, the vernacular name in $Silhet_f$ where it in indigenous, growing to be a middling sized tree, the wood'of which is employed by the natives in constructing their houses. Flowers in April and May. The seeds ripen in September.

Branchlets smooth.—Leaves alternate, abruptly-pinnate; from six to eighteen inches long. Leaflets from six to twelve pair, sub-opposite, short-petioled, lanceolate, remotely serrate,, acuminate, smooth, we e to six inches long, by one or one and a half broad.—Panicles terminal, very large and very ramous, a little hairy.—Bractes minute.—
*fa®ers numerous, small, white.—Calyx three-leaved with two smaller ones under thsm, which may be called bractes or a calycle; or,

the calyx may be called five-leaved,—*Nectary*, from the inside of the base of each petal arises a variously lobed, ragged ! which is incurved over the germ; besides which round the of the germ is a small, three-sided cup with bidentate angles, laments two, opposite, length of the germ, short, broad, with enlarge ed apex; from the base on the outside; rises a broad, tridentate scale, of about the length of the filament. Anthers twin, each lobe globular. opening transversely on the inside.—Germ superior, cordate two celled, with two ovula in each cell, attached to the partition. Style short. Stigma small, bidentate.—Irrupe size or a pea, smooth, black, and very hard rugose, one celled, two-valved, with a projection into the cell opposite to the remains of the style on one side near the base, which marks the abortive lohe. Seed solitary, conform to the nut. Integra-TOCHE single, menturanacciono. - A cresperio none, un un susse quante ty, and blended with the integument. Embryo curved, and folded up nearly as in the Convoloulacea. Cotyledons ovate-oblung. Rudicle inferior, curved

OLEA. Schreb. gen. N. 25,

Corol and calyx four-cleft. Germ two colled, two seeded. Drupe superior, one-seeded. Embryo inverse and furnished with a periosperm.

1. O. fragrans. Linn. Sp. Pt. ed. Willd. 1. 4. 6.

Shrubby. Leaves oblong-lanceolate, slightly somete. Pedandes axffiary^

Olea fragrans. Thunb. Jap. 18. t. S. good,

A native of China, in the Botanic Garden it blossoms during the cool season.

2. O. paniculata. R.

Leaves exposite, petioled, oblong, entire, smooth. Panicles exillery. Bractes deciduous. Lobes of the stigma divaricate.

A small tree; a native of the *Circar* mountains. Flowers during the hot season.

Leaves opposite, petioled, oblong, waved, entire, running down the petiole, smooth on both sides, firm, about five inches, long, and two broad.—Petioles an inch and half long, smooth, flat above.

—Stipules none.—Panicles below the leaves, and also from the axiUs, small, thin, brachiate.—Bractes small, nearly sessile.—Calyx four-cleft, small.—Corol one-petalled; tube shorter; border four-cleft; divisions oblong, spreading, concave; apices sharp and incurved.—Filaments two, opposite, short. Anthers large, oblong, erect.—Germ superior, round*—Style very short. Siigma two-cleft; divisions entire, acute. Ripe fruit not observed.

3. O. dioica. R.

Arboreous, dioicous. *Leaves* opposite, short-petioled^ oblong, serrate. *Panicles* axillary.

Atta-jam, the vernacular name in *Silhet*_j where it is indigenous; also on the hills of *Chittagong*. In both places it grows to be a pretty large tree, the timber of which is reckoned excellent, and put to many uses, by the natives. Flowering time the month of March and April; fruit ripe in JWy.

Bark of the old ligneous parts ash-coloured; of the young shoots smooth and green.—Leaves opposite, short-petioled, oblong, tapering equally at each end, remotely, and acutely serrate, acuminate, smooth, from four to eight inches long, by from two to four broad.—Stipules, the oval concave scales of the buds only.—Panicles axillary, and opposite, below the leaves, thin and not above half their length.—Male flowers more numerous, small.—Calyx four-tppthed.—Corol one-petalled, tube very short; border four-parted.—Filaments two, very short, inserted on the short tube of the corol. Anthers oval, hid in the corol.—Germ none, a small two-lobed gland supplies its place.—Female on a separate tree, (probably HERMAPHRODITE, and in that <*se, all the corols with the stamina, must have fallen off at a very

CIIIOX1ANTHUS. Schreb. gen. N. 26.

Calyx four-parted. Corol one-petalled; segments long. Germ two-celled, two-seeded.—Drupe superior, one or two-seeded. Embryo inverse without perisperm.

J. C. ramtflora. JR.

Arboreous. *Leaves* opposite, broad-lanceolar, entire. *Panicle* below the leaves.

A native of the *Moluccas*. Flowering time March and April. Seed ripe in September.

Trunk erect, bark smooth, ash-coloured; branches opposite \young shouts smooth, and round.—Leaves opposite, pelioled, broad-lanceolar, entire, acute, smooth on both sides; length about six inches.—
Petioles channelled, smooth, about an inch long.—Panicles opposite, from the naked branches below the leaf-bearing shoots, ovate, b. achiate, much longer than the leaves, smooth in every part.—
Mowers numerous, small, $ye \mid \mid ov$.-Bractes opposite, lanceolate.Calyx four-parted.-Coro/ to the base four-clef, consequently there is Imle or no tube, segments of the border lanceolate, *ith incurved m a r g m s . - i ^ short and thick, inserted both on the base

of the corol and the receptacle. *Anthers* a poleniferpus groove on each side of the short, thick filaments.—*Style* scarcely any. *Stigma* four-lobed.—*Drupe* oblong, one-celled,—*Nut* oblong, striped, one-celled. *Perisperm* none. *Embryo* inverse. *Cotyledons* conform to the seed.

2. C. Zeylanica. Liw. Sp. PL ed. Willd. 1. 47.

Leaves (opposite, short-petioled, obovate, entire, smooth. Racemes axillary, often compound; flowers ternary. B/actes ovate,

Linociera purpurea. Vahl. En. PI. 1. 47.

Said to be a native of Ceylon.

3. C. dickoloma. R.

Shrubby, dichotomus. Leaves cuneiform-Ianceolar, recurved, entire. Racemes axillary; pedicels three-flowered.

Native place *CoromandeL* The Asiatic synonima are uncertain. Flowering time in the Botanic Garden the month of March.

Trunk short; bark dark ash-coloured, with many, elevated, lighter coloured specks. Branches dichotomous throughout, yery numerous; height of the shrubs in the Botanic Garden, about seven feet in seven years.—Leaves opposite, short-petioled, broad-cuneiform lanceolar, entire, rather obtuse; surfaces smooth, texture hard; three inches lbng by one broad.—Racemes axillary, solitary, scarcely half the length of the leaves. *Pedicels* sub-opposite, diverging, three-flowered.— Flowers small, white, inodorous.—Calyx four-parted; segnients ovate, obtuse, villous.—Corol, the segments can scarcely be said to be united at the base, except by the filaments, which are inserted on the bases of two, and in lha⁴. manner form two pair of segments; they are Nearly exact, taper a little, and have their margins much incurved.— Filaments two short/ Anthers largo, with bifid apex.—Germ fouraided, ovate, two-celled, with two ovula in each attached to the middle of the partition. Style short. Stigma obscurely two-lobed.-^-Drupe superior, oval, or short obovate, size of a black current, so culent, when ripe purple, one-celled.—Nut obovate, rather thin, and

tender, tnaiked with four ribs from the apex to the base, with feet small, imperfect ones between, one-celled.—Seed solitary, coiiforfix to the nut. Integument single, thin, and tender.—Perisperm none* Embryo inverse. Cotyledons conform to the seed.—Radicle pat^' liform superior.

4. C. i smilacifolia. Wall.

Shrubby, scandent, with four-sided branches. *Leaves* oval, acuminate, three-nerved, gloucous. *Panicle* terminal and a.\iil\rightarrow ra* mous, brachiate.

A native of the forests of *Chittagong*, where it is called *Chunala*ta. In* the Botanic Garden it blossoms in April.

A rambling ever green ramous shrub, with ash-coloured separating bark.—Branches long and slender, acutely and exactly four-sided, as well as the other parts of the plant gloucous, smooth--" Leaves opposite, spreading, petiole'd, live to seven inches long? about three inches broad, acute at the base, firm and leathery, upper surface undulated (bullate) between the principal vessels, nerves an? rib much elevated on the pale under surface, and uniting a little above the base; veins a few, reticulated. There are two additional very thin nerves originating at the insertion of the petiole, which together with the preceding larger ones run along the margins of the leaf, forming two arched sub-marginal veins on each side.—Petiole⁸ scarcely an inch long, round, channelled above, articulated at the base.—Stipules none.—Panicles short-peduncled, pyramidate, acuminate, ramous, brachiate, about the size of the larger leaves—" Peduncles four-sided, much sub-divided, the upper ones sub-alternate; pedicels pubescent, slightly flattened.—Bractes lanceolate, very small, deciduous, opposite under each subdivision of the panicle.—Flowers small, almost scentless, ternate, sessile, smooth, greenish yellow.—Calyx urceolate, inferior, with four lanceolate acute erect, purple-margined teeth.—Carol infundibulifonn, somewhat fleshy. Tube twice as long as the calyx, large, obscurely foursided. *Limb* four-parted, longer than the tube, spreading; divisions linear clavate, equal, contracted at their base, thickened blunt and slightly'vertical at their end. *Mouth* shut up by the anthers.—filaments two subulate, inserted above the base of the tube.—*Anthers* flesh), with marginal cells, erect, scarcely elevated above the tube, between two opposite fissures of the border.—*Ovarium* ovate, two-celled; ovula solitary inserted at their base.—*Stifles* {Stigmas?} two, subulate, acute, parallel, very short.

Obs. This elegant shrub was introduced into the Garden in 1811, and commenced blossoming five years afterwards. Not having observed a single fruit I am doubtful of its identity with Chionanthus, under which however I have ad interim placed it. The erect position of the ovula seems to indicate that it belongs to the family of Jasmuiea, as limited by Mr. Brown in his matchless Prodromus Flora Nova Hollandia; in which case it may perhaps be found to constitute a new genus. The aestivation of the corol is yalvate.—N. W.

SCHREBERA. JR.

Calyx bilabiate. Corol salver-shaped. Capsule superior, turbinate, two-celled, two-valved. Seeds several, membrane-winged.

S. smetenioides. R. Corom.pl. S. N. 101.

Teling. Mucaadi.

Tarn. Mogalinga maruni.

A large timber tree, a native of vailies over the mountainous parts of the *Raja-mundri Circar*, *Balaghata* mountains, 8cc. Flowering time the beginning of the hot season.

Trunk erect. Bark scabrous. Branches numerous, spreading in every direction, so as to forma large beautiful shady head.—Leaves Nearly opposite, petioled, pinnate with an odd one, about a foot *ong. Leaflets, three or four pair, opposite, short-petioled, the lowermost largest, and obliquely-ovate, or cordate, while those towards the apex become narrower; all are entire, pointed, smooth on on other inches, and about three or four inches long.—Petioles round, smooth.—Stipules none.—Panicles terminal, thin, trichotomous.—Bractes small, caducous.—Flowers rather small, white and brown

variegated, very fragrant during the night.—Calyx beneath, Jubular, somewhat two-lipped; lips nearly equal, emarginate, sometime there are two lateral toothlets, one on each side in the fissures which separate the lips.—Corol one-petalled, salver-shaped. Tube cylindric, three times longer then the ca^Tyx. Border spreading, divided into fivd, six or seven cuneate, truncate segments.—Filaments two, short, inserted below the middle of the tube. Anthers oblong, hid within the tube of the corol.—Germ above, oval. Style a little longer than the tube. Stigma bifid.—Capsule large, pear-shaped, size of a pullet's egg, scabrous, very hard, two-celled, two-valved, opening from the apex.—Seed four in each cell, they are irregularly oval, and compressed, with a long membranaceous wing^

06*. The wood of this tree is of a grey colour, very close-grained, heavy and durable. It is reckoned less subject to bend or warp than any other hereabouts; on which account it is employed by weavers in many parts of their looms, particularly the beam. It is also used for a great variety of other purposes.

I am inclined to think it would answer well for scales to mathematical instruments; it does not look so well as box, but its not being subject to warp may render it fitter, though not so handsome.

ERANTHEMUM. Linn. Flor. Zej/l. 15.

Calyx five-cleft. Corol hypocrateriform; border regular, or nearly so. Filaments' four, two of them sterile. Capsule two-celled, two-valved, bursting with elasticity opposite to the partition.

• I.E. montamtm. R.

Shrubby, diffuse. Leaves oblong, acute. Spikes terminal. Bractes linear, hairy. .

Justica montana. R. Corom. PL 2. N. 176.

A small, straggling, jointed, under shrub; a native of the *Circar* mountains, flowers during the cool season.

Stems many, striated, jointed, smooth, leaning on the ground, and rooting at the joints, young shoots four-sided.—Leaves opposite,

petioied, oval and oblong, pointed, running down the petioles, from three to four inches long, and about two broad.—Spikes many, terminal, erect, slender. Peduncles four-sided.—Bractes exterioi opposite, decussate, linear acute, hairy, one-flowered. Jiracleoles two to each flower, pressing laterally the calyx, and like the exterior, vhut much smaller.—Flowers opposite, solitary, decussate, very pale blue.—Califx five-parted; segments subulate.—Coral willi a very long, and very slender tube, border of five equal obovate truncate, pale blue segments.—Filaments short. Anther*single/oblong, within the tube of the corol—Style length of the tube of the corol. Stigma unequally bifid, appearing just without the tube.—CV"'e linear-oblong, compressed, pointed, tyvo-celled, two-valved, opening across the partition, with an elastic jerk.—&ecfc two in each, compressed.

2. E. pukhel/um. Andrews. Repos. vol. ii. 88.

Shrubby, erect. *Leaves* ventricose-oblong. *Spikes* terminal, imbricated. *Bractes* ovate-oblong.

Juiticia puhhella. Roxb. Corom. Pi. a. No. 177.*

Justida nervosa. FdhL En. PL 1. 164.

Beng. Kalla-JatiJ

Hind. Gool-sham.

A most beautiful, stout, flowering shiub; a native of dry, uncultivated, shady places, over various parts of India, flowering time the cold season. It is generally in its full beauty in February.

Stems many, erect, and ascending, or nearly so; two or three feet high. Branches many; young shoots four-sided, smooth.—Leaves opposite, short-petioled, oblong, waved-, pretty smooth; from six to "e inches long, and from three to four broad; tjiey are of a much deeper and brighter green than in E. montana, *which this resembles niost—»*Spi7ces terminal.—Bractes disposed as in the former, but larger, broader, ciliate, and much nearer to each olher.—Flown dis-

posed as w the former but larger, and of a deep bright blue purple colour.—Capsule and seeds as in E. montana.

3. E. suffruticosum. R.

Shrubby, erect. *Leaves*, ovate-oblong, smooth. *Spikes* terminal; bractes wedge-shaped, naked. *Stamens* within the tube.

A native of the *Andaman* islands, from thence several plants were brought to the Botanic Garden, by Colonel Kyd; and are nowf (March 1797) in blossom. It is a small shrub, and of slow growth-

Stem and branches sub-erect, jointed; the younger somewhat four sided and a little hairy—Leaves opposite, shurt-petioled, oblong, and ovate-oblong, somewhat repand, smooth on both sides.—Spik& terminal, flowers opposite.—Brac'es three-fold, cne-flowered, the exterior large, wedge-shaped, and naked; the interior daggered.—^*'' rol; tube length of the exterior bractes. Border regularly five parted, pale blue.—Stamens two, abortive filaments issuing from the base of the two fertile ones. Anthers half hid in the tube of the cord-

4. E. diaritherum. R.

Suffruticose, erect. *Leaves* broadJancedar, smooth. *Racem*** terminal, in axillary, peduncled umbel lets. *Carol* somewhat bite' biate. *Anthers* twin.

A small delicate, perennial plant, brought from the *Moluccas* to 1800, blossomed in the Botanic Garden in September 1801.

Stem curved, simple; branches few in duv small young plants.— Leaves opposite, petioled, ovate-oblong, entire, obtuse, destitute of pubescence, somewhat bullate; about two or three inches long, by one broad.—Flowers numerous, collected on small, long-peduncled, axillary umbellefe; and in opposite fascicles, or solitary, on a long terminal, slender, erect raceme; small, white, with a slight tinge of red, and some minute red spots on the base of the middle divisions of the under lips.—Bractes, a single, ensiform one, at the base of each peduncle, with one or two, still smaller, about the middle of each pedicel.—Calyx divided ajmost to the base into five slender, acute divisions.—Cowl; tube long, slender, and curved. Border sub-bilabiate: upper Zip erect, two-parted; lower three-cleft; all the five segments equal.—Filaments four, short, in the mouth of the tube, t'' i' them very minute, and abortive. Anthers erect, twin.—Cffp-uU with two, or four, somewhat scabrous flattened orbicular seeds.

Obs. Is nearly allied to my *E. racemosum*, but differs from it in having long, slender-peduucled fascicles of ilowers in the axills of the leaves, as well *as* in having from one to three or more flowers on each of the lower opposite peduncles of the racemes, while in that there is only one; and lastly, in having the upper lip of the corol only two-parted; which in that is three-cleft.

5. E. *racemosum.* **25-**

Suffruticose. *Leaves* oblong, ventricose. *Racemes* terminal; *corol* somewhat bilabiate, both lips three-parted,

A small, under shrub, of great beauty, brought into the Botanic Garden from the *Moluccas*, in 1798; and blossomed in November, i799.

Stem small, with a few, slender branches; height of the whole plant about two feet.—Leave* opposite, petioled, oblong, ventricose, and running down on the petiole, entire, and pretty smooth; from two to three inches long, and broad in proportion.—Racemes terminal, some of them long, and slender; others shorter.—Flowers opposite, pedicelled, approximate, pretty large, colour a pale pink, or white, tinged with red—Bractes subulate, one at the base of each pedicel, and two on it.—Calyx; divisions equal, and subulate.—Corol Wundibuliform; border somewhat bilabiate; both lips three-parted, the under orte considerably larger.—Filaments four, short, inserted within the mouth of the tube, two of them minute, and abortive*
-Anthers half erect.

6. E. barlerioides. Roxb.

Shrubby, erect. *Leaves* ovate oblong, smooth. *Spikes* terminal. *Bractes* wedge-shaped, naked. *Stamens* within the long slender tube, adjoined to them are two abortive filaments.

A native of the *Andamán* Islands, from whence several plants were brought to the Botanic Garden, by Colonel Kyd, which blossom in March. It is a small shrub, and of slow growth.

Stem and branches sub-erect, jointed, the youngersomewlr.it four-sided, and a little hairy.—Leaves opposite, short-petioled, oblong and ovate-oblong, somewhat repand, smooth on both sides—Spikes terminal; flowers opposite.—Bractes three-fold, one-flowered, the exterior large, wedge-shaped, and naked; the interior daggered .^-Co-rd; tube length of the exterior bractes. Border regularly five-parted; pale blue.—Stamens, two abortive filaments issuing from the base of the two fertile ones. Anthers half hid in the tube of the corol.

7. E. strictum. Colebr.

Suffruticose erect pubescent, with ascending decussate simple branches. *Leaves* lanceolar, obscurely crenulated. *Spikes* terminal, slender, much elongated. *Bractes* opposite, fourfold, remote, one-flówered.

A native of the mountains near *Sylhet*, and from thence introduced into the Botanic Garden in 1813, where it produces its beautiful large blossoms in succession in the months of January, 1 coruary, and March.

Bengalee name Neel-Vasooka.

A small shrub of about four or five feet in height, slightly covered with short hair.—Stem almost round, jointed, sending forth four-sided slender branches in remote pairs.—Leaves about four inches long, acute at each end; their margins somewhat revolute and crenuiate, smooth and shining, of a peculiar greyish-green colour above, very pale, with prominent, hairy, and reticulated nerves and veins below. The uppermost or floral leaves, at the base of the spikes, ap-

proach to the size and figure of the bractes.—Peft'ofe* about an inch long, flattened ibove, and slightly marginated by the decurrent base of the leaf.—Spikes solitary, erect, from one to two feet long.—
Rachh sharply four-sided, almost four-winged.—Flowers large darkblue, opposite in alternate pairs, which become remote as the spike elongates.—Bracies adpressed imbricating, with their ends cuneate-lanceolar, dark green, acute, ciliate, about an inch long; the lowermost barren and becoming floral leaves.—Interior two very small, scarcely longer than the five calycine segments, and like them linear, pubescent.—Tube of the corol slender, pubescent slightly enlarged towards the mouth, about twice the length of the outer bracte.—Segments obovate truncate spreading and flat, equal, very pale below.—Two filiform barren stamina between the Jilaments.

Anthers in the mouth of the corol with parallel cells.—N. W.

JUSTICIA. Schreb. gen. N. 35.

Corol one-petalled, irregular. Capsule superior, two-celled, two-valved, bursting with elasticity contrary to the partition.

Sect. 1st. Anthers single.

1. J. Ecbolium. Linn. Sp. Pled. Willd. 1. 85.

Shrubby, erect. *Spikes* terminal, four-sided. *Bractes* oval, ciliate. *Corol* bilabiate, tube filiform; upper lip linear, reflexed, with bipartite apex. *Capsule* two-seeded.

Carim curini. Rheed. mah 2. t. 20.

Hind* Oodoo-jati.

A native of our *Indian* forests. *Flowers* the greatest part of the year.

Stems several, woody, straight, round, smooth, jointed, and swelled above the joints; from two to four feet highs—Leaves opposite, petioled, oval, tapering a little towards each end, smooth, a little waved—Spikes terminal, four-sided, imbricated with four rows of large, oval, sharply serrated, waved, one-flowered, bractes.—Flozv**rsapale blue or azure colour.—Corol; tube very long and slender,

upper Up linear, reflexed, becoming revolute, apex bifid; under lip veTy broad, three-parted.—Anthers simple, linear, erect.—Stigma perforated, ciliate.—Capsule two-seeded.

g. J. thrysiflora* 22.

Shrubby, erect, smooth. *Leaves* lanceolar, drooping. *Racemes* terminal, flowers verticilled. *Corol* sub-bilabiate, clavate, ten or twelve-seeded.

This beautiful stately species is a native of the interior part or Bengal, and from thence was introduced by Dr. William Carey, into the Botanic Garden, where it flowers in January and February; and the seeds are ripe in March and April.

¡Roof ramous.—Stem straight, woody. Branches nearly straight, general height from four to eight feet; woody parts round and covered with smooth ash-coloured bark; young shoots smooth, swelled at the insertion of the leaves, somewhat four-sided, and tinged with <hill purple.—Leaves opposite, shoit-petioled, drooping, lanceolar,</p> entire, smooth on both sides, of a firm texture, the upper side deep green, the under side pale; length from four to eight inches, and from one to two broad.—Racemes terminal, often solitary, though sometimes two, or even three-fold, thyrsiform, shape of the flame of a candle, crowded with large orange-coloured flowers.—Pedicels four-fold, verticilled, approximate, one-flowered, shorter than the divisions of the calvx.—Bractes three-fold, subulate; the inner two permanent, and inserted on the base of the pedicels; the exterior single one larger and caducous.—Calyx simple, five-cleft, to the base divisions equal, straight, subulate, half the length of the tube of the corol.—Corol about an inch long. Tube incurved, compressed, laterally somewhat villous. Border bilabiate; upper Up broad, projecting straight forward, deeply emarginate; vnder lip of three, equal, deeply-divided, ovate, acute *iivisious*.—Anthers even with the upper lip of the corol, dark brown, oval, with an opening on the under side for the discharge of the white pollen, and studded on the back

Style scarcely so long as the stamina. Stigma entire.—Capsule linear-clavate, smooth.—Seeds five or six in each cell.

Obs. This is one of the most beautiful species of *Justicia* I have yet met with in $India_y$ even when only in foliage. It grows readily from cuttings.

⇒ J. vilellina. 22.

Shrubby, erect. *Leaves* broad-hnceolar, reflexed, smooth. *Racemes* terminal, cylindric; flowers opposite; below fascicled, about the middle 'tern, and above single; sub-ringent, with ample-campa? nulate throat. *Capsule* linear, few-seeded.

A native of the hilly parts of *Chittagong*, where it blossoms in February and March.

Stems scarcely any; but several, erect, stiff, short branches, with their ultimate tender divisions four-sided, the angles sharp, and rather rough; whole height of full grown plants about three feet.—Leaves opposite, short-petioled, reflexed, from oblong to lanceolar, entire and pretty smooth; length from two to four inches, by from one to two broad.—Racemes terminal, solitary, rigidly erect, cylindric; from three to six inches long. RacUs four-anglea\—Flowers rather small, colour yellowish pink, on the lower part of the raceme in opposite fascicles, about its middle in threes on common very short peduncles and pedicels; above single.—Bractes to the single flowers solitary, o the lower three.— Calyx single, five-parted; divisions broad-subulate,—Corol with the tube shorter than the calyx, and an amplecampanulate throat; border sub-bilabiate; upper lip projecting almost horizontally, bifid; lower lip broad, and three-parted.—Filaments [^]Uch curved, hairy near the base. *Anthers* single, linear, lodged gilder the upper lip of the corol.—Germ two-celled, about four ovula ^ each.—Stigma simple, obtuse.—Capsule linear, smooth.

Shrubby erect, smooth. Leaves opposite, ovate-lanceolate, Spikes

⁴* J. alba. JR.

terminal, and axilfary. *Flowers* remote. *Corol*-with filiform tube, and bilabiate border.

This very pretty plant, a native of the great *Andaman*, was brought from thence to the Botanic Garden, by Capt. Stokoe. Flowering time the beginning of the hot season.

Stemerect, round, smooth, while)oung swelled above the insertions of the leaves.—Leaves opposite, short-petioled, oblong, waved, smooth and shining on both sides.—Spikes numerous, terminal, and axillary, spreading, with a considerable recurvature, longer than the leaves, round, and smooth.—Flowers opposite, remote, pure white.—Bractes, three small ones to each flower, shorter than the calyx.—Corol; tube long, straight, filiform; upper lip of two, erect, wedge-shaped divisions united below the middle; under lip three* parted; divisions broader and pointing downwards.—Füaments short. Anthers just without the' tube.

t. J. picta. Linn. Sp. PL ed. Willd. 1. 88.

Shrubby, erect. *Leaves* broad-lanceolate, pointed. *Racemts*, subglobular. *Tube of* the corol widening, vertically compressed, margin* of the segments of the border revolute.

Tgittfe-maram. Rheed. mal. 6.p. 111. t. 60.

.Folium bracteatum. Humph, amb. 4. p. 73. t. 30.

A Targe, elegant, ramous shrub, common in gardens, and one of our finest ornaments. 1 never saw it wild; is in flower most part of the year.

Leaves opposite, short-petioled, ovate-lanceolate, smooth-pointed, geueially variegated with large white spots, though sometimes of a uniform green, and we have a variety with the leaves uniformly ferruginous.—Racemes terminal, short, erect, smooth.—Flowers largef generally of a beautiful crimson colour.—BracUs opposite; below three or four-flowered; above one-flowered.-^(W, throat compressed, divisions of the border soon after they expand becoming spirally revolute, with their inside wrinkled, and beautifully ornamented with small chrystalline spec|cdc

6. J. paniculata. Unn. Sp. PL ed. Hilld. 1. 89.

Herbaceous, erect, four-sided, bnti-hiate. *Leaves* sub-sessile, lanceolate. *Racemes* terminal; flowers secund erect. *Coral* bilabiate; lips linear, revolute. *Anthers* coalesced, and bearded at the base.— *Capsules* linear, many-seeded.

Beng. Kafa-megh, Kalwp-nath, or Mziha-tita; the last name implies King of bitters, and a very powerful, much esteemed one it is.

Kreat is the name by which it is known on the *Malabar* coast, &s. where it is much used in medicine, and is the bitter of the famous Nostrum, called *Drogue arnere*.

Cara-canirum. *Rheed. mal.* 9. p. 109. t. 56.

Teling. Nella-vemoo.

A native of dry ground, under the shade of trees, bushes, &c Flowering and seed time, the wet and cold season.

Stem erect, generally annual, at least down to the root, branchy; slender, four-sided, jointed, smooth, one to two feet high. Branch-' es opposite, cross-armed, four-sided, spreading.^-Leatfes opposite, short-petioled, lanceolate, entire, smooth; two or three inches long*
—Racemes terminal, and from the exterior axiils, horizontal, long secund, four-sided.—Flowers remote, rose-coloured, long-pedicelled, alternate, erect, downy—Bractes, a large, exterior, opposite Pair; within the flower-bearing one there are two smaller, embracing the base of the pedicels.—Coro/, bilabiate. Tube recurved; hps linear, and reflected; the superior broadest, three-toothed; the inferior two-toothed.—Filaments as long as the lips of the corol, Projecting, hairy, Anthers very flat, obovate, firmly united at the base, and three-bearded.—Capsule erect, sub-cylindric—Seeds three or four in each cell, cylindric.

7. J. echioides. Linn. Sp. PI. ed. Wzlld. 1. p. 87.

Annual, erect, four-sided, hairy. *Leaves* sessile, decussate, oblog and linear. *Spikes* axillary, recurved over the bosoms of the leaves, secund. *Capsule* oblong, with four, verrucose seeds.

Pee-tumba. Rheed. mal. 9- t. 46.

A native of *Coromandel*, and generally found on old walls; iu flower all the year.

Stem annual, erect, four-sided, hairy, with ascending, opposite, similar branches from the base; whole height about a foot.—heater opposite, decussate, sessile, from oblong to linear, obtilafe, recurved, hairy; from one or two inches long,—Spikes axillary, spreading out over the bosom of the leaves, and in general shorter than them; iuxuriant plants compound.—Bractes opposite, small, lanceolate, hairy.—Flowers alternate, sessile, erect, upper lip purple, the rest white.—Catyx of five, long, hairy, ensiform divisions.—CoroZ bilabiate. Tube sub-cylindric, upper lip erect, broad, and trifid, tinder Up narrower, recurved, and bidentate.—Filaments projecting, straight, and about as long as the lips of the corol. Anthers simple, united and bearded at the base.—Capsule oblong, erect, hairy, length of the calyx.—Seeds generally two in each cell, oblong, rough.

6. J. polysperma. R.

Annual, creeping, round, jointed. *Leaves* sessile, lanceolate, downy. *Spikes* imbricated. *Bractes* three-fold, one-flowered, woody-*Capsules* with from twenty to thirty seeds.

Beng. Chhota-micheta.

Is a native of *Bengal*; appears during the cold season amongst grass, &c. uncultivated places.

Stems diffuse, or creeping, very ramous, six to twelve inches long* round, jqinted, a little downy.—Leaves opposite, sessile, lanceolate, entire, downty.—Spikes terminal, and axillary, imbricated with opposite, decussated flowers, and bractes.—Flowers small, pale blue.—Bractes three-fold, one-flowered, the lower one broader a little than the two lateral; all arc woolly.—Calyx woolly.—Capsules linear, contaming from twenty to thirty, small roundish seeds.

9- J. acaulis. Linn, Sp. PI ed. Willd* 1. 84. R. 'Carom, pi ** 2*. 127.

Root perennial, stemless. Leaves radical, sessile, ovate-oblong, 'cronate. Spikes ascending, imbricated. Corol ringtsnt. Capsules many-seeded.

Klylraria crenata. Vahl. Enum. plant. 1. 106.

Teling. Nella mura.

Grows on pasture ground, generally under the shade of trees. Flowering and seed time the wet, and cold season.

Roof perennial.—Stem none.—Leaves radical, spreading close on the ground, sessile, wedge-form or oblong, crenulated, rugose, woolly ou the under side; from six to twelve inches long.—Spikes radical, several, as long as, *or longer than the leaves, ascending, imbricated from top to bottom, with small, rigid, pointed bractes, each of the superior ones embracing a flower, and two small lateral bractes.—Flowers small, white.—Calyx five-leaved, the superior leaflets much the largest.—Corol; tube cylindric, recurved; upper lip vaulted, under lip broad, three-parted; with the divisions two-parted.—Capsules conical, eiglit-seeded.—Seeds kidney-form.

Sect. 2. Coroh bilabiate. Anthers double.

110. J. nasuta. Vahl. Symb. 2.15. Linn. Sp. PL ed. Willd. 1.90.

Shrubby, erect. *Leaves* short-petioled, lanceolate. *Panicle* axil* lary and terminal. *Vpper Up* of the corol linear, and bidentaie; *under Up* broad, three-lobed.

Pul-colli. Rheed. mal. 9. 135. t. 69.

Sans< **^r^RHmff**, Yoothika-pttrnee.

Beng. Jooi-panav

Teling. and Tamul. Naga-mulli.

This species I have only found in gardens: from whence it originally came, I cannot say. *Flowers* all the year round, but nevern-Pens its seed, owing, I imagine, to its being always propagated by cuttings, layers, or, slips. It grows to be a large thin shrub, of five, or more feet in height.

Root woody, ramous.—Stems many, erect, ramous, the old woo-

dy parts round, and covered with pretty smooth ash-colo^red bark; the tender branches, and young shoots jointed, smooth,, and obsoletely six-seeded.—Leaves opposite, petioled, broad-lanceolate, point obtuse, above smooth, below a little downy, entire; from two to four inches long, and from one to two broad.—Panicles coryin-biform, axillary, and terminal, always three-cleft, as also the sub-divisions.—Peduncles and pedicels short, round, a little downy.-*-*

Bractes minute.—Flowers small, white.—Corol with a long, slender, ycompressed tube; under lip broad, three-cleft, upper lip erect, line* ar, sides reflected, apex bifid.—Nectary, a fleshy ring surrounding the base of the germ.—Anthers without the tube, twin.—Capsule; y—I have not seen it,

Obs. Milk boiled on the roots, is reckoned, by the Indian physicians aphrodisiacal, and as such often employed; for no medicines are more sought after by the natives of *India* than those which are imagined to belong to that class.

The roots rubbed with lime juice, and pepper, are usgd, and often with good effect, to cure the *ring zvorms*, or Herpes miliaris, which in *India* is a most troublesome disease, and very common.

They are also used for the bite of poisonous snakes; hence the Telinga and Tamul name Naga mülli, or Jasmine of the Cobra de capella: Naga is therefore prefixed to the name of most of their antidotes, or medicines supposed to destroy the effect ofpoison, and occurs very often in their writings. For like the ancient physicians of Greece, Rome, &c. those of India at this day, make poisons, and their antidotes, a very chief part of their studies; but from the seeming inactivity of a very large share of them, we may safely conclude, that their practice is equally frivolous with that of the ancients, and ought to be discouraged as much as possible; because at least, they prevent the application of more efficacious remedies,

r

11. J. lanceolaria. -K-

Shrubby, erect. Leaves petioled, lanceolar, smooth. Fascicles terminal, panicled, clammy, from two to four-flowered, embraced

by many, long, ensiform, bractes. *Tube* of the corol curved, and twisied; *upper lip* three-dentate, *under lip* entire.

This beautiful shrub, is a native of the *Silhet* district, where it is called Toogee. Flowering time the cold season.

Steins erect, or nearly so, branches round and smooth, and while young, swelled just above the insertion of the leaves; whole height from two to four feet.—Leaves opposite, petioled, lanceolar, (that is tapering equally af each end) entire, acute, smooth; from three or six inches long by one or two broad.—Flowers numerous, large and rosy, collected in numerous, terminal, clammy fasicles of from two to four each, and embraced by numerous, ensifofm, clammy bractes, like a common calyx, and longer than the proper perianths; the whole forming a pretty large panicle at the end of each branch.—Ca/j/avfive-parted; segments ensiform, smooth.—Corol; tube long, slender, curved outward, and like my J. speciosa, latebrosa, &c. has a half twist; which, as in the orchidea, brings the lower *lip* uppermost. *Border* bilabiate, *lips* nearly equal, oblong; the *su*perior, in its inverted state, three-toothed; the inferior entire.— Filaments from the mouth of the tube of the corol; shorter than the lips, and projecting straight over the under one. Anthers double, one at the end of the other, forming one straight line the exterior half of the posterior one being attached to the apex of the filaments and to the base of the exterior anther.

i2. J. speciosa. Il>

Perennial, erect. .Leaves ovate-cordate. Peduncles axillary and terminal, proliferous, few-flowered, Bracies opposite, foliaceous. Corol bilabiate, tube curved, and twisted; lips equal; upper one tridentate, lower one bidentate.

A native of the interior parts of Bengal, where it blossoms during the cold season, and is then one of the greatest ornaments of the forests.

Stems erect, jointed. Branches few, and erect. Bark of the lig-

nous parts ash-coloured; of the young shoots smooth and green. Reaves opposite, decussate, petioled, ovate-cordale, entire, rather obtuse, a little wrinkled; from one to four inches long.— P^{e} " duncles allary, often proliferous and much longer than the petioles, supporting two, or three flowers.—Flowers large, beautiful* bright carmine colour.—Bractes, or floral leaves opposite, sessile, iioiii ovate to linear.—Calyx simple, divided almost to the base into rive ensiform, equal portions.—Corol; tube long, slender, curved, villousi and somewhat twisted; upper lip lineaisoblong, recurved over the tube, (ipex three-toothed, at the base some dark coloured spots; under lip broad lanceolate, pointing directly to the earthy apex slightly two-toothed.— Filaments inserted in the mouth of the tube of the corol, nearly as long as its border, and, with the lower lip, pointing downwards. Anthers double, linear, purple, with pale coloured pollen.—Style as long as the stamens, and beyond the tube taking the same direction with them. Stigma slightly emarginate* — Capules pedicelled, with two seeds in each cell.

13. J. tinctoria. R.

Shrubby. Leaves petioled, ovate-oblong. Flowers terminal, fascicled, involucred. Anthers linear.

• Folium tinctorium. Rumph. amb. vi. 51. tab. xxii.f. 1. Beng. Batia-rung.

Pouud in the woods about Calcutta, in full flower in October.

Stem scarcely any; branches numerous, sub-erect; young shoots jointed and swelled above the joints, round a little downy.—Leaves opposite, pe.ioled, oblong, entire, covered with a little harsh pubescence, two to three inches long.—Peduncles terminal, forming the exterior axills, each supporting some few fascicles, of four to six sessile flowers.—Bractes of the peduncles and pedicels opposite, those of the flowers, or rather, the involucres subulate, opposite, sessile, I* near oblong, cordate, entire, unequal; the upper one being the largest, and incumbent over the others, and the flowets they contain ** the calyx small.—Flowers sessile, large, of a beautiful deep pink co-

lour, opening in succession.—CaJyar five-toothed.—•*Corol, tube* length of the largest involucres, filiform, having a small twist near the apex. *Border* two-parted, both divisions oblong; the upper one three-toothed.—*Nectary* a gaping cup in which the germ rests.—*Stamens* projecting. *Anthers* two on each filament.—*Style* rather longer than the stamens. *Stigma* obtuse.

14. J. bivalvis. Linn. Sp. PL ed. Willd. 1. 82.

Shrubby. *Leaves* lanceolate. *Peduncles* axillary, * and terminal, three to six cleft; lateral pedicels often trifid; ultimate divisions bearing a small head of sessile flowers, between two, unequal, linear bractes. *Capsule* clavate.

A native of the *Moluccas*.

Folium tinctorium of Rumphius, quotted under the preceding species, does not so well agree with J. bivalvis. I think Add-Odagam, Rheed. mat ix. 81. t. 43. belongs to neither of them.

15. J. chiuensis. VahL £». PL 1. 110.

Perennial, retroflex. *Leaves* cordate. *Umbellets* axillary, from three to five, and with the pedicels (from three to five), distichous, involucels obovate, unequal. *Capsules* round and thin.

J. chinemis. Linn. Sp. PL ed. Willd. 1. 80. Burnt, ind. 8. t. 4. /. 1. is ba'd if intended tor this plant.

A middle-sized, straggling, suffruticose species introduced from China into the Botanic Garden, where it flowers from August, till •December.

Stem scarcely any; branches several, scarcely ligneous, straggling and ascending, slender, somewhat six-angular, pretty smooth; striking root where they rest on the ground; from one to two feet long.—Leaves opposite, petioled, ovate-cordate, entire, somewhat Ruminate, smooth, from one to two inches long.—Peduncles axillary, from three to five in each axil, distichous; of various length, each supporting a little, distichous umbellet of from three to five, one or two* flowered, short pedicels.—Involucres of the pedicels two, subulate.

opposite, of the flowers two, sessile, unequal, obowrte, or oblong* ventricose, embraciug between them oue or two, complete flowers, aud one or two rudiment.—JJracfes (or inner calyx), ensiform, two to each flower, and rudiment.—Flowers small, pale-pink.—Calyx fiv¹e* paned, segments ensiform.—Gorol; tube length of the involucres, a little twisted.—Border bilabiate, upper lip linear, three-toothed; wider lip oval, and slightly emarginate.—Anthers two on each fila* ment, purple.—Capsule pedicelled, small, flat, round, villous, WO-celied, with two ihin round seeds in each cell.

Ofis. I have two varieties/(if not distinct species) from the $COBS^{t}$ of Coromandel. In the first, the leaves are much narrower^and r^{uD} more down on the petioles, and, with the bractes of the flowed longer, more cuspidate, and ciliate. In the second variety, the leave are cuneiform-lanceolate, and the bractes of the flower broad-ova teshort cuspidate, and hairy.

16. J. latebrosa. Xon. MSS.

Herbaceous, branches straggling, round, smooth. *Leaves* petioled, cordate-oblong, pointed. *Tube* of the corol twisted, lips almost equal; the upper one three-dentate, the lower one bidentate; *Seeds* solitary.

Grows always among bushes, or under their shade, hi a drybarrd¹ soil. Flowering time, the wet and cold seasons.

"Root perennial.—Stem scarcely any; branches many, straggl^S' weak, round, smooth, jointed, ramous.—Leaves opposite, petiote cordate-oblong, pointed, entire, smooth; size very varioj^^ Flower* terminal, large, of a bright red colour.—Bractes nume** and large, of a bright red colour.—Bractes nume** are large, of a bright red colour.—Bractes nume

17. J. bicalycuhta. Linn. Sp. PL ed. Willd. 1.81.

Annual, erect, six-sided, scabrous. *Leaves* short-petioled, ovate-cordate, oblong, pointed, calyx double; tube of the carol twisted, border bilabiate, seeds solitary.

Dianthera malabarica. Suppl. 85.

- J. malabarica* Ait. Hort. Kew. 1. 27.

- ? Beng, Nasa-bhaga.
- . Teling. Jfhebiera.

A poor looking plant, a native of rirbbish, roadsides, and hedges. Flowering time the wet, and cold seasons.

Stem erect, annual, ramous, six-angled, jointed, scabrous, and hairy, from three to five feet high.—Leaves opposite, petioled, ovate-cordate¹, hairy, somewhat scabrous, size very various.—Flowers terminal, and axillary, numerous, red, generally three-fold, or rather sub*, panicled, and divided by threes.—Bractes small.—Calyx* double, or rather some bractes embracing the proper perianth.—Tube of the corol with a half twist about the middle; upper lip narrowest, linear, three-toothed; lower lip broad, oblong, emarginate.—Filaments shorter than the corol, projecting along the under lip. Anthers red, two on each filament.—Capsules four-seeded, two in each cell.

Sect. 3. Corols ringent. Anthers double*

. 18. J. Adhatoda. Willd. 1. 96.

§ub-arboreous. *Leaves* broad-lanceolar. *Spikes* short, long-pedun-^ckd''; exterior bractes ovate, permanent. *Cord* ringent, upper lip

^{Va}ulted, and emarginate.

Sans. first Vidyumatn, ftj^, Singhee, s n f a ^ V^sika, f^j, Vrishu, Uz^;, Uturoosha, f^%\^[h Singhashya, ^T^8, Vasoo* ka_J ^TfaCpfW¹* Vajidttnttfka.

Hind, and Beng. Bakws, Vasooka.

* The outer calyx may be called common, for there are always rudiments or bucke
• mor« than one flower in it, which often expand in succession,

This small tree or large shrub, is common over most parts *ot India*. Flowering time the cold season.

Trunk straight, bark pretty smooth, ash-coloured. Branches suberect with bark like that of the trunk, but smoother.—*Leaves opposite, short-petioled, broad-lauceolai, long, taper-pointed, smooth on both sides, about five or six inches long, and one and a half broad.

—Spikes from the exterior axills, solitary, long-peduncled, the whole end of the branch let forming a leafy panicle, flower-bearing portion short, and covered with large bractes,—Flowers opposite, large, with small ferruginous dots; the lower part of both lips' streak* <* with purple.—Bracles three-fold, opposite, one-flowered. Exterior one of the three, large, ovate, obscurely five-nerved. Interior pair, much smaller, and sub-lanceolate; all are permanent.—Calyx tive-parted lo the base; divisions nearly equal.—Lorol ringeut. Tuba short; throat ample •, upper lip vaulted, enia'iginate; lower tip broad, and deeply three-parted; both streaked with purple.—Filament* long, resting under the vault of the upper lip. Anthers twin.'

Obs. The wood is soft, and esteemed very **lit** for making charcoal for gun-pöwder,

19* J- decussata. iJ.

Shrubby, erect; branches twiggy, villous, and decussated. *Leave** from ovate to oblong. *Flowers* in opposite fasciculi on the leafies? brancWets. *Anthers* double, all calcarate.

A tall, stout shrubby plant,_xa native of the country above $Ra^{n}*$ goon; and from thence introduced into the Botanic Garden, where it is in flower during the mouth of February and March.

Stem straight to the top of the plant, ligneous; in two/years, old plants as thick as a walking cane. Branches regularly decussate, straight, all the younger shoots villous, and as they shoot into flovrer nearly leafless.—Leaves short-petioled, ovate-oblong, enure, pretty smooth; from three to twelve inches long.—Flowers in numei>ous, a little, opposite fascicles, of three to six, appearing subvert!-celled, over the slender, leafless twigs, subsessile, pale rose colour.-*

Bractes numerous, slender, and very downy.—Calyx five-parted; segments ensiform,*villous.—Coro/ ringent; tube gibbous near the base; upper Up sub-lanceolate, concave, erect; under'lip broad and three-lobed.—Filaments nearly as long as the upper lip; apex much enlarged. Anthers two on each filament, all with a calcarate base.—Gsrmoblong, sitting in a large, glandular, yellow ring. Style the length of the stamens. Stigma simple.

20. J. Gendarussa * linn. Sp. PL ed. Willd. 1.87,

Shrubby, diffuse, smooth. *Leaves* narrow-lanceolar. *Spikes* terminal, sub-verticelled. *Lower* anthers calcarate.

Vada-Kodi. Rheed. mal 9. p. 79* t. 42.

Gendarussa. Rumph. Amb. 4. p. 70. t. 28.

Beng. Jttgwt-mwdmi.

A handsome shrub. I have never met with it wild, but in gardens it is common, and grows readily from slips and cuttings; it is in flower during the wet season chiefly. I am told it is indigenous on the *Malay* Islands.

Stem scarcely any. Branches numerous, long, straggling, except when kept cut, they are then more erect. Bark of the young pai ts generally dark purple, and very smooth; in some varieties green.—

Leaves opposite, short-petioled, lanceolar, «obtuse, frequently a little scolloped, smooth; nerve and Veins dark purple, from three to six inches long, and from half an inch to an inch broad.—Spikes terniinal, eiect, verticelled.—Anthers double, the lotar ones have a spuMike process projecting downwards and outwards.

2U J. Betonica, Linn. Sp. Pi ed Willd. 1. 96. Shrubby. Leaves sub-ovate, finite terminal. Bractes white, with

[•] Willdenow has spoiled this name. Linnens wrote it Gandanwsa, which is near*
*r the truth. The word is \$3HTO> Gitudharusa.

treen veins. *Corol* ringent. *Anthers* two-lobed, the lower calca* rate. *Seeds* turbercled, two in each cell.

ftem-Curidi. Rheed. mal. %.p. S3. t. £1.

A perennial species; a native of *CoromandeL* Flowering time the dry season chiefjy, though it is more or less in blossom all the year, particularly wijifif in a Cultivated state.

Stems several, while young, erect by age, leaning in various direo tions, round, smooth, swelled above the joints, the height of the wholeplanfcfrom two to four feet.—Leaves opposite, petioled, nearly ovate, entire, or slightly waved; smooth on both sides; length from one to six inches.—Spikes terminal, secund, sub-cylindric, erect.—

JBractes of the rachig opposite, oyate-oblong, villous, white with green veins, the posterior one Always abortive; those of the flowers opposite, and resembling those of the rachis, but narrower.—Flowers pretty Iai-ge, whitish, with rose-coloured veins.—Calyx single, five-cleft | divisions ensiform.—CuroZriugent; upper lip vaulted, and two-tooth-*bed; lower three-parted.—Anthers twin, the lower one with a spur'', from the lower end.—Capsule longer than the calyx, vill'ous.—Seeds. two in each cellj, tending to be round, rough with numerous sharp points.

22. J. ramosissima. R.

Shrubby,-creeping, very ramous. *Leaves* sub-ovate. *Spikes* terminal, secund. *wBractes* lanceolate. *Lower* lobe of the anthers calca* rate.

A native of CoromandeL Flowering time, in the xioianic Garden, ihe cold season.

Stem none, branches numerous^isingj in every direction, as well as spreading on the ground, and striking root at the swelled joints; the tender parts striated, and slightly villous.— Leaves opposite, petioled, sub-ovate, rather obtuse, tapering down the petioles nearly to their base.—Spikes Iprjninal, secund, erect, many times longer lhaij. the leaves,—Bmctcs iu opposite paiis, lanceolate, coloured greett and white; the posterior one of the rachis always abortive, the other

Justice 131

two are caly cine.—Flower*..* -^i.^m longei than the bractes, dull white, With a few rosy veins on the centre of the totter jip.—Calyx of five linear-lanceolate, acut\$segments.—Corol ringed^upper lip vaulted, v/ith a bidentate apex; under lip broad, and three-cleft.— Aidhers double; lower lobe with a long curved, sharp spur.—Capsule oblong, four-seeded, very protuberant at the seeds.—Seeds nearly spherical, rugose.

Obs. In the foliage^spikes, flowers, and capsule*), this species is exceedingly like *J. Betonica*, which however, is always tftull, erect plant, with coloured bractes, while this is very bushy, spreads on the ground, and strikes root abundantly at the joints; the bractes also are narrower, and greener.

>>

fiS. J. tranquebariensis. Linn. Sp. PL ed. Willd. 1. 99.

Herbaceous. Leaves round, or broad-cordate. Spikes terminal, four-sided, occasioned by four rows of roundish ciliate bractes. Flowers solitary, in two rows on the fore-part of the spikes. Anthers calcarate.

Common amongst bushes on a dry barren soil, over the coast cf Coromandel. Flowering time the. wet, and cold season.

Roots perennial, somewhat granulated.—Stems m young plants erect, in old ones uncertain; branches annual, small, straggling, round, a little downy, jointed, and swelled, above the joints, from one totwo feet long.—Leaves opposite, shorUpetioled, oVal, or round, entire, pretty smooth*—Spites terminal, peduncled, long, erect, generally four-sided, occasioned by four rows of orbicular, short-petioled, opposite, ciliate brnctes; besides these their are a pair of small pointed ones which press the calyx laterally.—Flowers a mixture of *pale yellow, and red; standing in the axills of the two rows of bractes that occupy the fore part of the spikes; on the back Part they are generally wanting.—Calyx single—Coral; tipper lip eniarginate, erect 5 under lip broad, three-cleft, Antha\s doable, the lowermost calcarate.—Seeds two in each cell, bristly.

24. J. gfabra. Kon. MSS.

Herbaceous, erect, J>ranchy, round, smooth. *Leaves* petioled, ovate, pointed. *Peduncles* trichotomous. *Upper lip* of the corol vaulted. *Lower antiars* calcarate. *Capsules* four-seeded.

A native of simitar places with the last described. Flowering time the same.

Root perennial—Stems several, erect, branchy; annual, round, smooth, jointed.—Leaves opposite, oblong-cordate, pointed, entire*, smooth.—Panicles axillary, small, three-forked.—Flowers rose-coloured, yellow, and whitish green mixed.—Bracte's sinaH, pointed; generally two below every division of the panicle, and two or three pressing upon the calyx.—Calyx single.—Corol; tube short, widening; upper lip. erect, vaulted; wider lip broad, and three-parted*—Filaments concealed under the upper lip. Anthers double, the lower ones calcarate.—Stigma slightly bifid.—Capsule four-sided, two seeds in each cell*

*

25. J. tomentosa. J?»

Herbaceous, sub-erect, hairy. Leaves laticeolar, tomentose. Spikes terminal, strobiliform. Anthers distinct. Capsules conic, four-seeded*

A native of wet, rich, pasture ground. Flowering, time the wet and cold seasons.

Root nearly spindle-formed, pei enuial.—Sterns several, sub-erect, round, hairy, from one to two feet high.—Leaves opposite, pefoled? broad-lanceolar, entire, very downy; the lower many times larger than the upper ones, the former being often twelve inches long, and the latter (or floral leaves) not more than one:—Spikes terminal, oval, strobiliform, sessile on little terminal brauchlets.—Flo&~ers small, bright, bluish purple.—Bractes numerous, imbricated, oval, pointed, concave, hairy, one-flowered.—Calj/x four-cleft; the lower leaflet two-cleft.—Corol; tube gibbous on the under side, contracted at the mouth; upper lip ovate, half two-cleft, divisions point' «d; under lip very broad, three-parted.—Anthers twin, equal, oval.

—Stigma two-cleftj segments broad.—Capsules pointed; eight* seeded.

26. J. orixensis. K'6n. MSS.

Herbaceous. *Branches* straggling, foursided. *Leaves* cordate, repand. *Sjrikes* terminal. *Bracles* orbicular, ciliate. *Capsules* length of the bractes, containing about four echinate seeds.

Obs. It is a native of high, dry, gravelly ground, in the vicinity of Samulcola. Is very like J. tranquebariemis.

27. J. repent. Linn. Sp. Pi. ed. Willd. Qfr. Carom. PL 2. No. 152. Herbaceous, diffuse. Leaves sub-sessile, lanceolate. Spikes axillary and terminal, compressed. Bractes ovate, white, membrane-bordered, posterior rows neuter. Lower anthers crescent-shaped.

Adhadota. spicata fiosculos ex foliolis membranaceis producens. Burin. ZeyL 7. t. 3./. 3.

A native of pasture ground. Flowering time the wet and cold season.

Root perennial.—Stems many, diffuse, round, jointed, smooth, sometimes rooting at the joints; one to two feet long.—Leaves opposite, shorUpetioled, broad-lanceolate, entire, sharp-pointed, smooth.—Spikes axillary peduncled, erect, somewhat compressed, secund.—Bractes; exterior, four rows, oval, with a broad, white, Kiembranaceous margin; the two rows on the back of the spike neuter; the two on the fore part embracing the flowers; the calyx of *&ch flower is also embraced laterally by two smaller lanceolate bractes.—Flowers alternate, pale ^ose-coloured.—Corol, stamens, pistil and capsule as in J. procumbent, which it much resembles.

28. J. procumbens. Linn. Sp. PL ed. Willd. 1. 87.

Hoot perennial; branches diffuse, herbaceous. Leaves sessile, from orbicular to linear-lanceolate. Spikes terminal, four-sided. Bractes lanceolate, rigid. Lower anthers calcarate.

Euphrasia, Ahines angustiore folio, &c. Pluk. Aim. 142-/. 56./. S.

Very, common on pasture ground over the coast of *Coromana* flowering most part of the year.

Root often perennial,—Stems many, spreading, jointed, five-striated, often rooting at the joints, extremities sub-erect; size very various, but generally from six to twelve inches long.—Leaves opposite, subsessile, from round to linear-lanceolate, entire, a little downy; size various,—Spikes terminal, erect, four-sided.—Flowers opposite, various,—Vario

Obs. When this plant grows in wet places, it seems altogether another species, being many times larger, nearly erect, with linear-lanceolate leaves. I believe Dr.' Konig described this variety as » distinct species, under the name of J. juncea, or grtiminea*

29. J. quinque angular is. Kon. MSS.

Perennial in a dry soil; branches five-sided. *Leaves* sessile, Ianceo* late. *Spikes* terminal. *Bractes* linear. *Capsules* rather larger than the bractes, four-seeded.

A native of the borders of rice-fields about *Samulcota*. It is but little removed from *proewnbens*, when growing in the same soil*

30. J. pectinata. Carom. PI. 9,. N. 153.

Herbaceous, diffuse. Leaves short-petioled, lanceolar. Spite* sessile, secund.* Bractes five-fold, broad, white, membrane-bordered: lower anthers calcarate.

Compare with./.parvjftora. Retz. Obs. 5. p. 9.

A very beautiful, delicate, diffuse species, growing in shady places. Flowering time the cold season.

Stout many, diffuse, filiform, round, smooth, jointed. Branch*

alternate.—Leaves opposite, short-petioled, depending, lanceolate, entire, smooth; the pair are generally unequal in size.—Spikes axillary or terminal, sessile, inuch shorter than the leaves, secund, generally three together, the middle one largest.—Flowers very small, bright blue.—Bractes, to each fWer five, of different sizes, oval or lanceolate, with beautiful white, membranaceous margins.—Coro/; upper lip entire, acute.—Anthers, the lower one of each filament has a long obtuse horif from the under end.—Capsules four-seeded, *wo ii) each cell.

31. J. lamifolia. Ron. MSS.

Whole plant very downy, procumbent, annual. Leaves oval. Spikes terminar, imbricated. Calyx four-leaved*

Found in the vicinity of Calcutta, in uncultivated shady places.

Root fibrous.—Stems and branches very numerous, round, spreading close on the earth, clothed with long soft hair, and down, somewhat glutinous, length from one to three feet.—Leaves opposite, sub-sessile, oval, entire, clothed and glutinous like the branches; about an inch Jong.—Spikes terminal, oblong, closely imbricated with the bractes, and flowers.—Flowers numerous, small, variegated with deep* and light purple.—Bractes ovate, one-flowered, hairy, clammy.-^CV^.r four-leaved, the under leaflet with its apex bifid.—Corol ringent. 2wie gibbous; throat compressed; upper lip two-parted, and streaked with deep purple; under lip broad, and

i ted.—*Filaments* short, inserted into the mouth of the tube. *Anthers* twin, singly oval, and all equal.—*Stigma* of two, broadish, ⁸Preading lobes.—*Capsule* conical.—*Seeds* eight or ten, roundish.

Obs. It has the calyx of a Barleria, and the stamina of a Dianthera. Mr. It. Brown informs me that he thought it would belong to a new genus, which he calls Nelsonia.

32. J. terticillata. 22.

Frect, hairy, spines verticelled with their apices bifid, or trifid.

Leaves petioled, ovate. Flower amongst the verticils of spines, subsessile*

Hind. Cu\$too\a>

'Found by Dr. Hunter in the vicinity of *Ougein*, in seed and flow* er in March.

GRATIQLA. Schreb. Gen. N. 37.

Corol one-petallbd, irregular. Sterile filaments two, affixed to the lower lip of the corol. Antliers double, and connected* $Cap^{sU} \wedge es$ superior, two-celled, two-valyed. Seeds numerous,

1. G. amara. 12.

Annual (in Bengal), craping. Leaves petioled, cordate, serrate* Peduncles axillary, four to six flowered. Calyx four-leaved, exteri d pair cordate, inner subulate, apices of the sterile filaments free? Capsule ovate, hid in the calyx.

Carauga amara. VahL Enum. roh 1. 100.

Serratula amara, *Rumph. amb. 5. p.* 459* t: J70. f. 1. which haw been quoted by mistake, 1 presume, for *Scut el I aria indica*.

This pretty plant has been accidentally introduced into the Botanic Garden, among spice and other plants from the *Molucca***Flowering time the cold season.

Root fibrous.—Stems and branches creeping, with their extremities sub-erect, four-sided, coloured, smooth.—Leaves opposite Petioled, cordate, deeply serrate, somewhat rugose, of a sogrtexture but free of pubescence, general length about two inches.—Pedufl* cles axillary, solitary, rather longer than the petioles, supporting a their extremities, two or three pairs, of opposite pedicelled flowcy—Bractes small, oblong, one under the insertion of each pedice.—Calyx of two pair of opposite leaflets; exterior pair large, conditions and incumbent overs are to Tthe calyx, and all the corol except the under lip, inner or teral pair, linear-lanceolate, and much smaller than the exteflor

pair.—Corol bilabiate; tube contracted at the middle; upper lip straight, narrow, with a two-lobed apex; und r lip broad, three-lobed, hooping—Stamina, the fertile pair of filaments lodged under the upper lip of the corol with twin anthers adhering by pairs, the sterile pair from the under lip, with large yellow, free, clavate apices.—Stigma two-lobed.—Capsules ovate, two-celled, hid between the exterior leaflets of the calyx.—Seed numerous, very smnii *

Obs. As Rumphius observes, the leaves of thin nl»nr *»i" "PX(""Hinoly bitter, and might, no doubt answer valuable purposes in medicine.

2. G. grandiflora. Linn. Sp. PL ed. Willd. 1.105. Corom. PI. 2. N. 179.

Annual, creeping. *Leaves* sessile, broad-lanceolate, pointed, serrate. *Flowers* axillary, solitary. *Capsules* linear.

A native of moist places. Flowers during the wet and cold seasons. Stems several, annual, creeping, four-sided, smooth; fiom six to twelve inches long.—Leaves opposite, sessile, oblong, sharply-serrate, pointed, smooth___Peduncles axillary, about half the length of the leaves, erect, one-ftowered.—Floweis light blue.—Corol; tube cylindric, upper lip entire; under lip broad, three-parted.—Ctamem^ the two fertile filaments lodged under the upper lip, approaching arch ways. Anthers twin, united; the sterile filaments resting on the under lip and adhering to it, yellow, curved.—Capsules lanceolate, longer than the calvx.

3. ilf. alata. R.

Annual. *Leaves* petioled, ovate, serrate-dentate. *Racemes* terminal. *Calyx* five-toothed, and five-winged. #m7e filament free. *Cap** sule linear, hid in the calvx.

A native of the *Moluccas*[^] one of the largest of our *Indian Gra- Moly* and readily known by the five large membranaceous wings
which run the whole length of the calyx.

^{*} In November 1815,1 received specimens of this plant from SilUet, under the **Khase** name *Khai-Nim*. It is used medicinally there.—N. W.

4. G. involucrata. K.

Leaves unequally petioled, round-cordate, with large rounded lobes, many-nerved, serrulate, vill< us. Flowers collected into long peduncled, bracted heads. Sterile tilaments free. Capsule hid in the villous, gibbous, five 'toothed calyx.

This species is also a naive of the Moluccas.

5. G. rotundifolia. Linn. Sp. Pi ed. Willd. 1.103. Corom. Pi 3-N. 204.

Annual, erect. *Leaves* sessile, round-cordate, serrate-dentate. *Peduncles* axillary, solitary, longer than the leaves. *Capsules* globular.

A native of thoist places, appearing and flowering during t^{ie} wet and cold seasons.

Stems erect, four-sided, from four to six inches high.—Leaves opposite, sub-sessile, round-cordate, serrate, or notched, a little hairy.—Flowers axillary, or between the leaves, white. Peduncles longer than the leaves.—Corol; stamens; and stigma as in the foregoing species—Capsules round, as high as the calyx,

6* G. integrifolia. R.

Annual, while young straight, afterwards straggling, four-sided. *Leaves* sessile, ovate, three-nerved, entire. *Peduncle** solitary, axillary, one-flowered. *Capsules* the length of the calyx.

Tsjanga-pupuin. Rheed. mai 9. t. 57.

A native of *Bengal*, where it appears as a weed in gardens, during the rains.

7. G. lucida. Linn. Sp. Pi. ed. Willd. 1.103. bid. PL 3.N. 202.

Annual, spreading, four-sided. *Leaves* peiioled, ovate-cordate, •errate. *Flowers* long-peduncled, axillary, and terminal. *Capsules* ovate, hid in the calyx.

Crusta @Hae minor. Rumph. amb. 5. p. 460. t. 170./. 3.

Annual, and like the rest, appearing in moist places during tlit rainy season.

Stem scarcely any. Branches generally opposite, diffuse, four-sided, from six to twelve inches long.—Leaves short-petioled, cordate, serrate, smooth.—Flowers terminal, and also from the exterior axills, long-peduncled, of a bright deep blue colour,—Capsules ovate, rather shorter than the calyx.

8. G. veronicifolia. Linn. Sp. P/. ed.JVHld. 1,103. Carom. PL 2. N. 154.

Annual, while young erect, afterwards creeping. *Leaves* sessile, lanceolate, senate. *Spikes* terminal. *F.uwsrs* opposite. *Capsules* linear.

Crusta olla? major. Humph, ami, 5. p. 460. /. 170. /. 2.

A native of similar places with the last described; flowering time the same.

Stem several, creeping. Branches erect, four-sided, smooth; from SIK to eight inches long.—Leaves opposite, sessile, decussate, oblong, glandular, smooth, fleshy, finely and most sharply serrate; serratures ending in ti minute bristle.—Racemes terminal.—Flowers opposite, decussated, of a violet colour.—Corol, &c. as in the last species.

9. G. racemosa. R.

Annual, erect. *Leaves* sub-sessile, linear-lanceolate, entire. 12a* *cemes* terminal, brachiate. *Flowers* long-pedicelled. *Capsules* linear, three or four times longer than the calyx.

A native of cultivated land over various parts of *India*, appearing in the rainy season.

10. G. oppositifolia. Linn. Sp. PL ed. fVilld. 1, 105. Corom.,PL «. 2V. 155.

.Annual, sub-erect, *l&wer* leaves opposite to^each other or to a one-flowered peduncle, lanceolate, serrate. *Capsules* linear.

G, oppositifolia. Retz. obs. t. 4. N. 5.

A native of moist pasture ground. Flowering in the wet ieaaon,,

Stems several, nearly erect, ramous, four-sided, smooth; from t'iree to six inches high.—Leaves sessile, opposite to each other, or a flower, linear-lanceolate, 'serrate, smooth.—Peduncles leaf-opposed, or opposite; to each other, short, horizontal, clubbed.'—Bractes solitary, embracing the insertion of the peduncle.—Flowers sni&Hj blue-—An'hars two pairs united. Sterile filaments small, white.—Capsule* utivar, iwice the itiigth of the calyx.

11. G. serrata* JJ.

Annual, eiect, four-side:!, smooth. *Leaves* opposite, stem-clasping, oblong, smooth, most acutely serrate. *Racemes* in the division cf'the brandies, and temuudl, Jong-peduncled. *Capsules* linear, diverging,

He/ig. Bhoomf-n/zn.

Pee-tsjanga-putipum. *Rheed. mah* 9- t. 59- is exceedingly 1&e, this plant, though quoted by Linnaeus for *Ruellia antipoda*, which I have never met with, if this be not it.

A native of Bengal, and in flower during the rains.

Boot annual.—Stem erect, four-sided, ramous, smooth, from two to eight inches high.—Leaves opposite, sessile, or stem-clasping, oblong, very obtuse, most acutely sejrate; smooth on both sides'.—Racemes solitary, teimiual, and also from the divisions of the plant, on long, four-sided peduncles.—Flowers opposite, short-pedicetled, verging, pink-coloured.—Bractes lanceolate, the lower pair oi' the racemes dentate.—Califx palled half way.—Lorol, upper lip small, incumbent.—Capsules lanceolal^, twice the leugth of the calyx.

13. G. reptans. Ii.

Annual, creeping. *Leaves* opposite, from oblong to round, serrate. *Racemes* terminal. *Sterile* filaments free. *Capsule* linear.

A native of the *Moluccas*; from Iheuce intioduced into the Botanic Garden, where it blossoms during the rains.

7c.« and branches lound, smooth, and creeping close to the earth, wiiii short, (about an inch long) floiiferous, erect shoots.-

Leaves opposite, sub-aessile, ou the cieeping shoots round, on the

erect flower-bearing ones oblong, with rounded apices; all serrate, and smooth on both sides.—Peduncles or racemes teiminal, on the short, erect shoots, bearing several, approximate pairs of short-pedicelled, opposite, large, pale bluish pink flowers.—Bractes opposite, one-flowered, ovate.—Calyx five-leaved.—Carol with an enlarged throat, and ringent border: upper lip of one pale coloured segment; under Up broad, deeper coloured, and three-parted,—Sterile filaments large, yellow, clavate, with the apices a little recurved, perfectly free.—Stigma of two, thin, broad, round lobes.—Capsule linear, as long as the calyx, two-celled, two-valved.

13. G.paniflora. R. Cor. PL N. 203.

Annual, efect, ramous. *Leaves* sessile, ovate-oblong, three-ner-ved, serrate. *Flowers* long-peduncled, solitary. *Sterile* filaments two-cleft. *Capsules* oblong.

Stems' erect, ramous, four-sided; with their angles acute, about six inches high.—Leaves opposite, sessile, ovate-oblong, slightly serrate, acute, when large three-nerved.—Flowers axillary, solitary, long-peduncled, small; 1 have seen some plants with white flowers, and others with blue ones.—Anthers twin. Sterile filament two-cleft, each division headed.—Capsules rather oblong, pointed, longer than the calyx.

14. G. Mormieria. Linn. Sp. PL ed. Willd. 1.102.

Annual, creeping. *Leaves* sessi'e, long, obovate, entire. *Pedun** ties axillary, solitary, one-flowered. *Caljx* seven-leaved. *Corol* campanulate; *stamina* four.

Beng. Adha-birni.

Teling. Sambrani-chittoo.

A native of moist places, borders of brooks, &c. Flowering timt Ae wet and cold seasons.

Stems several, annual, creeping, round, jointed, very ramous, •mooth, succulent___Leaves opposite, sessile, obovate, wedge-shaped, or oblong, smooth, entire, obtuse, fleshy, dotted with minute spots—P«fo;<c/e* axillary, alternate, solitary, round, smooth, short-

er than the leaves, one-flowered.—Flurvers blue.—Bractes twoawled, pressing on the calyx laterally.— Cahfx iive-leaved, the exterior three leaflets large, oblong, the two inteiior small, linear, ail are concave, smooth, pointed and permanent.—Carol companulate; border siven parted, nearly equal.—Stamens as in Didynamia.—An/hers two-cleft, at the base, blue.—Sligma\avge9 somewhat two-lobed.—^iap-side ovate, two-celled, two-valved.—Seeds very numerous.

Obs. This plant certainly ought to be placed in the 14th class, it has no one claim, that I can observe, to a place in this genus-*

The natives use the expressed juice mixed with Petroleum,^{t0} rub on parts affected with rhetlftaatic pains.

15. G. hyssopioides. Linn. Sp. PL ed. Willd. 1. 104. Carom. P¹-2. N. 128.

Annual, erect. *Leaves* ensiform, stem-clamping, much shorter iha» the stem joints. *Peduncles* axillary. *Capsules* linear-oblong.

G. hyssopioides. liön, in Reiz obs. 4. jp. 8. Linn. Spec. PL €&• Jleichh. 1•48. Appears with the former species during the rai^{ng.}

16. G. Jnncea. Corona. PI. 2. N. 129.

Annual, erect, columnar, nearly naked. *Lower* leaves lanceolate, stem-clasping; above minute. The two pair of anthers not united* *Capsules* globular.

Like the res¹:, this species delights in a wet situation, where it appears and flowers duYing the rains.

Stern erect, almost simple, round, jointed, smooth, from six to twelve inches high.—Leaves opposite, stem-clasping, lanceolate, obtuse, entire. Floral leaves minute, triangular.—Peduncles axillary* solitary, one-flowered.—Flowers rose-coloured, small.—!Anthers twin, not united. The sterile filaments in this species stand between the fertile ones, and are very small.— Capsules globular.

17- G. cunetfolia. R.

Annual, erect, simple, nearly naked. Leaves one pair at the base,

• Monniera, Browne. Herpeslis, Rob. Brown.—N. W.

1,, <S

cuneiform, obtuse; above one or two minute pairs. *Elmers* solitary, long peduncled. *Capsules* round.

A native of wet places on the coast of *Coromandel*, and nearly allied to G. *lobelioides*, and juueea.

18. G. lobelioides. Linn. Sp. Pled, JYilld. 1.104. Retz.obs.4. 7-Vahh Enumer. 1. p, 92.

Annual, on the lower part of the simple stem grew from two to four pair of approximate, lanceolate, entire, sessile, leaves. *Floz&ers* toward the apex, remote, solitary, loug-peduncled. *Capsules* round.

A native of *Coromandel*, growing in wet places during the rainy season.

UTRICULARIA. Schreb. Gen. N. 41.

Calyx two-leaved.—Corol ringent, and generally calcaraic. Capsule superior, one-celled. Seeds numerous.

1. U. stellaris. Linn. Sp. PL ed. Willd. 1. 1 IS.

Floating, leafless. S^{ape} with a veiticil of bladders. Corol without a nectary.

Teling* Natsoo.

Grows in sweet waters, appears and flowers during the rains. *Root* conferva-like, swimming in, and not on the water; I have always found small utriculi adhering to its filaments.—*Scape* suberect, simple; raceme above the verticil of bladders, which rest ou the surface of the water.

2. U. fasciaihta. JR

Floating. Leafless, scapes naked; racemes four to éight flowered. Utriculi sub-ovate, two-horned, scattered amongst the fibres of the root. Nectary horn-shaped, ascending to the edge of the under P* Capsules beaked, drooping.

Teling. Natsoo.

Beng Janjee.

Found swimming in stagnant water in the vicinity of *Calcutta*, at the end of the cold, and beginning of the hot seasons.

Stern jointed, length various, but often extending Vorae feet.—'
Radicles most numerous, in alternate fascicles, multifid, filiform, armed with minute, acute, bristles pointing forward.—Utriculi scattered, semi-ovate, dotted, becoming black by age, with two horn* from the mouth.—Scape erect, from four to eight inches higli« bearing generally from four to eight, alternate, large, yellow, pedicelied floWers.—Bractes' ovate, obtuse, one-flowered.—Calyx pf two large, permanent leaflets.—Corol as in the genus. Nectary hom-^iaPe''>
blunt, nearly as long as the und^r lip, and bending up to its inaigi*1.5

—Capsules conical, pointed, reflected.

3. U. biflora. R.

Floating, leafless. *Scave* naked, two-flowered. *JJtricnli* ovate, with filaments from their apices. *Nectary* horn-shaped, ascending; along as the under lip. *Capsules* globular, erect.

Seng. Chota-janjee.

Found with the last described in stagnant water near *Calcutta* during the same seasons. A much smaller plant*

Root of a few, scarcely compound, filiform fibres, and some scattered, subulate nigrescent utriculi, with two or more filaments froistheir apices, or mouths.—Scape about three inches high, filiform, naked, generally two-flowered.—Flowers yellow, small.—Calyx and corol as in the genus, with the faux closed, and a horned, ascending nectary as long as the under lip—Capsules globular, erect.

Addition by N. TV.

4. U. nivea. FdhL Enum. i. 203.

Naked, suberect, filiform. *Scape* with a few gibbous *scales*, ending in a few-flowered *raceme*. *Bractes* three-parted, the middle segment adnate and sharp at both ends, the lateral ones minute. *Nectd''* ry ascending longer than the lower lip. *Capsules* globular nodding*

I found this delicate plant growing among rice in the vicinity of Eerampore during the rainy season.

Root consisting of a few capillary simple and short fibres.'—Scope about six inches long, sometimes divided in two equal branches, when fruit-bearing elongated and twining.—Flowers from four to eight, white Mith a)ellowish entire palate, very small on short alternate pedice-is. Catgv permanent, of two orbicular segments, the uppermos* 'ar^ei*' and concave.²—Upper lip very short, linear erect, t'udi:«g t<»'.,ifc?e:s; lower lip ovate, larger. Spur almost twice as iofig as the lower lip, conical.—Capsule half hid in the calyx.

LYCOPUS. Schreb. Gen. N. 44.

Corol four-cleft, with one of the divisions emarginate. Stamina distinct. Seeds four, retuse.

1. L. dianthera. Bitch.

Annual, erect, four-sided. *Leaves* petioled, rhomb-ovate, serrate. *Calyx* bilabiate.

A native of Nepal a; from thence Dr. Buchanan sent the seeds to this garden, (in 1802,) where the plants thrive during the cold season, and blossom in March and April.

Stems annual, straight, four-sided; sides slightly grooved; angles somewhat hairy. Branches axillary, decussate, four-9ided, &c. lite the stem; height of the whole plant from one to two feet.—Leaves opposite, petioled, declined, rhomb-ovate; anteriour margins serrate, dotted with minute, darker green glands underneath, general length about one inch, or less.—Racemes terminal.—Bractes opposite, lanceolate, one-flowereji.—Flowers pedicelled, small, very pale pink, almost white.—Calyx bilabiate; upper lip ascending, tride*tate; 700>trlip bipartite, and, defended with hair on the inside.—Corol; tube short, somewhat four-sided; upper division of the border broad and emarginate; lateral two of the same length, but narrower and semicircular; under one large, and nearly round.—Filaments four, short, *a the angles of the tube of the corol,—Anthers twin on the long fila-

ments, and tending to be so on the shorter ones, but very small, and abortive.—Is nearly allied to *Thymus*.

SALVIA. Schreb. Gen. N. 50.

Corol irregular. Filaments tuo-foiked; anlhers on the superior ones. S\$ed\$ naked.

]. S. benoalensis. Ron. Mss.

Shrubby. Leaves linear-ovate, lanceolate, entire. Racemes verticelled, verticils distinct, many-flowered. An anther to each division of the laments.

The natives on the Coromandel Coast have no name for it. From Bengal it was introduced into the gardens on the Coast a few years *g°> by Mn Parsons \$ and is only found in gardens, where it grows to be a large, strangling shrub.

Trunk seldom erect, woody, sometimes as thick as a man's arm* Bark cracked, and peelling off in irregular pieces. Young shoots dovjrny, round.—Leaves as in salvia ojftcinafis.—Race ties terminal, often compound, verticelled. Verticils approximate, globular, many-flowered.—Flowers white.—Calyx gibbous, downy, three or four toothed.—Corol, both lips recurved, or spreading.—Stamens, there are sometimes three or even four filaments, with their extremities bifid, each division bearing an oval proper anther.

Obs. The leaves of this plant smell and taste considerably stronger, I think, than those of S. officinalis, and are applied to the same uses.

- 2. S. brachiata, R.

Annual, erect, br^chiate. Leaves oblong, crenate, tomentose. $R^a \sim$ cemes verticelled; verticils six-flowered; seeds elevated on a receptacle.

Is a native of moist places, over various parts of India. Flowering time the cold season.

Stem annual, erect, rainous, four-sided, four-grooved, downy; from

one to two feet high. *Branches* opposite, cross-armed, ascending.— *Leaves* opposite, petioled, running down on the petioles, oblong, irregularly crenulate, waved, rugose, a little downy; two or threeinches long.—*Racemes* terminal, long, verticelled. *Verticils* six-flowered, six-bracted.—*Flowers* small, pale purple. *Stamens* as in the genus, with the rudiments of two additional sterile filaments between the large pair.—*Germ* elevated on a large fleshy receptacle.—This plant is slightly aromatic*

S. S. lanata, i?*

Herbaceous, four-sided, villous. *Leaves* sessile, ovate-oblong, entire, woolly. *Flowers* verticillate.

Found by Colonel Hardwicke on the most elevated mountain near Adwaanee, on the road from Hurdwar to Sirinagur. It is his S. *integrifolia*. See *Asiatic Researches*. vol. 6. p. 349.

Obs. Salvia rosea of Vahl, is the same as S. coccinea, an American plant, which though in a manner naturalized here has no right to. a place in this Flora.

VERONICA.

Corol four-cleft, the lower segment smaller. Capsules two-celled*

1. V. undidala, Wall.

Smooth, erect. *Leaves* linear-lanceolate, waved, unequally serrated. *Racemes* terminal and axillary, elongated. *Peduncles* covered With short glandular hairs.

This little plant was discovered in the Turraye by Mr. W. Jack, an assistant surgeon on the Honourable Company's Bengal establishment, who most obligingly communicated the following description.

- Root creening.—Stem herbaceous, erect, fistulous, round, smooth, famous__Leaves opposite, sessile, stem-clasping with their brpad base, linear-lanceolate, acute, gradually narrower towards their apex, with waved, unequally serrated margins, smooth.—Racemes long, axillary and terminal.—Peduncles and pedicels hispid with short, glan-

dular hairs.—*Biwies* linear, acute, smooth/entire, one under each pedicel.—*Calyx* deeply four-parted, smooth, persistent, with straight* Ianceolate, acute *segments*.—*Corol* white^ a little shorter than theca-Jyx; tube very small; three segments of the limb ovate, acute, equad the fourth and lowermost shorter, lanceolate.—*Stamina* two, uprigMi short. *Anthers* oblong.—*Pistil* as long as the stamina. *StigflM* caw pitate,—*Capsule* roundish, compressed, with a furrow on each side, emarginate at the top, beset with glandular hairs, two-celled. &&*** numerous, minute, round.—N.W.

BOERHAAFIA. Schreb. Gen. N.A3.

Calyx inferior, gibbous, entire, permanent, and becoming an tvr ve)o[,e for the seed. Germ one-celled; ovula single, eject. Coro* campanulate, inserted on the cal\x. Seed solitary. Embryo condfl-plicate, with inferior radicle, and central perisperm.

1. B. procumbens. Herb* Banks,

Root fusiform, perennial. Branches procumbeni, smootL Leattf variously cordate, covered with a silver coloiued pellicle underneath' Flowers terminal, in long-peduncled heads. Stamina three.

- Sans*Tji^cit, Pooimmuva, J x 1 ^, Shotwghnt^.

Beng. Gadha-poorna, the red variety; and Shue.a-pooma, tL« white one.

Talu-dama. Rheed mah 7*p. 105. t. 56. good for a young luxuriant plant,

- B. diandra, and erecta. *Burnt. Flor. Ind. p.S.t.l.* seem to be our. plant, taken at different ages.
 - B. erecta. G&rU Carp. ii. 209. t. 127.

This species, whatever it may be, whether *djffusa*, *erecta*, *rep<W* Ha or *diandra*, or all of them, is the only one I have yet found in India. It is not only common *enry* where, but is one of the most troublesome weeds we have. The loner, fusiform, perennial roots, strike «a deep, as to render it no easy task to dig them up, It produces blossoms and ripe seed the whole year,

Roof perpendicular, fusiform, slender, perennial. **Stem none:** branches many, herbaceous, with alternate, bifatious, round, smooth, jointed, often coloured branchlets spreading close ou the ground, U an extent of many feet in a good soil but never striking root.—Leaves opposite, unequal in size, one pf the leaves being alternately smaller in each pair; petioled, variously cordate, margins more or less scalloped, waved, and often coloured; sometimes acute, sometimes obtuse; all are smooth above, and covered with a silver coloured pellicle underneath; size very various.—Petioles shorter than the leaves, channelled.—Peduncles solitary, from the naked sweiled joints between the leaves, but nearest to the small leaf. At the ends of the branches, where the joints approximate, they are so numerous as to form a panicle, each supporting, from one to five, or six small heads of sessile, red or white, minute flowers.—Calyx (apparently the germ), beneath, five-sided, covered with headed 1 itm-• ous glands; month entire, and much contracted.—Carol campanulate, plaited, inserted on the crown of the calyx,—Nectary, a small fleshy, three-toothed cup, surrounding the base of the germ, in the divisions of which the filaments are inserted. It requires a powerful lens, and much patience to understand the structure of this part of the flower.—Filaments generally three, as long as the style. Anthers of two round lobes.—Germ oblong, hid in the belly of the €*lyx, one-celled; ovulum single, attached to the bottom of the cell. Style slender. Stigma peltate.—Pericarp turbinate, five-sided, covered with clammy pedicelled glands, &c. exactly as in Gartner's figures of his Boerhaavia erecta.

Obs. There are two varieties of this plant in Bengal; one with ted, the other with white flowers; in other respects they are the same. In the St. Heléna plant, B. repanda of the hortm beugaiemis, the leaves are more angular, the inflorescence terminal, raceme* verttelled, with one bracte only to each pedicel,

FRAXINVS.

Polygamous. Calyx none, or four parted. Cord none, or four petalled. Samara one-seeded, with lanceolate wings.

1. F. chinensis. JR.

Arboreous, with erect branches. *Leaflets* from three to sevely lanceolate, serrate. *Panicles* axillary, and terminal. *Flowers* with petals.

A native of China, from thence introduced into the Botanic G»^rden by the late Col. Robert Kyd, prior to 1793; where they b^{s*}som in April, but have not produced seed, or even full grown secvessels.

Our small trees have little or no trunk; but several, erect, straig "" branches and branchlets; giving an entire height of from ten twelve feet.—Leaves opposite, pinnate, and ternate. Leaflets froltt The pairs three to seven, opposite, lanceolar, serrate, smooth. short-petioled, much smaller and shorter in proportion to the** breadth than the terminal one, which is protruded on a longer $w'i^{\wedge}S^{\theta}$ ed petiolet.—Petioles channelled, sometimes with a marginal wing* —Panicles axillary, and terminal, small, drooping, and composed ** most slender, simple, and compound, sub-verticelled ramification** —Calvx, in all, four-toothed.—Corol none.—Filaments in the completely hermaphrodite flower much longer than the calyx. female wanting, or abortive, and hid within the calvx, MalefloWerS not found.—Germ ovate. Style long, and curved. Stigma em*!*'' ginate.

2. F.floribunda. Wall.

Leaflets oblong, tapering, acuminate, acutely and unequally serrated; male flowers with a corolla.

A native of Nepala, from whence I received specimens with *vad*^e flowers and others with seeds, in April, 1813, under the nain^e *Kangu* and *Tahasee*.

Grows to be * large tree with smooth, ash-coloured, dotted

branches; branchlets compressed.—Leaves opposite, with three pairs of smooth leaflets, which encrease somewhat in size, the terminal or odd one being the largest, ovate and equal; they vary in their figure from oblong to ovate-oblong, measuring from three to four inches, about one inch distant from each oilier, acute and more or less unequal at the base, tapering into a long narrow serrated acumen, perfectly smooth above, reticulated and nerved below,— Prtio/es slender, grooved, opposite, terminal one an inch long. —Pericles terminal, showy and large, compound, smooth, loose, interspersed with a few floral leaves, with opposite branches and btanchlets and long slender racemes consisting of innumerable short p: (iuncled or sessile fascicles of white scentless flowers on capillary p\ dicels.—Calvx truncated* four-toothed.—Petals very long, linearciavaie.—Filaments capillary, almost as long as the corolla; anthers linear, erect.—Rudiment of the female organs none.—Capsule linear, about an inch long, one-celled; wing scarcely two lines broad, veined and marked with elevated dots, slightly retuse at the apex. Seed solitary, possessing a bitterish somewhat aromatic tas':e; in other respects lik,e Fr. ex etsior, Gart. Carp. i. Q.Z2. tab. 49.

Ohs* 1 have not seen the female.flowers of this ornamental tree twhich unquestionably conies near to F. Ornus (the Manna or Flowering Ash), diffeiing chiefly in having taper-pointed, acutely serrated leaves.—N. W.

LIGVSTRUM.

Corol four-cleft. *Berry* superior of two cells with two seeds in each cell.

1. L. nepalense. Wall.

, leaves ovate, or ovate-oblong, acuminate, villous below. Panicle terminal, villous, consisting of sub-erect crowded racemes.

A native of the mountains of Nepala where it is called *Goom** gacha and grows to be a considerable tree, producing profuse clusters of white, sweet smelling flowers from April to June; berries "pen in four to six months.

"Branches round, opposite, ash-coloured, dotted with callous spots; $z|\cdot|$ the younger parts covered with abundance of soft hairs ^-Leaves opposite, spreading, on very shftrt channelled petioles, varying considerably in size and figure, mostly ovate with a rounded base, sometimes oblong orlanceolar, generally tapeiiug into along apex, tennina-j ted by a short cylindric point; from one to two, or .even three inches long, of a firm texture, shining above, densely villous underneath, when old entirely smooth, with very fine remote nerves communicating with each other in reticulated arches near the margin.—Panicle somewhat, contracted, ovate, from four to six inches long, sessile, consisting of pre*ty crowded racemes, the uppermost very short and alternate.-*

Pedunrles round, villous, with a deciduous sniall lanceolate bract un*

der each division.—Flowers short-pedicelled, smooth, disposed i*1 small bunches.—Calyx truncate, with four hardly discernible teetb»_c—Corol; tube equalling the calyx; segments of the limb spreading, ^'' ccpiate, acute, twice as long as the tube.—Stamina almost as long** the corol ifilamints inserted within its mouth between two opposite fissiires; anthers oblong, bursting lengthways on both sides__Pisti* shorter than the stamina, smooth; o:anM?ftroundish,.t\vo-celied, with two pendulous ovulain each cell; style short; stigma fleshy, oblong; acute.—Berries oval, dark blue with a beautiful bloom on them, rather smaller than those of the common Privet; pulp brown.—Feeds one or two; cotyledons broad-ovate. In other respects like those of Ligustrum. Gart* Carp- ii* 72. tab. 92.

Obs. This species differs from L. japoniewn, Thunb. and luciduffl* Ait in the figure and villosity of its leaves and the contracted shap⁶ of its panicle. It may perhaps be found the same as L sinense, Lourespecially if the racemes, which in the flora cochinchinensis are **-tribu/ted to that tree, are considered as panicles, which indeed has been done by the illustrious author of that article in Rees's New C)'' clopsedia.

I possess specimens taken from old branches, with more expanded panicles, which together with the leaves are perfectly smooth.—JS. ^f VERBENA, See Dxdynamia Angiospermia.

TRIGYNIA.

PIPER. Schreb. Gen. N.59.

Arab. Filfil.

Malay. Ladda.

Cultivated iu various parts of India, and its Islands.

2. P. trioicum. R.

Tricecous, shrubby, rooting. *Leaves* bifarious, obliquely-ovate, acuminate, from five to seven-nerved, glaucous. *Aments* leaf-opposed, cylindric, pendulous.

Teling. Murial-tiga.

Roots long, striking deep into the earth.—Stem jointed, winding, when old woody, and scabrous, running along the ground to a great extent, or up trees, &c. when trained to them; from each joint issue roots which take firm hold of whatever they meet with. Branches numerous, alternate; the young ones smooth, the old ones Woody, and scabrous like the stein.—Leaves alternate, petioled, cordate, broad-oval, ovate, or oblong, pointed, from five to seven

nerved, (generally five,) above, smooth and glofesy, below, lighter coloured, often somewhat bubbled, from four to six iuches long, and fiom two to four broad.—*Petioles* channelled, smooth, an inch or an inch and half long.—*Stipules* solitary, spathiform falling off when the leaf begins to be unfolded.

MALE PLANT. C«/yjfana;ne/^,leaf-opposed,peduncled,filifonw> pendulous, closely imbricated with five spiral rows, of fleshy, oval; one-flowered scales.—Scales oblong, peltate, sessile, one-flowered—Corol none.—Filaments three, very thick, and very short, scarcely elevating the anthers above the margins of the scales of the ament. Anthers four-lubed.—Pistil, iu some, a miliute cyliudiic gland m the centre, in others, not the smallest rudiment of one.

FEMALE PLANT. Cafj/x an ament, ieaf-opposed, shorter, thicker, and more rigid than in the male, imbricated with three spiral rows of scales.—Scales as in the male.—Corol none.—Stamens none—*

Germ sessile, globose, immersed in the substance of the aneot.

£>tgte none. Stigma three-lobed, white, glandular.—Pericarp, a smai!, round, red, somewhat fleshy berry.—Seed one, globose.

Obs. When 1 described the three vines included in this one speri* s, I bad not seen *Piper nigrum*, and took it for granted that thi9 was it; but as soon us I had an opportunity, of seeing that famous plant, I v ds immediately convinced that they were distinct 9pecies. In *trioicum*, the leaves have a glaucous appearance, which readily distinguishes it from P. *nigrum*, which has shining dark greeu leaves.

This vine I have found wild amongst the chain of mountains directly noi the from Coriuga, in the Raj l-mundrz Circar. It delights in a moist, rYh soil, well shaded with trees; to them it adheres most firmly, by HJtans of the roots which issue from the joints. Flowering time, in their wild state, duiting *he latter part of the wet season,* September and October. The pepper ripens in March. With me, in a cultivated state, they flower almost all the year round, but chiefly during the forementioued period.

1 have not met with any author, or any sort of information, that could lead me to think black pepper was the produce of? dioecous

plant, (male and female ou distinct vines,) fil upon examination, I found it was so. Attention to this circumstance will, I think, render tjie culture of pepper much more certain, and successful, viz. by planting to each prop tree a male and female | lant, the malt on the sides from whence the most prevailing wind blows; and the female on the other.

The vegetable world is* full of proofs tlizt the sexuahystern of t\emptyse immortal Linneus is founded on the soundest piuKi^es; and not a single plant have I ever found in India, thai does not couobuntte this fact. The Arabians from time immemorial knew, that to render the female date-tree prolific, it was necessary to bring it in contact with, the male; which they do by making a slit in the spathe of ihe female flower, just before it is ready to burst and thrusting therein a branch of the male spadix. I have therefore the utmost leason to conclude the pepper vine will be much more productive, if the above mentioned circumstance be attended to, by the cultivators. I think, if he Malays on Sumatra had known it, the accurate Mr. Marsden, would not have neglected mentioning so material a circumstance, when describing this plant, and the method of cultivating it there.

Soon after the above description was made, I found a third vine bearing ameuts with hermaphrodite flowers; or hermaphrodite and female flowers mixed on the same ameuts. At the same time 1 found Aat the pepper of the female viile did not ripen properly, but dropped while green, and immature from the plant, and that when dried it "d not so much pungency as common pepper, whereas the pepper of this ihird sort ripens perfectly, when dry is exceedingly pungent, and was been, by pepper merchants at Madras, reckoned equal, if not superior to the best peppei of the Malabar Coast, or Cejlou; consequently this must be the sort that is found cultivated; the oilier two being, I conjecture, entirely neglected.

This *hermaphrodite* plant grows wild, with the male and female, in the moist, uncultivated, over-run shady vallies, up amongst the fountains; and also upon the mountaius, where springs keep them to such places are common in the cliffs of the rocks, and there

the vines thrive with the greatest luxuriance. In its stem, branches, leaves, and stipules, it agrees perfectly with the other two. The aments are also the same in every respect, except that here are four spiral rows of flowers; the *scales* of the *ameflt* are as in the other U o, viz. the male and female plants.—*Stamens*, generally two, fleshy, clubbed filaments, shorter than the germ, and placed laterally, so as to press upon it. It frequently happens that ti.ey are entirely wanting, or only one is present. *Anthers* two oval pits in the apex of each filament.—*Germ* globular, immersed in the substance α^* the ament. *Style* none. *Stigmas* three, spreading.—*Berry* globular, size of a small pea, red, smooth, one-celled,—*beeds* solitary,

3. P. bngum. Willd. 1. 161.

Dioecous, shrubby, creeping. *Lower* leaves petioled, broad-cordate, floral leaves sessile, stem-clasping, oblong cordate; all are from five to nine-nerved.

Cattu-tirpali. Rheed. ma I. 7-p 9,7. t. 14.

Sans. efSjrt, Krishna, gro^qTi Oopukoo^ya, %**£), Videhee, मामधी, Magudhee, चयवा, Ch/<pffla, व्या, Luna, द्वा, Ooshuna, विषादी> P«PP«lee, fTpj^, Shoundee, iRKfi, Kola.

Beng. Pippul, the root Ptppzda-moola.

English. Long-pepper.

Pippul-chittoo is the Telinga name of the plant, and Pa'pp#Ioo the pepper.

The plant I have found wild amongst bushes, on the banks of water courses, up towards the Circar mountains. It flowers and bears, fruit during the wet, and cold seasons.

Root woody, perennial.—Stews many, creeping, jointed, round; joints swelled; young shoots downy. Branchleis bearing the fruit are erect, with the lea\es sessile, or nearly so.—Leaves on the creeping branches largest, petioled, broad-cordate, seven-nerved; on the erect, fruit-bearing branchlets (floral leaves) stem-clasping, obiong-cordate, five-nerved; all are smooth, somewhat wrinkled; below pale green; size various.—Stipules of the petioled leaves two, joining

lengthways to the petioles, lanceolate; of the sessile leaves within the leaf, single, spathiform.

FEMALE FLOWERS. Ament sessile, leaf-opposed, peduncled, erect, cjiindric, imbricated with five, or more, spiral rows of small, orbicular, permanent, peltated, one-flowered scales—Lclyx iioi*e.—Corol none.—Stamens none.—Germ* numerous, aggregate, sessile, sub-orbicular. Style none or exceedingly short. Stigmas tliree or four-lobed.—Pericarp aggregate, sub-cylindrical, composed of firmly united, one-seeded drupes.—Seed ovate, smooth.

Obs. It is in Bengal only, so far as I have been able to karn, that this plant is cultivated for its pepper. When the pejxper (ament) is full grown, it is gathered and cfcily exposed to the sun, till perfectly dry; after which it is packecf up in bags for sale.

The roots, and thickest parts of the creeping stems, when cut into small pieces and dried, form a considerable article of commerce all over India, under the name of *Pippula moola;* forwhicl purpose it is particularly cultivated in many of the vallies amotogsthe Circar mountains. This sort is more esteemed, and bears a higher price than that of Bengal; where by far the largest proportion is cultivated. It is, as well as the *pepper*, chiefly employed medicinally, and the consumption of both these drugs is very great.

by seed, but by suckers, and requires to be cultivated upon a rich, high, and dry soil. The suckers are transplanted soon after the setting m of the periodical rains, and the pepper (which is preserved merely by drying it in the sun), is gathered in the mouth of January, after which the stalk, and branches of the plant wither, and the roots only remain alive. A Wgha of 1 nd (ihe third of auEnglish acre) will yield in the first year about a maund (eighty-four pounds) of the pepper, in the second year four maunds; and in the third six; after which, as the plant becomes annually less and less productive, the roots are grubbed up, dried, and sold; and fresh foots, or young shoots are set in their stead, the earth requiring merely a slight covering of manure. The plants are never to be watered, and at the commence-

ent of the hot season the roots are to be carefully covered with "raw to preserve them against the heat of the sun. The plants should be set about five feet asunder. Large quantities of this pepper and also of the roots are exported to Bombay, and Suiat; where both are in great demand, the first for culinary, the latter for medicinal purposes. The Ryots in this part of the country, usually so's radishes, or barley, or plant brinjals (Solatium melongena), in the intermediate space between the plauts.

.4. P. Chaba. W. Hunter in AsiaU Res. ix. 391.

Shrubby, creeping. *Leaves* short-petioled, ovatt-lahceolate, base unequal, scarcely triple-nerved: ameuts leaf-opposed, erect, cylindrico-conical, firm and fleshy.

Piper-longum. *Rumph. amb.* 5. p. 33S. t. 116./'.].

(Jhs. Cattu-tirpali. Rheed.mal. 7. p. 2.7. t. 11. represents a very different species, the fruit of wh'ch is also usedjover the continent of India, and particularly in the western part thereof, as long pepper, md is much cultivated in Bengal, chiefly for its root, which the natives call Pippua. WoodvihVs figure, in his Medical Botany, is very bad, for it answers neither to this, nor P. longum, Lum. >p JPJ. erf. Willd. 161. which may be called the long pepper of the continent of India. Blackweli's figure is still worse.

5. P. sylvaticum. JR.

Leaves all petioled, broad-cordate, from five to seven-nerved, **obtuse**; lobes of the base large, equal, circular. AmenU erect, short-peduncled, columnar, male flowers tetrandrous.

A native of the mountains on the North-west border of Bengal, where the natives call it Pahari peepu], oi *mountain* long-pepper and use it, both green and iipe,in their dishes, hi the Botanic Garden it blossoms, and the berries ripeu during the raius.

Root perenn'i.—Stem or rather branches creeping on the ground, or rooting on trees like Ivy, and most of the East Iftdia species of pepper; all the young parts polished.—LeateS alternate, petioled, equal ly-cordate, obtuse, from five to seven-nerved, smooth, from three to five inches long, by from two to four broad.—Petioles from one to two inches long, grooved.—Stipules interfoliaceous,8cc. as in the genus.—Male aments leaf-opposed, short-peduncled, or columnar, slender. Scales one-flowered.—Corol none.—Filaments generally four, oval, fleshy, very short. Anthers one celled.—Germ none.—Female aments on a diffeient plant, leaf-opposed, short-peduncled, cyliifdrit?. «—Germ oval, one-celled, ovula single, erect, that is, attached directly to the bottom of the cell.

6. P. peepuloides. JR.

Leaves equally-ovate, and ovate-lanceolate, shprt-petioled, from three to five-nerved, smooth, acuminate. -4wie/tfs«ub-sessile,cylindru;.

Pippul the vernacular name in Silhet, and on the adjacent range of mountains where it is indigenous, and considered the * Pippul, or long-pepper of that country, and as such is used in medicine, &c. It differs specially, no doubt, from the long-pepper plant of lower Bengal, as well as from thafof Rumphius, called P. Chaba by Dr. W. Hunter, who found it common on the Island of Pulo-Pinang. It is immediately known from P. longum by the shape of the loaves, as well as by their being all equally petioled; and-fro'n P. Chaba, by both sicles of the base being equal, or nearly so; whereas in Chaba the lower side is much larger and longe/.

Hoot perennial.—Stems and alternate branches creeping, young shoots smooth.—Leaves alternate, short-petioled, from ovate-oblong, to lar.ceolate, entire, acuminate*? generally jive-ncrved, of which the exterior two are minute, and when absent the leaf is perfectly thte, pprvejj from three to five inches long, by from one to three broad; '—Sthu'e* «tem-claspir*g, and petiolary.—The Female aments have only been foui<(V ^hlch induces me to think this species is dioeco.s. PS most of -hem are; they are short-peduncled, solitary, and directly o^ posite to the leaves*—Berries smaller than in common

black-pepper (P. nigrwn) obliquely oval; pulp in small quantity, one-celled.— Seeds solitary, conform to the berry.-^Perisperm conform to the seed.—Embryo minute, lodged in a little hollow in the apex of the perisperm.

7. P. Beth. Linn . Sp. PL ed. Willd. 1. 159-

Perennial, dioeuou*, creeping. *Leaves* alternate, bifarious, cordate, from five to seven-nerved, smooth, entire. Female aments subcylindric, drooping.

P. qui saururus, &c. Barm. Zeyl.p. 193. t. 83. f* 2.

Sans. <f*3\$njgl, Tauiboolttvttllee, <fQT*ft, Tamboolee, ₹₹₹, NagMVwllee.

Hind, and Beng. Pan.

I have never met with this plant in its wild state. It is much cultivated over India and the Malay countries.

Root woody, ranwus.—Stems woody, creeping on the earth, or rising up trees, poles, &c. when carefully trained to them; smooth in every part; innumerable roots issue from the joints, by which the plant is well supported after they have taken h'dld.—Leaves alternate, pedaled, bifarious, from broad-cordate to obliquely ovate-oblong, somewhat pointed, from five to seven-nerved, entire, smooth; from four to six iuches long, and from two to four broad.—Petioles of various lengths, and channelled.—Stipules as in P. nigrum.—Female aments leaf-opposed, peduncled, filiform, sub-pendulous, closely imbricated with several spiral rows of scales, and corollets, exactly a* in P. trioicum.—The male flowers I have never found.

Obs. The plants are constantly raised from the slips, and cuttings, these are carefully planted in a rich moist soil, well inclosed, and shaded, so that they are in great measure, protected from both sun and

wind. In some places, small plantations of *Mschynomene grandijflora*, are made to train them to, and to keep off the sun; in others, poles are employed for the first, and a thin shed of mats over them for the latter purpose, they require to be frequently watered during the dry weather. Every history of India describes, and every body knows, the use the Hindoos of all ranks make of the leaves of this plant.

8. P. Cubeba. Gart. Carp. ii. 67. Linn. Sp. PL ed. WilU. 159.

Shrubby, creeping. *Leaves* petioled, ovate-lanceolate, scarcely triple-nerved. *Aments* leaf-opposed, on peduncles longer than the petioles. *Berries* pedicelled.

Piper canninum. Humph, amb. 5. t. Q&.f. 2.

A native of Prince of Wales Island and the countries to the east- ward of the Bay of Bengal.

9- P. lanatunt. R.

Erect, ramous at the top, saruientose. *Leaves*, from broad-cordate to oblong, smooth, five-nerved, the superior ones sub-sessile, *Aments* leaf-opposed, short-peduncled.

P. iatifolium. Hunter in Asiat. Res. JX. 392*

Gadu. Cando; or Gadukh, of the Malays.

A native of the Malay Islands, and brought by Mr. Smith into the Botanic Garden, where it thrives luxuriantly, and is in fruit most part of the year.

Stems erect, from six to eighteen inches high, ramous at top, jointed, and smooth. Sarmeritose shoots of a great length, issuing in abundance from the top of the root, and the lower part of the stem, by which the plant is quickly propagated to any extent.—Leaves alternate, the lower ones petibled, broad, re-entering, cordate; the upper ones sub-sessile, obliquely-oblong; all are smooth on both sides, and shining on the upper one.—Aments solitary, opposite to the leaves, short-peduncled, oblong, very small, being rarely more than a quarter of an inch long,—Germs oval, one-celled, ovulurn one attached by the base to the bottom of the cell.—frail compound, subcylindric, about the size of an infant's finger, when ripe softish, and of a dark green or livid colour. Berries numerous, most of the Seed solitary, oval, attached to germs prove abortive, one-ce'led. the bottom of the cell. Integuments single, thin, light brown.— *Perisperm* conform to the seed, friable.—*Embryo* shape of a small broad inverted cone lodged in the apex of the perisperm. Radicle superior.

17. P. angustifolium. R.

Scandeut, or creeping, smooth. *Leaves* sessile, obliquely-lanceolate, very smooth. *Aments* leaf-opposed, short-peduncled.

A native of the Malay Archipelago.

18. P. saiatile. WalL

Stems furrowed, creeping, with villous joints and fascicled suberect branches. Leaves sub-sessile quatern, obovate-rcuneate, fleshy, convex and villous beneath, with three-coloured nerves, veinless. Spike terminal, filiform, elongated, peduncled.

A native of the neighbourhood of Katmandu in Napala, where it grows on rocks and blossoms during the first four months of the year.

A small succUlent, probably annual species, which creeps to a

considerable extent, sending forth fascicled, sometimes single, opposite or alternate branches from each joint, which scarcely rise four inches above the surface on which the plant grows.—Stems thread-like, pubescent, with four or five furrows; branches once or twice subdivided into small opposite branchlets.—Leaves generally quatern, rarely tern, four or five lines in length, obtuse, cuneate at the base, shining and some what concave above, with copious short hairs below, slightly ciliated, without veins or ribs, and losing even the three palecoloured nerves when dry; the lowest verticils many times, the others two or three times shorter than the interstices between the joiuts.— Leaves of the young shoots linfiar-oblong, measuring sometimes an inch in length.—*Petiols* very short, villous, erect, with a gland-like body in their axils, villous.—Spike terminal, very slender, from an inch to an inch/ and a half long, round, villous, excavated on its surface with innumerable small pores in which the flowers are lodged, on a peduncle about half its length.

Obs. All the parts of this elegant little species have a faint pungent taste. I have not been able hitherto to examine its organs of fructification in a satisfactory manner.

Addition to Jasminum heteropftgUum, p. 99--By. N. W.

Since the above page was printed I have through the kindness of the Honourable Mr. Gardner been favored with flowering specimens of that interesting species which have enabled me to add the following description.

J. fveterophylhim. R.

Arboreous. Leaves alternate, petioled, simple or ternate, from oblong to broad ovate, acuminate,, waved, lucid, firm.—Panicles terminal, spreading, trichotomous, fastigitate.—Calyx urceolate with subulate teeth.—Segments of the corol oblong, equalling the tube.

Nepala names, Gooje and Javana-

It grows to be a midling-sized tree with long branches which have a tendency to become rambling. *Leaves* varying so much in size, aa well as figure, as to appear to belong to different species, while in

reality they are the produce of one and the same[^] tree, only taken from differently aged branches; oblong and tapering, some times ovateoblong, or even very broad-ovate almost cordate, generally alternate, in younger shoots opposite, from three to six inches long, two to three or even four inches broad, terminating into a long acumen, rounded, sometimes unequal at the base, perfectly smooth, shining above, pale below, with a very elevated rib, and long, sub-opposite, oblique, arched nerves which unite into, sub-marginal reticulated veins. The leaves are promiscuously single and ternate, or even binate on one and the same branch; but in general they have a tendency to become ternate on younger branches.—Petiols slender, grooved, as well as the peduncles covered with short hairs, which occasionally continue along the principal vessels on the under side of the leaves; from one to two inches long; partial ones, short; they are all articulated at both extremities.—Panicles more or less elevated above the leaves, large, spreading, many times branched, the first divisions being long, the subsequent ones gradually shorter.—Pe« duncles slender, lax, together with the calyx hairy, with subulate deciduous bractes under each ramification.—Fiowers very numerous and dense, ternate, yellow, delightfully fragrant, elevated on longish pedicels to nearly the same level 5 the intermediate ones sessile— Tube of the corol about half an inch long, cylindric, striated,—Sta* mens slightly elevated above the mouth.

Obs. This ornamental Jessamine is probably the largest of **the** genus, growing as I am informed, to a considerable tree,—N, W.

Class 3d.

TRIANDRIA

MONOGYNIA.

FALERIÁNA. Schreb. Gen. N. 60.

Calyx none. Corol superior, one-petalled, gibbous on one side of the base. Seed one.

fi. V. Hardwickii- Wall*

Triandrous villous- *lladical leaves* numerous, fleshy, ovate-cordate, acute, unequally sinuated, on long groved petiols; *cauline* sessile small, opposite, remote, pinnate or laciniate at the base. *Corymb* terminal gradually elongated; pedicels dichotomous. *Seeds* crowucd with a downy pappUs.

Valeriana. Hardw. in Asiat- Res. vi. 350...

A native of the mountains of Sirinagur and Nepala; where it blossoms in the beginning of the year.,

Newarree Name, Chammaha Soa.

Root fleshy, as thick as the little finger, sending out a great number of pale, cyliudric, slightly pubescent fibres.—Leaves numerous, spreading in all direction, from one to three inches long, with slightly waved and unequally repand, sometime^ deeply gashed, margins, covered on both sides with very short soft hairs; dark green and

somewhat shining above; very pale with fleshy prominent rib and nerves and slightly reticulated veins below; the lobes at the base more or less marked, sometimes decurr'nt or entirely wanting. As the stem grows in length they are elevated with it a few inches above the ground and are then perfectly opposite in very approximate pairs.—Stem leaves, two to three or even four very remote pairs, pinnate or pinnatifid, the terminal leaflets lanceolate, sinuate-dentate about an inch long, the others in otie or two pairs linear-lanceolate, very small.—Petiols cylindric, pubescent, with a deep channel above, tapering from a bnoad and thick base, twice or thrice longer than the leaf.—Stems several, erect, striated, fistulous, slightly villous, from one to four feet high, as thick as a good goosequill.—Corymb terminal, crowded at first, but after wards much 1 engthened, with opposite slender pubescent peduncles, the lowest one or two pairs of which are generally distant and appear like smaller axillary inflorescences; pedicels three or four times forked, capillary, ending into short, few-flowered or crpwded racemes.—Bractes linear opposite under each subdivision of the corymb; lowermost almost as long as the peduncles—Flowers very small, pale, with scarcely any other calyx than an elevated margin at the top of the ovarium. *Corol* funnel-shaped with a five-cleft regular border; its tube naked at the base, villous within.—Seed compressed, with a series of white hairs in the furrows of the ribbed side; in other respects like that of Vrubra. GarU Carp. ii.p. 35. t. 86.

Obs. I have received abundance of specimens with flowers and fruit from the Honourable Mr. Gardner. He also sent me roots of this interesting plant, which at present (May 1818), are shooting forth numerous large fleshy leaves. Its fibrous root acquires on being dried a strong smell like that of the common valerian and appearing to be permament. It is used, medicinally by the natives of Nepalfl.

The flowers and seeds seem like those of V. *Jaiamansi*, but in regard to the root and leaves the two plants differ widely.—N. W.

OLAX. Schreb. Gen. N. 61.

Calyx entire. Carol three-petalled. Nectary of a few abortive filaments inserted on the petals. Germ one-celled; ovulum one, erect. Drupe half hid in the enlarged calyx, one-seeded. Embrya inverse, and amply furnished with a perisperm.

1. O. scandens. Corom. PL 8. N. 102.

Shrubby, scandent. Leaves ovate-oblong. Petals and nefctarial filament bifid.

Fissilia psittacorum. Linn. Sp- PI ed. Willd. 1. 194.

Roxburgia baccata. König's Mss*

Teling. Turka-vepa.

A large, woody, climbing shrub, a native- of forests. Flowers all the year round-

Trunk leaning, often as thick as a man's thigh. Branches numerous, climbing.—Thorns one here and there over the old woody parts only, very large and strong, shaped like the horn of a Rhinoceros.— Leaves alternate, bifaridus, petioled, oval, entire, smooth, about two inches long, and one-broad.—Racemes axillary, solitary, half the length of the leaves, few-flowered.-*Flowers small, white.—Calyx cup-form, entire, permanent, and enlarging with the fruit.—Petals three; one* two, or all three half two-cleft; divisions linear, spreading.—Nectary of a bifid, filiform, yellow body, rising from the inside of the base of each division of the petals.—Filaments three, short, standing between the nectaries, inserted into the petals below their fissures. Anthers oblong.—Germ superior, ovate, one-celled, containing one ovuluttt attached to the bottom of the cell. Style length of the corol.—Stigma simple.—Drupe or berry globular, three-fourths covered with the enlarged calyx, yellow, pulpy, one-celled. Birds are fond of them.—Seed single, globular. Integuments, two; exterior nuciform; inner one white and spongy. Perisperm conform to the seed, amyg' Embryo inverse, minute, lodged in the apex of the pensdaline. Cotyledons two, equal, minute, semi-linear. Radicle larger than the *cotyledons*, oval, superior

2. O. imbricata. ft.

Shrubby, scandent. *Leaves* bifarious, from ovate-lanceoiate to oblong, entire, glossy. *Racemes* axillary, before the flower expands bifariously imbricated, (like the spiculae in *Briza*.) *Drupes* ovate.

A very large climbing shrub, or tree, if any scandent plant can be so called; a native of Chittagong, where it flowers in the hot season.

LOEFLINGIA. Schreb. Gen. N. 71.

Calyx five-leaved. Coroi five-petailed. Capsules superior, one-celled, three-valved.

1. L. indica. Linn. Sp. PL ed. Willd. 1. 191. Retz. Obs. 48.

Annual, diffuse, pranchy. *Leaves* sub-verticelled, cuneiform *Flowers* terminal. *Style* three-cleft. *Calyx* fleshy.

Phamaceum depressum. Mant. 564.

A small, diffuse, annual plant; appearing and flowering in the cold season.

Stems many, pressing on the ground, branchy.—Leaves opposite sessile, with many smaller ones from their axills, which makes them appear verticilled, oval, smooth, from a quarter to half an inch long. "-Stipules four-fold, membranaceous, with many small similar scales about the flowers.—Flowers sessile in the divisions of the branches, and terminal. Petals linear, with three or four-toothed apices.

HIPPOCRATEA. Schreb. Gen. N. 73.

Calyx five-parted. Petals five. Germ three-celled; ovula a few, attached to the axis. Capsules three, one-celled, two-valved. Seer/5 ^mbrane-winged* Embryo erect, without perisperm.

1. H. *indica*. *Linn*. *Sp. PI ed*. *Willd*. 1.193. *Corom*. *PL 2*. *N*. 130. Shrubby, climbing by tendrils. *Leaves* oblong, ventricose, serrate. *Corymbs* axillary. *Capsules* oblong, two-seeded^

A large, twining shrub, native of forests, hills, and wild uninhabited places, over various parts of India. Flowers about the beginning of the hot season.

Tendrils simple, woody.—Leaves opposite, short-petioled, oval, pointed, serrate, smooth, shining, about two inches long.—Panicles (Umhells) axillary, opposite, peduncled, about as long as the leaves, dichotomous, expanding—Flowers numerous, very small, of a rusty yellow colour.—Bracies minute.—Petals linear-oblong.—Germ superior, three-lobed, three-celled, with two ovula in each, attached to the axis.—Style shorter than the stamens—Capsules from one to three, oblong, one-celled, one-valved.—Seeds two, broad-winged; affixed to the bottom of the capsuks by the apex of the wing.

£. H. obtusifolia. ft.

Shrubby, climbing by the help of cirrhose branchlets. *Leaves* elliptically-oblong, entire, obtuse. *Corymbs* terminal and axillary* *Capsules* obovate, four-seeded.

A native of the coast of Coromandel. Flowering time in the Botanic Garden, March and April; the seeds take one year to ripen.

Stem and larger bramhes ligneous, and covered with cracked, spongy grey bark, climbing to a great extent by the help of the smaller, round, smooth, diverging, opposite branchlets, which take a turn, or two round their supporters.—Learn opposite, short-petioled, oblong, entire, (large luxuriant leaves are sometimes obscurelyserrate,) obtuse, firm, polished, length from three to four inches. Stipules of the leaves four-fold, minute, subulate; those of the branchlets larger.—Corymbs Lerminal, or from the exterior axills, often compoundly dichotomous, and shorter than the leave's—ZWe* minute, ovate.—Fiowers small, pale grewiish yellow—Calyx five-leaved.-Pt^fc five, ovate-lanceolate—Nectary, a large, fleshy receptacle receiving the base of the germ; its margin becomes thin, and is clvided into three, tapering, antherifes'ous segments, which are at first ereel, but soon become re volute.—Filaments no other than the three segments of the nectary. Anthers of two, round, one-celled lobes.—

Germ three-iobed, immersed in the thick, fleshy nectary, three-celled, each cell containing several seeds, attached to the axis—Style the length of the filaments; stigma three-toothed—Capsules three, ©bovate, thin, smooth, slightly veined, about two inches long, by one and half broad, one-celled, two valved.—.SWs generally four in each capsule, two on each side, lodged about its middle, of a narrow-oblong shape, with a large, oblong, meinbranaceous wing proceeding from the base, and attached by its extremity to the very base of the capsule. Integuments two; exterior a very thin, smooth mem* brane; interior rather thick and somewhat spongy.—Perisperm none*—Embryo erect. Cotyledons oblong, pale green while recent. P/w-mula two-leaved. Radicle short, inferior.

Obs. In the following species there are only two seeds in the capsule, in every other respect it resembles exactly this species.

3. II. arl&rea* R.

Sub-arboreous, with climbing branches. *Leaves* opposite, oblong, serrulate, cuspidate. *Corymbs* axillary. *Capsules* iiuear-oblong, two-s seeded.

B. Katluz-paharia.

A native of the interior parts of India. It blossoms iu July, and the seeds ripen in March.

Trunk tolerably straight, but short, about as thick as a man's thigh, covered with smooth, dark brownish ash-coloured bark. Branches and branchlets spreading and climbing to a great extent, young shoots round -and smooth, indeed highly polished; many of them form the clnspers.—Leaves opposite, short-petioled, drooping, oblong, taper-pointed, serrate, very smooth on both sides; from six to seven inches long, and about thiee broad.—Stipules none, but two or three small,' dark brown, scaly gems are found in each axil.—Corymbs axillary, dichotomous, with a pediceiled flovt or in iLe divisioud. -t-Bractes opposite, small, permanent.—Mowers veij numerous ajnd small, pale greeuish yellow.—Calyx beneath, generally umr, though sometimes five or even six-parted; divisions rounded, and only about half the length of the corol.—Corol four, five, or six-petalled, (six

is the most common, and I suppose the natural number,) in a **dota**ble series, equal, ovate-oblong, smooth. *Nectary* a three-sided, fleshy
cup surrounding the insertion of the stamens and germ.—*Filaments*three, meinbranaceous, shorter than the corol. *Anthers* four-lobed*
~-*Gen/i* ovate. *Style* short. *Stigma* simple.—*Capsules* three, cuneiform, striated, three inches long, and about one and a half broad,
one-celled, two-valved; *valves* exactly boat-shaped.—*Seeds* two, ovate,
compressed, enlarged with au oblong, soft, thin, spongy wing, the attachment is between its apex and the baje of the capsules. *IntegU' went* single, ochraceous.—*Perisperm* none.—*Embryo* oblique, compressed. *Cotyledons* conform to the seed, yellow. *Plumula* twolobed. *Radicle* oval, sub-inferior.

JOHNIA. R.

Calyx inferior, five-leaved, or five-parted. Corol five-petalled. Nee* tary or receptacle, of the stamina and pe3tillum sub-globular. Germ three-celled; ovula one or two in each cell, peltate. Berry one or more-seeded. Embryo without perisperm, direction various.

In honour of the Rev. Dr. John of Tranquebar. It is nearly allied to *Salacia*. *Gen. PL e&. Schreb*. 1380. Its proper place is probably the third order of this class.

1. J. salacioides. JR.

Leaves opposite, broad-lanceolate, entire, firm and polished. Calyx five-leaved. Petals sessile. Anthers sessile on the three divisions of the nectary.

A native of Tipperab, Chittagong, and other parts of the eastern frontier of Bengal. It flowers in the Botanic Garden during the hot season; and ibe fruit ripens about the close of the rains.

A large, very ramous shrub, with its *branches* spreading much, and often drooping elegantly. *Bark* of the lighteous parts brownish and somewhat scabrous, that of the young twigs smooth.

Leaves opposite, short-pelioled, recurved, broad-lanceolate, entire, firm, polished, obtuse-pointed; about four inches long; and

half as much broad,—Stipules minute, caducous.—Peduncles axillary, several, longer than the petioles, one-flowered.—Flowers small, deep greenish orange colour.—Calyx of five round, villous margined, minute leaflets.—Petals round, sessile, with the margins recurved.—Filaments no other than the three, short, triangular segments of the fleshy urceolate nectary, elevating the three, large, twin anthers even with the stigma,—Germ above, conical; three-celled, with two ovula in each, attached to the axis.—Style scarcely any; stigma acute.—Berry size of a crab-apple, round, smooth, dull-red. Pulp in considerable quantity, white, of a soft, tough, gelatinous consistence, and eaten by the natives.—Seeds two, or three, separated by a thick partition of pulp; transversely oblong; flat on the inside, convex on the exterior.—Integuments, single, spongy, brown.— Perisperm none. Embryo consisting of two equal cotyledons, con* form to the seed, and until vegetation begins, so firmly, and closely united, that they seem to be of one entire piece.—Radicle small, lodged at the umbilicus, relative, centripetal:

2. J. coromandeliana. R*

Leaves opposite, serrulate, polished. Calyx five-toothed. Petals unguiculate.

A small, straggling tree, or rather a large climbing shrub, a native of forests and mountains of Coromandel.

Leaves opposite, short-petioled, oval, smooth, shining, sometimes most slightly serrulate; about three inches long, and one and a half broad.—Peduncles axillary, several, bowing, one-flowered.—Calyx inferior, one-leaved, five-cleft.—Petals five, clawed, round, or oval, spreading.—Nectary a large globular, fleshy receptacle, elevating the stamens and pistil.—Filaments three, spreading, shorter than the petals, inserted iuto the top of the nectary round the germ. An* thers small, twin.—Germ half immersed in the nectary, three-celled, ^ith one or two ovula in each, attached to the axis. Style very short. Stigma simple.—Berry superior, globular, upon the remaining nee* tai7, or receptacle, size and colour of a small red cherry; one-celled, one-seeded.

IRIS. Schreb. Gen. N. 97-

Corol six-petalled, petals unequal, alternate, jointed and spreading-Stigmas petals, from cowled to bilabiate.

1. T. chin:;zzis Curtis's JBot- Mag. N. 373,

Rjot creeping *Leaves* ensiform, drooping, *scape* rainous, mapy flowerc:..

This elegant species has been introduced from China, into the Botanic Garden, where it thrives best in cool, moist, shady situations. Flowering time the beginning of the hot season, viz. March and April.

MOREA. Schreb. Gen. N. 80.

Corol six-petalled; the three inner spreading and narrower. Stigma three-deft.

1. M. chinensis. linn. Sp. PI ed. Willd. 245. Thunh Diss. N. 19. Herbaceous, stems compressed. Leaves bifarious, ensifonH* umbels terminal, proliferous, all the six-petals expanding.

Belameanda-shular mini. Rheed. mat. 11. t. 37*

Ixia chinensis. Curt. Magaz. 171.

Pardauthus chinensis. Annals of Bot. 1. 416.

Beng. Dusb&ha, or Dusbichundi.

A native of India, China, &c. *Flowers* in the rainy season in the Botanic Garden near Calcutta.

Is common in gardens over India, where it blossoms during the rains, an4 ripens its seeds in the cold seaspn.

COMMELINA. Schreb. Gen. N 86.

Calyx inferior, three-leaved. Corol three-petalled, often dissimilar. Nectaries or sterile filaments three, with a cruciform head. Cap* sales two or three-celled. Seeds one or more. Embryo simple, and furnished with a perisperm.

1. C, communis. Linn. Sp. PL ed. Willd. 1. 249.

Polygamous, creeping. Leaves ovate-lanceolate, smooth; spathes many flowered. Petals unequal. Anlliers dissimilar. Capsules tii-coceous.

Beng. Jwta-kanslui'a.

Ephemerum dipetalum. Kempf. aman. p. 888. t. 889.

This species is common over the low moist parts of *India*; flow* ering time the rainy season chiefly.

Root fibrous.—Stems numerous, creeping, dichotomous, jointed, round, smooth; length very various.—Leaves alternate, sessile on tubular, vaginatedsheaths, ovate-lanceolate, acute; margins waved; smooth on both sides, with delicate, parallel veins runing length ways on the under side; from two to four inches long; mouths of the sheathing petioles a little ciliate.—Spathes terminal, or sub-fasicled, semi-cordate.

2. C. bengalensis. Linn. Sp. Pi ed. Willd. 1. 250.

Polygamous, creeping. Leaves cordate. Spathes three-flowered. Petals unequal. Anthers dissimilar. Capsules three-celled, six»seeded* Ephemerum bengalense, &c. Pluck. 1. 27./. 3.

Beng. Kanshira, also Kanwraka.

Like the last described, this species is a native of wet places over Bengal, but much scarcer and smaller; flowering time the same*

Stems creeping, dichotomous, jointed, hairy.—Leaves alternate, petioled, cordate, nervous, a little hairy, about an inch long and three-fourth of an inch broad.—Petioles sheathing, hairy, and ciliate.—Spathes terminal, and axillary, of a shape between that of a short, inverted cone and falcate; open on the upper side only; each contain-

*ng a common peduncle of two hermophrodite flowers, and a long-peduncled male one.—Flowers small, bright blue colour.—Calyx as in the former.—Corof three-petalled; two of theoi larger, and long-clawed, as in the formei¹ species, the third small, and sessile, but coloured.—Nectary, stamens and pistil as in C. communis, only the style is here beautifully spiral.—Pericarp three-celled; three-valved, with generally two seeds in each cell.

3. C. moluccana. fl.

Annual, creeping. Leaves sessile, oblong, about five-nerved crs terminal, solitary, sub-sessile. Petals equal.

A native of the Moluccas. Compare with Vahrs. C. aitenuata.

4. C. salicifolia. R.

Polygamous, creeping. Leaves narrow-lanceolate. Petals three, equal. Spathes from four to six-flowered. Anthers dissimilar. Cup* sules pointed, three-celled, six-seeded.

Sans. QT.-^sft, Langwlee.

Beng. Panee*kanshira.

Found with the former in wet places near Calcutta, it is also a native of the Coromandel Coast; flowering time the wet season*

Stems creeping to a great extent, ramous, round, smooth, jointed, very succulent.—Leaves alternate, sessile on their cylindiic sheaths, narrow-lanceolar, a little hispid on the upper side and margins, when the finger is drawn backward; from, four to six inches long, and not quite one inch broad.—Sheaths cylindric, striated; mouth ciliate.—Spathes leaf-opposed, loug-peduncled, semi cordate, long-pointed.—Flowers hermaphrodite, i.nd male; large, of a beautiful deep azure colour, disposed as in the former species, only there are fewer to the common shorter peduncle, and often two ou the longer one.—Calif x as in the former.—'Petals three, equal, except that the lower one having a shorter claw is nearly sessile.—Nectaries, stamens, and pistilum, as in the former.—Capsules oblong, pointed, three-celled, three-valved, with two seeds in each. Cattle are fond of this species.

5. C. nana. R.

Creeping. *Leaves* cordate-lanceolate, stem-clasping. *Flowers* terminal, sub-pauicled. *Petals* equal. *Capsules* three-celled, many⁴ seeded.

A native of wet places over India; it appears during the rainy and cold season.

Root annual.—Stems or branches creeping, enveloped in the sheaths of the leaves; from' three to six inches long.—Leaves stem-clasping, sheathing linear-cordate, somewhat ciliate, and waved; sheaths* little downy.—Flowers terminal, sub-panicled, small, bright blue.—Calyx equal, permanent.—Corol of three, roundish, equal petals. Rectorial filaments as in the other Indian species, but naked.—Fila~ments three, from the middle downwards clothed with hairs, converging over the stigma. Aftthers blue.—Style shorter than the stamens, straight and tapering.—Capsules three-celled, with from three to six seeds in each.

Obs. Were the style longer, or even spirally bent, I should have concluded this plant to be Commdina spiratu. Mant. 2. p. 176. Bui man's figure of his C. diffusa. Flor. Ind. tab. 7. f. 2. is so bad that no comparison cau be made; they may be the same.

6. C. nudiflora. Linn. Sp. PI ed. Willd. 1. 252.

Frequently creeping. Leaves linear, sessile, sheathing. Flowers terminal, racemed, diandrous. Petals equal. Capsules three^celled; cells two-seeded.

Beng' Kand/ili.

Tali-pulli- Rheed. mah 9. t. 65.

Tradescantia malabarica. Sp. PL 412.

A native of most of the warmer humid parts of *India*, flowering time the rainy season.

Stems none, but it has many short, creeping, smooth, jointed branches, with their flower-bearing extremities sub-erect.—Leaves alternate, sessile, linear, sheathing, smooth, excepting a few fine hairs about the mouths of the sheaths.—Racemes terminal, long-peduncled, corymbed, bearing on their upper side many small blue flowers in succession.—Bractes solitary, one-flowered, concave, caducous.—Calyx three-leaved, equal.—Corol of three, obovate, equal, blue petals. Nt?ctarialfilaments with a very few, moniliform, blue hairs; corpuscles two, clavate.—Filament's three, two of them ascending, larger, and thicker, well clothed with beautiful jointed blue hairs. Anthers blue,

€val, the third filament sterile. *Style* short, ascending.—*Capsules* three-celled, with two scabrous seeds in each.

7- C. cespitosa. JR.

Polygamous, creeping. Leaves lanceolate. Spathe cordate, p^c* duncled, few-flowered; petals nearly equal. Capsules three-celled* with one or two seeds in each.

A native of Chittagong, from thence the plauts were sent to the Botanic Garden by Mr. W. Roxburgh. It is in blossom most part of the year.

Stems and branches numerous, slender, smooth, jointed, creeping close over a space of some feet and striking deep root at the joints. Leaves alternate; sessile on their smooth cylindric sheaths, ovatelanceolate, the upper ones narrower and longer; all are entire, and smooth on both sides.—Sheaths, besides the usual leaf-beating on?* there is a second Or inner annular one wherever there is a peduncle. Peduncles solitary, leaf-opposed, about an inch long, round, and emooth. Spathe cordate, or rather semi-cordate in their natural folded state, each embracing two common pedicels; the superior one bearing two, three, or four, ^>edicelled male flowers; and the lower about as many hermaphrodite ones; all blossoming in succession.—Caty* of three, equal, phovate, concave, pale blue, pellucid leaflets.—Petals three; the upper two reniform and pedicelled; the lower one cordate, and sub-sessile, all of a most beautiful light blue colour. Nectaries three, erect, on the upper side opposite to the stamens.—Filament* three, equal, ascending. Anthers, the middle one larger, aud sagittate.—• Germ ovale, (in the male flowers wanting.) Style ascending, as long Stigma incurved, simple.—Capsules oblong, threeas the stamens. celled, with one or two seeds in each.

8. C. scapijlora. R.

Root perennial. Racemes, radical, erect, with alternate, many-Aowered spalhes. Petals equal. Leaves in a tuft, Gasiform.Beng. Iturells.

A native of Hindoostan and introduce into the Botanic Garden by Colonel Hardwicke, where it blossoms in March and April, at which, time the plant is destitute of leaves, nothing being seen but the racemes ornamented with large lively blue flowers round the apex.

Root petennial, composed of several, smooth, elongated tubers, with a few filiform radicles.—Stems none, except the sheathing bases of ihe lea\es which appear a month or two after the flowers; these are ensiform, waved, acute, smooth, and maiked with several straight veins; length from four to ei^ht inches, breadth about one.—Bacemes ladical, erect,, straight, smooth, invested at each of there* mote two 01 three joints, with a small, solitary sheath; these sheaths toward the top are more approximated, each of them there embracing the insertion of a bianchlet which bears several pedicel led flowers.—Calyx the three leaflets thereof broad-lanceolate, and considerably shorter than the corol.—Petals equal, round, concave—Nectaries alternate with the stamens, hairy.—Filaments three, alternate with the petals, longer than the filaments of the nectaries, and like them hairy about the middle. Anthers blue.—Pistil declining. Stigma minutely three-toothed.

9. C. herbacea. JR.

Herbaceous. Stems jointed, ascending. Leaves lanceolate. Panicies terminal. Petals equal. Capsules three-celled, many-seeded.

A native of Sumatra, from thence introduced into the Botanic Garden by Dr. Charles Campbell, where it blossom and ripens its seeds during the whole year.

Root perennial, consisting of long, firm, thick fleshy fibres. Stem several from the same root, herbaceous, jointed, ascending, round, smooth, much swelled at the joints, from two to three feet in height, nearly the whole enveloped in the sheath of the leaves.—Leaves alternate, sessile on their sheaths, lanceolate, smooth, slightly marked with five parallel nerves, margins entire, waved, somewhat membranaceous, and coloured. Sheaths shorter than the joints, striated, and smooth, except a few white hairs round their mouths.—Panicles terminal; there

are also smaller ones from the superior axils, which are sub-globular, and smaller. Raunifications alternate, at first divaricate, afterwards Recurved.—F/oziwers numerous, small, short-pedicelled.^—B/flCtotnan* gular, acute*—Calyx, leaflets three, equal, oblong, concave, spreading* fleshy, furrowed on the outside.—Petals three, equal, oval, much larger than the calyx, concave, entire, spreading and of a delicate translucent pale bluish white.—Nectarial filaments alternate with the longer stamina, bearded (like the latter) towards tLe base, with delicate, sbgjrt blue hairs, and crowned with large incumbent, three-lobed, yellow glands.—Germ somewhat three-sided. Style oblique, length of the filaments. Stigma small, crowned with a tuft of hairs.—Capsules three-celled, three-valved, with generally from four to aix, or seven, angu* lar, rriugh seeds in each cell. Embryo lodged in a deep pit, in the back of the seed, small, oval.

SONERILA. R.

Calyx superior, three-toothed. Petals three on the mouth of the calyx, alternate with the stamina. Germ three-celled, cells many-seeded, attachment central. Capsule three-celled. Seeds numerous* minute.

1. S. maculata. Roxb.

Leaves opposite/unequally-cordate, bristle-spotted, serrulate, cil*-ate*

Soneri-ila. Rheed. mat 9. p. 127. t. 65.

Sootli, the vernacular name in the Kbassee language.

It is indigenous amongst the mountains on the North-East border of Bengal, and used by the natives as a potherb.* Flowering time the beginning of the rains. In its *natural character* it agrees very exactly with *Burmannia*.

Root fibrous.—Stern short, being only a few inches high, and "when old leaning much, branches opposite, longer than the stem, the lower reclinate, with their apices resting on the ground and striking

• I havt had specimens from Nepal* under the name »f Lushee-Sowa.—N.\W

root, all are nearly round and bristly; height of the whole plant from six to twelve inches.—Leaves opposite, long-petioled, more or less unequally broad ovate-cordate, nerved, bristle-serrulate, pointed, surface builate, and marked with numerous small white specks, from the cent-'e of each rises a slender, subulate, bristle 5 veins and nerves bristly, length from two to six inches* by from one to three broad.—Racemes axillary, spiral, their peduncles as long as the petioles, deeply coloured and hairy.—Flowers springing from the upper convex side of the raceme, short-pedicelled, red, bristly.—Bractes subulate, minute.—Calyx superior, three-sided, 'nd tubular; mouth three-toothed, permanent.—Petals three, lanceolar, inserted into the mouth of the calyx, alternate with its segments, smooth on the inside, on the outside are Aequently found some slender bristles. Nectary of three, . laciniated scales round the base of the style.—Filaments three, alternate with the petals, and about their length. Anthers sagittate, oneth.iaas long as the filaments, until the flower has been expanded some time they are inverted within the tube of the Galyx, afterwards erect, — Germ clavate, three-sided, three-celled; ovnla numerous, attached to their respective receptacles, rising from the axis, exactly as in Osbeckiachinensis. Gart. Carp. 2,. t. 12b\ Style length of the stamens. Stigma simple.—Capsules erect, three-sided, clavate; pedicel included, about half an inch long, three-celled, opening at the apex.— Seeds very numerous, and too minute to admit of my ascertaining their internal structure.

2. S. emaculata. lioxb.

Leaves opposite, unequally narrow-cordate, acute, bristly, but void of spots, serrulate, cilfete.

A native of the Khassee mountains on the North-East border of Bengal, where it flowers in July, and differs from the preceding species, in the leaves being destitute of the little round white spots, into which the bristles are inserted, (viz. one in the centre of each spot.) It is also less robust than that plant, with longer peduncles to the racemes, which are sometimes leaflet-bracted at the middle.

The flowers, and seed vessels are alike.

S. S. angustifblia. Roxb.

Leaves opposite, unequally oblong-lanceolar, serrulate, hairy.

A native of the; mountains on ihe North-East border of Bengal, and like the two former species in habit, but the shape of the leaves, widely different, and only a little hairy.

4. S. moiuccana. R.

Sub-c*u!es'cenr. Leaves in pairs, entire, hairy, one minute ana nearly round, the other unequally cordate. Racemes umbelled*

A native of the Molucca Islands.

5. S. sqnarrosa. WalL,

Stems short, cylindric, marked with numerous stipulary inoffensive prickles which are deciduous, together with the sub-sessile crowded, sub-verticilled, cuneate-lanceolate, serrulate, smooth leaves.

Growing among ferns on the Khassee mountains, where it *is* called *Tearanga*. It blossoms during the rains.

This little perennial plant rises to the height of from four to six inches.—Root consisting of capillary fibres.—Stem ash-coloured, about the thickness of a crow-quill, erect, marked with large elevated tubercles to which the leaves were attached, and innumerable small, subulate, axillary sub-erect prickles which together with the leaves are deciduous leaving the lower portion of the plant naked. They are about two lines long and interspersed with small elevated dots. —Branches few, simple.—Leaves of a daik green colour, sometimes verging towards brown, crowded near the top of the plant, spreading, somewhat fleshy, slightly dotted, veinless, scarcely above half an inch long, acute, with adpressed, bristly, purplish serratures, entire toward their base and tapering into a very short flat petiol which articulates with the corresponding tubercle of the stem or branch. —Stipules, two axillary, opposite, prickles.—itaceme terminal of axillary on a filiform peduncle, two or three times longer than the leaves.—Flowers unilateral on short pedicels, large in comparison with the size of the plant, rose-coloured, imbricated during their aestivation.—Calyx slightly coloured, with pubescent angles and the segments obscurely keeled.—Petals oval, acute, contracted at the base and inserted into the mouth of the calyx so as to occupy its whole circumference.—Filaments naked.—Anthers btaked, subulate, with a cordate base, bilocular, opening on bolli side? along their whole length.

O6s. I received this pretty little plant from my indefatigable and Zealous assistant, Mr. Smith at Siihet, in 1817. It stems to thrive very well on an elevated bed, in a soil mixed with pebbles, and while I write this, iu July the following jear, it commences shooting out numerous fresh leaves from the cop of tht Stem and branches. The structure of its dowers agrees entirely with that of the first species; but they are about one thud smaller m size.—N. W.

XYRIS. Schreb. Gen. N. 89.

Head with roundish one-dowered scales. Perianth beneath, three-leaved. Corol three-petalled, equal, waved. Neaaries three, bitid, Capsule one-celled, three-valved. Seeds numerous, on parietal receptacles.

1. X. indica. Linn. Sp. PL ed. Wittd. 1. 254.

Leaves ensiform. Heads globular; scales round.

Kotsjilelti-pullu. Rheed. mal. 9-^- 139-1. 71.

Beng. Ckeena ghauzi. Dubi dooba.

Grows on a low clayey soil, over many parts of Coromandel, and Bengal. Flowering time November and December. Seeds ripen in January and February.

Root fibrous, annual.—Leaves radical, bifarious, straight, sword-shaped, on one edge 'slit into a sheath for the scape, pointed, smooth; from six to twelve inches long.—Scape naked, round, striated, erect, length of the leaves, each supporting a round, flower-bearing head.—flowers a beautiful bright yellow.—Bractes, or scales one-flowered, orbicular, concave, hard, smooth.—Calyx three-leaved, hid within the scale, membranous,—Petals three, each supported on an unguig

the scales.—Nectary, three filaments inserted, alternately with the petals, round the base of the germ; apex two-cleft, each division ending in a pencil of fine yellow hairs; adhering firmly at the cleft the edges of the petals, near the apex of the claws.—Filaments three, short, broad, erect, inserted on the inside of the apex of the claws of the petals. Anthers twin, ereci, united by a continuation of the filament.—Germ superior, three-sided. Style length of the claws of the petals, from thence three-cleft. Stigmas torn.—Capsule three-valved, one-celled. Seeds numerous, attached to a heel down the inside of each valve.

Obs. The following account of the virtues of this plant] have been favoured with, by the Honourable John Hyde, who informs me that "the natives of Bengal esteem it a plant of great value because they think it an easy, speedy, and certain cure for the troublesome irruption called ring worms." This accords with what Van Rheede says of it, at page 139 of the 9th volume of the Uortus Malabaricus, viz. Foliorum succus cum aceto mixtus impetigini resistit. Folia cum radice oleo incocta contra lepram sumuntur.

FUIRENA. Schreb. Gen. N 90.

Amend imbricated on all sides with tailed scales. Corol three* petalled. Seed naked.

1. F. ciliaris. R.

Culms erect, about twelve inches, columnar, jointed, leafy. Leaves hairy. heads axillary and terminal. Scales very hairy. $StigM^{\wedge}$ three. Seeds three-sided.

Scirpus ciliaris. Linn. Sp. PL ed. Willd. 1.309. Uottb. gram* 5. t. 17./ 1.

Teting. Elagabora gaddi.

A native of moist places on the Coast of Coromandel, with the ocirpj, &c.

Root fibrous.—Cuhns nearly erect, about a foot high, round/*

striated, leafy, jointed, but not piped.—Leaves sheathing, shorter than the culms, hairy, ciliated on the margin, concave on the inside, not ketled.—Heads sub-globular, compound, axillary, and terminal, the terminal one is considerably longer, they are composed of several oval, imbricated, many-flowered, sessile spikes* Involucre of the terminal head one or at most two small leaves; of the others, nothing more than the sheath of the leaf from whence they issue.—Scales of the ame. Its, or spikes, corol, &c. as in the genus.

«' KYLLINGIA. Schreb. Gen. N. 9.

Ament imbricated. Flowers with calyx and corol of two chaffy valves each. Seed one.

l.K.monocephala. Linn. Sp. PL ed. Wiild. 1. 256. Vahl. in PL 2. 379*

Roitb. gram. 13. t. 4.f. 4.

Culms six to eighteen inches high, triangular; head terminal, single; involucres three or four. Seeds cbcordate, without angles.

Pee-Mottenga. Rheed. mal. \%. p. 99. t. 53.

Gramen capitatmn. Rarnpk. amb. 6. p. 8. t. 8.f. 2.

Beitg. Sweta gothoobi; Nirbishee, its fragrant aromatic root being accounted an antidote to poisons.

Cunnum over *India* on low shady pasture ground, when totally shaded the heads are generally more green, which is rather uncommon.

Hoot fibrous, and stoloniferous.—Culms erect, from six to eighteen inches high, generally about eight; three-sided, smooth, naked except near the base; angles sharp, and sides hollowed.—Leaves sheathing, as long as the culm, smooth, sharp keeled.—Head teruiinal, sessile oval, generally white.—Involucre three-leaved, unequal, the largest leaf as long as the culm. Back of the glumes of the corol hispid,—Stamens three. Stigma three-cleft.—Seed obliquely obcordate, much compressed; smooth, light brown.

2. K. triceps. Linn, Sp. PL ed. Willd. 1. 256,

Culms from six to twelve inches high, three-cornered. Heeds terminal, sessile, from three to six; involucres three or four; Jlorets diandrous; Seed oblong, without angles.

Mottenga. Rheed* Hort. mal. 12. p. 97. t. 52.

A native of low shady pasture ground.

Moot somewhat tuberous, with capillary fibres.—Culm⁸ straight from six to twelve inches high, smooth, naked, except at the base, obtusely three»sided; angles, rounded.—Leaves sheathing, nearly as long as the culm, smooth.—Head terminal, composed of from three to six sessile, oval, white spikes, ihe largest ons is in the centre, the rest in the circumference.—Involucre as in K. monocephala.—Stamens ** dom more than two.—Stigma two-cleft.—Seed oblong, much coinpressed, white, no angles.

06\$. It differs from K. *monocephala* not only in having a compound head but in being diandrous, with a bifid style, and oblong laⁿ* ceolate seed. I have found luxuriant plants with more than o^{llC} flower in the caljx.

3. K. umhellata. Linn. Sp. Pi. ed. tVitld. 1. 257. Rottb. gram-15. t. 4./. 2.

Culms from one to two-feet high, three-sided, umbel of sessile and peduncled, cylindrical, ragged spikes, involucres many; i»^{v0}* lucels none. Seeds three-sided, linear-oblong.

Kol pullu. Rheed. Hort. mal. 12. t. 63.

Mariscus umbetlatus. VahL Enum. PL 2. S76.

JJeng. -Bwra-goihoobż.

A native of wet or marshy places.

Root tuberous, rust-coloured, with rusUcoloured fibres.—Cuhns erect, from one to two feet high, three-fourths naked, three-sided* smooth.—Leaves sheathing nearly as long as the culm.—Umbel terminal, sessile, composed of sessile and peduncled, cylindrical spikes of numerous diverging flowers.—/wo/wcre; universal, many leaved,

unequal; the largest leaf often as long as the culm; *partial*, none. *Calyx* and *corol*, &c. as in the genus. *Seeds* three-sided.

O6s. As this plant wants the partial involucre it may be K. sumatrensis of Retzius.

4. K. cyperoides. 12.

Culms trom six to eight inches high, three-sided. Umbel com* pound, consisting of globular heads of numerous spikelets, involucH three-leaved. Seed oblong, three-sided.

An elegant cyperus-looking small species, a native of moist pasture ground.

Hoot fibrous.—Culms erect, two-thirds naked, from six to eight inches high, three-sided, smooth.—Leaves sheathing, as long as the culm. Involucre; universal, three-leaved, very unequal, the largest leaf being as long as the culm, and the smallest one inch, partial, minute.—Calyx, corol, &c. as in the genus, excepting that there are sometimes two flowers in the same calyx.

TUNGA. R.

Ament ovate, imbricated on all sides. Calyx one-valved, one* flowered. Corol two-valved. Seed naked.

The plants which come under this definition I cannot by any means reconcile to the character of *Schccaus*, nor indeed to any genus known to me. 1 have therefore constituted a new one of them, under the Telinga name *Tunga*, which is applied to the whole family of *Calamarias*. Linn. *Cyperoidea*. Juss. This genus is probably the flame as Vahl's *Ilypachiptum*.

1. T. triceps. R.

Culms from four to eight inches high, a little compressed; spikes two or three, terminal; involucre two-leaved.

A native of Coromandel, growing with other cyperL

Root fibrous.—Culms erect, mostly naked, from four to eight inches high, a little compressed, smooth,—Leaved sheathing, broad,

toearly as long as the culm.—Spikes terminal, generally three, sessile, oval, imbricated with innumerable small rust-coloured flowers.-*-*

Involucre two-leaved,-tHe largest is often erect, and looks like a continuation of the culm, it is from two to three inches long; besides these there are two or more oval, lateral, scales*—Calyx, a scale, single, nearly as in the tcirpi, one-flowered, wedge-s^a^ed, striated.—Carol two-valved, membrunaceous, shorter than the scale.—St&mem three.—Stigma three-cleft.—Heed oblong, thice-aided, without bristles.

£. T. lavigata. R.

Culms from one to two feet high, three-sided. Spikes several; terminal. Involucre three-leaved*

A native of moist vallies.

Roct fibrous. Culms erect, from one to two feet high, nearly naked, three-sided, smooth.—Leaves numerous, sheathing, half as long as the culm —Head terminal, generally composed of about seven oval, sessile, closely imbricated spikes.—Involucre ttvo or three-leaved, very unequal, the largest from five to eight inches, the shortest one, or one and a half.—Calyx as in T. triceps, only sometimes three-lobed at the apex.—The rest as in T. triceps.

S. T. diandra. R.

'Culms leafy, two or more feet high, thrqe-sided; corymbs terminal; involucres alternate. Flowers diandious. Style two-cleft.

A stout, erect, smooth, long-leaved species; a native of Amboyna. *Culm* jointed, three-sided, smooth.—*Leaves* one at each joint, sheathing, rising much higher than the culm, linear, smooth, acute, three-nerved, about three feet long.—*Corymbs* terminal, decompound or more.—*Involucres* several, the largest at the first division of the corymbs, and like the leaves of the culm, but smaller; *spikelels* oval, minute, composed of many small brown imbricated flowers as-in the *scirpi*—*Calyx*, a glume, roundish, smooth,—*Co'*/'crf; the two valves, small, placed transversely with

respect to the calyx, and smaller than it—*Filaments* two, one rising laterally from the bosom of each valve of the *corol; anthers* linear. *Germ* oblong, *style* dtepiy tsvo-cleft. *Seed* oval, rather longer than the calyx.

SCHCENUS. Schreb. Gen. N 92.

Calyx, or Corol, glumes several; seed one, naked.

1. S. articulatus. R.

Culms three-sided, erect, from four to five feet high, jointed, leafy. Corymbs terminal and axillary, compound and decompound. Style undivided. Seed obovate, beset with bristles, and crowned with the conic base of the Style.

TeiiHg. KondsT-tunga.

A native of marshy places up amongst the Circar mountains. It may be referred to Vahl/s *Rynchospora Enum. PL* 2. 229.

Lulms erect, three-sided, leafy, jointed, smooth, from four to five feet high, angle3 sharp, between the joints fistulous.—Leaves of the root as long as the culm, smooth, except that the margins are a little hispid, slender considering their great length, those of the culm from five to eight, sheathing, shorter than those of the rout.—Urn* bels the terminal one decompound, those only from the exteiior axils compound.—Involucre of the terminal umbel, from three to four-leaved, about as long as the umbel, leaf like; the axillary umbels have no involucre, or, at most, a very trifling one,—Flowers sub-solitary, chesnut-coloiued.—Ct lyx none. Carol; petals four-Style undivided, with a permanent conical base.—Stigma entire, acute. Bristles, six permanent ones surrounding the genii.— Seed a little compressed, crowned with a large brown, spongy, conical body, the base of the st)le.

Obs. There is frequently a very slender male flower within the large or inner glume of the corol; it consists of one glume or scale, and three stamens. The plant is so very coarse that cattle **will** not eat it. .

CYPERVS.

Glumes chaffy, bifariously imbricated. Carol none. Seed one, naked.

Sect. 1st, with culumnar Culms.

1. C. setaceus. Linn. Sp. PL ed- Willd. 1.269. Retz. Obs. 5. p. 10. Culms setaceous, from two to three inches high; spike terminal, solitary, naked.

A native of Coromandel, appears and flowers during the rainy season chiefly.

2. C. mncronatus. Linn. Sp. PL ed. Willd. 1.273. Retz. Obs. 5.10. Culms from six to eight inches high, round, incurved, half naked. Spikes lateral, sessile. Involucre one-leaved, besides the continuation of the culm. Seed oval, rounded.

A native of moist sandy places, over various parts of India.

Root creeping, invested in brown sheaths.—Culms half naked, issuing singly from the root at some small distance from each other, nearly round, ascending, from six to eight inches long; the lower half is involved in the sheath of a single, short leaf.—Lea/'sheathinir, generally one to each culm, v*hich is only about half its length.—Head about an inch and a half below the extremity of the culm, it consists of five or six small, oval, ten or twelve-flowered spikes.—Involucre one-leaved, about as long as the spikes; besides these there are some small, chaffy, calyx-like scales.—Seed naked, oval, compressed, white.

3. C. late rails. Font, descript. 13. N, 28.

Culms erect, columnar, from eight to twelve inches long, naked; Head of five or six sessile spikes beneath the straight apex of the culm; Stigma bifid; Seed oval, compressed.

A native of Coromandel.

rect, from eight to twelve inches high, round, and naked:—Leaves no other than a short sheath or two, embracing the base of each culm

-Spikes sessile, five or six, forming a small head on one side of the culm about au inch and half below its apex. Involucre a minute, subulate leaflet immediately under the spikes, and of the same length with them.—Scales of the spikes numerous, ovate-oblong, white, smooth and rather obtuse—Stamina three.—Sügmct bifid.—.Seed.oval, fiat on the inside, and convex on the exterior, leadcolour or grey, and smooth.

Obs. This differs from the plant which I consider to be C niucronatus of Retz. fasc* 5. p. 10. In being perfectly erect and destitute of foliage; whereas that species has leaves, is smaller, and always ascends in a curved direction; in that the scales of the spike are acute, in this obtuse, in other respects they are very much alike. At present I am inclined to think C. muaonatm of Vahl. and Rottboel may be referred to this, consequently Wildenow's C. mucronatus. iSp. PL 1. 2?3. includes these two species.

4. C. nudus. R.

Culm from three to four feet high, round, naked, inwardly intercepted. Leaves none; Umbel compound; involucre chaffy. Stigma three-cleft. Seed three-sided.

A native \)f stagnating, or slowly running sweet water over India. Root perennial, fibrous.—Culms erect, round, naked, articulated, smooth, from three to four feet high, above as thick as a common large quill.—Leaves no other than a rusty coloured sheath or two embracing the base of each culm.—Umbel terminal, generally compound, though sometimes decompound.—Involucre several small, chaffy scales—Umbellets long, slender, peduqcled, bowing, composed of from eight to twelve linear, sessile, rust-coloured spikes.— Involuceh like the involucres.—Seed sub-linear, three-sided, smooth, light brown.

Culms from two to six feet high, round, tending to be angular

top, naked. Leaves none. Umbels decompound, with an involucre half its height. Stigma thre-e-cleft; Seed three-sided.

Beng. Gola-methee.

Teliftg Godoo tatnga kooda.

This species is with the former a native of wet places.

Root perennial, creeping, fibrous.—Culms erect, from two to six feet high, round, smooth, naked, except at the base, which is embraced by three or four sheaths.—Leaves no other than the sheaths just mentioned.—Umbels generally decompound, erect.—Involucre three-leaved, equal, shorter than the umbel, sides and keel hispid.—Umbellets and partial umLeUets peduncled, composed of linear-lanceolate, yellowish spikes. Seed three-sided, smooth.

Ob\$. CaLle are not fond of it, and it is only eaten occasionally by buffaloes.

Sect. 2d, with a three-sided Culm.

6. C. dubins. Rottb gram. 20. t 4./. 5. Linn. Sp* PL ed. Willd. 1. S7S-

Culm from six to twelve inches, high. Head terminal, roundish, sessile. Involucre of four or five long leaves, some of them longer than the culm.

Cyperus longus. Rumph. amb. 6. p. 5. t. 2.f. 1.

C. hyllingamdes. Fahl. Emm. PL 2. 312.

Teling. Tagada twnga.

JBeng* Chhota-gothoobz.

This species is much like *Kyllingia monocephala*, and is with it, a native of shady, moist pasture lands.

Root, a somewhat tuberous head, with many rust-coloured capillary fibres.—Culms erect, from six to twelve inches high, three-sided, smooth, the lower third or fourth part involved in the sheaths of the leaves.—Leaves sheathing, radical, embracing the base of the culm, very smooth, many of them longer than the culm.— Head gloimlar, size of a large cherry, composed of numerous, lanceolate, white-panted spikes.—Involucre four or five-leaved, un-

equal, some of them longer than the culin.—Seed three-sided, point* ed, dark rust-coloured^ smooth*

O6s. Cattle eat it.

7. C. mnnocepholus. K.

Culms from twelve to eighteen inches high, straight; Head terminal, ovate, compound; Involucre, from three to four-leaved; spikelets ovate. Style undivided. Seed three-sided, elevated on a spongy ieceptacle.

15'eng. Golhodhi.

A native of low Met places over Bengal.

lioitt fibrous.—Culms straight, three-sided, smooth, general height fium twelve to eighteen inches.—Leaves three, four, or five, investing with their sheaths, ttie lower part of the culms straight and smooth, length various, the longest about as long as the culm. In* tolucre, leaves several, diverging, of very unequal lengths, the Ions*-est as long an the culm, and the shortest about an inch.—He rids terminal, composed of a larger one in the centre, and four or live smaller ones in the circumference, all rigidly sessile.—Spikeiefs ovate, incurved, ten or twelve-scaled, each spikelet embraced on ihe under side by an ovatercordale, smooth, dark brown, bracte.—Scales boat-shaped, pointed; keel greenish; sides deep, polished, chesnut colour.—Stamens three. Style simple and undivided to the extremity.—Seed three-sided, elevated on a spongy whitish receptacle.

 Ob^* . The undivided style and spongy receptacle of the seed distinguish this from all the other species I have yet found in India.

8. C. dijfusu* R.

Diffuse, ft om two to four inches high. *Heads* terminal, glomerate, sessile; *spikelets* incurved. *Scales* daggered. *Involucre* many-leaved.

Mulcn-pullu. Rheed. Hort. mal, 12. p. 101. t. 34.

A native of moist pasture ground.

Hoot fibrous.—Culm three-sided, several, diffuse, from two to four inches long, smooth, towards the base le»fjp?nd of a fyk

chesnut colour.—*Leaves* sheathing, two or three embracing the base of each culm and about the same length. *Heud* terminal, sessile, composed generally of one large capitulom in the centre, * four or five in the circumference; these are again composed of small, incurved, from eight to twelve-flowered spikes. *Involucre* many-leaved; tlie exterior three larger, being as long as the culm oi longer.—*Stigmas* two, revolute. *Seed* three-sided.

9- C squarrosus. Linn. Sp. PL ed. Willd. 1. 274.

Culms erect, from four to six inches high, leaves as long as the culms. Head terminal, glomerate, round. Involucre many-leaved. Scales with acute, recurved points.,

C. pygmccus. Rcttb* gram. CO. t. 14.y. 4.

-A native of Coromandel.

10. C. aiistatus. Linn. Sp. PL ed. Willd. 1. 275. Rottb. gram-£3.*. 6./. 1.

Culm from three to six inches high, with sharp angles. Heads generally single, and sessile; scales with a long recurved point. I^{n} " volucre ihree-leaved.

Scirpus intricatus. Mant. 182.

JA native of moist \ asture ground. It is in general from three to x incLes high, though sometimes I have met with luxuriant x sru^mei.s ten inches in height.

'Hoot fibrous.—Culms erect, from three to six inches high, three-sided, two-thirds naked, smooth; angles bharp.—Leaves sheathing* tied, short, smooth; bheaths purple.—Head generally simule,, and sessile, though sometimes, there is a second, which is peduhi led; and in the larger plant above mentioned there are two or three sessilt*, and two or three peduncled, they are composed of small, sessite, ragged, from six to eight-flowered spikelets.—Involucre three cr 1. ur-Jeaved, broad, unequal, the largest being about the length of the culm.—Calyx, scales tapering to a long, fine recurved point, which pivrs the spates the ragged appearance they have,—Seed three-ri*"

i 1. C. pectinatus. R.

(Culms three-sided, leafy* from eight to twelve inches high, straight. V\7ihel terminal, sessile. Involucre length of \{\text{he umbel Spike*} \text{ all sessile, linear, pectinate, scales mucronate. Seeds three-sided.}

 $\c A$ native of Coromandel.

Culms erect, straight, three-sided, leafy toward tLe base; from eight to twelve inches high.—Umbel terminal, simple, sessile, globular, composed of about twelve ses&ile, linear, diH'r^iug spikes.— i/aa-hicr* from two to three-leaved, the longest leatiet-aboul as long as the umbel.—Scales with long, acute, recurved apices.—Stamina three.—Style with a three-cleft apex.—Seed obovate, three-sided, smooth, dark ash-coloured.

12. C. niveus. Linn. Sp. PI. ed. JVilld. 1. £73. Retz. Obs. 5. p. 12. Culms from five to eighteen inches high* Umbels or rather heads, sessile. Involucre {wo-leaved. Style three-cleft. Seed three-sided.

A native of shady moist pasture land.

Root creeping, fibrous.—Culms erect, from five to ten inches high, mostly naked, three-sided, smooth.—Leaves surrounding the base of the culm, sheathing, those that are nearest the root are little more than sheaths, those within are nearly as long as the culiu, and waved. ~-Umlel terminal, simple, sessile, about an inch each w ay, composed of linear, many flowered, sessile spikes.—Involucre two-leaved, length of the spikes.—Seed three-sided.

13. C.jemcmcus. Linn. Sp. PI. ed. Willd. 1. 231.

Culms from two to four inches liigh, obscurely thiee-comered; base lullifercus. Umbels siirple. Involucres and syikelets alternate. Scales acute. Seed roundish, three-sided.

Puri-gaddiis the Telinga name of the plant, end Puri-dumpa that of the roots.

A native of dry sandy pasture ground near the sea.

Root bulbiferous, stoloniferous. \l hen the small oval bulbs arc taken up entire they appear covered and entirely sunouudedw itli two*

three, or four black and brovn, loii^tudinally striated shefoths, Theie are many capillary which burst and fall off in surcessi .a fibres issuing f'rat> the base of f e · idti The stolones generally pjush their way up th ough the sUiitiif, ai d • u: a1 their mouths, run thorizoMtally, prociucing from tbp'r cxfr^ni. us the uewplant. Onrenioving the sheath a small truncate J, JH niUs»; IM'I is ouserved, resting M the upper side of the base of tue ciim, v.hiifti (ouiun-iuc) is foflBed by the united sheaths of the leaves. 'ii-iS liti.t bulb, which > slightly connected to the base of lie cului on \ L':ch n rests, is tie eatable part; it is composed of two or tl*. ee coats, and about the size of a pea; when its proper exterior brown membran \cdot us $b ||f|'^{\text{lii}}$ removed, it is very white, inviting to the e\e, and pltasau . taste.—Culm erect, two-thirds naked, between round, and thret - ... ed, two, three, or four inches long.—Leaves a few, filiform on • 5 upper side, grooved, four or five iuches long, below the surface of the earth, their sheaths form the little firm culm above-mentioned; from its' bead the capillary roots and stolones issue.—Umbel simple, composed of from six to ten sessile, linear, diverging spikes.—Into* lucre generally three-leaved, unequal, the largest twice, as lung as the spikes; they issue not as usual from the same point, but alternately one above another.—Scales oblong, striated.—Stigma two-cleft.— Seed roundish, three-sided, grev.

Qbs. The little bulbs are gently roasted or boiled, then rubbed between the hands or the folds of a cloth, to take off the sheaths, which is all the preparation the natives give them, to make them a pleasant wholesome part of their diet, which they have frequent resource to, particularly iti times of scarcity. Some dry them in the sun, grind them into meal, and make bread of them, while others stew them in their curries and other dishes ,• they are palatable, tasting like a roasted potatoe. I wish they could be enlarged by culture, when they might soon prove a valuable acquisition, for on account of their smallness, it is troublesome and tedious gathering and cleaning any quantity of them.

14. C. pòtystachyos. Linn.Sp. PL ed. Willd. 1.275. Rottb. gram. 39. t- 11. /'. 1. Vahl. Enum.pl. 2. 315.

Culm twelve inches long, leaves short, umbel compound, ses^eile_f crowded. Involucre many-leaved. Style two-cleft. Seeds linear, obcordate, without angles.

Gramen cyperoides, 8;c. *Pluck, mant.* 97. *tab.* $4 \mid 6*fig.$ 6. is not unlike this plant.

A native of moist pasture land, of ditches, 8cc.

Root fibrous.—Culms erect, about a foot high, simple, thre'fe-sided, smooth, lower part involved in the sheaths of die leaves.—Leaves prter than the culm, smooth.—Umbel terminal, compound, crowded, sessile, about an inch each way. Umbellets sub-sessile, crowded, composed of numerous, sessile, linear-lanceolate spikes.—Involucre from four to six-leaved, unequal, the longest being from six to eight iuches long, and the shortest only one.—Stigma iwu cleft.—Sc't'd compressed, oblong-obcordate.

15. Q.punctalus. R.

Culms from two' to six inches high, shorter than the leaves. Umbel compound. Involucres longer than the leaves. Seeds oval, compiessed, dotted.

Gramen cyperoides elegans, &c. Pluck, t. 192.yi 3.

A small elegant species; x a native of moist pasture ground.

Root fibrous.—Culms erect, from two to six inches high, halfnaked, three-sided, smooth.—Leaves sheathing, the lower ones little more than the sheaths, the superior ones longer than the culm.—Umbel terminal, compound, about an inch each way. Umbellets some sessile, some peduncled, composed of linear, miiny-flowered spikes.—Involucre from three to fou: leaved, unequal, longer than the culm; scales daggered.—Seed compressed, obova^e, beautifully marktd with white di'ls, on a daik-colfctned ground, hence the Specific name.

06\$. In Kiinigs catalogue he called this C. pygmaus, but Retzins says the culm of Jhat species is round; whier tas in this plant it is three-sided.

16. C. capillaris. Kön. Mss.

Cuhn filiform, from one to two feet high, umbel of one sessile, and two pedicelled umbellets. Involucre three-leaved, filiform, florets diandrous, S^lyle two-cleft. Seed obovate, without angles.

A native of moist pasture ground.

Root fibrous.—Culms erect, from twelve to eighteen inches higher three-sided* filiform, three-fourths or more naked, smooth.—Leaves, sheathing, generally two to each culm; the lower one short, the superior one as long as the culm, very slender and smooth.—UniM small, compound, generally com posed of one sessile, and two peduacleS umbel ie*s, these are again composed of linear, many-flo ered spikes.—Involucre three-leaved, filiform, the largest is Ion?*, than the culm; the shortest about an inch long, arid the other between the two.—Scales membraiaceous* obtuse.—Stamens two—Style two-cleft_Seed obovate, compressed, brown, pretty smooth, half hid in the rachis.

17. C. compressus. Linn. Sp< PI- ed. JVilU 1282 Vuhl E.um. PL 2. 32 i.

Culms from six to ten inches high, shorter than **the** leaves, **angles** blunt. Umbel simple or compound. Involucre three-leaved. Scab* daggered. Seed obcordate, triangular.

Gramen cyperoides rarius, Stc. Pluck* t. 192./. 1.

JBeng. Chooncha.

Teling. SaliU/nga.

Delights in a moist soil.

Root fibrous.—Culms erect, from six to ten inches high, two-thirds naked, three-sided, smooth; angles blunt—Leaves uumerous sheathing, many of them longer thau the culms, smooth and glossy.—Urnlei terminal, simple, or compound; when compound the umbelleta are peduucled; from one to three; and consist of from three to six, green, linear, sessile, many-flowered spikes.—Involucre three-leaved* smooth, the largest of them is nearly as long as the culm.—Scale*

**acute.-T-Seed turbinate, three-sided, smooth, dark-brown colour.

06\$. The upper flowers of the spike are incomplete.

18. C. castaneus. Linn. Sp. PL ed. Willd. 1. 378.

Culms from two to six inches high, length of the leaves. Umbels generally compound; length of the iuvolucre. Scales with Iongrecuj ved points, uionanttrous. Seed rugose, obtusely triangular.

A most beautiful delicate, small species; delights in moist, san-»Jj*; pasture lam!,

Hoot fibrous.—Culms erect, from two to six inches high, naked, t!*.ree itied, smooth.—Leaves sheathing, filiform, scarcely so long as Ln.—Umbel terminal, one or one and half inches, simple, or mi.!, but in general composed of from one to five small pedunfj 11 in bet lets; and one or two sessile ones.—Spikelets linear, many-veied.—Siales th Re-keeled, with a recurved point, green keel and chesnut-coloured sides.—Stamen siugle, (at least I have not found more.)—Style two-cleft.—Seed obtusely three-sided, oblong, rugose

19- C. dijjormis. Linn. Sp. PL ed. Willd. 1. 280. Yalil Etium. 2. 337.

Culm from nine to eighteen inches high, angles sharp. Umbels compound, umbellets globular, spikelets crowded. Involucre from two totliree-leaved. Scales imbricated. Seed obovate, three-sided:

Giamen cypefbides, 8tc. Pluck, aim. 192./. 3.

Jieng. Behooa.

Grows equally in either a dry, or wet sandy soil.

Boot fibrous_Culm\$ two-iuirds naked, erect, from nine to eighteen inches high, three-sided, smooth, angles sharp.—Leaves sheathing, as long as the culm, keeled, smooth.—Umbel compound, small, being only about an inch and a half each way. Umbellets from two to four, sub-sessile, and from two to four longer or shorter peduncled, globular, composed of innumerable, very small, o«fl spikes.—Xn-vulucre from two to three-leaved, very unequal, the longer being half as tongas the culm; and the liiiid (when present) less,than an inch, imbricated, margins membrauaceous.—Seed three-sided.

20. C. pumihis. Linn. Sp. PL erf. Willd. 1. 282. Rottb. gfavi QQ. t. Qmf. 4. Vakl Erturn. PI: 2. 336.

Culms about six inches high, angles blunt. Umbels compound; umbellets sub-globular. Spikelets, Scales daggered.

Delinhts in a moist soil.

Root fibrous.—Culms erect, six inches high, half naked, obsolety ly three-sided, smooth, angles rounded.—Learn sheathing, shooth than the culm.—Umbel compound, umhethts from three to six, s*>oi< or longer peduucled, globular, composed of ten or twelve lineai^*^ ny-flowcred spikes.—Involucre three or four-leaved, unequal, $vee^$ largest as long as the culm. Scales acute.

21. C; emeritus. Linn. Sj). Pled. Willd. 1. 275. Rottb. gra»^l>
•* I. † • 5. t; • 1*

CuLiu three-sided, from six to twelve inches long. Leave's sjub-radical, umletcompound, involucre three or four-leaved. Scales obtu\$^e> Iljwc'rs: liandrous. Style two-cleft. Seed round and smooth.

A .lative of low pasture land all over Bengal, &c. where it is found grow ing in tufts during the rainy season. Like most of this natural Older.

Obs. Cattle rarely eat it,*^xcept when pressed by hunger.

22. C incurvatns. R.

Cultuo triangular, base Itipfy, incurvate. Umbel compound. InVO'' lucres two or ihree> incurvate. Spikes needle-shaped, incurved* b'al+s W.»ngf obtuse. Stigma three-cleft.

A u u ve nf tli£ nuist banks of the Ganges. Flowers during tht

*Msit .r w, iml.diied, siior er than the culms _____Culms slightly inrurv

oblong, obtuse, with a green rib.—Stamina three.—Germ oblong* Stigma three-clefts*Heed linear, oblong, thiee-aided,8inooih, brown*

£3. C. tortuosus. Kon. Ms\$>

Culms obtusely three-sided, from six to eight inches high. Umbel compound, length of the iuvolucre. Spikelet linear, incurved, flowers diaudrous. Seed obovale, compressed, without angles.

A native of moist pasture ground.

Boot somewhat tuberous, with filiform fibres*—Culm erect, from six Jo eight indies high, naked, three-sid, d, smooth.—heaves radical, shorter than the culm.—Umbel compound. Umbellets from four to eight, shoi ter and longer peduncled, composed of large, linear, manyflowered, chesnut-coloured, curved spikes.—Jaw/wri'three-leaved, longer than the umbel.—Stamina two.—Style t\VQ'Cleft<-~Seed ob^ cordate, compressed, smooth.

24. C. rotundus. Linn. Sp. PL ed. Willd. 1.283. VahL Enum. PL S4S.

Root tuberous. Culms from one to two feet high, obtusely three-sided. Umbel compound, spikelets alternate; involucre three-Ieaveda length of the umbel. Seed angled.

C. rotundus. *Rumph. amb.* 6./?. 1.1; *l.Jig*_% 1.8*.

C. hexastachym. Rottb. 28. t. 14./.2.

Sans. 5 ^ i; Moosta, W??% Moostaka.

Beng. Ivlootha.

Teling. Shaka-tunga.

This is by far the most common species we have in India; it delights in a moist dandy soil, though it grows abundantly every where*

Root tuberous, \vith filiform fibres, tubers about the size of filbert^ or acorns, of irregular form, outwardly a dark brownish rust colour; inwardly firm, tender, white, and very fragrant,—Cnlms erect, from one to two feet high, naked, three-sided, smooth, with the angles rounded* *—Leaves radical, or only investing the base of the culm, sheathing. Sorter than the culm, smooth, glossy.—I/»jfai[terminal, compound

verv luxuriant plants, sometimes decompound, from two to three , icbe8 eacfi way. *Umbellet** from two to eight, all having peduncles oi from one-fourth of an inch to two inches long.—*Involucre* genera - Jv lhree-leaved, unequal, smooth, the largest is only a little long** ,i the umbel.—*Spikes* linear, subrse^iie.—*Seed* obsoletely three-brown, a little rugose.

Oh. Cattle eat it. Hogs are remarkably fond of the roots. Dried lit 11 il they are used as a prefume at the weddings of the-n³"

-. I' i» b> far the most troublesome weed we have in our gardens,
e is uo extirpating it as every little bit of the root grow?

2J. C. pc ieni'.is. U,

Cairns from three >> foot *"eet high; sub-rotund atthebase, three elv. Umbel compound and decompound Seeds three-sided.

Beng. Nagur-Mootha.

low ut i pi sices, HI the vicinity of Calcutta.

— Culms named, except at the base, straight, generally three or fe^{ur} feet him, sleuder, tapering mucl), toward the base nearly round, becoming one and more thiee-sided, till they are acutely so at the composition of the culm.—Umbel compound and decompoint, which is sile umbdl?t, and three or four, on naked, suioovif find inn peduncles, of different length, and these again composed of from. four to twelve, most slender, long, filiform, niany-flowered points.—Involucre three-leaved, the longest about the length of the umbel, the other two shorter, all slender, and tapering to most acute points.—Scales membrauaceous.—Stamens three.—Style three-cleft*—Seed iliree-sided.

Ou Its naked delicate form, small and compound umbel, short

slender leaves, and scanty involucre, immediately distinguish i hem '\$\hat{R}\$ the other Iudian species I have yet met with.

26. C. tuberostn. Linn. Sp. PL ed. WUld. 1. £81. Roftb. gram* «8. /. 7. / 1. VahL Enum. PL & 340.

Root tuberous. Leaves Jiuear, length of the culms. Umbels compound, or decompound* Involucre three-leaved, longer ihan iLe-utiii bel. Style ihree-cleft. Seed oblong, three-sided.

This seems to me to be only a luxuriant variety, if so irinoK of C. rotundus. It grows in the same places, the roots are tube* win, &c. in short, £ can scarcely perceive any difference.

27-X?. tenuiflorus. Linn. Sp. PL ed. WUld. 1. 284. Roltb. gram. SO.;. 14./. 1. VahL Emm. PL 2. 374.

Culm from two to four feet high, sharp angled. Involucre three or four-leaved, much longer than the decompound umbel. Spkdels alternate. Scales obtuse; seeds obcordate, three-si'defl.

Teling. Gelleba-fonga.

Grows hi standing sweet water.

Root creeping, with ramous fibres.—Culm erect, from four to six feet high, naked, three-sided, smooth-; angles sharp.—Leaves most-* ly radical, shorter than the culm, deeply channelled, tiirioolh.—L'mbel terminal, decompound, from four to eight inches each way.—AH the umhelhts peduncled, oblong, spreading, computed of alternate, sessile, lanceolate, from twenty to thirty-flowered spikes.—Involucre three or, four-leaved, very 'unequal, the largesi being from one to two feet lonsf, and the shortest about one or two uw ches.—Scales obtuse, apex often emarginate and meinbrauaceous.—Seeds three-sided, obovate.

28. C. strictus. R.

Culms about twelve inches high, stiff and straight, shorter than the ** leaves; angles sharp, Uinbtt decompound, straight fiowers duw« Vous. Seeds obovate, compressed, without angles.

Delights in a moist uncultivated &6il. ' '

Root fibrous.—Culm straight; rigid, about a foot high, obtusely three-angled, three-fourths naked, smooth.—Leaves mostly radical sheathing, many of them longer than the culm, erect, rigid, much keeled, smooth.—Umbel erect, linear, thin, sometimes decompound, though in general only compound. UmbelLts, one or two sessile; and from three to eight with peduncles of unequal lengths; the laigest peduncles are compound.—Involucre fi oin three to live-leaved, very unequal; the largest nearly as lou^ as the cul/11, the smallest not more than an inch long.—Spikes sessile, lanceolate in suidli plants, in large ones linear.— StUMem two.—Stifk two-clein.—Seef compilessed, obcordute.

29. C.flavldm. Linn. Sp. PL ed. Willd. 1.279- Retz. QbslS. 13. Tz&S, Enum. PL 2. 334.

Culms irom six to ei^ht inches high, generally shorter than the leaves. Umbel decompound, longer than the involucre; umbelM* globular, spikelets crowded; Jlowers monandrous. Seeds obcordatfy three-sided.

This is a small delicate species, a native of moist places on the coast of Coromandel.

Root fibrous, dark purple.—Culm erect, from six to eight inches long, naked, three-sided, smooth.—Leaves sheathing, very short, embracing the base of the culm.—Umbel compound, or decompound; from one to two inches high, umbellets one or two sessile, and Irom two to eight 'on peduncles of various lengths, the highest sometime* bears a small partial umbellet. Involucre two-leaved, shorter thai* the umbel. Spikes lanceolate, chesnut-coloured, flowers monatt* drous. Seeds white, short, three-sided, a little rough.

SO. C. *Iria. Linn. Sp.Pl ed. Willd.* 1. 286. *ValxL Enum.* 2. *S6Q>* . *Culm's* from one to two feet high, *angles* sharp, *uruLeU* decompound, shorter than the involucing; *spikelets* alternate!; *Jfowtrs* rather distinct, *wales* imbricated. *Seeds* obovate, angular.

Ira. liheed. mat. 12.j>. 105: t. 55. does not very, well agree with my plant.

- Gramen cyperoides, &c. P/ \ll ft. Almcg t, 19 L/. 7. is much more like this plant than the above-quoted plant of Van Rheede.
- •; Beng. Bwra^choocha,

Is a native of moist, cultivated lands.

Hoot fibrous.—Culms erect, from one to two feet high, four-fifths naked, three-sided, sharp-angled—Leaves sheathing, nearly the length of the culm, keeled, smooth.—Umbel decompound, from two to four inches' high, umbellets from four to eight, one or two sessile, the rest unequally peduncled; partial umbellets lanceolate, raceme* like, being composed of alternate, linear, from six to twelve-flowered spikes.—Involucre from three to four-leaved, the largest two or three times as long as the umbd.—Scales imbricated, with mem? branaceous sides.—Style two-cleft.—Seeds three-sided, length of the scales.

SI. C. inundatui. It.

Culms horn two to four feet high, exactly triangular. Leaves as long as the culms. Involucre from four to five-leaved, one very long. Umbel decompound, Spikclets lanceolate. Stamens two. Style too-cleft. Seed obebrdate, a tittle compressed.

Beng. and Hind. Patee.

Found in great abundance on the low banks of the Ganges and rivulets near Calcutta; where the tide rises high over it, it thrives most luxuriantly and helps much to bind, and protect the banki from the rapidity of the water.

Root jomied, creeping, sloloniferous, perennial.—Culms ertct_t from thiee to four feet high, exactly three-sided, about as thick as the little finger.—Leaves numerous, radical, or surrounding the base of the culms, smooth, deeply channelled on the inside, and keeled on the back.—Universal involucre composed of four or five leaves of very unequallengihs, the largest being two feet or more long, and the shortest as many inches; partial involucre subulate,—Umbel de-

compound, erect, about a span long.—*Spikelets* sessile, diverging, lanceolate, rigid, obtuse.—*Stifle* two-cleft.—*Seeds* obcordate, a lit^{**}c compressed, smooth.

52. C. Partgorei. Rottb. gram. SI. t. 7.f. 3. Linn. Sp. PI *&-mild. 1.284.

Culms from three to four feet high, naked. Leaves scarcely any. Umbels decompound; involucre three or four-leaved; involucels setaceous. Spikelets filiform. Seeds oblong, compressed*

Beug. Chumati Patee.

Is common on the banks of the Ganges, and serves, with C- *iM** datus*, the same useful purposes, though in an inferior degree.

Root jointed, creeping, stoloniferous, perennial.—Culms erect, naked, smooth, three-sided towards the apex, sides concave, from two to four feet high, and about as thick as a goose quill.—Leaves one or.two, sword-shaped, very short, involving with their sheaths, the base of the culm. Universal involucre three or four-leaved, very smooth, the longest twice the length of the umbel; partial minute, setaceous.—Umbel decompound, composed of one sessile umbel* let in the centre, and from four to eight spreading, compound ones in the circumference, supported on fine, coiftpressed peduncles of unequal lengths.—Spikelets iilifoim, from ten to twenty-flowered*—Scales obtuse.—Stamens three.—Seed oblong, compressed.

Obs. Its naked,, exactly three-sided culms, and scarcity of short leaves readily distinguish it from all the other species I'have yet described. C. *tegetum* has the angles rounded, and no leaves.

33. C.procerus. Rottb. grata. \$Q. t. 5. f. S.

Culms from three to six feet high, angles sharp. Umbel decompound. Involucres none; spikelets alternate, linear, Jlowers diandious. Seeds obcordate; compressed, without angles.

Pota-pullu. Rheed. ml 12. p. 93. t. 50.

Is a native of iauist vallies, rivulets, kc. amongst die *inountains*

O£s. In Bengal this plant, or one exceedingly like it, (for it differs from it only in haying three stamens, the culm, leaves, umbels, scales, and seeds being the same) grows on the banks of the Ganges and so low as frequently to be entirely under water during the high tides; yet it thrives and helps to bind the banks of the rivers where it grows and is one of those plants that prevent their giving way so much to the rapidity of the stream as they otherwise would do.

34. C. spinulosus. R.

Culms from three to five feet high, rigid. Umbel scarcely decompound; spikes loug, and short peduncled, globular, spikelets rigid, from three to ibui-llowered; involucre and invoiuceh many-leaved.

Teling. .Kurra-tiaiga.

£ large strong coarse species, grows in ditches and water courses. Root fibioiis—Culms erect, from two to five feet high, very rigid, obsoletely three-sided, smooth, four-fifths naked.—Leaves sheathing, length of the culm, rigid, striated, margins hispid.—Umbel terminal, decompound, from six to eight inches each way; Umbellets with peduncles of various lengths, composed of peduncled, globular heads, and these again of numerous small, sessile, linear, lanceolate, rigid, spimilous-pointed, from three to four-flowered spikelets.—Involucre from four to six-leaved, unequal, the largest being from two to three feet long, and the shortest about the same number pf inches, margins hispid, like those of the leaves. Itivolucel from three to six-leaved, length of the umbellets.-^Sca/es linear.

Obs. I have not seen the pistil nor seed. It is a remarkably coarse species; no animal eats it.

35. C. elatus. Linn. Sp. PL ed. Willd. 1.287. Vahl. Enum. 2.363. Culms from six to twenty feet long, sharp-angled. Umbel scarcely decompound. Spikes all sub-sessile, linear, erect. Spikelets most numerous, alternate, from six to eighteen-flowered, anthers ending in a thread. Seeds oblong, three-sided.

Beng. Gol-mulunga. Teling. Rakjsha. This i3 by far the largest species on the coast of Coromandel. It grows in sweet standing water•

Root fibrous.—Cillms erect, from six to twenty feet high, and thick in proportion, naked, except near the base, three-sided, angle* sharj?, rigid and scabrous, so as to cut the hand readily, other paits pretty smooth.—Leaves sheathing, in small plants, as long as the culm, about an inch in diamtter at the bioadest part, triangularly concave, with the keel and inuigins sharply senate.—Umbel terminal, decompound, erect, small lor tile size of the plant, being only about a tooc high in middle-sized ptauts. Umbeilrfs one, or two, sub* sessile and from eight to ten peuuucied, composed of erect, linear, short pedicelled, compound spikes, of simple, sessile, lanceolate, from six to teu-riovveicd spiketets which bui round every part of the compound spikes.—Involucrg three»leaved, with some smaller withm these three, margins and keel as in the leaves Involucels small* one-third the length of the umbellets.—Scales membrane-bordered, acute.—Filaments three, menibranaceous. Anthers ending in * thread.—Seeds three-sided.

36. C. itmbellatus. Valih. Enum. PI 2. 362.

Culms from four to six feet, blunt-angled. Umbel decompound; spikes all sub-sessile, linear,' spreading; spikelets numerous, alternate, from three to foui-flowered* Seed elliptic, three.sided-

Teling. Pedda sbaka.

A large species, growing in standing fresh water.

Root fibrous—Culns erect, from four to six feet high, pretty smooth, naked, except at the base, obsoletely three-sided, angles rounded, sides hollowed.—Leaves mostly radical, sheathing, the longest of them about as long as the culm.—Umbel decompound, spreading, about six inches each way. Umbellets% two or three sub-sessile, and from five to ten on pretty long peduncles of unequal lengths; they are composed of small partial, short-pedicelled umbellets of three to six linear compound spikes, composed of numerous, small, sessile* from three to four-tiowered# simple spikelets, Involucel from three

to four-leaved, of the length of the umbellets.—*Involucre* from three to six-leaved, unequal; the longest from two to three feet, the shortest as many inches.—*Seeds* three-sided, smooth.

37. C. digitatus. R.

Culms from one to six feet high. Umbel decompound, fastigiate. Involucre and involuceh many-leaved; spikes digitate, linear, spike-his diverging, many-flowered, scales with long recurved points.

A middle sized species; grows in marshy places, ditches, &c.

Root,- a somewhat tuberous head with many fibres—Culm erect, from one to si? feet high, mostly naked, smooth, three-sided.—
Leaves sheathing as in the other species, the ir nia^g ns slightly armed willi minute prickles.—Umbel compound, or decompound, from two to four inches high—Umbellets sessile, and peduncled, composed of erect, compound spikes, of small diverging, linear, acute, from four to six-flowered spikelets.—Involucre many-leaved, unequal, most of them longer by far than the umbel, margins armed like the leaves. ^-Involucel many-leaved, length of the umbellets.—Heed three-sided, oblong, with grooved sides.

Obs. In Bengal I have met with this species six feet high, with * a decompound umbel, a foot or more every way, and with from twelve to twenty-four flowers to the spikelets, the culm between round and three-sided, and in the largest almost entirely round.

38. C. verticiliatus. JR.

Culms four feet high, three-cornered, leafy at the base. Umbel decompound; involucre many-leaved, involuceh filiform, spikes of the umbellets verticelled; spikeHs lanceolate. Scales with a blunt point. Seed linear, oblong, three-sided.

Beng. Burethi.

Pound during the rains, in wet low places, in the vicinity of Calcutta.

Root perennial, somewhat tuberous, with numerous dark-co-loured, thick, spongy fibres.—Culms naked, except just at the bsue,

from two to six feet high, and about as thick as a stout quill, absolutely three-sided, smooth, shining, deep green.—Leaves, one, two, or three at the base of each culm, and about the same length, keeled, somewhat spongy, very deep green, whitish underneath, margins armed with minute, short, sharp, aciculae, pointing forwards. , — *Umbel*, compound and decompound. *Umbellets* many oh smooth somewhat angular peduncles of various lengths, composed of from five to eight cylindric, spreading spikes in a vertical, with an erect, sessile, simple or pedicelled compound one in the centre.—Spikelets most numerous, imbricated, lanceolate, from eight to twelve-flowered.—Involucre many-leaved, some of them- nearly as long as the culm, and like the radical leaves keeled and armed on the margHis-—Involuceh scarcely so long as their respective umbellets.—Scales of the gpikelets boat-shaped, with membranaceous margins, and sharp thickened 'points.—Sta.tnejis three.—Seed oblong, obsoletely three-sided.

Obs. This species comes near Rottboell's Cyperus afopecuroides*

39. C. distans. Linn. Sp. Pled. JVilld. 1. Q88. Vahl. Enum. PL Z..362.

Culms about three feet high, three-cornered. Umbel decompound* with the involucre and involuceh many-leaved; spikelets linear, alternate; flowers distant, with obtuse scales. Seeds oblong, three-sided.

C. elatus. Rottb. gram. 37. t. 10.

Beng. Panee-mwhinga.

Is a native of wet places around Samulcota.

Root fibrous.—Culms erect, two feet high, four-fifths or more naked, three-sided, smooth; angles blunt.—Leaves from two to four, embracing the base of the culm, and nearly as long, sheathing, deep* ly grooved above, and keeled below, smooth.—Umbel decompound, from four to six inches high. Umbellets some sessile, and from four to eight, with erect peduncles of unequal lengths. Partial umbellets oblong, raceme-like, being composed of alternate, needle-like, diverging spikes.<-±Involucre from three to six-leaved, unequal; the

largest about a foot, or fifteen inches long, all are smooth.—*Involucels* three-leaved, length of the umbellets.—*Flowers* remote, scales obtuse.—*S&d* three-sided.

40. C. tegetum. 22.

Leafless, culms from three to six feet high, angles rounded, umbel decompound. *Involucre* as long, and longer than the umbel; *involuvcts* chaffy. *Spikelets* linear-lanced, alternate. *Seed* clavate, three-sided.

Hind, and Bepg. Madoor-kaU".

Is common ia ditches, borders of lakes, &c. in the vicinity of Calcutta during the rains.

Root creeping under ground, perennial.—Culms naked, generally from three to six feet high, obsoletely three-sided, stmooth.—
Leaves no other than two or three sheaths embracing the base of the culms.—Umbel docompound; \imb\$fe*ts sub-sessile, and on peduncles of various lengths, sub-erect—Involucre about four-leaved, one or two of them longer than the umbel.—Involucels minute.—Spikelets alternate, linear-lanceolate, many-flowered.—Seeds eliptically triangular,

Obs. Those elegant, useful, durable, large mats so common on the floors of rooms in and about Calcutta, are m^de of the culm of this plant. When green they are split into three or four pieces, which in drying contract so much as to bring the margins in contact, or to overlap each other; in this stale they are wove.

41. C. alopzeuroidiis. Rottb. gram. 38. t. 8. /. 2. Vahl. Enum. Pl.Q. 368.

Culms from four to five feet high. Vmbel decompound; involucre three-leaved, spikes nodding, spikelets alternate, many-flowered.

Wara-pulla. Rheed. ma I. 12. p. 77. t. 42.

Cyperus glomeratus. Linn. Sp. PL ed. JVffld. 12. 277.

This is also a large species, and a native of the same places.

Root fibrous.—Culms erect, from four to five feet high, except

at the bases tlvree-sided, smooth—*Leaves* as in the other species— *Umbel* decompound, drooping, from six to twelve inches high. *Unibeliefs* one or two sub-sessile, and from four to eight with peduncles of various lengths. *Pattial uml.elkts* peduncled and composed of beautiful, linear, bowing, compound racemes of lanceolate, manyflowered, chesnut-coloured spikeleis.—* *Involucre* three-leaved, un^e* qual. *Ltvoluce/s*, small, frequently only chaffy scales.—*Seed* three-sided, smooth.

O6s. I have seen small plants with the umbellets small, dense and globular.

42. C. nudus, R.

Leafless. Culms from four to six feet high, three-cornered, torn? bels super-decompound, naked. Involuces, and involucels chaffy? spikelets subulate, alternate. Seed oblong, compressed without angles,

Beng. Gooia-Methhi.

A native of low wet places over Bengal. Flowers during the rains.

Root perennial, somewhat tuberous.—Leaves no other than a short sheath or two, which envelope the base of the culm, the up* permost one sometimes ends in a short erisiform leaflet.—CW¹ about five feet high, naked, smooth, bright-green, three-cornered, with the angles rounded. Involucres three or four, sub-lanceolate; erect, about one-fourth the length of the umbel.—Umbels decompound and super-decompound, with the sub-divisions, and slender, smooth, compressed peduncles of various length.—Spikelets alternate, subulate, of a bright brown colour, each bearing from twenty to thirty flowers.—Stamens three.—Style three-cleft.—Seed oblong; compressed, without angles.

Obs. This species is very like C. *tegetitm*, and about the same size* though I am informed, never used for mats, as that is. To know it from C. *tegetum* attend to the iuvolucre, which in this is only about one-fourth the length of the umbel, but in that as long or longer.

43. C. Haspan. Linn. Sp. PL ed. Willd. 1. 287.

Culms from four to sixteen inches high. , Umbel super-decompound, involucre two-leaved. Seeds globular, white;

Gramen cyperoides madasarpataDum, &c. *Pluck. alnC* 192./. & *Teling.* Poo-cusi.alic.

An elegant small species, a native of cultivated moist places.

Root fibrous.—Culms erect, from four to twelve inches high, three-fourths naked, obsoletely three-sided, smooth.—Leaves sheathing, often as long as the culm, very slender.—Umbel super-decompound, in small plants as long as the culm. Umhellets one or two sessile, and from four to six peduncled. Partial iimbellets of the first and second degrees pedicelled.— Involucie generally two-leaved, unequal, the longest rather longer than the culjn; involucel a few chaffy scales only.—Stamens two or three.—Seed sub-globular, pure white, smooth.

scmpus.

Glumes chaffy, imbricated on all sides. Corel none. Seed one.

Sect, 1st. Without leaves.

1 S. tuberosits. R.

Root tuberous. Culms culumnar, jointed, leafless. Spikes terminal, cjlindric, naked. Scales oblong. Base of the style cordate. Seed obcordate, beset with gluchidate bristles.

Pi-tsi, Maa-tai, Pu-tsai, or Pe-tsi, or water chesnut of the Chinese.

It is mentioned by Abbe Grosier under the first name, and under the other appellations was transmitted from Canton, by Mr. Duncan, at the desire of the Governor General, for the Company's Botanic Garden, where it blossoms about the close of the rains, *in* September.

Root fibrous, with stoloniferous shoots and round turnip-shaped tubers.—Culms erect, naked, slightly twisted to the right, inwardly intercepted by slender membranes, distant a line, or a line and a half from each other, every eight or tenth of these partitions, is of a

firmer texture than the others and visible on the outside, even when the plant is growing.—*Leaves* none except a slender short sheath or two at the base of each culm.—*'Spike* terminal, solitary, cylindric, naked-*Scales* oblong, membranaceous margined.—*Stumens* three.—*Style* two or three-cleft, at the bas&swelied out into an ovate-cordate, compressed shape.—Seed obcordate, surrounded with glochidate bristles.

Obs. For the ceconollical uses of the tuberous roots of this plant, I beg leave to refer to 'Abbe Grosier, and other historians who have had opportunities of observing in what manner they are employed by the Chinese, and to the following extract from Mr. Duncan's letter which accompanied the plants.

"The Maa-tai, Pee-taiov Ptise of Abbe Grosier, the water-ches*
"nut, grows in ponds, which are manured for its reception about
"the end of March. A pond being drained of its water, small pits
"are dug in its bottom, these are filled with human manure, s»d
"exposed to the sun for a fortnight; their contents are then intiinately blended with the slimy bottom of the pond, and the slips
« or roots of the plant deposited therein; the water is now returned to the pond/ and the new crop of tubers come, to perfection
"by the beginning of September.

"This nut is in high estimation among all ranks of Chinese, "not only as a pot root, but also a medicine. It is eat either boiled or raw. I will not vouch for the truth of the singular virtues as cribed to the Maa-tai, but just relate one of the most plausible. The children here often play with cash in their mouths, which sometimes slip down into 'the stomach, and bring on alarming symptoms. The nut is immediately given in quantities, either raw or boiled, and, they say it never fails to give relief being cousidered as specific which has the effect of decomposing the metal."

2. S.plantaginus-Linn. Sp. Pled. Willd. 1. 291. Rottb. gram. «• t. 15./. 2. Vahl Enum. $PL_{2\cdot(2}\sigma l.$ $R_e tz.$ Obs. \$. 14. Culms, culumuar, from two tyour feet high, intercepted. Spike

terminal, naked, sub-cylindric; *scales* oblong, obtuse. Seeds beset with bristles.

A leafless, rush-like species; it grows in shallow standing sweet water.

**Root stoioniferous, with thick, spongy, and capillary fibres.—

Culm erect, round, smooth, naked, except the lower part, which is covered with a membranaceous sheath or two\$inwardly. intercepted with transverse, rigid septunis, at every inch and quarter, besides, numberless, irregular, smaller ones between.—*Spike terminal, cylindric, two inches long, naked.—*Scales* obovate, smooth, a little keeled, margins membianuceous.—*Stamens* three, with bristles intermixed round the base of the germ.

3. S. tumidus. R.

Culms from two to three feet high, round, regularly intercepted. Spike terminal, cylindric. Scales broad-lanceolate. Seeds beset with simple bristles.

This species is very much like the last described, and a native of similar places, but much rarer..

Hoot, the same.—Culm erect, three feet high, round, smooth, naked, seemingly swelled, intercepted with a conspicuous transverse partition every sixth of an inch.—Leaves none, but sheathes as in the former.—Spike single, terminal, erect, cytindric, an inch long.—Scales broad-lanceolate, acute, a littlf keeled, otherwise smooth.—Stamens, bristles, &c. as in the other species.

4. S. spiralis. Linn. \$%). PL ed. Willd. 1. 290, Rottb. gram* 45. t. 15. f. 1. VahL 2. 252.

Culms from two to three feet high, three-sided. Spike terminal, naked, cylindric, obtuse. Scales lapped. Seeds beset with bristles.

This is a native of the same places with the last described.

'Root stoloniferous, &c. as in S. plantag^nus.-^Culm erect, from two to three feet high, naked, three-sided, angles sharp, smooth, not articulated, nor interrupted inwatdly.—Leaves none, but a sheath or two embracing the base of the calm.—Spike as in S-plantagi-

'nus, but the flowers are more numerous.—Scales imbricated se. emin without order, smooth, lapped, margins broad, and membrana'ceous.—Stamens, brhtles, &c. as in the two preceding species.

5. S. acutangulus. R.

Culms from two to three feet high, triangular. Spike terming tapering, acute; scales somewhat acute; seeds bristly.

Grows in similar places to those which produce the two last species.

Obs. It differs from S. spiralis in having the angles of the cull*¹ sharp. In having the flowers few and disposed spirally. In having the scales striated, oblong and somewhat pointed.

6. S.medius. R.

Culms from one to two feet high, three-cornered. Spike terminal, sub-cylindric; scales obtuse. Seeds bristly.

A species resembling the last, and growing in similar places.

Root as in the species already mentioned.—Culm erect, one of two feet high, smooth, three-sided, angles rounded.—Spike as & the former.—Scales smooth, obovate.—Stamens, bristles and fi& as in the last four species.

7-S. incurvatus* R.

Culms in tufts, culumnar, from six to nine inches high, incurved, leafless, intercepted. Spikes in a globular, naked verticil near the base of the culm. Stigma trifid. Seed three-sided.

A native of moist places near Calcutta. Flowers during the cool season*

Receiption

Root of ni8t*coloured, capillary fibres.—Culms numerous, from their iucurved shape forming nearly a globe, leafless, round, smooth, intercepted at every half inch or less; general length from six to eight inches, and thicker than a crow quill.—Sheathes a few between the spikes and root.—Spikes numerous, sessile, ovaterobloug, forming a round verticil about an inch and a half above the root.—Scales round* ovate-obtuse.—Seed ovate, triangular.

. 8. S. articulatus. Linn. Sp. PLed. Willd. i. 290. VakL Enum. ii. 358« Cu/ffzs from two to four feet high, culumnar, intercepted with conspicuous partitions. Spikes pointed, crowded into a head near the base*. Seed naked, three-sided*

Tsjeili. Rheed. mat. 12. p. 135. t. 71.

Hind, and Beng. Putputi-chechka.

Teling. Luiti-pitta-allie.

This is also a native of standing sweet water.

Root s'toloniferous, and fibrous as in the former.—Culm erect, from two to four 'feet high, round, smooth, naked, intercepted inwardly by transverse septums at every inch, or half inch; they are conspicuous on the outside, even while the plant is growing.—Leaves v.o other than a short sheath or two, involving the base of the culm.—Head lateralynear the base of the culm sessile, sub-globular, composed of many, (fifty to sixty) oblong-pointed, sessile, many-fiowered spikes.—Scalesbroad-cordate> a little pointed.—Stamens three; the bristles of the foregoing five species are here wanting.—Style slightly two-cleft.—Seed three-sided, smooth, white.

9- S. subarticulatus. It.

Culms from two Ur three feet high; culumnar, intercepted with inconspicuous partitions. Spikes obtuse, crowded into a head near the base. Seed three-sided, pointed.

A native of the same places with the former.

Root resembling that of the preceding species.—Culm erect, front two to three feet high, round, smooth, naked intercepted every

quarter of an inch by a slight membrane; their places do not appear externally even when the plant is dry.—Leaves no other than a sheatn or two.—Head lateral, near the base of the culm, sessile, globular, composed of many, (about one hundred) sma|l, oval, obtuse, sessile, many-flowered spikes.—Scales oval, membranaceoua.—Seed ihree-sided, white, smooth.

10. S. dubius- R.

Root tuberous. • *Culms* naked, culum&ar; intercepted with numerous partitions.

· Teling. AlU'ke.

Roots tuberous, with stolones and numerous fibres issuing $A^{*,0}$ them, outwardly of a dark dusky colour, inwardly white.— $Le \le e^{sS}$. erect, cyliudric, smooth, about a foot long.

Obs. I have never met with flowers of this plant which is a native of wet sandy pasture ground, and was formerly considered $\&^s$ a species of Isoetes. The natives boil and eat the roots which the say they are as good as yams.

11. S. capitatus. Linn. Sp. PL ed. Willd. i. 294. Kahl.il 250-Culms naked, from four to eight inches high, culumnar; \$pik^{eS}' terminal, globular* Seed black, roundish, Jbristle-bes\$t.

S. caribaus* Rottb. gram. 46. t. 15.jf.-S.

A native of barren, sandy, moist places.

Root fibrous.—Culms erect, from four to eight inches high, roun t smooth, naked.—Leaves no other than a sheath or two.—Spiketerminal, naked, sub-globular; permanent bristles surround the germinal, naked, as in those with single, terminal, cylindric spikes.—Style two-cleft.—Seed obcordate, compressed, smooth, shining black.

12. S.juncoides. J2.

Culm's from one to three feet high, culumnar. Spikes oval, from three to five in a sessile head, far below the apex. Seed roundish beset with bristles.

A native of wet and marshy places.

Root fibrous. Culms erect, from one to three feet high, naked, round, and blender in proportion to the height, striated, otherwise smooth. Leaves none, 'except two sheaths embracing th\$ base of each culm. Spikes from three to five, lateral, sessile, oval, naked, from four to six inches, belov/ the apex of the culm, which is erect, and like that below the spikes. Involucre none. Stamens three, intermixed with firistles. Stigma two-cleft. Seed obcordate, compressed, smooth, white.

13. S. mucronatus. Linn. Sp. PL ed. Wittd. i. SOS. VahL Enum. iL 256.

Culms from six to twelve inches high, three-cornered. Spikes peduncled and sessile below the apex. Seed black, scabrous, subtriangular*

A native of sandy ground.

Root fibrous.—Culms erect,, from six to twelve inches high, firm, naked, three-sided, striated, with rounded angles, above the spikes half round, with a groove on the flat side. Spikes lateral, sessile and peduncled, naked, from six to twelve, oblong, many-flowered. Nectarial bristles of the germ wanting.—Seed somewhat three-sided, black, with scabrous spots.

14. S. triangulatusiR*

Culms in tufts, erect, two feet high, naked, acutely three-angled. 'Spikes from eight to twelve, sessile just under the straight three-winged apex. Germ *mlbraced by six long, slender bristles, besides the three-broad filaments.

Native of Chittagong, where like most of the order, it delights in low wet ground.

15. S. supinus. VahL Enum. PI. ii* 257-

Culms in tufts, curved, three-cornered, generally naked. Spikes several, under the grooved apex, sessile and peduncled/ · Imolucre one-leaved, besides the apex of the culm. Seed three-sided, transversely rugose on the back, black.

S. lateralis. Linn- Sp. PI. ed. Willd, I 302- ReU* Obs. iv, 12.

found growing in tufts, in wet places, in the vicinity of Calcutta, during the cool season.

Root •!' brown capillary fibres.—Culms numerous, about a foot high, curved, three-cornered, angles rounded, above the spikes incurved, and deeply channelled.—Leaves rarely any other tlan a few short shealhs, investing the base of the culms, and they generally end in an ensiform point, when present solitary and like the culm above the spikes.—Spikes many, peduncled and sessile, considerably under the apex, oblong.—Scales ovate, uiucronate, with brown chaffy margins.—Seed three-sided, black, transversely rugose.

16. S. globulosus* Linn. Sp. PL ed. Willd. I 301.

Culms from one to two feethigji, nearly culumnar. Umbel compound; involucre shorter than the umbel* Seedlong, obovate, smooth

Teling. Biijapa. * »

A native ofcwet sandy places.

Root fibrous.—Culms erect, from one of two feet high, as thick as a crow quill, a little compressed, smooth, 4e ept near the base which is involved in, from three to five, large, pointecfslieaths.—C^^terminal, small, compound. Spikes oval.—Involucre two-leaved, unccfual, erect, shorter than the umbel.—Filaments, three, broad, and membianaceous*—Style broad, margins fringed. Stigtna.tweffte—Seed obcordate, compressed, smooth, light brown.

17- S. pectinatus. R,

Culms from three tpfyir feet high, culumnar. Panicle lateral, just below the straight subulate apex of the culm. Scaks daggered* Stig" ma two-cleft. Seed roundish, beset with four pinnate bristles.

Grows chiefly in marshy places, where the soil is sandy, '

Rcot fibrous.—Culms erect, from three to four feet higfy as thick as a sluilly naked, round, smooth.—Leave^no other than a sfoeath or two round the base of each" culm.—Vmbel lateral, about its own length below the apex of the culm, compound, rarely decompound, bowing,—Spikes oblong.—Involucre no other than the ter-

mination of the culm, which is erect and about as long as the urn-be\.—Scales chaffy, daggered.—Stigma two-cleft.—tiectarial bristles two on each side of the germ 'they are beautifully pinnate and permanent.—Seed obovate, compressed, smooth, brown, embraced by the nectarial bristles.

18. S. pentagonus. R.

Culms, from six to nine inches high, somewhat five-sided. Umbel terminal, compound; involucre chaffy; Jfo&wsmonandrous. Seed obovate, triangular.

A native pf pasture ground.

Root fibrous.—Culms erect, from six to nine inches high, naked, somewhat five-sided, slightly striated, otherwise smooth.—Leaves no other than a sheath or two.—Tfmbel terminal, compound, small, erect.—Involucre, a few small chaffy scales, with long tapering points.—Stamens single.—Stigma three-cleft.—Seed somewhat three-sid* ed, white, scabrous.

Sect. %d. With leaves.

19. S. atropurpureus. Linn. Sp. PL ed. Willd. i. 294.

Grows in small tufts. *Culms* from three to four inches high, setaceous, erect, culumnar, longer than the leaves. *Spikes* terminal, naked, solitary, oval.

A native of poor, wet laudy, pasture land.

20. S. minimus. R.

Grdws in tufts. *Culms* from one to two Scfies long, setaceous, curved, shorter than the leaves! *Involucre* three-leaved. *Spikes* terminal, globular, squarrose, abcufas long as the involucre.

Found with S. atropurpureus ch poor, wet sandy lands.

21. S. monostachyos, Rön.

Culms straight, from six to twelve inches long, culumnar. Spike terminal, solitary, naked, scales roundish. Seed obcordate, smooths Delights in barren, sandy pasture lands.

Root fibrous, purple-coloured.—Culms erect, from six to twelve inches high, round, smooth, three-fourths or more naked.—Leaves sheathing, nearly as long as the culm, filiform.—Spikes terminal, single,naked,oval; flowers few.—Scales sub-orbicular—Style broad, with downy margins. Stigma two-cleft.—Seed obcordat#, compressed, smooth, light brown.

22. S. strobilinus. R.

Culms two feet high, three-sided, base leafy. Leaves triangular. Spike lateral, solitary. Scales cordate, cuspidate. Stigmas two-cleft. Seed roundish, beset with bristles.

A native of the soft, wet banks of the Ganges. Flowering time the cool season.

Root stoloniferons, with pale-coloured fibres.—Culms simple, straight, about two feet high, three-sided.—Leaves two or three, of different sizes, embracing the base of each culm, the longest near* ly the length of the culm, keeled and deeply channelled, smooth—Spike solitary, lateral, one-third part of the culm below its apcx ovate-oblong, about one inch in length. Involucre one-leaved, besides the continuation of the culm, length of the spikes.—Scales cordate, cuspidate, smooth.—Stamina three, with about double the observed of bristles between them.—Anthers linear, when old spiral.—Germs obovate. Stigma two-cleft.—Seed flat, particularly on the inside, roundish, obcordate, crowned with ajninute portion of the remain ing style, and embraced by about six slender, soft, permanent busties which are about the same length*

23. S. scaber. JR.

Culms erect, from four to eight inches high, angular. Spikes terminal. Scales oblong, diandrous. Stigma bifid. Seed obcordate^scabrous.**

Compare with S. poltftrichoides. Retz. Obs. iv. p. 11.

A native of dry, sandy pasture ground on the coast of Coromao* del.

Root composed of dark purple capillary fibres. Culms erect, from four to eight inches high, four-fifths naked, angular, smooth__Leaves sheathijng, mostly radical, filiform, half the length of the culm,— Spike single, erect, oblong, many-flowered.—Involucre two or three-caducdbs scales, shorter than the spi^e_Scales oblong, apex rounded, falling as the seeds ripen.—Stamens generally two.—Stigma two-cleft.—Seed obcordate, compressed, lead-coloured, rugose.

24. S. bispicatus. Ron.

Culms erect, from six to twenty-four inches high, 'filiform. *Spikes* from two to three, terminal, sessile, and peduncled, icvolucred; *scales* roundish. *Seed* obcordate, with a callous margin.

Telfag. Khooshi-tiingtf.

Beng. Kesooii-mt/k/nga.

Delights in a moist rich soil, grows in large distinct tufts.

Root fibrous.—Culms sub-erect, four-fifths naked, very slender, filiform, somewhat five-sided, smooth.—Leaves sheathing, in large plants long, slender, and often twisted a little, in small plants more rigid.—Spikes two or three terminal, ovate; one is always sessile, the other one or two peduncled.—Involucre one or two-leaved, about as long as, the peduncled spikes.—Scales nearly or-bicular.—Stamens and style as in S. monostachyos.—Seed obcordate, compressed, white, with a thick callous margin.

25. S. schanoides. KOH. Ret*. Obs. v. 14.

Culms erect; from six to twelve iiiches long. *Spikes* one or two, terminal, naked, acute. *Scales* pointed*. *Seed* obcordate, angular, dotted*

Beng. Moormoorż.

A native of dry pasture ground, generally amongst bushes.

Root fibrous.—Culms sub-erect, from six to twelve inches high, three-fourths naked, filiform, a little compressed, particularly towards the tops, and striated.—Leaves as in the former.—Spike generally single, though there are sometimes two, in which case **one** i* peduncled, few-flowered*—Involucre entirely wanting.—Scales

Stigma three-cleft.—Seed three-sided, very scabrous, pearl-coloured

26. S. tristackyos. Vahl. Ennm. ii. 254.

Culms from six to eight inches long, slender, curved, spiated. Leaves shorter than the culms. Spikes from two to four, oblong. /*• qolucfe two-leaved, one longer than the spikes, apparently a continuation of the culms. Style two-cleft, villous. Seed obcordate.

A native of Bengal, appears during the cool season in low mow* places.

Root fibrou3, brown.—Culms numerous, in tufts, slender, variously bent, though nearly erect, slender, grooved, particularly deep on the opposite sid^s, from six to eight inches high,—Leaves fety subulate, hard, half the length of fte culms.—Spilcef generally three, varying however from one to five, sometimes short-pedunded, oolong.—Involucre^ two-leaved; one erect, longer than the spikes, seems a continuation of the culm.—Scales oval, somewhat cronate.—Germ cordate. Style villous. Stigma two-cleft.

Ofo. It differs from Rottboell's plant in having the scales mucronate, and the stigma two-cleft; yet I think they must be the same-

«7. S. squarrosus. Linn. Sp. Pl.ed. fVilld. i. 308: Rottb. gram. 49.*. 17./5.

Culms from three to six inches long. Spikes three; involucre two-leaved. Scales ending in a long recurved hairy horn. Seeds angular.

Motta-pullu. Rheed. mat. 12. p. 72. t. S8. Beng. Gooii.

A small delicate species, growing in distinct tufts on dry sandy pasture ground.

Root fibrous.—Culms numerous, bent in various directions, from three to six inches long, four-fifths naked, round, smooth, filiform*—Leaves a few only, sheathing, shorter considerably than the culm—Spikes terminal, generally three, sessile, oval.—Involucre two-

leaved, the largest about an inch long; being nearly erec^it«appears a continuation of the *culm.—Scales* numerous, terminating hi a !o:?r, hairy, recurved point.—*Seed* three-sided, oblong, smooth.

28. ^ monander. Linn* Sp* PL ed. Willd. i. 511. Rotlb. gram* 50. t. 14./. 3.

Culms erect, from three to six inches high, angular. Head terminal, of three to five spikelets; involucre from two to three-leaved; s:ates acute, monandrous* Seed roundish, angular.

A native of sandy*pasture ground.

Root consisting of capillary fibres.—Culms naked, straight, from three to six inches high, angular, smooth.—Leaves filifonu, as long as the culm, woolly near the mouth of the sheaths.—Head terminal, sessile, composed of from three to five small, sessile, few-flowered spikes.—Involucre from two to three-leaved. Scales pointed.—Star:*v single.—Siigma three-cleft.—Seed three-sided, short, thick, > white.

29. S. antarcticus. Linn. Sp. PL ed. Willd. i. 310. Fahl. Enum*

Cturns e-ect, from three to six inches high, round. Head terminal, of many spikelets. Involucres from two to three-pointed. Seed three-sided.

Grows on sandy pasture ground.

Hoot fibrous.—Culms erect, from three to six inches high, round, smooth.—Leaves radical, embracing the base of the culms, sheathing, half the length of the culm.—Head or Vmhellet terminal, globular, composed of numerous small, sessile, few-flowered, conical, pointed spikes.—Involucre from two to three-leaved, scarcely the length of the head- Scales pointed.—Seed three-sided, smooth.*

^{*} This is. *Tsolepis barbata*, R. Brown, prodr. nov. boll. I. 222.—I liav« had specimens from Nepala," where it is common during the rainy season, forming extensive inft. notes of the sheaths, as well as their ligula, are bearded with long hah s.

SO. S. argenteus. K'on. Rottb. gram. 51.1.17./.6. Linn. Sw. 'ed. Willd. i. 311.

CwZ/ws sub-erect, from four to eight inches high, semi-culuxnoar-Head terminal, of inauy sub-sessile spikelets; involucres from two three, scales obtuse, monandrous. Seed roundish, compressed.

Fimbristylis argentea. Fahl. Enum. ii. 294.

Found on sandy pasture ground, growing in large tufts, w* exterior culms of the tuft curved.

Root fibrous.—Culms erect, or ascending, mostly naked, sometimes high, round on one side, and flattened on other, sometimes with a groove on the flat side.—Leaves as m former species.—Head or Umbellet terminal, composed of front teen to twenty cylindrical, obtuse, sessile, silver-coloured, many flowered spikes.—Involucre two, three, or four-leaved, unequal.—Scales oblong, obtuse; keel green, the rest silver-coloured.—Scales obcordate, compress smooth, pearl-coloured.

31. S. glomeratus. Linn. Sp. PL ed. Willd. i. 296.

Culms six inches high, semi-culumnar. Leaves numerous, from one to two inches long. Umbel composed of from six to twelve ovate spikelets. Involucres and involufels the length of the spikeletSi

Hind. Bura Ni'rbz'ahee.

Native of Coromandel and Bengal.

32. S. arvensis. Relz. Obs. iv. p. 11.

Culms from six to twenty-four inches high, compressed, furro Leaves tortuose. Umbel simple. Involucre one or two-leaved, t d er than the umbel. Scales obtuse, diandrous. Seed obcordate, stria e and dotted.

A native of various parts of India, appearing in low moist pl*c * during the rainy season.

Culms about six inches high, compressed, and furrowed' Leaves radical, or surrounding the lower portion of the culms, 0

a little twisted, and nearly as long as the culms.—*Umbel* generally simple, of from four to six sessile, or pedicelled, ovate-oblong brown spikes; sometimes one of the pedicels supports two spikes.—/??
volucre one or two-leaved, small and shorter than the umbel.—

Scales of the spikes ovate, chaffy.—Stamens two.—Stifle thick at the base apex two-cleft, and villous.—Seed abcordate, furrowed longitudinally, and dotted with white on a brownish ground.

S3, S. tenellus. R.

Culms twelve inches high, leafy, sub-cylindric. Umbels thin, scarcely compound. Involucres minute. Style with enlarged base. Sligma three-cleft. Seed obovate, dotted, pearl-coloured.

A native of Coromandel.

Culms many, uncommonly slender, erect, about a foot high, to-ward the base invested with the sheaths of a few slender leaves.—

Umbel very thin, composed of one sessile, oblong spike, and of from six to twelve Or about half the number of pedicells of various lengths.—Involucres minute, the longest scarcely exceeding the sessile spike.—Scales boat-shaped, scariose, with a short point.—

Style swelled at the base to the full size of the germ; this swelled part, however, is not more permanent than the rest of the style. Stigma trifid.—Seed obovate, obscurely three-sided, much dotted, pearl-cotoured.

34. S. (Rhynchospora?) mollis. Wall.

Culms roundish, erect, longer than the narrow, setaceous, villous leaves; umbel composed of about seven unequal, one to three-spiked rays; involucre about five-leaved, shorter than the umbel, villous; spikes oblong scales; ovate, sub-aristate, smooth.

\ native of Nepala, where it is found during the rainy season.

llooi creeping, blown.—*Culms* one or two feet high, jointless, slightly furrowed and hairy, somewhat compressed at the top.—*Leaves i* few towards the base of the culm,; five pr six inches long, channelled above, with long membrane-margined, very hairy sheaths.—

Hayso? the umbel from half an inch, to one and a half inches long* with one or two sessile spikes among them.—Leaves of the involucre state us, hairy, one or two, a3 long as the rays; the rest as well as into luces shorter than the brown, acute, from three to six lines long spikes.—Scales smooth, broad-ovate, with a greenish rib abortive.—State three, short.-r-Vvafium minute, surrounded three has harry bris lies.—Stifle compressed, hairy aud ciliate<

a broad c< date articulate base.

Ois. The habit of this gross is that of a *Fimbrutytis*, from however it differs in having several long, curved bristles attac seems therefore to be a legitimi: to seems therefore to be a legitimi: to seems therefore to be a legitimi: to seems therefore to be a legitimi:

35. S. tridenlatas. R.

Culms straight, from two to five feet high, angular. Limbel compound; involucres from two to Inree; spiketets pointsd; scates lapped, jagged and daggered. Seed roundish, three-angled, and bistiy.

Compare with S. maritimus.

'Iding. Gooraj ia-sliaf;a-tHiiga.

Grows in water courses, ditches, &c. where the water is fresh*

Lums erect, rigid, leafy, jointed, from two to rive feet high, three sided, sm. woth, angles sharp.—Leaves numerous, sheathing, sub-ewell, rigid, seeled, smooth.—Umbel compound, small for the size of the plant.—Involuere irom two to three-leaved, erect, unequal, the l*>ngest being Llirce times the length of the umbe), and the shortest equaling the latter.—Spikes lauceo late or cylindric, hige; some sessiles some peduucled,—Sea less three-toothed, the lateral ones torn, M^and le one long and subulate, keel green, the re'>t rust-coloured*

—Seed three-sided, short, lliick, smooth, with btistlei round the base.

Obh I believe Kb'ni- c, lled it S. maritimus ind icus, but theform

•Di. the seeds and jointed culm, will, I think, render it a very well marked and distinct species.

S6. S. strictus. R.

Calms straight, from twelve to eighteen inches high, culumnar. Umbel compound. Involucres chaffy; scales obtuse, diandrous and rivwi'iish, compressed.

Grows on,a moderately dry, hard, barren, sandy soil.

Root tibrous.—Culms straight, naked, rigid, from twelve to eighteen inches high, round, very smooth.—Leaves radical, short, rigid, but smooth.—Umbel terminal, sometimes decompound, contracted, seldom more than two inches long, and one broad.—Involucre from two to four, small, chaffy, tapering sheaths.—Spikes ovate, small, many-flowered.—Scales with a broad, white, membranaceous border.—Stamens two.—Stigma two-cleft.—Seed much compressed, obcordate, dotted with brown.

37. S. brevifolius. R.

Culms erect, from six to eight inches high, semi-culumnar. Um~ lei decompound; involucels chaffy 5 scales cuspidate, monandrous. Stigma bifid. Seeds obcordate, striated.

Is found generally on low sandy pasture ground.

Root fibrous.—Culms, erect, mostly naked, from six to eight inches hi»h, flat on one side and rounded on the other.—Leaves sheathing, short.—Umbel terminal, decompound.—Involucre from two to three-leaved, shorter than the umbel.—Spikes small, oblong; while young sessile, but when old appearing peduncled, the scales and seeds gradually dropping off and leaving the rachis naked.—Scales keeled and pointed.—Stamen single—Style broad, enlarged at the base; above, the margins are hairy. Stigma two-cleft.—Seeds obcordate, convex on the outside, flat on the inner, white, striated.

Obs. The single stamen and striated seed are the best specific marks. It much resembles Rottboel's figure of S. dichotomies, but

that species is described by Vahl as having three stamina: (see Fimbristylis dichotoma, Enum. ii. p. 287,) consequently they must be different.*

. astivalis. Retz. Obs. iv. 12.

Spikes rounded, subsquarrose; involuere six-leaved longer than the compound umbel; scales monandrous. ^^mmum. it ons.

I received this elegant little grass from Nepala where it grows in low fields during the rainy season.

above. They are three inches high; spikes oblong, obtuse, note auring about three lines in length, with villous scales which end in a long, recurved, scabrous awn as in S. squarrosus. Orarium ticular, obovate, smooth, shining, pearl-coloured, covered almost to its base with numerous loosely adhering, white, flat fascicles of villi, which proceed like rays from the enlarged base of the smooth, bind style, and serve to eep the latter attached to the seed. This is a second instance of a singular structure, observed by the immortal action of the Prodromus flore nove hollandise, in another species of Fimbristylis, (vol. i. p. 225).—N. W.

39. S. diphyllus. Linn. Sp. Pl. ed. Willd. i. 301.

Culms erect, from one to two feet high, semi-culumnar. Umbel decompound; scales obtuse, diandrous. Seeds. DESSER, obcordate,

''=5Imbristylis diphylla. Vahl. Enum. ii...^K

Delights in a rich wet soil.

Root fibrous.—Culms erect, seven-eighths naked, from one to two feet^aga^\SQiBgtmies^\4\da-^fImpg^\\data d.—Leuves chiefly radical, half the length of the culm, rigid.—Umbel terminal, decompound.—Involuce two or four-leaved, the larger about the length of the un-

^{*} I have received specimens of this grass, which undoubtedly is a Fimbristylls, from Vepala; it is intermediate between F. . . . and glauca, Valil, differing from both in being monandrous. - N. W.

bel, partial involucres small.—Spikes numerous, oblong, some' ses_T sile, some peduncled, exclusive of the naked rachis of those that are old, dark brown.—Scales oblong, obtuse, dark brown.—Sta* mem two.—Stigmas two-cleft.—Seed obcordate, much compressed, smooth, brown.

40. S. (Isolepis) densus. Wall.

Culms tufted, setaceous as well as the short leaves; sheaths bearded; umbel decompound with unequal capillary rays; involucres squarrose, awned; *pikelets oval, long-peduncled, except the central one?•

Native of Nepaia; in vigour during the rains.

A most slender, glaucous, capillary, spreading, smooth grass, which forms extensive and dense tufts. *Root* grayish, consisting of innumerable long fibres. *Culms* from six to twelve inches high, three-cornexpdT—Leaves three or four near the base of the grass, and a great many radical ones, three or four times shorter than the culm; sheaths short, flaccid, brown, with a\number of long curved hairs at their back and mouth. Rays about five, unequal, mostly an inch long; some of them bearing a few.spiked umbellet, others supporting only a single spikelet. *Scales* of the involucre chaffy, brown, imbricating, one of them often ending in a capillary leaflet.—*Spikelets* very small, brown, somewhat angular, consisting of oval, keeled, pointed scales,—*Seed* obovate, sharply three-cornered.—*Dnstles* none.

Obs. The root, culm, leaves and sheaths of this elegant little grass are exactly like those of Isolepis barbata, (see above 5) the inflorescence, however, is totally different.—N. W.

41. S. miliaceus. Linn. Sp. PL ed. Willd. i. 305. Rottb: gram. 57. t. 5./. 2. Retz. Obs. 5. 16.

Culms erect, from one to two feet high, scmi-culumnar. Umbel decompound; involucres and involucets shorter than the umbels and utnbellets. Seed obcordate, striated.

Fimbristylis miliacea. Vahl. Enum. ii. 237*

This speciea delights in wet pasture ground.

Root fibrous.—Culms erect, from one to two feet high, seveneighths naked, generally round, though sometimes a little compressed, and chiefly near ihe apex striated, otherwise smooth.— Umbel decompound, very thin.—Involucre three or five-leaved, unequal, but
the largest is seldoiii so long as ihe umbel. Involucels like the involucre, but much smaller.—Spikes sessile, cr peduncled, oval, rustcoloured, many-flowered—Scales broad, aliitle pointed, very con?
cave.—Stamens two or three.—Style enlarged at the base, broad,
with hairy margins. Stigma two-cleft.—Seed obcordate, compressed, pearl-coloured, striated, without bristles.

42. S. complanatus. Vahl. Enum. ii. 279- Retz. Ols. 5. 14.

Culms sub-erect, from one to two feet high, edged. Umbel from compoundtosuper-decompound* Involucre two-leaved, erect; scales lanceolate. Seed obcordate, dotted.

Hind. I^tira'ţya-jiivani.

A native of moist or wet places.

Hoot fibrous.—Culms nearly erect, but waving a little, from one to two feet high, naked, except at the base, compressed, two-edged; edges sharp, and turned different ways, striated, smooth, o'ten a little twisted.—Leaves radical, or embracing the base of the culm, nearly as long as the' culm, linear, waved, often a little twisted, apex abrupt.—Umbel super-decompound, dense.—Involucre two* leaved, opposite, erect, unequal, the longest about the length of the umbel. Involucels chaffy, ending like bristles.—Spikes sessile, or short-pedicelled, oblong, few-flowered.—Scales rust-colouredj acute'.—Seeds obcordate, rugose, white.

43. S. tetragonus. R.

Culms from one to two feet high, four-angled. Umbel decompound and super-decompound. Involucre and involucels bristly, scales roundish, diandrous. Seeds round*

Hind. BMra-jz\(\pma\)vam.

Teling. Murcushalee.

Grows with the other species on moist pasture ground.

Root fibrous.—Culms nearly erect, from one to two feet-high* naked, except at the base, four-sided, smooth.—Leaves radical, and about the base- of the culm, bifarious, tapering, nearly as long as the culm.—Umbel super-decompound, rather thin,, and of an irregular • form.—Involucre and involucels small, bristle-like.—Spikes minute, globular, many-Howered.r—Stamens, from one to two, rarely three.—Stigma two or three-cleft.—SeeAnearly globular, compressed on the inside, scabrous, white.

44. Sc. quinquangularis. VahL Enum. ii. 279.

Culms from one to two feet high, live-angled. Umbel super-de*.. compound; involucre much shorter than..the umbel; scales oval,... monandrous. Seed three-sided, rugose.

A native of similar places with the last species.

Root fibrous.—Culms as in complantus, and tetragonus, and of the same height, but in this species always five-sided. The angles 'harp and the sides concave.—Leaves as in So. complanatus.—Urn-* hel super-decompound, rather thin, and unequal as in Sc. tetragO'' nus.—Involucre' three-leaved,- the largest about the length of the umbel.—Spikes mostly pedicelled, oval, very small, few, from six to «ight-flo/vercd.— Scales oval.—Stamen one.—Stigma three-cleft.—* Seed obloag, three-sided, rugose.

45* Sc. pallescens. R.

Calms from six to ten inches high, columnar. Umbel super-decompound, rather shorter than the involucre, monandrous Scale* obtuse. Seed obcordate, without angles, streaked, and wrinkled.

A native of low pasture ground.

Hoot fibrous.—Culms newly erect; from six to ten inches high, Mostly naked, nearly round and striated.—Leaves sheathing, as long ** the culm, concave; edges slightly serrulate, somewhat woolly.—Umbel terminal, super-decompound, large ia proportion to the rett of the plant.—Involucre two-leaved, nearly erect, opposite margins slightly serulate, longer than the umbel, a few small scales intenaU>.

ed.— Spikes very minute.—Scales oval, concave.—Stamens solitary.
—Style two-cleft.—Seed, obcordate, a little compressed, striated longitudinally, and wrinkled transversely.

46. Sc. anceps. R.

Culm erect, twelve inches high, two-edged. Involucre two-leaved, shorter than the super-decompound, four or five times-divided umbel.

JBeng. Joopi.

A native of Bengal.

47. Sc. comosus. Wall.

Glaucous. Leaves radical, together with those of the mvolucntf* very long, channelled,, ending' in a triangular capillary acumen. Corymb super-decompound, nodding. Spikes geminate or temate, sessile, oblong, crowned with the long straight silvery hairs of the seeds-

A native of Nepala, where it is found among rocks during th« Tains.

Root fibrous_Culms many, tufted, erect, from six to twelve, af more inches long, very slender, scarcely thicker than a crow-qu''1 obscurely jhree-cornered, smooth, naked.—Leaves radical, numerous embracing the base of the culm with their short brownish, membrauaceous sheaths, which burst on one side; generally twice as long as the culm, very narrow, slightly keeled, channelled above, the margins and keel scabrous, ending in a long three-cornered point.—CoryM" terminal unilateral and slightly nodding, composed of about twelve unequal, slender, somewhat flattened, smooth rays from three to si* inches long, surrounded at the base with a short, brown, narrow, two-keeled ochrea; they end in partial, more or less compound umbellets, consisting in general of four or five simple or divided short capillary peduncles.—*Involucrum* consisting of five very long leaves, resembling the radical ones, but somewhat broader at their base, embracing the apex of the culm with their brown, membrane-winged insertions j the largest measuring from twelve to eighteen inches*

-—Involucels consisting of a few chaffy, brown, subulate scales.—
Spikes very numerous, about three lines long, terminal, or lateral, sessile, geminate, sometimes ternate; some single pedicelled ones are crowded in the centre of the general and partial umbels.—Scales lanceolate, keeled, brown, with short subulate points; the lowermost broader and sub-arist ate, barren.—Ovarium linear, oblong, surrounded at the base by about twelve silvery, shining straight hairs, which arc twice as long as the scales. Style trifid, scabrous, shorter than the hairs.

Obs. This beautiful gra9s, which I have received both from Katmandu and Gossein-Than, an uninhabited place at the foot of the Himalaya mountains, from whence Mr. Gardner, the Honourable Company's Resident atfNepala, has sent me the most rare plants, comes near Sc. eriophorus and like that connects the genus Scirpus with Eriophorum. It differs in its shorter and smaller stature, and in having oblong sub-cylindric spikes. Perhaps it i* only a variety of that species.—N. W.

48. Sc- Kysoor. R.

Culms from five to six feet high, triangular, and hispid. Umbel super-decompound. Spikes ovate. Seed oblong, three-sided* crowned, and beset with five villous bristles.

Beng. Kesoor or Kesooree.

Common in Bengal, growing on the borders of lakes, ponds, 8cc. of fresh water, in flower during the latter part of the rains.

Root tuberous, with numerous ferruginous fibres.—Culms straight, from four to six feet high, three-angled, the sides deeply grooved. *nd the angles very sharp, and backwardly hispid.—Leaves several to each culm, and about their length, sheathing at the base, above that part deeply channelled, with the margins and keel while young, somewhat hispid, and the points long and subulate.—Umbel, terminal, super-decompound.—Involucres about three, very unequal, the largest from one to two feet long, and the shortest Js many inches; resembling the leaves in form.—Spikes ovate^

brown.—Scales roundish oval, concave, chaffy, brown, smooth; the rib or nerve ending in a subulate point beyond the rounded apex.

—Stamens three on the exterior side of the germ., one-bearded bris*

> tie between each filament, and three on the back, making in all five.

*—Germ ovate.—Style with swelled, permanent, cordate base.—

Stigma three-cleft.—Seed oblong, three-sided, surrounded by the iive-bearded bristles.

Obs. It approaches Sc. grossus. FdhL Enum. ii. 270; the best •marks to distinguish them by, are the bristles which embrace the germ, and continue with the seed; here they are five in number and villous, there six, and barbed, or armed on the margin, with sharp bristles pointing backward. My Sc. maximus is a much larger species, xind the germ destitute of bristles.

49. Sc. grossus. Vahl. Enum. ii. 270.

-decompound. Seed three-sided, beset with six, backwardly hispid bristles.

Exclude Sc. grossus. Retz. <Obs. v. 15. which I presume is my Sc^* maximus; the germ and seed being there destitute of the bristly in* Volucre. To which of these Sc. grossus, Linn. SnppL ought to be -referred, I cannot say.

This, next to Sc. maximus, is by far the largest species I have ever riiet with. It grows in standing sweet water.

- Culm erect, mostly naked, from six to ten feet high, three-sided; anghs sharp, sides concave.—Leaves radical, and round the base of the culms sheathing, mi\ch keeled, almost as long as the culms; edges slightly scabrous,—Umbel super-decomf«nnd, five or eight inches each way.—Involucre three-leaved, the largest about two fee** the shortest six inches, they taper to a long, a<;ute point; margins pretty smooth.—hrvolucds chaffy.—Spikes oblong, dark-brown, many-flowered.—Stamens three, with two bristles between each pair.—Style three-cleft.—Seed three-sided, embraced by the six enlarged tiriitles, which are armed on the edges with stiff, bent -back, short htes.

50. Sc. marimus. R.

Culms straight, from six to fifteen feet high, triangular. Umbel decompound; spikelets roundish. Seed obcordate, three-sided, with-out bristles.

Sc. grossus. Retz. Obs. v. 15. and probably Linn. Suppl. p. 104, Teling. Booda-tunga.

Is found only in pretty deep, standing, sw : water.

Root fibrous, and stoloniferous.—Culms erect, most rigid, naked, except at the base, from six to fifteen feet high, and from one to two inches in diameter, three-sided; angles very sharp; sides somewhat concave.—Leaves mostly radical, almost as long as the culm, much keeled, (a transverse section appears like the letter V.) smooth, inside only a little striated.—Umbel super-decompound, generally about a foot long.—Incolucie, from three to four-leaved, the largest from three to four feet long, the smallest from three to four inches, smooth.—Involucel chaffy.—Spikes minute, ovate, few-flowered—Scales broad, and short.—Stamens three.—Stigma three-cleft.—Seed three-sided, without bristles, which easily distinguishes it from the last Sc. grossus.

Obs. I have not in any of the foregoing genera of Cyperoider taken notice of the sheaths which embrace the base of the peduncles and pedicels of the umbels, and their sub-divisions; because they are commoSToTEIimd so much alike, that I do not think they can convey any information. Nor have I attended to the form of those peduncles and pedicels; because I have not found it uniform. The culm, inflorescence, involucre, and seed, are I think, the best marks to discriminate the species by, particularly the culm and seed. The number of stamens and divisions of stigma, sometimes vary even in the same plant, much more in different plants of the same species.

Nearly the whole of thodairifcotos ing to the six foregoing Genera (called Calamaria by Linneus, and Cypervidea by Jussieu) are natives of low, barren, moist places, and borders of rice fields on the coast of Coromandel. They appear, blossom, and ripen

their seed during the rains, and the beginning of the cool season* They are in general rejected by cattle.

DIGYNIA.

TEROTIS. Schreb. Gen. N. 1714.

Calyx none. Corol two-valved; valves equal, and awned»

1. P. laiifolia. Linn. Sp. PL ed. Willd. i. 324.

Culms piped, from nine to eighteen inches high. Leaves short; waved, and ciliate. Ráceme cylindrical.

Tsjeria-kurcn-pullu. Rheed. MaL 12. 117./. 62.

Anthoxanthum indicum. Linn. Sp. PL M. Willd. i. 157.

Saccharum spicatum. Linn. Sp. PL 79-

Is a native of high, dry sandy barren ground, over the coast of Coromandel-

Root fibrous.—Culms at the base resting on the ground, and there branchy, above erect, leafy, jointed, from nine to eighteen inches high, smooth.—Leaves sheathing, short, broad at the base, margins waved and hispid; sheaths about half the length of the Joints.—Racemes (not spikes) terminal, erect, cylindrical, lead-coloured.—Flozcers numerous, diverging.—Calyx, two-valved, both awned, and are totally destitute of hairs round their base, or any where else:r~Corol two-valved, very minute. Seed.. ••..

Obs. Cattle are not fond of this grass.

CENCHRUS. Schreb. Gen. N. 1574.

Involucre echinate, and four-flowered. *Calyx* from two *to three** valved, one or two-flowered.

1 • C. biflovus. R.

Spikes simple, cylindric. Involucres t\yo-ilowercd; segments sue bulatef, hooked, ami j^ry within.

A native of the interior, elevated, dry parts of the Coromandelcoast *Culms* straight, from six to twenty-four inches high, smooth— *Leaves* long, slender, somewhat scabrous; mouths of their sheaths a little hairy.—*Spikes* terminal, solitary, simple, cylindric, from three to four inches long. *Rachis* flexuosc, three-sided.—*Flowers* numerous, solitary, alternate.—*Involucre* two, rarely one-flowered, multifid, divisions longer than the flowers, subulate, grooved on the back, inside hairy, apex slightly hooked. Both flowers hermaphrodite.—+*Calyx* three-valved, one-flowered, the exterior one smaller, all are thin, smooth, nerved.—*Carol* two-valved, valves hard, acute, but not awned, in length nearly equal, and scarcely longer than the calyx.— *Stamina* three.—*Styles* two, plumose.

SACCHAKUM. Schreb. Gen. N. 104.

Calyx one-flowered, two-valved, girt at the base with wool; coral uncertain.

1. S. cylindricum. Linn. Sp. PI. ed. Willd. i. 323.

Cubris from one to two feet high, shorter than the leaves. PanU cle linear, white with the wool of the calyx. Coroi and calyx two* valved and diandrous.

Lagurus cylindrica. Sp. PL 120.

S. Thunbergi. Linn. Sp. PL ed. Willd. i. 323. Retz. Obs. v. p. 17*. Gramen caricosum. Humph, amb. 6, 17. t. 7-/. 2.

Beng. Ooloo.

Teling. Baroomhiss.

Is a native of moist, stiff, pasture ground, and particularly common over Bengal, where the fields are white with it when in flow-* er, after the first rains in April and May.

-Roof creeping at some depth under the surface.—*Culms* erect, simple, from one to two feet high, leafy, jointed, joints bearded.—*Leaves*, those of the root or lower part of the culm are much longer than the culm, tapering equally towards each end, smooth, those of

the culm are little else than sheaths.—*Panicles* terminal, cylindric, from three to four inches long, composed of small, erect branchlets, of a bright cotton-like whiteness, from the quantity of wool that surrounds the insertion of the flowers_*Flowers* pedicelled, generally simple.—Ca/j/xtwo-valvedjwitl¹! here and there along white hair.—*Corol*, two-valved, minute.—*Stamens* two.

. *Obs.* Cattle are not fond of it, particularly when old. It is used ip the marriage ceremonies of the Telingas. In Bengal it is much used for thatch.

S. S. spontaneum. Linn. Sp PL ed. Willd. i. 321.

Culms from five to fifteen feet high. Leaves involute when dry* Panicle linear, spreading, verticilled; ramification simple, calyx ciliate. Corol one-valved.

Sans. Kasha.

Hind. Kagara.

Teling. Relloo-gaddy.

Grows on the banks of rivers, in hedges, and on moist, uncultiva^ted land; in a good soil, it is frequently from tea to fifteen feet high, in a poorer soil, from five to ten.

Root perennial, creeping very deep in the ground.—Culms annual, erect, leafy, round, lower parts perennial, and as thick as the finger, annual shoots about as thick as a common quill, solid, height various as above observed—Leaves sheathing, remarkably long and narrow, but firm; margins hispid; a transverse section appears crescent; sheaths with their mouths woolly.—Panicles terminal, spreading, erect, oblong, from one to two feet long, composed of verticiled, filiform, simple, (except the lower verticil or two,) spiked racemes; spiked, because half the flowers arc sessile, and half pediceled. The immense quantity of long, bright, silver-coloured wool, which surrounds the base of the flowers gives this species a most conspicuous, gaudy appearance.—Flowers paired, one-pedicelled, the other sessile.—Calyx two-leaved; margins ciliate, acute^sur-

rounded with many soft, very long j silver-coloured hairs.—Corol one-valved, ciliate, acute, membranaceous.—Stigma feathery, purple.

Obs. 1 have not seen the ripe seed. It is so very coarse that cattle do not eat ir, except while *very* young. It makes good mats for various purposes, and is used to ilialch houses.

3. S'fuscum. R.

Erect, from five to eight feet high. Leaves sub-lanceolate, smooth. *Panicle* spreading, verticilled; *ramifications* compound. *Flowers* paired, both pedicelled, wool of the calyx short and scanty., *Carols* three-valved.

Beng. Khi/ree or Pata-Khwree.

A native of damp places over Bengal. Flowering-time the rainy season.

Culms erect, from five to eight feet high, as thick as the little finger, hairy near the top.—Leaves sheathing, linear-lanceolate, smooth in every part, except the margins of the sheaths, which are fringed with much soft hair; length' about three or four feet, breadth about, or under two inches*—Panicles from one to two feet long, erect, linear, verticilled, except toward the apex; ramifications compound; ramule nodding.—Flowers paired, one short-pedicelled, the other longer, both hermaphrodite; wool of the pedicels, &c. short and in small quantity.—Calyx with ciliate margins, otherwise smooth and shining.—Corol three-valved, of which two are equal and nearly as long as the calyx, the third minute, all much ciliated.—Seed long, obovate, brown, smooth.

Obs. The natives make their pens of the culms of this and the following species, and use it for screens and light fences.

4. S. semidecumbens*

Lower portion, of the culms procumbent, and perennial. *Leaves* narrow, channelled; *Panicle* oblong, lax, with compound verticil*. kd ramifications, *corol* one-valved.

Beng. Khuree.

A native of Bengal, where it delights in low wet places, blossoms about the close of the rains, and the beginning of the cold season.

Root perennial—Culms of grpat length, i. e, from eight to sixteen or more feet long, one half or more, generally resting on the ground, and striking roots at ihe joints; this portion is often as thick as the little finger, and perennial; the extreme portion erect, straight, and taper to the thickness of a crow-quill at the panicle; tilled with pith in every part.—Leaves from one to six feet long, very slender, pointed, channelled, bottom of the channel white, margins most acutely hispid, mouths of the sheaths and for some way above them bearded with much soft white hair.—'Panicles ovate, or oval, erect, large*
Ramifications coloured, verticilled, compound.—Flowers app'oxi* mate, paired; one sessile, the other pedicelled, both girt with much, pure white, soft hair.—Calyx two-\alved; inner valve cjliate.—
Corol one-valved; ciliate.

5. S. OJichiarum. Linn. Sp. PI ed. Willd. i. 321.

Culms from six to twelve feet high. Leaves flat. Panicle ovate, spreading; branches alternate, decompound. Corol one-valved.

Sans. "J/STJ, Ik shoo, TTC;, R?;sala; the light-coloured varieties; T(5h) Poondra, and qfiTn^qp/ Kangwraka, the red.

Beng. Ik, 0«>k, Ak. Kooshiar, also Poori and Kidlooa the two pale varieties, and Kajooh* the red.

Teling. Cherukoo-bodi, or Cherukoo-duboo.

Whe're wild, I do not know.—Pawicfes terminal, spreading, erect, oblong, from one to three feet long, of a grey-colour, from the large quantity of long soft hair that surrounds the flower. *Ramifications* alternate, tery ramous, expanding.—*Rachis* striated.—*Flowers* hermaphrodite, in pairs; one sessile the other pedicelled.—*Calyx* two-leaved, smooth.—*Corol* one-valved, smooth, membranaceous, rose-coloured.—*Stamens* and *Pistil as* in the genus. I have not seen the seed.

Obs. It is much cultivated in the Rajamundri Circar, where they only make a cuarse sort of brown raw sugar, which is sold on the spot for about three half-pence per Pound. The cane is cultivated

on their best lands, which can be easily watered; but, unless the fanner pleases, not easily flooded during violent rains.

The laud is first well ploughed during the month of April and be-The field is then flooded from the river, if there ginning of May. is not sufficient rain; the upper part of the cane is then cut into two lengths of one or two joints each, (the lower part of the same canes arc employed to make sugar from) the&e are placed .over the wet field, at about fifteen or eighteen inches asunder, in rows, the* rows about four feet from one another, and trode under the soft wet surface with the foot; in six days after the planting, the field is again flooded, if there has not been rain. In about eight days more the shoots appear; the land is soon after slightly hoed, and weeded. A month after the planting some rotteu chaff, or other such manure, is scattered about the young plants. Every teu or tifteea days, if there be not sufficient rain, the field is watered; two mouths from the planting, some stronger manure is strewed about the plants: and every fifteen or twenty days the field is slightly hoed, suid the weeds rooted out.'

During the wet season, drains must be made, to carry off the superabundant water. By August or September, the cane will be from three to five feet high; in each shoot, the produce of every cutting, which may coutain from three to six canes, a straight bamboo is stuck into the earth, in the centre; to this the canes are tied by In this country the leaves are never script from the their leaves. cane, but as they wither are tied round them. This must impede the free circulation of air, which may be conceived hurtful. January, viz. between nine and ten months froin the time they were planted, the cane, when stript of its leaves, and the useless top cut off, will be about as thick as a good stout walking cane, and from four to six feet long; they then begin to cut the cane, expiess the juice, and boil the sugar, which 13 with the natives here, a very simple process; a small mill turned by cattle squeezes the cane, and one boiler boils it.

In Bengal there are three varieties cultivated, viz, The above

described or common yellow cane, called by the Bengalees *Pooru* Secondly the purple cane called by them 'Kajooli, which is said to yield juice one-eighth part richer than the yellow cane; but the sugar thereof is always of a dark-colour. The third and last is a very large, light-coloured cane, called KuUooa, which grows in a low swampy soil, where neither of the other two will succeed; its juice is still weaker than that of the yellow cane; but it has these advantages, that it grows to a much larger size, and where neither of the other two will thrive. It is therefore much cultivated, because the other sorts planted on higher situations are apt to suffjer from drought.

6. S. sinensis. R.

Culms from six to ten feet high. Leaves flat, with margins hisp \mathbf{w}^* panicles ovate, with simple and compound verticilled branches. W^0 rol of two valves on the same side.

Stem erect, jointed, whole height from ten to fifteen feet; the greatest part covered with the sheaths of the leaves; joints from four to eight inches long, and from two to three inches in circumference* colour pale brownish yellow.—Leaves sub-bifarious, tapering from *e base, to a long, fine, point; plain, smooth on both sides; margin* armed with numerous, small, very acute spines pointing forwaid* length from two to three feet, and about an inchandahalf broad at the base.—Sheaths smooth, with a small ligula, or stipulary "lll2" round the inside of the mouth*— Panicle ovate, erect; branches, sim* pie and compound, sub-verticilled, reclinate, long and slender. In officinarum the branches of the panicle are scattered over the common rachis and are decompound, and super-decompound; on t''. 1 rest the most obvious specific deference, independent of the additional small inner scale, or valve of the corol.—Calvx, and its s^{ur}* rounding wool, as in the genus.—Corol of the two valves on w same (anterior) side, the inner one very small.—Nectary of two, last \$5> broad, cuneate, crenulate, fleshy scales, which occupy the two P°s* tenor sides of the germ, opposite to the two valves of the corol.

Obs.*This new species, for such it appears to me, was introduced from Cliimtiuto the Botanic Garden, at the close of the year 1796, in hope of finding it in some respects better than the common cane cultivated over India. It promises considerable advantage; particulail, fi\>m its being so solid, and hard, as to 1 esi>t the forceps of the white ants, and the teeth of the jackall, two great enemies to our East Indian sugur plantations. At the same time it bears drought much better than the sorts in general cultivation. It produceap profitable crop even to the third year; while the common cane of India must be renewed every year. It is also said to jield juice of a licher quality.

This seems to be the sort employed over China for making their sugars, as appears from the following extract of a letter from Mr. A. Duncan, surgeon to the factory at Canton, to Richard Hall, Esq. President, &c. of the Select Committee, dated Canton 26th October, 1796, which accompanied plants of this cane from China; explaining the mode of cultivation and manufacturing the sugar in the province of Canton.

"Sugar canes- A first and second sort are cultivated in the pro"vince of Canton; the former being small, compact and highly Sac"charirie, is manufactured into sugar, whereas the latter, being of a
"larger size, and looser texture, is generally cut into joints, and eat
"by the natives, either raw, or gently heated.

"The culture of sugar canes commences about the, middle of "March or beginning of April, in proportion to the temperature of "the weather, when a good, light, sandy soil is thrown up into beds of about four feet diameter leaving intermediate spaces of one "and a half, which serve as drains and passes*for the husbandmen. A composition of human manure aifd water is thrown overthe beds; "after which the tops of sugar canes, fifteen inches Jong, (the Chinese are here economical) are planted in a slanting position, and coccasionally watered at sun set, till the young shoots rise a cubit high, when the husk and refuse of the ground nut, or of some oleaging, when the husk and refuse of the ground nut, or of some oleaging, when the husk and refuse of the ground nut, or of some oleaging, when the husk and refuse of the ground nut, or of some oleaging, when the husk and refuse of the ground nut, or of some oleaging the number of the section of the ground nut, or of some oleaging the number o

« powder and put round the root of the plants, in small quantities and " afterwards covered over with earth. The canes are now left to the " fertility of the soil till they arrive at maturity, except when it proves " such a dry season, that watering becomes requisite, and are cut « down about the 1st of November. The first sort planted in the " foregoing manner, generally yields three crops, while the second " requires fresh planting.

"The sugar canes are now removed from the ground to the mill The juice", being extracted, is carefully strained, " mixecf with a small quantity of lime water, then poured into large "warm iron pans, placed on a plat-form of brick work, with tire "places below; it is now boiled for a length of time, and being "removed from the fire, and allowed to cool, it is a second time "strained, and being again returned to the pans, the boiling is re-" peated for once, or twice, till it acquires a saccharine consistence* "The sugar, still very moist, is now put into cylindrical jars, which "have a small hole in each of their bottoms, for the purpose of <c draining; and their tops Being covered over with from hair" an "inch to an inch of clayey moist earth, these are placed on stands, " and remain tor three or four days; when the old eariheu covering "is removed, and a fresh one put on. They continue in ihat situ-"ation for three or four days more, the covering is then taken off, ^u and the sugar being sufficiently clarified is removed from the jars, "and spread out on flat baskets, exposed to the sun till dry, when "it is fit for use.

"The mill for expressing the juice; of which I have sent a very "exactminiature model, appears so far as I recollect, preferable to "those used in India. The machine is wrought by a buffalo "yoked to the small end of the crooked beam, while its thick end is "fastened to the long axle of one of the cylinders. The canes hav"ing undergone one expression, and being consequently in a split state,
"are not thrust a second time through till all the irons are greased*
"The cylinders are not always of the same dimensions; those I ex"amined were two cubits high, and one and two-thirds in diameter.

w these are the common size; I am however told they are sometimes u much larger."

To point out the benefit that may accrue to the cultivators of this sugar cane, I need only add the following copy of a letter from Mr. Richard Carden, superintendant of the Honourable Compaq's Uum and Sugar works at Mirzapore Culna in Bengal, to me, dated 13th August, 1801, soon after the introduction of the cane.

" VVuli r. speit to the produce of the common Bengal sugar can "I have never been able to collect an account that can be depended "upon; the natives generally manufacture the juice into Jaggery in "my neighbourhood, which yields them nearly 14 cutcha inauuds, ^u pi 60 sicca weight, per bigha on an average; and a profit of about " 11 or 12 rupees per bigha. N either the white ants nor jack alls, "have committed any depredations on the China canes that 1 have "planted, although the latter have often been seen among them, " which cei tainly gives these canes a decided preference to the Ben-"gal sugar canes. I do not think the China ones degenerate in the "least, nor do they improve; they appear to me to remain nearly " in the same state. If planted at the same time the natives put " their canes into the ground, they will not make such good r.etunw " as the Bengal sort, but planted in the West India mode, in the "month of September or October, and suffered to remain on the " ground till the December or January twelve months, they will then " yield double the returns of what the Bengal canes do, which is " owing in part to the length of time they are in the ground, and " principally to the ants and jackalls not destroying them, whereas " if the Bengal cane was to remain so long on the ground, the na-"tives would, have great difficulty to prevent the greatest part of <c them from being destroyed, and the young shoots would suffer very " much from the hot winds, and ants, which I witnessed the second "year I came to Mirzapore; but the shoots from the China canes "I cut last January, stood the last hot season uncommonly well, "and will next January, I have reason to believe, from the present "appearance, make half, or nearly three-fourths the quantity of

"sugar they did last January; and that with the trifling expence of clearing the giound twice; cutting, and manufacturing the juice. «I should be extremely happy to have sent you a more particular account, but that is not in my power, as the native statement is not to be depended upon. I did purchase twelve, cottas of the best Bengal canes last January, merely as an experiment, which yielded just half the quantity of sugar my China canes did."

7. S. procerum. R.

Perennial, from tea to twenty feet high, erect. Leaves ensiform, with a white rib, and hispid margins. Panicle diffuse, with verticilled, compound and decompound branches. Corol of the pedicels flower two, and of the sessile three-valved, with the inner one ietusc.

Jieng. Teng.

A native of Bengal, and by far the most beautiful of the ge»^{u5} I have yet met with. It comes nearest in appearance to S. Officin&* rum,,but is a taller and much more elegant plant.

Culms perennial, straight, simple till the second or third year, the'1 branchy, about as thick as a slender walking cane; joints from six to twelve inches long, and filled with insipid pith; height of the whole plant, when in flower from ten to twenty feet.—Learn'from threfi to five feet long, tapering to a long and very fine point, the greats breadth is at one or two. feet above the sheath, and is there from one to two inches; nerve white, margins hispid.—Sheaths bearded round tltf niouth, and at their insertion on the outside.—Panicles large, from one to two feet long, ovate, erect, composed of numerous expanding, su'''' verticilled, compound, woolly branches, when in blossom much expanded, afterwards they become erect, and pressed in on the comm⁰¹¹ rachis, forming a dense cylindrical panicle, and I have repeatedly observed this variation iu the form of the panicle at different periods, to run through the whole genus.—!Flowers in pairs, one sessile, the other pedicelled.—Ca/yr purple, woolly.—Corol of the sessile floW er three, of the pedicelled two-valved, all are exceedingly delicate, and the third valve of the sessile Hower is retuse.

Obs. The seeds or culms are long, strong and straight, and employed by the natives for skreeus, and various other economical purposes.

8. S. sara. R. ·

Erect, from, eight to twelve feet high. *Leaves* flat with pricUv margins. *Panicle* denseywub-verticilled; *ramifications* decompound* *Flowers* paired, one of the pair sessile. *Corol* three-valved.

Sans, zi%*i, Goondra, TTŞr^^f:, Tcjirauka, ^jr^:, Shwra. JBiwsf. Shwr.

Sara. Asiat. Res. iv. 2-17.

FuuiiJ in the viciir iy of Calcutta but rather rare, whereas S. spontaneum (which Sir William Jones mistook for Sara) U i's y common every where. It is readily distinguished by being a stronger' reed, the leaves much larger, with very hispid margins, the ramifications of the panicle decompound, and a corol of three-valves. Culms perennial, erect, from six to sixteen feet high, often near the base as thick as the little finger, smooth, remarkably strong.— Leaves, the lower ones from four to eight feet long, and narrow; the superior ones shorter, broader, tapering from the base to a most fine point, strong, and rigid; concave above, margins hispid.—Sheaths from twelve to eighteen inches long, with a tuft of hair above their mouths rn the inside.—Panicle dense, when in flower open, when in seed condensed and of a lanceolate shape, from one to three feet long; 'branches decompound, or more; the inferior alternate., the superior sub-verticilled with generally three sharp angles armed with small stiff bristles besides long white silky hairs.—Flowers paired, one sessile, the other pedicelled.—Cah/x hvo-valved, clothed with long, soft, white, silky hairs.—Corol three-valved, fringed.

9.S. exaltation* R.

Culms from ten to sixteen feet high. Leaves flat with prickly margins. Panicles linear, crowded. Calyces woojly. Corol, two and three-valved.

Kerpa. *Hort. mal.* 12. 85. t. 46. seems to be this, rather than spontafieum.

Te/ing. Konda-Kanamoo.

A very high beautiful species, a native of vallies; compare with S. Arundinaceuni.

Root creeping.—Culms many, erect, from ten to sixteen feet high, toward* the base perennial, ligneous, inwardly spongy, (not piped,) I smooih, round, without any groove, or hollow any where, about an inch in circumference at the thickest part which is near the middle. —Leaves alternate, sheathing, rfmote, remarkably long and narrow. but firm, tapering from the middle towards each end; margins armed with very sharp spines, mouth of the sheaths woolly.—Panicle* terminal, crowded, when the flowers are on the decay linear, oblonifc erect, eighteen inches long, three in diameter, and composed of beautiful cream-coloured, downy, short, sub-erect, ramous, sub-verticelleo spiked racemes.—Rachis round, striated.—Flowers in pairs, one sessile, the other pedicelled, both hermaphrodite.— Calyx one-flowered, two-valved, both valves pointed, and covered with much long, creamcoloured soft hair as well as their pedicels, and particularly round their insertion.—Corol of the sessile flower three-valved, of the pedicelled flower two-valved, membranaceous, white. I could not observe auy nectary.—Stamens, &c. as in the genus.—Sired clavate, smooth, clear whitish yellow.

Obs» Cattle do not eat it,

10. S. Munja. R.

Straight, from eight to ten feet high, every part smooth, except the inside of the base of the hispid, margined, long, linear, white-nerved, channelled leaves. *Panicles* large, oblong, spreading; *branch** es thereof verticelled, and super-decompound. *Flowers* all hermaphrodite. *Corols* two-valved.

Hind. Munja. See Asiat* Res. iv. \$48.

A native of the countries about Benares where the natives make ropes of it. In the Botanic Garden it blossoms in November. *

never saw it, nor, so far as I can find, is it known so low down as Bengal, otherwise I might have thought it Kb'nig's S. bengalense.

U.S. canaliculatum. 11.

Perennial, erect, (from eight to twelve feet high.) Leaves subulate, deeply channelled, very long. Panicles linear-oblong, ramifications simple, and verticelled; calycine valves with thick callous base and fringed margins, corol one-valved.

A most beautiful stately species, a native of Bengal in most thick' est, 8cc. where the soil is rich, flowering in August and September.

Culms about as thick as a common ratari* incrusted with a white substance under the sheaths; filled with pith.—Leaves from five to seven feet long, semi-cyliudric, no where thicker than a pack thread, the whole being only a perfect channel; their sheaths simply bearded at the mouth.—Panicle sub-cylindric, about two feet long, waving with its immense quantity of silver-coloured long, soft hair, to every breeze.—Flowers paired, one sessile, the other pedicelled. Cfl-lycine valves are remarkable on account of their large thick smooth callous base.

ANTHISTIRIA. Schreb. Gen. N. 1567.

Polygamous. *Involucre* one-valved, seven-flowered, hermaphrodite, solitary, with a two-valved, one-ilowered calyx, and corol of one valve and an awn. the Accessary jiorets male or neuter, six; four sessile, resembling a calyx, and two pedicelled, their structure various.

1* A. ciliala. Linn. S/>. PL ed. Willd. iv. 899-

Erect. Leaves taper from the ciliaie base. Accessary Jiorets two °r three-valved, neuter, exterior valve of the sessile flower papillose, ciliate near the apex.

A. ciliata. Gaert. Carp. ii. p. 465. t. 75.

An erect annual species, a native of various parts of India, ap-'pears, about the close of the rains, in October and November, and continues during the cool season.

<

Culms erect, about two feet high, in our rich soil of Bengal, more slender than a crow quill, smooth, and often coloured.—Leaves few, ensifbrm; broadest at the hue and there more ciliate, particularly the small floral leaves.—Sheaths much shorter than the joints, smooth, and carinated on the back.—Ligula short and chaffy.—Panicle* sometimes drooping, though iu general erect aticl composed of a few, rather remote, axillary branches.—Involucres longer than the flowers, smooth, cuspidate.

valvedj valves hard, obtuse, and somewhat hairy, by age changing from straw colour to darit brown.— C^rvl one small, pellucid va.ve, and a very strong, long, thick, broxui, hairy awn on the opposite side—Stigma three.—Styles two, with ochraceous plumose stignias* which become brawn by age.— Nectariul, scales large,\vill vill cremate, truncate apices.

ACCESSARY FLORETS six, all neuter. —Catyces tuo-* aliped, those of the sessile four, papillose, ciliate near the apex; those of the upp^{er} pedicelled two, smaller and smooth.— *Carols* none, or of one, s>ita'j byalhie. valve.—*Stamina* none.

2. A.polystachya. R.

Culms numerous, sub-erect. Leaves taper from their sub-ciliate base. Accessary fiorets three-valved, male, exterior valves oft' sessile four, papillose, ciliate near the apex.

A native of Bengal, and with the other species which are natives of the same country, appears at the close of the rains, in October and November.

Culms many, annual, erect, or ascending, smooth, from one to two feet high.—Leaves about the length of the joints of the culflV taper from the base, and there sometimes sub-ciliate.— Panicles slender, erect, or nearly so, compose'd of a few alternate, axillary branches.—Involucres longer than the flowers, smooth, sub-aristatc

HERMAPHRODITE FLOWERS bearjkd at the base.—Calyxtw valved, both hard, a little hairy awn on the opposite side—Corolone" valved with a long, strong, hairy awn on the opposite side.

ACCESSARY FLORETS six, all male <u>Calyces</u> two-valved, 'the ex tenor one of the four pessile iLrets papillose, ciliate dear the apex. —Corol of one tianspaieut valve.—Stamens threes-Pistil none.

3. A. scemdens. R.

\''fivunu , lurtioa^, scandent, geniculate, emitting roots from the joints. Floral itaves with the base ciliate. Fankles copious, shaggy. Involucres sinooih. Acces*aiy florets two-vahed, neuter; e&teriv vaive of the sessile four, papillose, ciliate near the apes!.

A native ot' Bengali iiovvers during the cool season.

hoot [j^vtuA/dL^ Culms] scandent, running to an extent of many feet, smooth, rumous, jointed, and coloured, from the joints numerous roots issue, aud enter the ground it' not too far removed from it.—Leaves eusifotni, thefioiak cues much shorter, and ciliate at the buse.—Panicle terminal, composed of erect ramifications of numerous, rather remote fascicles of axillary, short pedicelled umbellets, each of which is furnished, with a boat-s!. aped spatlie or bracte, and consists of four, sessile, neuter, two-va!ved florets in ateriicil; above these are two more, but much sma'ler, on short'pedicels, with one sessile, awned, hermaphrodite one in the centre, on a short scaly receptacle—Calyx two-valved, the exterior valves of the lower four neuter florets bearded, of the hermaphrodite ones boat-shaped, and very obtuse.—Corol of the hermaphrodite flow* er two-valved, with a long, ferruginous, straight arista.

OAs. It differs from A. ciliata in being an extensively scandent, perennial plant.

4[^] A. heteroclita. R.

Culms leaning, geniculate. Leaves ciliate. Involucres five-flowered, two awned hermaphrodite ones, and three ciliate male ones.

This is one of the smallest of the genus, a native of newly made pasture land in the vicinity of Calcutta, where it appears about the close of the rains, and during the cool season. Culm* annual, erect, or leaning, geniculate, smooth, and coloured; from twelve to twenty-four inches high.—Leave's ensiform, soft and hairy. Sheaths much shorter than the joints.—Panicles copious, hirsute, composed of numerous small uinbells and these in general of five or more umbellets, the former with a common cymbiform, bristly involucre, and the latter with a small, proper characteristic involucre, equally bristly; all the bristles have a rolind bulbous base.—Umbellets five-flowered; the two hermaphrodite ones awned, and the three male ones pedicelled, and awnless; one of the former is sessile below, with a pedicelled male one by it; the other elevated on a common peduncle, embraced by the other two male ones on their proper pedicels, in all of them the calyx is two-valved, no corol, the arista in the hermaphrodite flowers excepted.

Obs. This species may be immediately distinguished by its umbellets being composed of two hermaphrodite awned florets, and three male ones. In all the rest, which 1 'have met with there is one awned hermaphrodite, and six male, or neuter florets in the unibellet.

ŏ.^A.prostrata. Linn* Sp. PL ed. Willd. iv. 901.

Creeping. Leaves scarcely longer than their sheaths. Involucres smooth. Accessary Jlorets male, with a two-valved hairy calyx and one-valved awnless corol.

A common grass, delighting in rich pasture ground.

Culms creeping, or leaning on other plants, filiform, ramous, winding from joint to joint, round, smooth, from one to three feet long.--*
.Leaves below, and on leafy shoots bifarious, small, particularly the floral ones, smooth.—Sheaths short, compressed.—Panicles thin, leafy*
—Flowers numerous, collected in little pedicelled, involucred fascicles from the axils of the exterior leaves. Fascicles, or umbellets their peduncles are jointed near the apex, and from thence upwards embraced by a long, boat-shaped sheath or involucre. FlBwers, of the

umbellet seven; one hermaphrodite or female, and six male; four of the male florets on their proper short pedicels surround a common pedicel which elevates the hermaphrodite or female one, and the other two male florets; these last two have also their proper pedicels: all their insertions are surrounded with hair.

HERMAPHRODITE TWO, OR FEMALE THREE FLOWERS. Calyx. two-valved, pointed.—Corol one-valved, a pretty long twisted awn occupying the place of the other.—Stamens three, or none.—Male Ilowers, four at the base, and two embracing laterally the hermaphrodite, or female flowers, each of these two has its proper pedicel.—Calyx two-valved, lanceolate, hairy.—Corol one-valved.—Stamens three.

Ofts. It often happens that there are two hermaphrodite, and seven male flowers in the fascicle; in that case one of the usual lateral pedicels supports the additional two flowers.

6. A. cymbaria. R.

Erect, ramous. Leaves many times longer than their sheaths.—
Involucres smooth*—Accessary florets male, with a two-valved, ciliate calyx, and a one-valved, awnless corol.

Andropogon cymbarius. *Linn. mant.* SOS. *Sp. PL ed. Willd.* iv. 90\$. *Teling.* Pedda Ghella.

This is a tyge species. I have generally found it amongst bush* es on mountains.

Culms many, erect, from three to six feet high, very ramous, smooth, solid, ligneous, joints smooth.—Leaves large in proportion to the size of the plant.—Panicles linear, leafy, erect, composed of innumerable bracted, fascicles like those of the last described.—
Bractes boat-shaped, ending in a very long, subulate point, sometimes coloured, and in luxuriant plants fringed with many long rigid hairs.—Flowers seven in each fascicle or umbellet as in the last, and disposed exactly in the same manner, only here the four male flowers that surround the base, of the common pedicel are sessile.

HERMAPHRODITE FLOWERS. Calyx two-vaived—/ alcelels nearly equal? obtuse, smooth, of a firm, texture.—Coiol one-valved* the place of the second is occupied by a long twisted awn.—Stamens three, &c. as in the genus.

MALE FLOWERS. Calyx two-valved, the exterior va've fringed with many strong hairs about the apex.—Corol one-valved.—Stamens three.

7. A. arundutacea. JR.

Perennial, straight, from six to twelve feet higii; *leaies* from four to eight feet long, *accessary florets* male, with both *calyces* and *coroh* two-valved; the exterior valvelet of the fuuner shaggy.

A native of Bengal. Flowering time the beginning of the *coql* season.

Root perennial.—Culms straight; jointed, glaucous, between the joints much contracted, round and very smooth, the lower joints of the large plant as thick as the fore finger; every part tilled with white spongy pith; height of the whole plant when in liowei*, from six to sixteen feet. In the Botanic Garden where the soil is rich, some plants are full sixteen feet high.— Leaves from six to eight feet long* slender, deeply channelled toward the base, reciirvate, margins h*8* The radical ones are bifarious, the floral ones alternate; sheaths smooth, compressed, much shorter than the joints of the culm.—Pa?iicle, the whole upper half of each culm may be so called, and is composed of numerous, axillary, very ramous branches* bending elegantly to one side, particularly with a breeze of wind. —Bracles one to each umbellet of flowers, boat-shaped.—UniW" lets numerous, long, slender, pedicelled, drooping, each ohe is coin* posed of four, sessile, awnless accessary male flowers surrounding; and inserted on a short clavate pedicel, which supports an hermaphrodite awned flower, and two pedicelled awnless ones.

MALE FLOWERS. Calyx, glume, two-valved, the exterior valve clothed with much diverging fulvous hair, making it quite shaggy-"^* Corol, glume, twb-yalved, linear, membranaceous.—Nectary of cuneate, truncated scales.—Stamens three —Pistil none.

HERMAPHRODITE FLOWERS. Calyxtwo-valved, villous.—Co-?ol one-valved, a long arista occupies the piace of the usual second valve.—Nectary and stamen as in the mule.—Germ oblong; styles two, villous.

ANDROPOGON. Schreb. Gen. N. 1566.

Polygamous. Flowers in pairs, hermaphrodite, sessile.—Caly? two-valved, one-flowered.- Coroi for the most part two-valved, and generally awned. Male, or neuter pedicelled—Calyx asm the hermaphrodite.—Corol for the most part two-valved, generally awnless.

Sect .1 s{. With terminal spikes.

l.A.serratus. Retz.Obs. v. 21. Linn. Sp. PL ed.Witld.iv.Q03.. Spikes solitary, or paired, imbricated with sessile, hermaphrodite, awned flowers on the outside, and two rows of awnless pedicelled dale ones on the inside*.

Sans. 3*5ft, Venee, JJ^, Khwra, j^, Gwree, wmft, l/guree, trait> Klmragiiree, ixxiTO^, Gi/ragwree, gTOi^!, Devtttai^ Jeemoota.

Ben*. Detafa, or Detfc.

A native of pasture ground. Flowers during the cold season.

Culms at and near the base creeping, branchy, with only about a foot of their flower-bearing extremities erect, and as thick as a sparrow's quill, round, smooth, joints slightly villous.—Leaves small, inside a little hairy, mouth of the sheaths hairy.—Spike terminal, generally solitary, though sometimes there are two or even three; when single, long-peduucled, when two, each has a very short, erect pedicel; the spike or spikes are about an inch or an inch and a half long. -+~Flmer\$ in pairs, numerous, imbricated, on one side are two rows of sessile, hermaphrodite ones, and in the other two rows of <pedi« celled ones; male rachis, waved, jointed and hairy- Hermaphrodite flowers sessile.--Cafyce* two-valved, the exterior one broad, coin-

pressed, striated, a little hairy, rounded at the apex; *margins* fringed with hairs; *involucre* smooth, glossy, keeled, pointed.—*Qorol* of the hermaphrodite flower one-valved; the arista which is pretty long and twisted, occupies the place of a second; that of the male two-valved, the inner one slender and bifid.

Obs. Cattle will eat it, but not greedily.

*

2. A. contortus. Linn. Sp. PL ed. Willd. iv. 904.

Monoicous. *Spikes* solitary: *inferior flowers* male or neuter and awnless; *superior flowers* one female and awned, the other male and awnless.

Teling; Yeddi.

Grows in tufts on rich pasture ground.

Culms near the base spreading a little, there compressed and famous, the rest from one to two feet high, erect, round, and smooth; joints smooth.—Leaves below bifarious, middle-sized, upper side scattered with a few hairs, margins and mouths of the sheaths hairy*—Spikes always single, terminal, bowing, cylindric; rachis jointed; waved, 'round, below where it is occupied by the male and neuter flowers smooth;' above where the female flowers are, it is covered with much, short, brown hair.—Flowers numerous, imbricated in pjurs; on the lower half of the spike they are all neuter, or male, and awnless, one sessile, one pedicelled; on the upper half the sessile flower is female, and the pedicelled one male.

MALE or neuter FLOWERS. Calyx two-valved, one-flowered, exterior valvelet green, and covered with stiff white hair, inner valve membranaceous, and smooth, except the margins, which are slight ciliate. Corol two-valved, membranaceous, margins slightly dilate. Stapiens three or none.

FEMALE FLOWERS,' *Calyx* ose-valved, one-flowered, rigid, embracing the corol on all sides, brown, a little hairy.—*Corol* one-valved, small, the place o* the other is supplied *hy* a very loug, twisted arista.

3. A. tenellus. It.

Filiform, *spikes* paired, *flowers* paired, the sessile ones henna* phrodite, and awned; the pedicelled ones neuter, and awnless; exterior valves of both calyces oblong, striate, hairy, and three-toothed! neuter corol of one minute valve.

A most delicate tall grass, a native of Bengal, where it appears in hedges, &c. during the cool season.

Culms from two to three feet long; at the base resting on the ground, ruinous, scarcely so thick as a pack threap; joi; ifr villous.—. Leaves slender, a few hairs toward the base.—Spikes paired, erect, short-pedicelled; outside imbricated with two rows of sessile, awned, hermaphrodite flowers; inside with rows of pedicelled, awnless, neuter ones.—Rachis jointed and hairy.—Calyces two-valved; exterior oblong, three-toothed, striated, hairy; interior acute, three, nerved, that of the neuter flower shorter.—Corol of the hermaphrodite flower, one-valved, with a Jong brown awn on the opposite, or inner side, that of the neuter flower single, and very minute.

4. A. binatus* Linn* Sp. Pled. Willd. iv.913. Retz. Obs. v.24. Slender, towards the base creeping'; spikes paired, incurved^oaiers paired, the sessile ones hermaphrodite, and awned, the pedicelled ones male, with an awnless, two-valved corol.

A native of Bengal, appears during the cool season.

Culms very slender, toward the base rameus, and creeping; joints with a scanty short beard.—Leaves slender, somewhat hairy toward the base.—Spikes paired, on a long filiform peduncle, short pedicelled, somewhat incurvate; outside imbricated with two rows of sessile, awned, hermaphrodite flowers, inside |nt|| two very distinct (for they are separated by a deep groove) rows of pedicelled, awnless, male ones. Rachis jointed, and hairy.—Calyces of both two-valved; exterior oblong, hairy, ciliate, five to seven-nerved, edges thin, apex of the male trideiitate, of the hermaphrodite obtuse. Inner valves acute, three-nerved.—Corol of the hermaphrodite flower of one hyaline valve on the outside and an arista for the other; of the male one

of two very unequal hyaline valves.—Styles two ,• stigmas purple, vUious.—Seed oblong^ smooth.

5. A. conjugatus. 2J.

Straight, very ramous, filiform. Spike* conjugate, both flowers liermaphiodite, and both awned; exterior valves of the calyces Ian* ceolar, and copiously ciliate.

A native of Bengal, ?nd the smallest of the genus I Lave yet met •with. Flowers during the cool season.

Hoot a few very slender, brown fibres.—Culms in tufts, and very ramous, filiform, erect, smooth, even the joints; from six. to twelve inches high.—Leaves minute, a few hairs near the base,—Spikes always exactly paired as in most species of Ischccmum, erect, flat on the inside, where they touch each other. Rachis winding, and clothed with long, silver-coloured hairs, length about an inch.—FloW*

Frs in pairs, one sessile, one pedicelled, both hei maphrodile, aurl both awned.—Calyces Iwo-valved, one flowered; exterior valve in both lanceolate, with the margins copiously ciliate.—Corol two-valved; valves transparent, and brown, that (the inner) which gives support to the arista, bifid—Stamens three. Stifles two. Stigmas long and plumose.

6. A.filiform U. B.

Filiform, annual, erect. *Spikes* paired. *Floners* all sessile, solitary; hermaphrodite, diandrous, with a corol of one valve, which ends in a long awn.

This is the most delicate species I have yet met with; appears in small in fits, on pasture land near Calcutta, in the months of October, November, and December.

Culms numerous, filiform, smooth, erect, from nine to twelve inches high.—Leaves small, slender, and mooth.—Spikes two, terminal, fili* form, scarcely two indie* long.—WOZCM;S all hermaphrodite, solitaryi Sessile, no pedicelled flower being found, no pubescence about the calvx, no rachis.—Calvx two-valved, one-flowered.—Corol of one-

large, awned valve.—Stamina two, one of the anthers larger.—Germ ovate.—Styles two.

7- A. iristachyos. B.

S/HAes three, both flowers hermaphrodite, and both awned. Caty~ces lanceolate, and ciliate.

A delicate, beautiful species, found on newly laid down pasture ground in the vicinity of Calcutta, and in flower in October, November, and December.

Annual, with numerous, nearly straight, erect, smooth, slender, pithy culms, of from one to two feet hi height.—Leaves taper from the base, most acute, about as long as the joints of the culms; a few long soft hairs on the inside near the base.—Sheaths smooth, shofter than the joints.— Spikes two, rarely three, and I have not seen four, one sessile the other two a little more elevated on a com* mon pedicel, expanding; f om two to three inches long. Rachh jointed, binding, and hairy.—rimers in pairs, one sessile, the other pedicelled, both hermaphrodite, and both awutd.r-Cdlj/ces two-Valved; valvelets lanceolate, ciliate; backs smooth, aiid brown.—Corel of two, small, pellucid, brownish valves, the inner of each, ends in a long, brown arista, proceeding from the bifid apex of the valvelet.

"8. A. trident at iis». R.

Spikes paired, hirsute, both flowers hermaphrodite, and awned. Calyces shaggy, exterior valves cuneate, tiuncate, tridenlate. Carols % fpur-valved.

A delicate, rather tall species: a native of Coromandcl. ~

Culms straight.—Leaves small.—Spikes terminal, paired, sessile, lanceolate, shaggy.—Flowers in pairs; one sessile, the other short* pedicelled, both hermaphrodite, and both awned.—Calyx, exterior valves in both flowers cuneiform, with apices truncate, tiidentate, back striated; middle part, as well as the margins from thence down, and the base bearded with fulvous hairs; inner valve longer than

**>•

the exterior, ending in a pretty long arista, margins amply fringed with long fulvous hairs.—Corol in both flowers four-valved; the exterior one on the inside bifid, and awned.

9* A- lanceolatus. R.

Leaves lanceolate, with cordate stem-clasping base, bristle-piliate. Spikes tern, peduncled. Sessile or hermaphrodite flower awned, with the margin of the exterior valve of the calyx acutely pectinate, serrate.

A native of Coromandel, and very much like *Fanicum setigerum* Culms* scandent, or creeping, emitting roots from the joints, seems perennial.—*Leaves* lanceolate, base cordate, and stem-clasping, apex acute, smooth on both sides, but the edges from the middle down, bristle-ciiiate.—S/>z7v'isterniina],two, three, or four, peduncled. *Kd*^m cAisand *pedicel* of the male flower somewhat woolly.—*Ca/j/cesfon*-ceolate; *exterior valve*, and chiefly that of the hermaphrodite sessile flower with the margins minutely and acutely pectinate-seifate.-*'' *Corol* in both twovalved, with an arista in the hermaphrodite one*

10. A. scandens* JR.

Climbing, *spikes* from three ty^six, digitate; *calyx* lanceolate, male corols one-valved, and awnless, hermaphrodite ones with an one-valved corol and an awn.

Grows commonly in hedges, and on that account scandent; appears and flowers during the rains.

Culms long, ramous, creeping, or climbing over bushes, &c. emitting long roots from the joints; smooth and deeply grooved on one side; flower-bearing extremities erect, and about one or two feet long; joints woolly.—Leaves sometimes a little hairy on the upper side, mouths of the sheaths membrane-stipuled, and hairy.—Spikes generally from three to six, terminal, short pedicelled, sub-panicled flowers in approximate pairs; one hermaphrodite, and sessile, the other male, and pedicelled. In both the calyx is of two lanceolate, tomewhat hairy valves. In the hermaphrodite one the corol is of

one valve, and the place of the second valve is* occupied by a long twisted arista. In the male one it is two-valved.

Qbs. It is a cdaise grass. Cattle are not fond of it.

11. A. pertusus. Linn. Sp. PI. ed. Willd. iv. 922.

Near the root creeping. *Spikes* from four to eight, digitate, pedicelled, exterior valve of the sessile, awned, hermaphrodite calyx with a pit on the back; male or neuter corol one-valved

Ilolcus pertusus. Kön. Linn. Mant. 301.

Is found on old pasture ground, which is generally shaded by trees.

Culms creeping near the base, &c. as in the last two species; joints bearded.—Leaves small, ciliate; mouths of the sheaths bearded.-^
Spikes from four to eight, in other respects exactly as in the last species.—Flowers, the specific mark is to be found in the pit of the exterior valves of the calyx of the hermaphrodite flowers, as in A. strictns9 and A. pu net at us, to be described; an arista occupies the place of the second valve of the corol; the valvelets of the calyx are both awnless.

Obs. I should doubt this being König's Ifolcus pertmm if he had not pointed it out to me himself.

12. A. Bladhii. Linn. Sp. PL ed. Willd. iv. 920.

Sub-scandent; joints pubescent. *Spikes* from three to six, sub-panicled. *Calyces* lanceolate; male corols two-valved; hermaphrodite ones one-valved with an arista; *Jlowers* paired.

Beng. Loari.

A native of hedges, and road sides, but chiefly of old pasture ground. /

Culms as in the last described species; joints much bearded.—
Leaves the same.—Spikes from four to eight, short-pedicelled, inserted round the last half in each of the culms; in other respects they are as in the last described species.—The flowers resemble those of that species, but are a little more iemote.—Calyx and Corol the same as in A. scandens.

13. A. Ischamum. Linn. Sp. PL ed. Willd. iv. 921.

Spikes from six to eight; fascicled, peduncled; rachh hairy. Flow ers lanceolate; hermaphrodite, sessile, and awnedj male pedicellec and awnless; calyces acute; exterior valve hairy.

A native of Coromandel, a stout, erect species, with a brancr from the axil of each of the superior smooth short leaves, having muqii the appearance and habit of *Bladlni* and *pertusus*; from the former it differs most conspicuously in the valves of the calyces being acute, whereas in *Bladhii* they are broad and rounded; a¹¹, fi am *pertusus* in the want of the pit on the back of the exteriof talve of the hermaphrodite flower?

Sect. 2d. With long peduncled, axillary sjtikes,

14. A. monandrus. R.

Erect*, filiform, with eiect, filiform, branches at the top. Spikes solitary, flowers hermaphrodite, and female; exterior valvelet of the calyces and corols of both awned, hermaphrodite, monandrous*

A native of mountainous countries.

Culms many, ramous, filiform, straight; about a fpot high, round and smooth.—Leaves small, base and mouths of the sheaths hairy—Spikes generally solitary, terminal, and from the exterior axils, long-peduncled, straight, about an inch long.—Peduncles, filiform, jointed, and spathed at the middle. llachis jointed, winding, hairy*'''
Flowers numerous, imbricated in pairs; one, thehermaphrocljt^ses* sile and the other, female, pedicelled.

HERMAPHRODITE FLOWERS sessile. *Calyx* hvo-valved, nearly equal, exterior valvelet ending in a long slender arista, the inner one with its apex obtuse, and bearded.—*Corol*, exterior valve ending in a long slender awn.—*Stamen* one.—*Styles* two, &c. as in the genus.

FEMXLE FLOWERS pedicelled. *Calyx* and *cotol* as in the hermaphrodite oncsjjpnly the inner valve of the calyx is pointed, as bearded.

• 15. A. strict us. JR.

Straight, ramous at the top; base of the leaves ciliate. Spikes fascicled on their own proper pedicels; exterior valvelels of both calyces pitted; inner glume of the hermaphrodite corol awned.

A native of mountains, and their vicinity.

Culms straight, rarnous, about two feet high, and as thick as a sparrow's quill, round and smooth; joints bearded.—Leaves slender, a little hairy, and ciliate near the base; mouths of the sheaths stipuled.—Spikes from three to six, long-pedicel led, and collected on a common peduncle, one of which is terminal, and one or two more from the next one or two exterior axils; very slender, perfectly erect, and about an iuch long. Rachis as in the former species.—Pediets most fine, straight, two inches long, jointed near the base, where a fine slender spullie begins.—Flowers in pairs; one hermaphrodite and sessile, the other small and pedicelled.

HERMAPHRODITE FLOWERS sessile. Calyv as in the genus, except that the exterior large vahelet has a large pit in it, as in Andropogon pertubtts,—Carol, inner valve slender, ending in a long twisted awn.

MALE FLOWER pedicelled. *Calyx* one-valved, and pitted as iu the Hermaphrodite flower.—*Corel* two-valved, awnless.

16. A. pohjstachyos. R+

Straight, *spikes* numerous, axillary, simple, each elevated on along jointed, sheathed peduncle. *Flowers*, inferior pairs male and awnless; one of the superior ones is female and amply awned, the other male and awnless.

A native of the Peninsula of India. The flowers greatly resemble those of A. *contortus*, but the habit of the grasses is very different.

Culms straight, ramous.—Leaves ensiform, straight, acute, ciliate at the base.—Spikes simple, many together on the axil of the leaves, each elevated high on its long, filiform, jointed, sheathed peduncle, lengthom—one to two inches.—Flowers paired, those on the lower

two-thirds of the spike are all male, and awnless, and, as usual, one of them sessile, the other sliort-pedicelled; *superior pairs*, theses* \sile one of each of these is a slender female, amply bearded at the base with much dark brown hair, which is the more conspicuous a* e\cry other part of the sjiike is smooth; the other short-pedicelled* male, ami awuless, like the inferior pairs.

MALE FLOWERS. Calyx two-valved.—Corol two-valved.—St&* nvna tlnee.

FLMALE FLOWERS. *Calyx* of one linear, striated, hard, dark-brown valve.—*Corol* one-valved with a very long, twisfed awn of the other side.—*Stamina* none. *Styles* two.

Sect. 3d. Panicles naked, and terminal.

17. A. tickula!us. Linn. \$p. PL ed. Willd. iv. 906.

CiCfping *Leaves* shoiter than their sheaths. *Taniclt* linear-ob* long, eiect, *ramifications* three-flowered, one hermaphiodite, sesail^e* and two male, peduucled.

Gramen aciculatum. Eurnph Amh. 6. t. 5.f. 1. good.

lvuphis tnvalvis. L<; ur. Coclunch. 676.

Kmlira-pullu. Kheed. MaL VZ. p. 97. t. 43.

Sans. ^}fjg~ft; SliMiikhijuee> ^ t ^ H ^ , Chora-poaslipee, ^fsi~ft* Kestmiec.

J3eng. Chum kanta.

Grows on ban en, moist, pasture ground; its freeds are exceeding"
1)' troublesome to those who walk where it grows, as they sticit lu the stockings and produce a disagreeable itching.

Culms straight, simple, from one to two feet high, round and smooth.

—Leaves small, wa\e.J, with the margins prickle-ciliate.—Paniclt terminal, erect, linear-oblong, from two to three inches long. Ra* thijications (or rather peduncles) Verticelled, simple, three-flowered nearly erect; apex armed with short stiff hairs.—Ffotoers, one sessile, hermaphrodite, and two pedicelled male ones on each peduncle*

HERMAPHRODITE PLOWEU. Vnlyx twb-valverf, nearly equal; At iun«r one eirtfe W * D i t Mfita/aud k^ fhe keel scabrous; fca>e

involved in brown short hair.—Corol two-valvedj.the inner one ending in a short rigid arista.—Stamens three, &c. as in the genus.

MALE FLOWERS. Calyx and Corol as in the male, except that there is no arista to the corol.

Obs. It is of a very coarse nature. I never found it touched by cattle.

18. A. verticil/atus* it.

Erect. Leaves $long_x$ and very hairy; Panicle conical, ramification* veiticelled, three-flowered; one hermaphrodite, sessile, with two-awns; and tvo.-pedicelled, male, with one awn each.

A native of mountaius, flowering about the end of the wet season': *Root* woody, perennial.—*Culms* erect, simple, very leafy, smooth, round, towards the base solid, as thick as a small gpose quill; from four to six feet high.—*Leaves* approximated, eighteen inches Ion?, and three quarters of an inch broad; margins set with minute «piues, and particu!aily hairy on the inside near the *base*.—*Panicles* erect, conical, las, from eight to ten inches long, composed of many verticelled, most simple, filiform, waved, bowing, three-flowered branches, as in A. *ackulatits*.

HEHMAJPHKODITE FLOWERS sessile. *Calyx*, glume one-flowered, two-valved, inner valve awned, both hairy, having the base surrounded with much brown hair.—*Corol* one-valved, a long twisted awn Occupying the place of the other.—*Stamens* three.—*Style* yellow.

MALE FLOWERS pedicelled, one on each side the hermaphrodite one; pedicels covered with brown hairs.—*Calyx*, exterior valve a little h:tir\, and awned, base involved in short brown hair.—*Corul* two-valved.—*Stamens* three.

19. A. saccharoides. Linitr~\$p:Tt. ed. Willd. iv. QIC.

Sub-erect. Leaves remarkably long. Panicle oblong, composed of simple, alternate, -filiform, short-pedicelled, erect,, patcirt branches; neuter florets two'-valved and pedicelled.

A large, leafy, sub-erect species; a native of the mountainous parts of die northern* Circars.

I am not possessed of any other description of Swartz's A. sac* charoides than the specific character, as it stands in Wilidenow's edition of the species, which agrees with my plant; I theiefore conclude they are the same.

20. A. Ischamum. Linn. Sp. PI. ed. Willd. As. 921.

Spikes from six to eight, fascicled, peduncled; rachis hairy. Flowers lanceolate, hermaphrodite, sessile and awned; mate pedicelled and awnless; calyces acute, exterior valve hairy.

A native of Coromandel. It is a stout erect species, with a branch from the axil of each of the superior smooth short leaves; it hat much the appearance and habit of *B/adhii*, and *pe/iusus*; from the former it differs most conspicuously hi the valves of the calyces being acute, whereas in *B/adhii* they are broad and rounded; and Irom *pertusus* in the want of the pit on the back of the ext** rior valve of the hermaphrodite flowers.

SI. A.punctatus. R.

Erect, simple. Leaves large, long, and numerous. Panicle °* numerous, Simple, secund ramifications. Exterior valves of the calyces of both hermaphrodite and neuter flowers pitted.

This is a mountain grass.*

Culms from two to four feet high, without branches, below ben towards the earth for half a foot, often erect, entirely surrounded with the sheaths of the leaves; not piped, but replete with spongy pith.—Leaves numerous, large, with some long white hairs scattered over them near the base; mouths of the sheaths stipuled, bearded, and woolly.—Panicle erect, oblong, from four to five inches high* composed of many, erect, shorf-peduncled, filiform, secund, spiked racemes; rachis and flowers exactly as in A. fasclcularis; except that here the outer valve of the calyx of both flowers has a pit in the middle..—The corol of the hermaphrodite flower wants the inner valve, in its place is a pretty long twisted awn.

22. A.J'asacularh. R.

Erect, ramous. *Fanicle* composed of fascicled, simple, or divided branches. *Flowers* paired; hermaphrodite ones awned \ neuter ones awnless and without a corol.

Teling. K/mda-jeri.

A native of mountains.

Culrm erect, jointed, smooth, rather thicker than a crow's quill, from three to live feet high, sulcaled, mostly naked, rush-like, not piped.—Leaves from three to four, small, remote, retrorso-scabrous; mouths of the sheath hairy; from each sheath spi ings a short panicle-bearing branch.—Panicle terminal, six inches long, erect, fascicled; fascicles remote, alternate, composed cf sevtral erect, filiform, often ramous, secund spikes, or spiked-racemes.—Flowers in pairs; the hermaphrodite ones sessile; the neuterpeduncled. Common raclis round, smooth; partial one undulated, jointed, compressed, woolly.

HERMAPHRODITE FLOWER. Calyx, glume one-flowered, two-valved, smooth, awnles*, base surrounded with wool.—Corol, exterior valve the length of the calyx; inner short, bifid, with a long twisted awn from the fissure. Neuter Itorel small, its pedicel woolly, length of the hermaphi odite flower.—Calyx two valved.—C#rol none*

23. A. muricatus. Retz* Obs. iii. IV. 95. and v. £0.

Erect in all situations. *Leaves* sub-hilarious, long, narrow, and rigid. *Fanicle* verticelled, *ramifications* simple, expanding, hermaphrodite and male flowers awnless, with muricate calyces, and cowrols of three valves.

Sails. qtTSf> Veenmwng, cffccTCf, Veerirttirimg.

Beng. Benay the name of the plant, and Khuskkus the root.

Tarn. Woetiwear.

Virana. Asiat. \$e*i vol. iv. p. 306.

It is very common in every part If the Coast and Bengal where it meets with a low, moist; rich soil, especially on the banks of water courses. &c.

Soot of many perennial, long, spongy, brown.fibres.—Culms many, smooth, simple, rigidly erect, a little compressed at the base, jointed, smooth, inwardly spongy; from four to six feet high and as thick as a goose quill.—Leaves near the base bifaiious, narrow, erect, from two to three feet long, pretty smaoth, rigid.—Panicle from six to tw elve inches long-, conical, composed of numerous spreading, shortpeduncleii, simple, Jiuear, verticelled spiked-racemes. Rachisofthe spiked-racerues jointed, winding, naked—Flowers paired, awnless, one hermaphrodite, sessile; the other male, and pedicelled; insertion nearly naked.

Calyx two-valved, nearly equal* HERMAPHRODITE FLOWER. muricated.—Corol thiee-valved, membranaceous.—Nectary, two ODcordate scales embracing the germ 'nd insertions of the filaments.— Stamens three.—Stigmas feathery.

Calyx as in the hermaphrodite.—Corol two-MALE FLOWER. Nectary as above.—Stamens three. valved.

Obs. The roots, when dry, and then gently moistened, emrt a pleasant kind of fragrance; they are employed to make large fans, commonly called Vissarees; and also to make screens which are placed before windows and doors, which being kept moist during the hot winds render the air that passes through them, both cool and fra-See Observation on Aristida setacea. The grass is ofte*1 employed for thatch.

Dr. Kbnig was too accurate a Botanist to describe this very conipicuous plant under two names, viz. A. squarrosus. Linn. Sp. "'• Willd. iv, 908, and A. muricatus; the former is evidently a very different specie?, and found by him in Ceylon, floating on pools of water; whereas A. muricatus (which I formerly called aromaticus) & always rigidly erect, whether growing in water, or on dry landroot is delightfully aromatic, as mentioned by König himself, and by Sir William Jones, particularly when moistened with water.

I am inclined to think König's Andropogon squarrosus is my uicum paludosum; a species with thick spongy culms which is senerally found swimming on pools of sweet water.

24. A. glaber. R.

Erect, ramous, smooth. *Tanick* ovate, verticelled; *ramification* simple, two or three-cleft. *Flowers* paired, the hermaphrodite ones aw ned, with the calyx pitted; the male ones neither pitted nor aWned, with a t;vo-valved corol.

Beng. Gundha goorana.

Found thinly scattered on rather elevated spots over Bengal.

Root perennial.—Culms sub-erect, very ramous, smooth, from three to four feet high.—Leaves glossy, smooth in every part.—Panicles ovate, verticelled; ramifications simple, and two-cleft, or even three-delet sometimes.—Flozoa \$ paired j the hermaphrodite ones sessile and awned; the male ones pedicelled, and avvnless.

HERMAPHRODITE FLOWERS. *Calyx* two-valved, smooth, pur* pie-coloured; exterior valve pitted on the back.—*Corol* one-valved, a long awn occupying the place of the second.

MALE FLOWERS nearly as large as the female*—Calyx not pitted.
—Corol two-valved.

25. A. monianus. R.

Shrubby near the base, creeping. Leaves long and slender. Tanide sub-verticelled; ramifications ramous; flowers paired, the hermaphrodite ones awned, the neuter awnless, with a corol of one valve.

Teling. Auroots hangaiz.

A native of mountainous countries.

Culms many, below resting on the ground and rooting, round, smooth, from three to four feet high, and as thick us a large crow-quill.—Leaves long and narrow, a little liairy on the upp^er side near the base only; mouths of the sheaths bearded.—Panicle terminal, conical, from four to eight inches long, composed of many, rapiotis, sub-yerticilled spikes, or rather spiked-racemes; rachis winding, jointed, a little hairy.—Flowers as usual, in pairs, an hermaphrodite one sessile; and a neuter one pedicelled.

HERMAPHRODITE FLOWERS. Calyx two-valved, the exterior

one a little hairy.—Corol onc-valved, a twisted awn two or three times the length of the corol supplies the place of the other: N^{ell} -ter flowers like the hermaphrodite ones, but without arista.

Sf). A. bicolor. R.

Erect. *Panicle* diffuse, with expanding, decompound and super-decompound branches; *hermaphrodite* cances with smooth backs, and fiinged margins; *corol* three-vaived, and rwned, calyx of neuter *Jfozcer* hairy v.iih a two-valved corol.

Hoicus bicolor. Linn. Sp. PI. ed. IVitld. iv. 921).

Beng. Kar/*-deodhan.

Hind. Kala-jooar.

Teiing. Mwka-janoo, and M/ikajr.noalar the grain.

I have only found it in a cultivated slat^.

Culms generally single, straight, round, smooth, from four lo ^dl feet high, and as thick as the tirijjjer or thumb, mostly covered by the sheath of the leaves.—Leaves from one to three feet long, and bota one to three inches broad, smooth; mouths of the sheaths bearded*

•—Panicle erect, oval, dense, composed of many ramous, expand**1?' sub-verticelled branches, the various ramifications angular and very hispid when the finger is drawn backwards over them, their flow er-bearing extremities hairy.—Flowers paired, and, as in the genus of the sessile one is hermaphrodite and the pedicelled one neuter.

HERMAPHRODITE^FLOWERS sessile. Cafyx, valvelets nearly equal, with the back smooth, and as they lipen becoming of a shis black, wirfi many white hairs round the margins (ciliated.)— $C^{\bullet rol}$ three-valved, fringed, the second or so'v wy valve ending in a short twisted arista.—Seeds oval, brown, smooth, nee, with an impress^** on the back near the base.

NEUTER FLOWERS pedicelled. *Calyx* striated, hairy.—*Corol* two-valved, awn less.—*Stamens* ncne.

Obs. This and the following species A. Sorghum seem to me to possess more of the character of Andropogon than of Hoicus. I baV« therefore changed their places from the latter to the former.

27. A. Sorghum. R.

Erect. *Panicle* contracted, dense; hermaphrodite calyces hairy. *Carols* three-valved, awned.

Ilolcus Sorghum. Linn. Sp. PL ed. Willd. iv. 929.

lieng. and Hind. Jo oar.

Teting. Telia, or Konda (white) janoo the name of the plant, and Tella-janoolar the grain.

Obs. This also 1 have only found in a cultivated state. It differs from the former.

1st. In having the panicle contracted, very dense, and less regularly verticelled.

Qd. In having the glumes of the calyx of a whitish green colour and very woolly.

3d. In having three-valves to the neuter flowers.

There are two other sorts, which I take to be only varieties of the last; their names in Telinga are *Pacha* (green) *Janoo* and *Terra* (red) *Janoo*.

These last two with their varieties are much cultivated on a rather elevated, good soil. Seedtime October; and harvest time January. The produce in good soil is often upwards of an hundred-fold. The grain is much used for food. It is probable that through the whole of Southern Asia as many of the inhabitants live on the various kinds of dry or small grain, as upon rice, and they are reck, oned fully as wholesome as that is.

All kinds of cattle are remarkably fond of the straw notwithstanding its thickness, and solidity.

28- Ai cernuum* 22.

Erect, from five to fifteen feet high; lower half with verticels of roots from the joints.. *Panicles* oval, with numerous, long, compound, cernuous branches; *glumes* villous and fringed; *corol* three-valved and fringed, the inner scarce awned. #

Holcus cernuus. Linn. Sp. PL ed. Willd. iv. 930.

This species, (or variety of Sorghum,) is the kind cultivated by the in. habitants of the $Muni\ poor\ a_f$ Koonkee, and other mountainous districts

immediately east of Bengal. The grain is milk white; some of it was sown in the Botanic Garden, during the early part of the rainy season of 1812, and in November the plants were from ten to fifteen feet high, several ramous stems arising from the same root, or grain of seed; all the joints of the lower half of the original stems which are as thick as a slender walking cane, throw out copiously verticels of roots from all the joint, the lower ones near the soil enter it, and give additional support and nourishment to the plants, which are of two, or more years duration, if suffered to remain; the leaves are from twenty to forty inches long, by two or three broad, soft and smooth, the rib white on both sides. Panicles large,' oval on the more sleri' der branches, and in those, while in flower erectj but in such a* terminate the primary stems the form is obscure, from the drooping habit of their branches. The flowers agree with those of Sorghum^ except that the awn is so small and short as to be hid within the glume of the calyx \ the neater ffowers are very minute, and consist The grain of of only one or two slender, villous, calycine glumes. this plant is the staff of life of those wild savage mountaineers, wher inhabit the above mentioned countries, Mhere it is one of the te# articles cultivated by them. Cattle are fond of the straw, or rathe? canes.

29. A. sacharatm. R.

Erect. ¥ ankles verticelled, with ramifications drooping. Cafy* hairy, corols awnless; hermaphrodite three-valved, neuter one-vaW* fed.

Holcus saccharatus. *Linn. Sp. PL cd. Willd.* iv. 930* *Hind*, and *Be.n*<5*. Deo-dhan.

Is much cultivated over various parts of India during the rainy and cold seasons upon land which is too high for rice.

Root ramous.—Culms erect, round, jointed, sometimes- ramous, lower joints radicaung, from eight to twelve feet high, three ork>^{ur} inches in circumference near the base.—heaves bifar.ous, sheathing sword-shaped, margins hispid, the rest smooth, with a white nerve

on the upper side, three feet long, and three or four inches broad. *Sheath* as long as the pauicle is when young, afterwards the whole is completely bent down from the weight of the seed.—*Flowers* paired, one hermaphrodite, sessile; the other neuter, and pedicelled.

HERMAPHRODITE FLOWERS sessile. *Calyx* one-flowered, two* valved, both valves hairy.—*Coral* three-valvpd, the solitary valve daggered; dagger, shorter than ihe calyx.—*Seed* oval, white.

NEUTER FLOWERS pedicelled. *Calyx* two-valved, hairy.—Co-rol one-valved, awnless.—*Stamens* none.

Obs. The only circumstance that renders me uncertain whether this is *Holcus saccharatus* of Linneus is the total want of the arista in the hermaphrodite flowers; in other respects they agree.

50. A. laxus. Linn. Sp. PL ed* Jfilld. iv. 907.

Erect, from one to iifteen feet high. *Panicle* ovate, lax; *rami-Jications* sub- verticelled, com pound and decompound. *Calyx* hairy; *corols* fringed, those of the hermaphrodite three-valved, and awiied.

IJeng. Kula-nwocha.

Te/ing* Gaddi-janoo.

Grows in hedges, on banks of water courses, and oil land that has lately been in cultivation.

Root somewhat woody, perennial.—Culm Dear the base bending to the earth, and there rooting at the joints, the rest erect; the whole is of a firm ligneous texture, inwardly spongy, jointed, round and smooth; belojtv naked, above covered by the sheaths of the leaves. In hedges on the b&nks of the rivers, &c. where the soil is good, it is often from ten to fifteen feet high; while on a barren dry soil, not more than one or two.—Leaves long, smooth, except the margins, which are scabrous.—Panicle very large, oval, oftea bowing, rather thin, composed of sub-verticelled, ramous, spreading branches, with woolly insertions; the branchlets of the branches are composed of four or six pedicelled, spiked racemes. Rachis of the spikes jointed, &c.—Flotcers paired, &c. as in the other species.

HERMAPHRODITE FLOWERS sessile.' Calyx two-valved; valve-

lets equal, hairy.—*Corol* three-valved, membranaceous, margins fringed with hairs; the second one retuse, with a pretty long twisted arista; the inner one very small.—*Nectary ns* $\ n$ the last species.

MALE FLOWERS pedicelled. *Calyx* as in the hermaphrodite, *Corol* two-valved.

SI- A. miliaceus. R.

Erect, from six to ten feet high. *Panicle* ample, lax; *ramifications* verticelled, expanding, or drooping. *Corol* three-valved, iu both hermaphrodite and male flowers-

The seeds of this most beautiful stately grass were sent me from Lucknow, by the late Gen. Claude Martin, under **the** name of bilf grass. It being a native of the mountains north of Oude. It blossoms in this garden during the latter part of the rains.

Culms erect, ramous, smooth, the largest of them nearly as thick a:, the little Jinger, general height (in the rich soil of the Botanic Garden) about tun feet.—Leaves eusiform-Ianceolate, soft, akw smooth, except the margins, which are armed with miuute slfrn bristles, pointing forward, general length from two to three feet, and from one to two inches broad near the base, where broadest.— Sheaths smooth, except at the mouths, and there bearded on botlf sides.—Panicle very large, erect, wilh long, slender, smooth, elcgautivdiooping, verticelled, compound, and decompound ramificalioii.-- -Flowers in pairs, as in the genus; one hermaphrodite, a»« - other male, and pcdipelled.—Ca/yjc^wo-valved, <^{)lie-} ilowcied, oval, ruthc , ami hairy, but without the characteristic woolly, or luur> involucre round the base of the flowers.— Coral in both sorts thiee-valved, membranaceous, and fringed, sometimes the hermaphrodite flower is av/ned.—Nectary two, fles.»)^ri bi\>rd, truncated, fringed scilcs.

Ohs. In habit this beautiful species .comes near my Andropogon turnbackiamis, from ihcCape of Good Hope, but is more elegant in the panicle.

Sect. 4th. Panicles foliaceous.

Jan A. pumilus.R.

£iect; twelve inches high; *panicles* composed of nitmeron9 axillary, and terminal, conjugate spikes, on long, jointed, sheathed peduncles. *Calyx* of the sessile hermaphrodite, flower awned, cuspidate.

A native of Coromandel, and one of the smallest of the genus.

Culms ramous, erect, smooth.—Leaves rather small, particularly the floral ones, which aie little more than large sheaths.—Panicle composed of numerous, axillary, and teuninal, conjugate, hirsute, secund spikes, elevated ou slender, jointed peduncles, embraced by many delicate, chaffy biactes at the base, and byashea; h from the joint upwards.—Flower* in pairs on the joints of the hairy rachis, one sessile and hermaphrodite, the other peduncled and male.—Calyx two-valved, that of the hermaphrodite flower cuspidate*—Cormology one-valved, an arista occupies the place of a second in the hermaphrodite flower,

S3, A. parvijtonts. It.

Ascending. Leaves linear. Paujck leafy, thin; spikelels solitary, with proper, jointed, leafy spathes; both flowers awned, the pedicelle<J one a rudiment only.

A very beautiful most delicate species, a native of pasture land up amongst the Circar mountains and also of the mountains themselves.

Culms very branchy, ascending, filiform, about a foot, or a foot aud a half high.—Leaves numerous, small, linuu', rather obtuse, mouths oli the sheaths stipuled.—S/?i/>'£J axillary, minute, peduncled, generally one or two, rarely three. Rachis jointed and waved as in the other species, but here it is smooth, except at the insertions of the flowers.—Peduncles most slender, jointed at the middle, from whence a small spathe ascends, which generally hides a part of its spike.—Flowers in pairs; one hermaphrodite and sessile, the other merely the rudiment of a floret on a long clubbed pedicel.

34. A. Schananthus. Linn. Sp. PL ed. Willd. iv. 915.

Perennial, erect. *Panicle* sub-secund, linear, leafy **spikelets thereof paired, on a common, spathed pedicel, with proper pedicels and spathes | flowers of both sorts awnlgss, the mal? corol one-valv* ed.

Sans. JTrerrzfnrzfo Malatrinj/kwng, *T^T7f, Bhoostrcnmig. Seng. Crundha-bena. ...

Schopnanthum amboinicum. *Rumph.'amb. 5. p.* 181. f.72-/- '• Schoenanthus, or Juncus odorutus of the *Materia Medic a*.

On the Coast I have Qnly found this elegant valuable species »* a state of cultivation, few gardens being without it; I have but twice found it in flower and both times during the rainy season**

Hoot perennial, young propagating-shoots issue from the axils of the leaves that si>rround a short, sub-ligneous leaf-bearing culm^ pulms from tive to seven feet high, erect, simple, smooth, about*8\$ thick as a goose quill.—Leaves many, near the root bifarious. **** pn the upper part of the culm, of a soft texture, pale green $c\theta$ " lour, slightly scabrous on the margins when drawn backer against the fingers, otherwise smooth; from three to four feet to ng including their sheaths, and about three-quarters of an inch broad, Floral leaves small,—Panicle linear, a little bent to one side, com? posed of many fascicles of spikes that are both terminal, and \hat{n} |||Q|| exterior axils.—Spikes generally pairep! op a common p^{edun} £le, with a common boat-like spathe? or involucre ^t the division > Ra. his pacli has also its proper pedicel, and' both spathe-sbaped. ailiculuted, much waved, hairy.—Floxcers in pairs, one hermanlino fiiteand sessile, the other male and pedicelled; the last hermapl*10dite flower of each spike has two males; below, only one nrale, "" the raclds occupies the place of the other; this is the case with i?i $^{\circ s}$ pi the species of the genus.

HERMAPHRODITE FLOWERS sessile. Glume girt at the base with wool, 8cc. as in the family.—Corol tWQ-valved, awnless. &&"

^{*}Ifi i.ie North of Bengal terge tracts of waste land are coyer^d ^ith it. «

 $tary_{\hat{l}}$ two, broad, shfcrt, wedge-formed, obliquely lobed, crenulated bodies embrace the insertions of the filaments and the forepart of the germ.

MALE FLOWERS pedicelled. *Calyx,glumes* as in the hermaphrodite ones.—*Corol* one-valved, avvnless. *Nectary* as in the hermaphrodite.—*Stamens* three,

Obs. The fresh leaves are much used as a substitute for tea. The white succulent centre of the leaf-bearing culms is often put into curries, to give them an agreeable flavour.*

S5. A. Iwarancma. Philosoph. Transact. Vol. 80. 284.1.1(5.

Perennial, erect. *Leaves* long, and very slender. *Panicles* linear; *spikelets* paired, five-jointed, with common spathes; hermaphrodite flowers awned; male one-valved and awnless.

Bern, and Hind. Ibharankusha, Iwarankusha, Kutankusha.

Iwarancussa. Asiat. Res. iv. 109.

A native of the skirts of the northern mountains of India. Dr. Blane found it between the river Raptee and the mountains, and Dr. Boyd about Hurdwar \ it is therefore probably a native of a very extensive tract along the skirts of that range of mountains which bounds the plains of Bengal, Bahar, Oade, &c. Flowering time the rainy season.

It grows in large tufts, each tuft composed of a number of plants adhering together by their roots.

Root perennial, the principalparts thereof are thicker than a crow'? quill, and marked with circular cicatrices, from these issue many small, firm, aromatic fibres.—Culms erect, generally simple; from three to six feet high, smooth in every part, not hollow, but filled with a light spongy substance.—Leaves, those near the root longer than the joints of the citing margins hispid when the linger is drawn backwards over them, otherwise smooth in every part.—Panicle axillary, and terminal, or the whole may be reckoned a

^{*} The natives of the Molucca Islands extract a pleasant-tasted essential ».** from the leaves. *L.J.*

long, linear, erect, or drooping, intercepted panicle, contposed of numerous, (many of them pioliferoua,) fascicles of slender, pedicelled, thin spikes of five joints; each fascicle is furnished with it* own proper, boat-shaped sjtathe, besides many chaffy braeles within it among the insertions of the pedicels; and a proper spathe to each pair of spikes.—Flowers on the body of the rachis paireH; one awned, hermaphrodite, and sessile; the other awnless, male, a pedicelled, the terminal ilorets are three, one hermaphrodite, ses^'> and awned; the other two male, pedicelled, tfttd awnless.

HEUMAPHKODITE. Calijx one-flowered, two-valved, base g^{irt} with wool, as is also the rachis, and proper pedicels.—Corol *\(^1\) valved, and fringed; inner valvelets two-parted, with a short aii** in the fissure. Nectary two, minute, leaflets embracing the g^{crlU} laterally.—Stamens, pistil, and seed, as in the genus.

MALE. Calyx as in the hermaphrodite. Corol one-valved, $i^{ieC}*$ tary and stamens as in the hermaphrodite, no pistil.

Obs. This species comes remarkably near to A. Schananthiis ^oil in habit and taste.

For the virtues of the roots of this plant, see Dr. Wane's acco^{nt} thereof in the second part of the 80 volume of the Philosopb^{ica} Transactions of the Royal Society of London; also Asiatic B. searches iv. p. 109. The virtues seem to reside almost entirety ¹¹¹ the larger parts of the root, marked with annular cicatrices, the ta*^{te} is agreeably aromatic, with same degree of bitterness.

S6. A. Martini. R.

Perennial, erect. Panicles linear, siib-secund; spikelets V^* three-jointed, with common spathes only; hermaphrodite corola of one valve, and an awn; male awnless.

A native of the high lands of Balla-ghat, General Martin collect ed the seeds while there with the army, during the last war $*^{l}$ f Tippoo Sultan, and has reared abundance of it at Lucknow.

It is also now plentiful in the Company's Botanic Garden, »'als*, ed from seed sent from thence by that gentleman, whose name I have applied as a specific one for this elegant plant.

Hoot perennial, with long wiry fibres—Culm* erect, from three to bix feet high, often ramous, smooth, filled with a spongy pith.—Leaves very long, tapering to a very fine point, smooth in every part and of a soft delicate texture.—Sheaths shorter than the joints on full grown plants, with a membranaceous stipulary process at the mouth.—Panicles as in A. Izcarancusa; spikelets paired, but with owly three joints.—Flowers also paired, &c as in the former specie*, only there the lowermost pair on the most sessile of the two spikelets are both male, and one of them rests upon a smooth, con. vex, callous receptacle instead of a pedicel.—Rachis jointed, and woolly.—Calyx as in A. Iwarancusa.—Corol one-valved, a long black awn occupies the place of the other, which has two small tilament-J near its base. Nectary, &c. as in the foregoing species.

Obs. General Martin, who sent me this grass from Lucknow, writes to the following effect:

'» 1 i?ok particular notice of a sort of long grass which the cattle were voraciously fond of, which is of so strong an aromatic and pungent taste, that the flesh of the animals, as also the milk and but'er, have a very strong scent of it. Of this grass I send you a small stalk, some roots, and seed; if you taste the latter, though old, you will find it of a very pungent aromatic taste."

r ASP ALUM. Schreb. Gen. N.S1.

Calyx one-flowered, two-valved, valvelets rounded, equal. Corol of two-valves, and like the calyx. Seed adhering to the corol.

1. P. scrobiculatum. Linn.*Sp. PL ed. JVilld. i. 330.

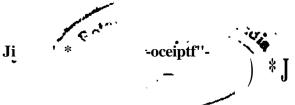

Spikes, axillary and terminal, sessile, alternate, erect. Flozcers alternate, in two rows, or crowded, smooth.. Calyces from three to five-nerved. Culms erect, two feet high, smooth. Seed round, smooth.

Sam. *FCQlfr Korttdooshfl, JJSrsj^, Kodrwva.

Beng. Koda.

Hind. Koda-ka-choul.

Teling, Aruga.

This is cultivated by the natives over many parts of Indiadelights in a light, dry, loose soil, but will grow in a very barren one. Time of cultivation the rainy season.

Root fibrous.—Culms erect, ramous, jointed, smooth; about two feet high, involved in the sheaths of the leaves.—Leaves sheathing? bifarious, longer than the culm, every part smooth. Sheaths longer than the joints, often embracing the spikes like a spathe.—Spite* axillary and terminal, from two to four, alternate, sessile, «rect, secund.—Rachh broad, membranaceous, with a waved keel on the inside—Flowers oval, alternate, in two rows; in luxuriant plants the flowers are crowded without order.—Calyx, exterior valve three-nerved, interior valve five-nerved.—Seeds brown, smooth, size o* that of hemp.

Oos. The seed is an article of diet with the Hindoos, particularly with those who inhabit the mountains and most barren parts of "ie country, for it is in such countries only where it is cultivated, it being an unprofitable crop, and not sown where others more benefice* will thrive. I have eaten of the boiled grain, and think it as palatable as rice.

2. P. Kora. Linn. Sp. PL ed. IVilld. i. 332.

Spikes terminal, alternate -, floiven alternate, in two-rows, smooth. Calyces from three to five-nerved. Culms below procumbent, from one to eight feet high.

P. orbiculare. Forst- prodr. N. 33.

Hind. Kodu.

Teling. Neer (i. e. water) Aruga.

A native of the borders of water courses.

Root fibrous, annual.—Culms resting on the ground near the base, above ascending, branchy, jointed, smooth; from one to three feet long.—Leaves as in P. scrobiculatum, but shorter. Spikes generally two, or three, though in very luxuriant plants I have seen seven or eight, terminal, sessile, horizontal, and erect/ the rest by i- *• : iast described species.

Obs. Cattle are very foild of these two species, whether green or dry.

3. P. longiflontni. 'Linn. Sp. PL ed: IVilld. i. 332. Retz. Obs. iv. 15.

Spikes paired, terminal, horizontal. Calyces oblong, obtuse, smooth. Culms creeping,

Teretu-pullu. Rheed. mal. 12. p. 81. t. 44.

Paspalum longifiorum. llelz. Obs. iv. p. 15.

A native of low pasture ground. Compare it with P. distichum. Linn. Sp. PL ed, Willd. i. 322.

Root creeping.—Calms creeping, with their extremities ascending six or eight inches high, jointed, smooth.—Leaves &heatisfelg, alternate, bifarious, short; mouths of the sheaths bearded.—Spifcer paired, terminal, sessile, spreading, secund.—Flowers in two rows, alternate, oblong, somewhat paired, smooth.—Calyx and corql without nerves.

4. P; longifolium* JR.

Erect, simple. *Leaves* as long as the culms. *Panicle* of many simple, alternate, diverging spikes scattered round a tliree-sideil rachis. *Valvelets* of the calyx three-nerved. Seed oval, lucid, and marked with minute pits.

Of what country this is a native is uncertain. It appeared in the Botanic Garden in 1807, in a place where plants from Sumatra had been planted, it is therefore more than probable that the seeds were in the earth.

Culms several from one root, simple, straight, jointed, nearly erect, round and smooth, height of the whole plant when in flower above three feet.—Leaves long, viz. from one to three feet, sheaths included, slander, acute, smooth, except the edges when rubbed backward. Sheaths longer than the joints of the culm, anil smooth, except at the top, where there are a few, long, soft hairs near the short scariose Jigula.—Panicle composed of from twelve to twenty*

four, simple, diverging spikes, scattered alternately round a three-sided rachis, nearly a foot in length.—Spihis sessile, with a fevr, long, straight, white hairs round their insertions, about three inche, long. Rachis flat, with a waved keel on the underside, and coloured, waved margins.—Flowers in numerous, alternate, imbricated. pails on the underside of the flat rachis, on unequal, short-pedicels.—'Calyx of two, very equal, oval leaflets with a nerve or rib round the margins, and one down the middle.—Seeds oval, dotted wilh interpretable, small pits, shining.

LAPPAGO. Schreb. Gen. N. 131.

Calyx from two to thwe-valved.—CVo/two-valvecI, resupine.

1. L. bijlora* R.

Culms creeping. Pedicels two-flowered; inner valveletp of

Phalam murk at a. Forsh descript. 202.

It is a small, prostrate grass, a native of the dryest pasture ground on the Coromandel Coast.

Culms pressing on the earth, and striking root from the joints, fi^{100l} «ix to twelve inches long, ramous.—Leaves short, margins cil» affinand waved; mouths of the sheaths bearded.—Racemes terminal, simple, from one to two inches long.—Pedicels short, diverging? two flowered.—Flowers lanceolate, echiuated on the back, or outside diverging on all sides round the rachis, which is waved, anguing striated, and downy.—Calj/x one-flowered, two-valved; the extern valve very minute, second or inner valve, (for there is no other,) lanceolate and completely embracing the corol on all sides, on the back and sides covered with many, strong, hooked bristles.—*Corot two-valved, membranaceous. Nectarial scales large.—Stamens, Pistil. 2tc. as in the genus.

PANICUM. Schreb. Gen. N. 107.

Califx, Glume one or two-flowered, three-valved: exterior valve-Leis minute: seed adhering to the corol.

Sect. 1st. Spikes simple.

1. P. indicum. MatU. 184. Retz. Obs. iii. p. 9.

, *Qilms* from four to eight inches, ascending from a repent base. *Spikes* sub-cylindric, naked. *Calyx* smooth, no involucres.

P. conglomeration. Linn. Sp. PI. ed. Willd. i. S41. does not agree with our plant in having cylindrical spikes with flowers equally disposed on all sides. This is a very small species, a native of Coromandel.

2. P. barbatum. R.

Culms from three to five feet high; very ramous at top. Leaves lanceolate. Spikes simple, cylindric. Lnvolucrets simple, and bearded, surrounding on every side a single flower; seed smooth.

This species sprung up in beds, in the Botanic Garden wherer earth had been thrown that came from Sumatra, or Amboyna, Compare with P. polystachyon. Linn. Sp. PL ed. Willd. ii 335.

Root annual in Bengal—Culms erect, about five feet high, simple, till near the top, there very ramous.—Leaves lanceolate, often a foot and a half long, hispid on the margins, otherwise smooth; the sheaths about half the length of the joints, with a few single hairs at the mouth.—Spikes terminal, and solitary (though from the numerous ramification of the top of the culms the whole may-be called a large leafy panicle) sub-cylindric, about three or four inches long.—Involucrets of two sorts, the longest about twice the length of the flowers with their lower half bearded, (hence the specific name, which for the same reason is also applicable to my Panicum holcoides,) the innermost one is in this species about double the length of the other five, six, or seven; all are of a reddish browu colour from the bearded part to the point. The other sort of in-

volucrets are simple and about the length of the flowers. The two sorts surround on all sides a single flower.—Calyx one-flower* ed, exterior valve very minute.—Seeds smooth, slender and pointed^

Obs. It differs from my P. kolcdides in the culms being very ramou* at the top only, and in the leaves being lanceolate; from polystachyon it differs, I think, in having two sorts of iuvolucrets equally disposed round the flower, and in the leaves being lanceolate and smooth-

3. P. spicatum. R.

Erect. *Spikes* cylindric. *Involucres* hairy, surrounding from one to three awnless polygamous flow ers. *Calyces* two-valved, both shorter than the corol, the inner longer and retuse.

Holcus spicatus. Linn. Sp. PL ed. Willd. iv. 928.

Gramen pauiceum, Pluck. &c. aim. t. 32./*. 4. good.

Hind. Biijera, or Bwjra.

Pedda-Gantee is the Telinga name of the plant, and Gantzlo°> the grain.

I have only found this in a cultivated state. It is sown about the beginning of the rains, viz. the end of June, and the beginning $^{\circ*}$ July, and ripe in September.

Culms several, if the soil is good, from the same grain of seed, erect, with roots from the lowermost joint or two, round, smooth, from three to six feet high, and nearly as thick as the little finger-—Leaves alternate, sheathing, broad and long; mouths of the sheaths bearded.—Spikes or rather racemes, terminal, cylindric, erect, as thick as a man's thumb, or more, and from six to nine inches long. *Pedicels* generally two-flowered, though sometimes only one and sometimes as many as four.—Flowers surrounded with many, woolly, hispid purple bristles or *involucres*, about the length of the flower Calyx two-flowered, one hermaphrodite the other male, two-valved; exterior valvelet minute, interior nearly as long as the corol, retuse, both awnless.—Corol of the hermaphrodite flower. StigmaW⁰". two-valved, of the male one-valved Style single. cleft, feathery.—Seed obovate, pearl-coloured, smooth.

Obs. It agrees perfectly well with our Indian species of Panicum, on that account I have transferred it to that genus.

This species is much cultivated over the higher lands on the Coast of Coromandel. The soil it likes is one that is loose and rich; in such it yields upwards of an hundred fold, the same ground will yield a second crop of this or some other sort of dry grain during October, November, December, and January.

The Hindoo farmer knows four other varieties of this species, all of which he cultivates. Their Telinga names are \st. Pitta (birds)

Cantee; Qd. Munda-boda-Gantee; 3d. Palla-boda-Gantee; and
4th. Yerra-Gantee.

Cattle arc fond of the straw, and the grain is a very essential article of diet amongst the natives of these parts.

4. P. involucratum. R.

Erect. *Spikes* cylindric, numerous, scattered, two-flowered, alternately longer and ciliate; shorter and smooth. *Calyces* two-valved, the exterior one minute, the inner one shorter than the corol, and emarginate.

A native of mountains chiefly, where it grows wild.

Culms as in the last species, from two to four feet high; joints woolly.—Leaves, ^liouths of their sheaths bearded.—Spikes as in P. spicatum, but the pedicels smaller, two-flowered.—Involucre, many bristles surrounding on all sides the flowers, they are of two sorts, simple ones awled, and longer ones with fringed margins.—Ca/j/tf one or two-flowered; valvelets as in the last species.—Coroly when there is only one to the calyx it is. hermaphrodite, when two, one hermaphrodite the other male as in the last species.—Styles two.

Obs. I know of no use this is put to at present; it may be Panicum spicatum in its wild state, though it is more like my Panicum holcoides in its present wild state.

⁵- P. glaucum. Linn. Sp. PI. ed. Willd. i. 335. Culms **erect, from ''are' to** three feet high; involucel **one** bundle of

hairy bristles, one-flowered. *Flowers* generally polygamous. *Seed* transversely rugose,

Beng* Pingi-natchi.

Teling. Naka-kora-

This species is generally found on cultivated lands, growing amongst the different sorts of small or dry grain.

Root fibrous.—Culms sometimes near the base resting on the ground, and striking root; the rest erect, ramous, smooth, a little compressed; from one to three feet high.—Leaves sheathing, nearly bifarious, smooth; mouths of the sheaths hairy.—Spikes terminal* columnar, from two to six inches long.—Flowers solitary, or joined to the rudiments of one or two more, short-pedicelled, numerous.—Involucels longer than the flowers, consisting of one bundle of hairy bristles which issue from the middle of the underside of the, pedicel.—Calyx generally two-flowered, in which case one is male, the other hermaphrodite, with its corol, as in the family. The male corol consists of one membranaceous glume between the inner valve of the corol and inner glume of the calyx, it has three stanitn9 only.

Oft5.lt may probably be P. helvolum of the Supplementum Plan* tarum. P. 107.

In India we have two or three varieties of this coarse grass, ca» any of them be *Alopecurus indicus?* the small reddish one comes very near it.

6. P. holcoides- JR.

Erect. *Involucels* numerous, scattered, one-flowered, alternately one longer and woolly, and another shorter and smooth *ijlozeers* sometimes polygamous. *Seed* oblong, smooth, resembling a small grain of common oats.

Beng. Swat?.

Grows, with *the* former, on cultivated lands, but chiefly up amongst the mountains.

*Root ahtQ\\\\$*_t^rCtrfms% erect, rainous, from two to four feet high;

round, smooth.—Leaves sheathing; sheaths half the length of the joints;' mouths bearded.—Spikes as in P. glaucum, but larger.—Flowers solitary, short-pedicelled, without order__Involucels, numerous, bristles entirely surrounding the flower; of two sorts, the largest twice the length of the flower, and wooily from the middle down, the other sort are smaller, and without wool or hairy.—Calyx one or lwo-flo\vered, as in the last; exterior valve minute, the other two as long as the corol, of which the apex of the exterior one is someftvhat three-toothed—Seed smooth, vciy like common oats, but smaller.

Obs. It differs from P. polys-dchy on in having the involucels scattered round the pedicels and flower. It may therefore be Itumph's gramen caricosunu vol. vi. t. 7.J\ 2. A.

7. P. interruptum. Linn. Sp. PL ed. Willd. i. 341.

Culms above water erect. Spikes simple, cylindric; farcers crowded, smooth, polygamous j seed smooth.

lie//-'. Nardula.

Teling. Wolam.

A very large species, grows in deep standing water.

Culms ramous, those parts under the water swelled, as thick a* the little finger, with many fibres from the joints; the parts above the water erect, about as thick as a common quill, from two to four feet high, smooth, involved in the sheaths of the leaves.—Leaves, •heaths longer than the joints, smooth.—Racemes or spikes simple, erect, columnar, from four to six inches hij;h.—Flowers small, ovaf, pedicelled, numerous, generally many, from nearly the same place. ^Involucre entirely wanting.—Calyx two, inner glumes striated, from six to seven-nerved.—Corol, the small flower is present here. *—Seed oblong, smooth, shining white.

8. P. curvatum. Linn. Sp. PI. ed. Willd. i. 352.

Culms erect. Spikes curved; Jiotners crowded, smooth, heimaphrodite; seed smooth. Grows about the borders of lakes.

Culms numerous, ramous, erect, as thick as a crow quill* fro^m two to three feet high, smooth.—Leaves numerous, very long, slender, and smooth.—Racemes, or spikes columnar; lower part somewhat lavnous; branchlets adpressed.—Flowers numerous, covering most comple'ely every part of the racemes, pedicelled. oval.—Cuty** two inner glumes striated.—Carol no neuter, only one hermaphrodite.—Seed smooth, shining, white.

Obs* This; may be only a variety of P. interruption.

9- P. dimidiatum. Linn. Sp. PL ed. Willd. i. 339.

Spikes secund, jointed; joints excavated, daggered on alternate aides of the apex, from one to five-flowered. Calyx two-flowered, one hermaphrodite, the other male.

A native of the Peninsula of India, scarce.

Culms short, oblique, smooth; whole height from six to twelve inches.—Leaves slender, smooth, obtuse, rather broad toward the ape*.—Spikes solitary, secund, jointed, smooth, from three to five Joints of the rachis from eight to twelve rigid, exinches long. cavated for the reception of the flowers, except the lower one or two, which are longer; in all except these a long sharp point or dagger proceeds from the apex, on the alternate sides of the articulation.—Flowers lodged in the concave joints of the rachis, on very unequal pedicels, the lowermost having eafth three or more, white those about the middle of the spikes have uniformly two, and the last two or three only one. -Calyx two-flowered, two-valved; flower* both sessile, one hermaphrodite, the other male; valves uuequal, the exterior one smaller; the inner one about as long as the valve of the corol, or it may be described with three valves as in the genus; but then the male flower will have but one glume.—Corols two-valved; valves nearly equal, those of the male flower much firmer, the sides of the exterior one (which may be called the inner valve of the caly** if it be allowed, to have three), with the sides bent in at right angles-—Stamina three—Girm in the hermaphrodite flower oblong. Styl

undivided for a short distance. *Stigma* plumose.—*Seed* oblong, dark brown, dotted; on the anterior side near the base is au oblong elevated mark.

Obs. Dr. Rottler, of Madras, an excellent Botanist, obliged me with the only specimens of this lare grass which I have yet met with, and had he not informed me that this was considered to be P. dimidialum I should have been inclined to have taken it for an ischaemum.

Sect. Qd. Spikes paired.

10. P. conjugatum. JR.

Spikes conjugate, secund. Flowers solitary, sessile, awnless. Co* rol, with an accessary neuter valve.

A slender, soft, villous, half creeping species; a native of Coromandel. It differs from P. *distachyon* in the number of the spikes being constantly two, and the flowers always solitary and sessile. To these marks of distinction may be added that the valves of the calyx are three-nerved, and the accessary one particularly large.

11. P. squarrosum. Linn. Sp. PL ed. Willd. i. 345. Retz. Obs. iv. 15. and v. t. 1.

Culms creeping, from ten to twenty inches long. Spikes paired, horizontal, rachis articulate; Jlowers in a fascicle on the upper end of each joint of the rachis.

Cenchrus muricatus. Mant. 302.

P. dimidiatum. liurm. Ind. 25. t. 8./. 2*

A native of dry sandy ground near the sea.

Culms branchy, creeping, with their flower-bearing extremities sub* trect; from ten to twenty inches long.—Leaves short, but rather broad, and covered with soft hair; sheath large, downy, involving most of the culms.—Spikes two, terminal, spreading, horizontal, or ascending like a pair of horns, secund. Rachis composed of from four eight, oblong joints, divided by a \;aved ridge; on each side of

the ridge membranaceous.—Flowers collected in sessile bundles of from four to eight, alternately disposed on the upper end of each joint.—Calyx, the exterior one minute, and lanceolate; the second large, embracing loosely the corol, pointed, and striated; the inner one nearly as small as the exterior, tapering from the base to a fix point, three-nerved; margins fringed, of a chaffy texture.—Corol as in the genus, and rather longer than the inner 'lume of the calyx, here is a thud neutral uiembrauaceous valve, as in many species of this genus*

Sect, 3d. Spikes fascicled.

32. P. dactylon. Linn. Sp. 77. ed. Willd. i. 342.

Smooth, creeping. *Spikes* digitate, secund, corol gibbous on on© side, and twice as long as the calyces.

Agrostis liuearis. Linn. Sp. PI. ed. Willd. i. 375. Retz. Obs. iv. N. 51. Sir W. Jones. Asiat* Res. iv. p. 248.

Sans. ^-djT, Doorva, TScITIbERII Shutw] i/rvika, स द अवेद्यी, Su-hjtt!'tfveerya» ? m f ^ }, Bharg/wee, NjJTnn, Quroolia, स्रवन्ता, Ununta.

Jhag. Doorba,

Teling. Giiericha.

'Jam. Arugam-pilla.

This is by far the most common and useful grass in India. I* grows every where abundantly, and flowers all the year.

Root creeping.—Culms creeping, with their flow er-bearing branchlets erect, from six to twelve inches high, smooth.—Leaves small, and smooth.—Spikes from three to five, terminal, sessile, filiform, expanding'', secund, from one to two inches long. Rachis waved.—Flowers, alternate, single, disposed in t^;o rows on the underside.—Calyx much smaller than the corol.—Corol, the large or exterior valve boat shaped, keel slightly ciliate.—Stigmas villoua, purple.

Obs. This most valuable grass forms ihree-fourths of the food of our horses and cows iu India. It is by the bi-alvmwns of the Coast*

held sacred to *Gunesha*, (the *Janus* of the ancients,) under the name of *DoorwalL*

13. P. acgyptiacum. Linn. Sp. PI. ed. Willd. i. 543.

Creeping at the base. *Spikes* from four to eight; corymbed, smooth. *Flowers* paired on unequal pedicels; accessary valve of the calyx minute OF wanting, the other two very unequal, nerved, and ciliate on the margins only.

Obs. Is rather a scarce grass in India, and grows in tufts. Cattle do not seem fond of it, whereas all are fond of P. dactylon.

14. P. ciliare. Linn. Sp. PL ed. Willd. i. 344.

Culms creeping at the base. Spikes sub-digitate. Flowers paired, one sessile the other pedicelled; inner two valves of the calyces equally long, and bearded with four woolly ridges; third minute.

Bind. Makj/r.jalee.

Teling. Shaiigali-gaddi.

It delights most in newly laid down pasture ground.

Culms creeping, with one or two feet of the extremities erect, these ramous, round and smooth.—Leaves sheathing, short for the size of the grass; margins ciliate near the base; sheaths sometimes a little hairy, shorter lhaii the joints of the culm, their mouths rise above the insertion of the leaf, stipule-like, as in Dr. Smith's Erharta calyciiia, but here it is entire.—Spikes or rather spiked-racemes, from four to ten, digitate, expanding, secund.—Flowers paired, one sessile, one peduncled.—Rachis three-sided, waved.—Calyx, exterfat valve most minute. Interior two many-nerved, four of the nerves are clothed with very long, white, soft hairs.

Obs. Small plants on a poor soil, have much the appearance of -Agrostis radiata. Cattle are very fond of this grass.

15. V.filiforme. Linn. Sp. PI ed. Willd. i. 343.

Creeping, filiform, smooth. Spikes, from two to four, sub-digi-

tate, filiform, secund; *flowers* paired, one sessile the other pedicelled. *Calyx* with the accessary valve, minute; inner one half the length of the corol or middle one \ these last two are three-nerved, and viilous on the margin.

From China it was brought to the Botanic Garden, where it thrives well, and blossoms the whole year, but chiefly during ih^e rains.

Culms ramous, creeping, very delicate, and smooth, a large portion next the spikes erect, naked, coloured and filiform.—Leaves soft and small, ciliate, with a few long hairs at the base.—Spikes ge* nerally from two to four issuing from the same paint, very slender, secund. Rachis flexuose.—Flowers, in a pair, one sessile.—Calyx one-flowered, flower hermaphrodite; accessary valve exceedingly minute, but by careful observations may always be found; second valve as long as the corol, the inner one only half their length, which is one of the best specific marks; these two ha.e three smooth nerves on the back, and their margins are slightly bearded.—Corol two-valved.

16. P. lineare. Linn. Sp. PL ed. Willd. i. 344.

Sub-erect, smooth. *Spikes* from two to MX, digitate, filiform* *Flowers* all hermaphrodite, awnles*, and pedicelled. *Cafycine* valves, the accessary one minute; the inner two equalling the corol, and three-nerved.

P. lineare. Burm. Lid. p. 25. t. 10./. 3, is a tolerable representation of this pretty delicate grass.

A native of China, accidently introduced from thence into the Botanic Garden, where it is in flower the whole year; but like most other grasses most luxuriant during the rains. It has a great resemblance to P. $dactylon_t$ ciliare, Jiliforme, and aegypticum, but does not creep like them. The flowers are less regularly paired, more minute, smooth, and obtuse, the two inner valves of the calyx equal, and as long as the corol, and the accessary one very minute, or not to be found.

17. P. cimicinum. Linn. Sp. PL ed. Willd. i. 344.

Culms erect, hairy, from one to two feet high. Racemes peduncled, corymbed; forcers polygamous, in pairs; exterior valvelets of the calyces fringed; coroL awned.

Milium cimiciuum. Mant. 184.

A rare plant, native of ground that has been lately in cultivation.

Culms from one lo two feet high, sub-erect, hairy.—Leaves short tnd broad, hairy, and fringed round the margin; sheaths also hairy. '—Racemes from four to ten; when more than four or five, the rest are elevated on a common peduncle above the point from whence the first four or five issue; all are pedicelled, bowing, secund.—flowers in two rows and in pairs, scarcely ever single.—Calyx, border of the inner valve fringed, with red hairs.—Coral, the arista is sometimes wanting, and its valves three-nerved; in mine there is a second, or male floret as in many species of Fankum.

18. P. corymbosum. JR.

Sheaths of the leaves bristly* Spikes numerous, corymbed. Calyces two-valved. Seeds oblong, smooth.

Teling. Cheepa-bora-gaddż.

Tiiis species I have found only in the vallies amongst the Circar mountains; it grows to a great size in standing sweet water.

Culms of great extent, creeping, or floating, with their extremities erected above the water; on dry ground I have also found it where it is in general from one to four feet high.—Leaves as in other grasses; sheaths covered with stiff white hairs.—Spikes corymbed, numerous; from four to eight inches long, filiform, sub-erect, secund, level-toped. Rachis, common striated; partial three-sided.

•—Flowers oblong, in two rows, paired; one very short pedicelled, the other longer.—Calyx two-valved; the exterior valve small, the other as large as the coral, and seriated, but no third or inner valve,—Cow/ as in the family.—Seed oblong, smooth white.

Sect. 4th. Spikes alternate on one side only of a common rachis.

19. P. brizoides. Linn. Sp. PL ed. Willd. i. 338.

Culms sub-erect. Leaves thort. Spikelets remote, adpressed. Flowers oval, solitary, polygamous; inner two-valves of the calyx equal; nectarial petals long; seed ovate, pointed, rugose.

P. flavidum. *Linn. Sp. PL ed. Wiild.* i. 339. *Rttz. Obs.* iv. 15. appears to be the same plant growing on a barren sjil; this was the opinion of Kiinig. P. *flaccidum* of the *Banksian Herbarium* seems the same, or a variety only.

Teling. Oda, or Wuodoo-gaddt.

It is common in every soil and situation, even in deep water; in one that is rich and moist, it is often from two to four feet long, and again on one that is d:y and barren only as nnny indies. I* grows in tufts, various parts of it are often tinged purple.

Culms near the base resting on the ground, and rooting above, regularly ascending, compressed, smooth.— Leaves bifurious, smooth, their length differs much; mouths of the sheaths bearded.— Spikes compound, secund, their length various according to th* size of the plant. Spikehls secund, number very various, alternate, erect, pressing on the common rachis; below they are often two or three times their length from each other; above less remote. R&" Ciiis, common, somewhat three-side, with a groove on the outside where the spikelets rest.—Flowers always disposed in two rows, sub-globular.—Calyx two-flowered. Inner valve the size of the corol, middle valve rather shorter; all are striated with green nerves. —Corol one hermaphrodite, and one male, as in some of the species already described, always present, except in very minute plants, and even then the stamens of the second floret are only sometimes wanting.—Nectary, in each two obovate scales.—Seed short, oval, pointed, slightly rugose.

20. P.Jluitans. Linn. Sp. PL ed. Willd. i. 3S8.

Culms from two to three feet high, creeping at the base. LeaW

long. *Spikelets* numerous, approximate, longer than the interstices. *Flowers* hermaphrodite, oblong, two exterior valvelets of the calyces minute; *seed* oblong.

}3eng, Peti-nar.

Teling. Doosa.

Delights in a moist rich soil, such as the banks of water-courses, borders of rice fields, &c.

Culms sit the base creeping, above nearly erect, round, smooth, from one to four feet long, including the part that rests on the ground.—Leaves smooth, except about the moujlhs of the sheaths where they are bearded, and sub-ciliate.—Spike compound, secund, exceedingly like that of P. brizoides, only here it is generally longer, with often as many as twenty-five or thirty spikelets; their distance from one another is not so regular and is generally less than their own length.—Flowers disposed in two rows on the outside of the spikelets, which are oblong.—Calyx one-flowered, the two exterior valves very small.—Seed oblong, pointed, rugose.

21. P. lanceoiatum. Linn. Sp. PL ed. Willd. i. 337.

Culms, creeping. Leaves lanceolate, mouths of their sheaths elevated and bearded. Flowers hermaphrodite; valvelets of the calyces equal, the exterior one awned. Seed smooth, oblong.

P. aristatum, of the same author, seems the same grass.

Compare with P. compositum. Linn. Sp. TL ed. IVilld. i. 346. In the Baiiksian Herbarium the same species is labelled P. tuh guinosum. Grows under the shade of trees.

Culms creeping, ramous, with their extremities, from one to two feet high, sub-erect.—Leaves lanceolate, waved, often tinged with purple; sheaths shorter than the joints, hairy! mouths elevated, stipula-like, and hairy.—Spikes composed, secund; from six to twelve inches long. Spikelets alternate, somewhat remote, secund, direction between expanding and adpressed. Rachis, common and partial three-sided.—Flowers generally paired, one-sessile, the other •hort-pedicelled j insertions often surrounded with hairs, wheu single

there is an awn, or lie rudiments of a second floret accompanying it—*Calyx*, the exterior glume as large as the next within it, and end-* in in a long waved, puiple awn; exterior glume rather longer. Corol no neuter, nor male tloret.—Seed oblong, smooth, slightly three-nerved.

Obs. Cattle are not fond of it.

M. P. Burmanni. Linn. Sp. VI ed. Willd. i. 339- Retz. Obs, iii. N. 16.

Culms, creeping. Leave* lanceolate, hairy; jloncers hermaphrodite; all the valvelets of the caljces hairy, and awned. Seed slender, smooth, pointed.

P. hirtellum. Burm. hid. 24.1.12./. 1.

Hippogrostis amboinica. Rirmplh amb. vi. p. 14. t. 5.f. 3.

This species is always found on pasture ground, udder the shade of large trees.

Culms, creeping, branchy, with their extremities erect.—Leaves sheathing, lanceolate, waved, hairy; sheaths half the length of the joints; very hairy.—Spikes compound, secund, erect. SpikeleU from four to eight, alternate, secund, adpressed. Rachis, common and partial three-sided.—Flowers generally paired; one sessile the other pedicelled.—Ca/yx, the two exterior glumes are hairy, and have long awns, that of the inner is shorter and smoother.

, 33. P. stagninum. Linn* Sp. PL ed. Willd. i. 337.

Culms, from one to four feet high. *Leaves* smooth. *Flowers* p0-lygamous, three-fold, sub-sessile. *Calyces* hairy, and hispid; inn^{el>}-valvelets awned.

Beng- Dul.

Teling. Pedda-woondoo.

Delights in wet, cultivated, paddy lands.

Culms, towards the base resting on the ground, and striking root; above erect, which part is from one to four feet high.—Leaves smooth, soft, with only the mouths of the sheaths ciliate.—Spike*

*

1

compound, secund, erect. *Spikelets*. alternate, sessile, secund, expanding a little. *Rachis*, both common and partial three-sided.— *flowers*, very numerous; three-fold below, above in pairs, all sessile, or nearly so; their insertion surrounded with small bristles, in. volucre-like.—*Calyx*, only the inner valve awned, all striated, hairy and hispid.—*Carol*, complete; *male* florets, besides the usual hernia* phrodite one.

Obs. This is a coarse species. Cattle are not fond of it.

24. P. crus corvi. Linn. Sp. PL ed. Willd. i. 337-

Culm, creeping at the base. Leaves downy. Spikes from six to ten, thiee times longer than their interstices. Calyces downy. Corol three-valved. Seed oblong, obtuse, smooth.

A middle-sized, delicate, rare species, found on pasture ground. *Culms*, tiiifoim, creeping at the base, above nearly erect, ramous. —*Leave** soft, downy; sheath hairy.—*Spikes* compound, secund, from one to three inches long. *Spikelets* from four to twelve, alternate, addressed, secund, about three-fourths of an inch long; some, times there is a very small ramitication at the lower part of one or two. *Rachis*, common, two-furrowed; partial, three-sided, downy. —*Flowers* paired, or single, in two rows; both pedicelled; *pedicels* hairy, of 'unequal length, but both short.—*Calyx* striated, very downy...—*Corol*, the neuter valve LS here present*—*Seed* oblong, smooth, shining white.

25. P. colonum. Linn. Sp. P/. ed. Willd. i. 338.

Culm's, creeping at the base. Spikes from six to ten, short. Flowers three-fold, sub-sessile. Glumes of the calyces three-nerved. Carol three-valved; seed roundish, smooth, three-nerved.

JBeng. Shama. There is a reddish variety, called Lal-shama.

Teling. Woondoo-gaddi.

Delights hi rich pasture ground.

'Culms, below resting on the ground, and rooting; above sub-erect, Jhat part is from one to two feet high, branchy, a little compressed, smooth.—Leaves tending to be bifarious, short, smooth, tapering from the base to a sharp point.—SpiTces compound, secuncf. Spikelets, from six to twelve, alternate, somewhat remote, secund. Rachis, both common and partial three-sided; the two sides from wheqce the spikelets issue concave.—Flowers two or three from the same point, generally three; all sessile, or ver) nearly so; sometimes a jew small bristles mixed with them.—Calyx as in the genus, all the glumes three-nerved, a little hairy, and scabrous.— Qorol, the neuter valve is here present, but no stamens.—Seed broad, oval, smooth, a little pointed, three-nerved.

Obs. Cattle are very fond of it, yet it is not cultivated in these parts.

£6. P. grossarium. Linn. Sp. Th ed. Jülld* i. 349.

Culms, creeping. Leaves soft and downy. Spikes from six to ten; Ilowers solitaiy, sub-sessile. Carol three-valved. Seed oblongi acute, transversely rugose.

Loves fresh pasture ground.

Culms, in a good soil creeping to a great length, in a poor soil nearly erect.—Leaves, tapering from the base to a fine point, somewhat downy, and very soft.—Spikes compound, secund. Spikelets from four to twelve, alternate, secund, expanding on one side, most simple, in two rows.—Calyx pretty smooth.—Corol, the neuter val\e is always present. Nectary a rugose gland between the gerfli and exterior valve of the corol.—Seed oblong, white, slightly rug<> in a tiaus\eise direction.

CLs. The form and rugosity of the seed distinguish it from P-colonum, the flowers also are here single, their two or three from the same point.

27. P. umhrosum- Limy Sp. PL ed. IVilld. i. 343.

Culms, at the base creeping. Leaves soft. Spikes, from six to ten; Ilowers paired on a common pedicel. Corol three-valved. If ovate, longitudinally streaked, and transversely rugose.

This is also a native of pasture ground, hut chiefly that which is shaded.' It is exceedingly like the last described species.

Culms, creeping, &c. as in the last.—Leaves also the same.—
Spikes, the same as in P. grossariwn. Spikelets or rather racemes, the lower one or two sometimes branchy in luxuriant plants. Rachis, common striated; partial three-sided, and downy.—Flowers, the inferior ones in paiis, upon a short, common pedicel; besides, having their partial pedicels, one of which is nearly as long as its flowers; above they are often single, sjnd somewhat remote; hairs surround the insertion of all.—Calyx hairy.—Carol, the neuter valve is here present.—Seed ovate, a little pointed, rugose, like that of the last species.

Ubs. The chief character consists in the lower flowers of the racemes being paired on a common peduncle, with pedicels of very unequal lengths and hairy involucres.

28 P. cuspidatunt. R.

Creeping near the base, wholly smooth. Leaves linear, without ligula. Spikes compound, secund; spikekls adpressed, secund; flowers from one tot! nee, equally sub-sessile, all hermaphrodite; valves of the caixx three nerved, and cuspidate. Seed cusp.idate.

A native of Bengal. Found in a rich moist soil, in flower and seed in April.

Culms, numerous in luxuriant tufts, creeping near the original root, then ascending to, about two feet in height, raijious, smooth.—

I eaves ensiform, smooth, with coloured margins. Sheath shorter than the joints, smooth, and completely destitute of ligula.—Spi/ps coinpound, sccund,-slightly recurvate, with the secund spikelets on the convex side pressing on the common, three-sided, hispid rachis; often of a dull purple colour—Flozvers, from one to three together, and equally sub*sessile.—Calyx, all the glumes three-nerved, and cuspidate, and generally armed with a few minute bristles.—Corot three-valved; the third or accessary one membianaceous, and neuter.—Seeds ovate, smooth, cuspidate,

Sect. 5th. Spikes alternate on all sides of a common rachis.

£9. P. setigerum. Linn. Sp. PL ed. Willd* i. 338:

Culms, below creeping, sub-ligneous. Leaves with cordate base and ciliate margins. Insertions of the spikelets and Jlowers bristly* Corol three-valved. Seed oval, transversely rugose.

JJeng. IWa-jal-ganti.

P. setigerutn. lletz^Obs. iv. 1Q.

Grows amongst bushes or under the shade of trees.

Culms long, straggling! looting when they rest on the ground, firm, almost woody towards the base, but small, and very smooth; joint* downy.—Leaves sheathing, broad-cordate at the base, tapering fr<>111 thence to the pomt; margins ciliate, and waved; mouths of the rfieaihs hearded.—Spike's compound. Spikelets from four to twenty; secund, spreading, dispose requally on all sides. Rachis, com* mon four, five, or six-sided, partial three-sided.—Flowers paired pairs alternate, in two rows, one sessile, one pedicelled, intermixed with many long slrong hairs, like an involucre.— Ca/yx, the two in* ner glumes downy and striated length way's with many green nerves.

*>—Coral, the ueuter membrauaceous valve always present, but no star sueus.—Seed oval, transversely rugose.

Obs. When exposed to the weather, the leaves are of a smooth shining deep gieen, when under trees, of a pale colour, soft, and somewhat downy, which made me long think they were different species. Cattle are fond of it.

,30. P.jepens. Linn. Sp. PL ed. Willd. i. 347.

Creeping. *Leaves* bioad, waved, base cordate, stem-clasping, and piliate. *Spikes* from four to ten, equally disposed on all sides. *Flow pr\$* awnless; *involucre* hairy. *Corol* three-valved.

P. repens. Barm. Lid* /. 11./ 1. is like this, only the partial spikes are rather too long, and the leaves too narrow.

Common about the beginning of the ruins on cultivated li^nd, in gardens, &c. near Calcutta. It is a pretty, cespitose species which cattle arc fond of.

Culms, creeping to the extent of from one to two feet, geniculate, smooth, often coloured.—Leaves lanceolate, base cordate, stemclasping, and ciliate. Sheaths shorter than the joint9, somewhat hairry.— Spikes from four to ten, small, short, sessile, secund, equally inserted on the four or six-sided, villous rachis.—Flozcers generally paired, and both unequally pedicelled, with an involucre of long soft hairs on the outside of the pedicel.—Calyx', exterior valve minute, and truncate, the inrter two equal, five-nerved.—Cotol, with a neuter valve.

31. P. hirsutum. Kdn.

Leaves broad-lanceolate, with cordate, stem-clasping base, waved, ciliate, and hairy. Flowers, polygamous, solitary, sessile. Seed ovate, transversely rugose.

Hind. Jal-ganU*.

Te/ing. Salla-woodoo.

Is found on the borders of cultivated land, on pasture ground, Sec.

Culms, spreading at the base; resting on the ground and rooting; above asceijding; joints downy.—Leaves broad, base cordate and embracing the culms, much waved, hairy, with the edges ciliate; sheaths also hairy with a thick beard round the mouths.—'Spikes composed of six or twelve, simple, alternate, secund, expanding spikelets, surrounding a common, four or five-sided, hairy rachis.—Partial, rachis three-sided, hairy .—Flowers in two rows, single, alternate, sessile, often intermixed with bristles.—Calyx, all the valves hairy and striated.—Corol; a complete, one-valved male floret in the same calyx with the hermaphrodite.—Seeds ovate, transversely rugose, white, daggered.

Obs. Cattle are very fond of it.

32. P. tomenlosum. R.

Culms, sub-erect. Leaves hairy; spikes from ten to twelve, oblong, from six to eight-flowered, intermixed with hispid bristly involucels. Seed ovate, transversely wrinkled.

This is a delicate, rare species, found growing in tufts, or dry pasture ground over various parts of India.

Culms, ascending, compressed towards the basé, branchy, from twelve to eighteen inches high.—Leaves soft, covered with much, long, soft hair; sheath half the length of the joints; mouth bearded.— Spikes compound, terminal, consisting of ten or twelve (generally alternate, though sometimes in pairs) spike/ets of six or eight flowers, intermixed with hispid bristles, they are not placed on oild side, but round the, common rachis, which is generally three-sided.—Calyx, the two interior valves five-nerved; the second, half the length of the corol, as in P. glaucum.—Corol\\a& a third neUter valve.—Seed transversely wrinkled, as in P. glaticum.

33. P. verticillatum. LiQ. Sp. PL ed. Willd. i. 334.

Spikes cjliudric. Spikelets quatern, sub-\erticelled. Incolucebt backwardly hispid bristles. Seeds oblong, three-nerved, and rugose. Hind* Dora-byara.

Teling. Chicklenta.

Delights in a rich soil in out of the way corners, where there i* rubbish, Sec.

Culms, below resting on the ground and striking Toot, above weak, often leaning over to one side/smooth, length of the creeping? art; from one to two feet, and that of the more erect culms from one tff two feet.—Leaves sheathing, linear-lanceolate, a little downy; margins hispid when felt backwards; mouths of the sheaths hairy. Spikes columnar, compound, from three to four inches long, generally matted together by means of the bristly involucels.—'Spike* lets or rather racemelets, tending to be verticelled, generally four the verticel, composed of three or four short-pedicels, each bearing a few flowers; all intermixed with very stiff bristles (Involucefs) armed with short, stiff, recurved points, by which they adhere firmly to every thing that touches them.—Calyx as in the family.—Coroh a third neuter valve, but no stamens tsi it.—Seed three-nerved, and slightly waved across.

06\$. Cattle will not eat it, so that it is reckoned a troublesome Weed wherever it is found.

Plants reared from English seed, were not near so luxuriant as those of Ind.a, but evidently the same species. Thunberg's large cultivated variety is certainly *Panicuni italicum*. Curtis's figure in his *Flora Londinensis* is represented with the leaves broader at the base than our Jndian plant, or even than in plants reared in India from English seed.

34. P. italicum. Linn. Sp. PL ed. Ifilld. i. 336.

Culms erect. Spikes nodding; spikelets scattered, ovate; pedicels-from two to three or four-flowered, with smooth bustles intermixed. Seed ovate, three-nerved.

P annum. Humph. A/)ib. v. p. 202. W.75.f. 2.

Sans, era", K«ugoo, f^ff, Piiymigoo.

Beng. Kungoo, and Kungnee.

Hind. Kora.

Teling. Kora; Koraloo, the grain.

This is one of the plants called dry or small grain. It is cultivated in many parts of India, and requires an elevated, light soil. I never saw it wild.

Culms several from one grain of seed, erect, from three to five feet' high, round, smooth; roots issuing from the lower joints.—Leaves. margins backwardl) hispid; mouths of the sheaths bearded.—Spikes compound, &c. There is more or less of a third, or neuter valve on the corol.

Obs. Small plants have the spike more erect, and uniform, without vacancies between the racemelets.

The seed is an article of diet with the natives. It delights in a light, elevated, tolerably dry soil. Seed time for the first crop, about the month of June and July; harvest time in September; produce about fifty-fold in a favorable season. A second crop may be had from the same ground, between September and the end of January.

35. P- stricttm. JR.

Culms straight, from two to three feet high. Spikes compo^{un(*)} cylindiic, straight, with numerous expanding spikelets. Glumes of the calyx hairy, and acute. Corol three-valved, the innermost one awned.

Jieng. Gang-bena.

A native oi Bengal, where it is found, though rarely, on dry barren spots.

Culms straight, from one to three feet high, slender as a crow quill, hairy, particularly at and near the joints.—Leaves short, straight? broadest at the base, and from thence tapering to a fiue point; a little hairy, particularly underneath.—Sheaths more hairy, their mouths bearded with much long, soft, white hair.—Spikes, (pa»¹-cles) cylindiic, straight, composed of numerous, one-ranked, expanding, short spikelets.—Flo&s paired, on shorter and longer pedicels which unite before their insertions into the rachis of the spike* lets.—Calyx, valvelets acute; two exterior with a few straight hair8? inner one smooth; corol-like.—Corol three-valved, the inner and smaller one awned.

\$6.T?M\$pidulum. Retz.Obs.v.p. 18. Linn. Sp. Pled. Willd.i.346.

Culms erect, from three to four feet high. Spikes panicltd, erect, lanceolate; spikelets secund; flowers two-folo, both sub-sessile» valvelets of the calyx bristly, the middle one daggered, the inner ow awned; corol three-valved; seed ovate, pointed, polished.

Beng. Bwra-Shama.

Grows on the borders of rice lands, and rich moist places. Is ⁿ ver cultivated nor made any use of.

Culms erect with a few erect branches.—Leaves long, narro p fine-pointed, smooth—Spikes straight, panicled, composed of p merous, secund, erect spikelets, surrounding the common fou five, cr six-sided rachis.—Flowers numerous, almost always together and equally sub-sessile.-Catyx, all the three valves harsh with numerous sharp bristles issuing from the nerves of the glum p

The two exterior ones with sharp subulate points; the inner one ends in a pretty long, strong, hispid arista.—*Corol*, with a third, membranaceous, neuter valve.—*Seed* ovate, pointed, polished.

Obs» It comes near my P. *fmme/Uaceum*, and may probably be the same in its wild state,

37- P. frumentaceum. iJ.

Culms erect, from two to four feet high. Panicle erect; spike? flecund, incurved; flowers three-fold, unequally pedicelled. Valvelets of the calyces daggered, or awned; send ovate, smooth.

Sans. ?\$XZ{T3\\ Shyamaka.

Beng. Shaina.

Teling. Bonta-shama; shamabo, the grain.

This I have only found in a state of cultivation, it delights in a light, tolerably dry, rich soil; the sale ground yields two crops between the first of the rains in June, July, and the end of January.

Culms erect, ramous, a little compressed, smooth, from two to four feet high.—Leaves large, margins hispid.—Panicle erect, oblong, rigid, composed of numerous, secund, condensed, incurved spikes; they entirely surround the common rachis and sometimes tend to be verticelled. Rachis, common five or six-sided, a little hairy; partial three-sided, waved.—Flowers almost always three from the same point, one sessile, the second short pedicelled, and the third a little longer pedicelled.—Calyx, with all the glumes three-nerved; the two large daggered.—Corol, with a third neuter valve.—Seed ovate, pointed, smooth.

Obs. There are several varieties of it known to the Hindoo farmers. The seed is wholesome and nourishing, it is an article of diet, particularly amongst the lower classes of the natives. It yields about fifty-fold in a good soil. Cattle are fond of it.

Sect. 6th. Panic/ed.

38. P. trigonum. Linn. Sp. PI. ed. fVUld. i. S52.

Culms creeping. Panicle halved. Leaves stipuled. Pedicels two
Mm 2

flowered. *Inner* valve of the calyces vaulted; *eorol* three-valved. *Seed*, half round, smooth.

Grows on pasture ground, under the shade of trees, &c.

Calms creeping, filiform, from one to two feet long, with a fex* inches of the extremities erect.—leaves lanceolate, soft, a little downy; sheaths cihate, with a stipule-like process —Fanicle halved, oblong, smooth, composed of from three to ten ramous bianchlets, littug on one side only when the plant is sin.ill; pedicels t^o-flowered. Partial pedicels unequal —Calyx, inner vahre cucullate, obtuse; all the valves striated and hair;.—Carol, with a neuter, but small valve.—Seed smooth, obtusely and obliquely three-sided.

39. P. patem. Linn. Sp. PL ed. Willd. i. 352.

Calms creeping. Leaves witii a cordate base. Panicle oblong*
Pedicels one-flowered. Ap three-valvelets of the calyces equal*
Flowers polygamous. Seeo/nat on one side, smooth.

A small, delicate, creeping species ^ it delights in shady pasture ground.

Culms like those of P. trigonum.—Leaves broad, with a cordate base, from thence tapering to a tine point, downy; sheaths haiiy* their mouths want the stipule-like process.—Panicle small, about one and a half or two inches long, oval, ramous; ramifications smooth.—Flowers oval, solitary.—Calyx9 two-flowered, the ihree valves are nearly equal, all smooth but striated; the inner one appearing more like a second valve to the male rtoret than one of the calyx, and the more so as it drops off with the seed, leaving the two exterior ones behind.—Corol, one male, or sometimes one neuter, and one hermaphrodite.—Seed oval, smooth.

40. P. brevifolium. Linn. Sp. PL ed. Willd. i. 353.

Culms creeping. Leaves lanceolate, cordate. Panicle ovate, very ramous, partly hid in the sheath of the exterior leaf, second valvelet of the calyces bearded; corol three-vaUed. Seed ovate, smooth.

Grows, with the two preceding species on shaded pasture ground and is very much like them.

¹ Cfilms creeping as in the two last described species, but rather more robust.—Leaves broad, and somewhat cordate at the base, waved; margin* of the sheaths r.iliate.—Panicle, the lower part always confined within the sheaths of the extreme leaf, oval, from three to five inches Ion?, composed of numerous vuy fine cajillary ramifications, the common rachis and larger branches very woolly.—Flowers obliquely-oval, numerous, on very tine, long pedicels.

•—Calyx, the exterior valve lanceolate, the second boat-shaped, with the outside covered with very long soft wool, the third ova!.-*-Corol; with a neuter valve, but no stamen.—Seed oval, smooth, white.

41. P. lenellum. R.

Culms ascending. Leaves long. Panicles oblong, very ramous. Flowers solitary, remote; second valve^ts of the calyces recurved, and painted. Corol, three-valved. Sera oval, smooth, five-nerved.

Grows on pasture ground, borders of cultivated lands, &c*

Calms many, branchy, near the ground prostrate, routing at the joints, the rest ascending; from one to two feet hi^h, and as thick as a sparrow's quill.—Leaves soft with white hairs—Panicles oblong, generally as long as the rest of the plant, thin, composed of expanding, capillary, ramous branches.—Flowers remote, oval, small—Ctf-tyx, the glumes stilated, otherwise smooth.—"Coral, with a third neuter valve.—Seed oblong, smooth, light-brown, five-streaked.

42. P. serrulatum. R.

Culms erect, from two to four feet high. Leaves sword-shaped, Vith serrulate margins. Punicle, spiked valvelets of the calyces sharp-pointed; Seed smooth, oblong.

A large erect, coarse species: a native of moist valleys.

Culms erect, ramous, from two to four feet high. Leaves somewhat cordate at the base, from thence tapering to a point, margins ciliate; sheaths as long, or longer than ihe joints, smooth.—Panicle erect, linear, composed of erect, linear, ramous ramifications, which, stand somewhat remote, particularly below, so that the pa-

nicle appears to be a compound, interrupted spike.—Flowers lanceolate.—CalyXy glumes lanceolate, very acute, the two inner ones somewhat hispid on the back.—Corol single, hermaphrodite.—Seed oblong, smooth, white*

4S. P. paludosum. 22.

Calms erect, from two to three feet high* Panicle erect, ovate* thin5 ramifications few, three-sided, with sharp hispid angles; pedicel two-flowered; valvelets of the calyces cuspidate. Corol three-valved. Seed oblong, smooth.

Beng. Boruu, and Kttltfs-nar.

Teling. Soda.

It grows generally in sweet water amongst the Circar mountains-

Culms erect, from two to hree feet high, swelled under the water, and ihere emitting roots from the joints.—Leaves erect, acute, retrorso-hispid; sheaths longer than the joints, with a thick bearded mouth.—Panicle oval, diffuse, thin, composed of scattered, sub-*''' ternate, ramous branches; all nearly triangular, the angles sharp* and armed with tine points.—Flowers oblong, pointed, in pairs of a common pedicel with unequal partial pedicels.—Calyx, exterior valve short, broad, involving the bottoms of the others.—Corol, wit*¹ a small neuter glume, always without stamens.—Seed oblong, smooth* brown.

O6s. This grass is of a coarse nature; cattle are not therefore fon of it When it grows on dry ground, the grass is much smaller; but the panicle larger.

44. P. vliginosum. R.

Culms erect, from two to four feet high. Panicle thin; ramifications four-aided, smooth powers polygamous, solitary; seed oblong; smooth.

Beng. Burtmda.

Teling. Gundru.

A native of the moist borders of rice fields, in wet ground.

Root fibrous, white.—Culms many, ramous, below renting on the ground and rooting; above erect, a little compressed, smooth; from two to four feet high.—Leaves short and sharp, inside a little downy; sheaths shorter than the joints; mouths bearded. paludosurn they are surrounded on the inside with hair. ramifications are compressed, and somewhat four-sided, there triangular, and hispid.—Panicle more contracted than in paludosum.— Calyx the same.—Corol, with a complete male floret.—Seed oblong, smooth.

TOIANDRIA

Obs. To distinguish it from P. paludosum, attention must be paid to the leaves, ramifications of the panicle, and male florets.

45. P. sarmentosum. R.

Perennial, inane, hairy, sarmentose, with sub-erect, floriferous shoots from the joints. Panicle patenW Flowers solitary; calyces smooth and obtuse, containing one hermaphrodite and one neuter floret.

A native of Sumatra; and from thence introduced by Dr. Charles Campbell into the Botanic Garden in 1804, where it grows luxuriantly, and blossoms throughout the year.

Culms round, sarmentose, and of great length, inane, with nearly erect, frequently ramous, floriferous shoots of about two or three feet in height rising from the joints; every part clothed with much soft hairy pubescence, particularly the runners.—Leaves ensiform, soon becoming reflex, margins hispid, length from six to twelve inches, from half to three quarter of an inch in breadth at Sheaths rather longer than die joints.-- Pa* the broadest part. nicle terminal, ovate; composed of many, single, alternate, patent, compound, smooth branches.—Flowers very numerous, awnless, smooth, solitary, pedicelled___Valves of the calyx three, obtuse, slightly marked with green nerves, the exterior one long, containing % two-valved hermaphrodite flower, and a small neuter one,

46. P. miliare. Lamarck.

Culms erect, ramous, from two to thre* feet high, smooth* P<ti

nicle thin; flowers paired on a common pedicel, with unequal partial pedicels; corol three-valved; seed ovate, smooth, five-streaked.

Teling* Nella-si.aina. Nella shamaloo, the giain.

This species I have found only in a cultivated state, it is one of the sorts of dry or small grain which is generally cultivated on an elevated, light, rich soil.

Culms, many from the same seed, erect, branchy, round, smooth, from two to three fegt high.—Leaves \$ur>oih.—Fatt>cJe oblong/beautifully bowing with the weight of iliegiatn; b>iiuclies alieiiia^{te}> - ramous; capillary, angulai, lu-pid.—Fiowsrs oval, paired upo» a common pedicel, with unequal partial pedicels—Calyces, gluwes smooth, striated length ways with uerves.—Coiol, accompanied by a neuter vale.—Seed oval, striated, smooth, shining brown.

Obs. The seed is an artidfc of diet with those Hindoo* •who iuba* bit the higher lands. Cattle are fond of the straw.

47. P. miliaceum. Linn. Sp. PL ed* Willd. i. 348.

Calms erect, ramous, from two to four feet high; the whole p'ant very hairy. Panicle oblong; glumes of the calyces cuspidate; coro* three-valved; adventitious valve two-toothed; seed oval, sniootHj five-streaked.

Sans, jftftSfc, Vreehibheda, 3 ^, Unoo.

Hind, and Beng. Cheeiuz.

Teling. Worga; Worglo, the grain.

This is another of the cultivated cerealia; the same soil suits 1^{t} as is proper for the last described species. Time of culture immediately after the rains.

Culms many from the same seed, erect, ramous, very hairy; fr. 11 two to four feet high.—Leaves large, with long sheaths, which movelve most part of the culms, every part covered with much vou hair.—Panicle as in the former, only here and there a hairs.—Calyx all the three glumes are much pointed.—Coro/it* neuter valve is here emarginate. Nectary two, triangular, emtu's

ate bodies embrace the germ laterally.—Seed oval, mouth brownish, with smooth, coloured streaks lengthways, as in the last.

48. P. tenue. R_m

Culms erect, ramous; from one to six feet high. Panicle thin, flowers paired on a common hairy pedicel, with unequal partial pedicels; Carol three-valved; Seed ovate, transversely waved.

This is a wild species, which grows amongst the Circar mountains. Culms erect, sometimes resting on the ground, and striking root there, ramous, smooth, from one to six feet high.—Leaves large; upper-side hairy; edges armed with very sharp points. Sheaths shorter than the joints, hairy, with their mouths bearded.—Panicle erect, till the seeds are ripe, then, as in the cultivated sorts last described, bowing from the weight of the grain, it is composed of alternate, compound, nearly secund racerafes. Rachis, common from four to five-sided; partial three-sided, winding, and hairy.—Calyx, glumes many-nerved, otherwise smooth.—Corol, the neuter valve is here present, and in luxuriant plants, the stamens also.—Seed oval, transversely wrinkled, which distinguishes it from all the other panicled species.

49. P. plicatum. R.

Erect, herbaceous, harsh with stiff hairs. *Leaves* lanceolate, plicate. *Panicle* lanceolate, ramifications compound, flowers paired, polygamous.

Introduced into the Botanic Garden, from the Island of Sumatra. Flowering time the beginning of the cold season.

Root perennial:—Culms erect, or ascending, below as thick as a goose quill, and then somewhat compressed; every part filled with pith.—Leaves sub-bifarious, expanding, lanceolate, plicate, a little hairy; from six to twelve inches long, and from one to two broad.—Sheaths about the length of the joints of the culms, armed with *harp, rigid hairs; mouths ciliate.—Panicle oblong, lax; lower [3]

mifications rather remote, above appYoximate, and composed or unilateral short spikelets.—Flowers solitary, paired^ or threefold, when more than one they are on pedicels of unequal lengths; sometimes there is a single coloured bristle from the pedicels of the exterior flowers.—Calyx three-valved, two-flowered, one of the flowers male, with a corol of one membranaceous glume; the other, hermaphrodite, and having the usual iwo-valved coro!.—Seed oblong, rugose on the convex-side.

(Ms. It is of too coarse a nature for cattle, but its foliage make it ornamental in the shrubbery, or flower-border.

50. P. nervosum. R.

Erect, from three to four feet high. Leaves lanceolate, plaited; sheaths longer than the joints, with the mouths bearded. Panicle very lliin, composed of long, sfhiple, filiform, remote branches. Flowers generally single, with a neuter valve to the corol.

From Nepalfl Dr. Buchanan sent lite seed to the Botanic Garden, where the plants blossomed in October, just one year from the time the seed was sown.

Root perennial.— Culms erect, slender, completely invested in tly sheaths of the Iea\es, except from six to twelve inches below 1bc panicle; height three or fuur feet.— Leaves lanceolate, plaited, a little hairy, particularly near the base, from six to twelve inches long* and one and a half broad.—Sheaths longer than the joints, a little hairy; mouths bearded.—Panicle very thin, and composed of long* simple, filiform, drooping branches. Spikelets remote near tie base, secund, bearing a few alternate, generally single flowers.—Calyx three-valved, smooth, from three to seven-nerved.—O0 with a third neuter \alve, but no stamens.

Obs. In foliage this agrees very exactly with my Panicum plicaturn, but differs widely in the panicle,

51. Fl cost at urn. I?.

Culms creeping. Ztarr* lanceolate, plaited, very hairy, as a so

their sheaths, which are shorter than the joints. *Panicle* compos* ed of short expanding, secund, spiked-racemes. *Flowers* polygamous.

Introduced into the Botanic Garden from the Mauritius, by Captain Tennant, in 1802.

Culms creeping, throwing out numerous strong roots from the joints; length from three to six feet.—Leaves lanceolate, plaited, hairy; about six inches long, by one broad.—Sheaths shorter than the juints, very hairy.—Panicle oblong, smooth, composed of somev.hat compound, secund, spiked-racemes, with here and there an arista-like coloured brislle—Calyx three-valved, smooth, from three to five-nerved.—Corol three-valved, two-iiowered; the exterior floret one-valved and male. Seed transversely rugose.

Obs. In the foliage this is perfectly like my P. nenosum and pli- "catum.

52. P. montanum. R.

Culms erect, smooth, from three to four feet high. Leaves lanceolate, unequally divided by the nerve. Panicle oblong; ramifications capillary, straight. Corol two-valved; Seed smooth, oval, three-nerved on the back.

A native of the Circar mountains.

Root fibrous, from a ligneous perennial head.—Culmjs erect, smooth, of a fiun woody texture, as thick as a crow quill, and three to four feet high,—Leaves lanceolate, large, beautifully striated lengthways, somewhat hairy, lower margins next the mouths of the frheath ciliate; the nene divides the leaf unequally, which is au uncommon circumstance in grasses.—Panicle linear, oblong, from twelve to eighteen inches long, composed of straight, sub-erect, capillary ramifications.— Flowers small, oval, remote.—Calyx as iu he genus.—Corol as in the family; this is one of the few instances of the want of a male or neuter floret.—Seed smooth, brown, with hree stripes.

PHLEUM. Schreb. Gen. N. 128.

Calyx two-valved, sessile, linear, truncated, with a bi-cuspid tip-Coral inclosed.

]. P. crinitum.

Grows in tufts; *Culms* ascending. *Panicle* linear, crowded wit^h innumerable soft, bearded ramifications; both glumes of the *caly** awned and ciliate, and the large glume of the corol awned.

A native of Nepala, and of the northern part of India-

From the former country it was introduced into the Botanic Garden by Dr. Buchanan; and from the latter by Col. Hardwicke.

Culms numerous from a single root, ascending, length from six to twelve inches, round, smooth, and involved in the sheaths of the leaves, which are longer than its joints.—Leaves ensiform, from three to six inches long, smooth.— Panicle linear, oblong, deuxexecedingly soft from the immense number of most delicate, prescoloured awns.—Flowers minute and numerous.—Calyx, glunie one-flowered, two-valved; valves nearly equal, with a most delixeate, long, soft arists from the apex; hairy, chiefly on the backet and menibranaceous ciliate margins.—Corol two-valved; valves obtuse, much shorter than the calyx, as in general a very minute atforessues from the apex of the larger valve.—Seed smooth, oblong; but pbtusp.

Obs. In the cold season of 1802 -3,1 reared the same grass fro[^] seed sent from England by A. li. Lambert, Esq.

MILWM. Schreb. Gen. N. 10.

Calyx, glume one-flowered, two-valved. Corol two-valved, l^{eS} than the calyx.

1. M.^/i/brwze. JR.

Cieeping, smooth. Leaves shojt, with a stipulary process at

the mouth of the sheath. *Racemes* two or three, terminal, erect; *flowers* alternate, solitary, awnless.

Hind. Kanka juriya.

Grows on pasture ground, is a small, delicate species, has much the appearance of *Agrostis linear is*.

Culms creeping, except a small flower-bearing portion, which is erect, round, smooth; and from six to twelve inches high.—Leaves small, smooth; mouths of the sheaths stipuled.—Racemes two or three, terminal, sessile, erect, secund. Rachis membranaceous, a little waved.—Flowers single, alternate, imbricated in two row3, awnless.—Calyx, glumes nearly equal, membranaceous, a little hairy.—Corol, valves rigid, smooth.

2. M. sangninale. R.

Culms sub-erect, smooth. Racemes sub-digitate; flowers three* fold, on unequal pedicels.

Panicum sanguinale. Burm. Flor. Ltd. t. 10. f. t.

Beng. Chiri-chira.

A native of pasture ground.

' Culms sometimes creeping near the base, the rest erect, smooth, and about a foot and a half high.—Leaves long, narrow, smooth in every part.—Panicle racemed, sub-erect. Racemes from four to eight, secund, erect#rachis three-sided—Floaters generally in threes, though sometimes in pairs or in fours, all have pedicels of unequal length.—Calyx and corol as in the last species.

3. M. ramosum. Linn. Sp. PL ed. Willd. u 361.

Smooth; *culms* sub-erect, from two to four feet high. *Panicle* six or eight, remote, with somewhat ramous branches; *flowers* paired on common pedicels. *Calyces* pointed, and very hairy.

Found growing in large tufts, on moist, rich pasture ground.

Root creeping.—Culms from one to four feet long, spreading near the base, and striking root at the joint9 that rest on the ground.—heaves smooth.—Panicle oval, very thin, composed of a te;v, from

four to eight-compound, spreading, secund, racemes. *Rachis* of the racemes three-sided.—*blowers* below, on a common-pedicel, besides which each lia9 its proper pedicel, but of unequal length; above single.—*Calyx*, valves equal, pointed, and very hairy.—*Carol*, the exterior valves ends in an awled point.

AGROSTIS. Schreb. Gen. i. 111.

Calyx, glume one flowered, two-valved. Corol two-valved, larger than the calyx.

1. A. coromandeliana. Linn. Sp. PL ed. fVilld.i.S74. Relz* Obs. iv. N. 52.

Culms from four to eight inches high. Panicle verticelled; ramification simple, secund; inner valve of the calyx as long as the corol; exterior valve minute. Seed naked, obovate, rugose.

Teling. Yellika-t«ngoo-gad£.

A native of pasture ground.

- Culms spreading near the base, then ascending, from four to eight indies long, mostly involved in the sheaths of the leaves.—Leaves rather broad, waved and slightly ciliated; mouths of the sheath bearded.—Panicle oblong; large for the ^ize of the grass, composed of expanding, simple, ver.ticelled, secund racemes.—Flowers awnlcss, generally in pairs, unequally pedicelled.—Calyx, fxterior valve small, like that of the accessory valve in Panicum. Inner as large as the corol, and gaping with it when the seed ripens.—Seed, it drops uncovered by the corol, leaving it ancT the calyx in their places; it is of an oblique oval form, brown, and transversely rugose.

2. A. tenacissima. Linn. Sp. PL ed. Willd. i. 374.

Smooth, creeping. *Leaves* minute. *Panicle* filiform; exterior valvelet of the calyx shorter than the corol.

Teling. Tocma-genka.

A small, rigid species; growing on old, poor, stiff, pasture ground* where it 'forms extensive plants of tenacious turf.

Culms ramous, creeping to a great extent, with from four to eight inches high of their flower-bearing extremities, erect, smooth, filiform, and very firm.—Leaves very small, and smooth.—Panicle erect, linear; ramijications and flowers adpressed, from one to two inches long.—Calyx, exterior valve snhaller than the ipterior.—Corol as large and long as the inner valvelet of the calyx.

3. A. Matrella. Linn. Sp. PL ed. Willd. i. S66.

Creeping. *Leaves* pungent. *Spikes* terminal, solitary, few-flowered.

A native of the barren sandy lands, near the sea on the Coast of Coromandel.

4. A. diandra. Linn. Sp. PL ed. Willd. i. 371. Relz. Obs. v. N. 37.

Smooth; *culms* erect, from one to three feet high. *Panicle* linear, branchlets short, expanding *powers* paired, diandrous. *Calyx* scarcely half the length of the corol. *Seed* naked, obovalte, rugose.

BeHg. Bena-joni.

A native of moist pasture ground, in the vicinity of Calcutta.

Culms nearly erect, from one to three feet high, almost covered with the sheaths of the leaves.—Leaves narrow, tapering to a fine point, smooth; mouths of the sheaths slightly bearded.— Panicle lincaf-oblong, bowing a little, often a foot long, composed of expanding, alternate, compound; seemingly simple racemes.—F/ozvers in pairs on a common peduncle, but unequally pedicelled.—Calyx, valves equal, scarcely half tile length of the corol, smooth, membranaceous.—Stamens two. Seed narrow-obcordale, dropping from the calyx and corol, brown, obtusely rugose.

5. A. maxima. R.

Culms erect, from four to twelve feet high. Panicle ovate, expanding. Calyces minute, exterior valvelets of the coro! fringed with Ions hairs.—Stamens two.

This is the largest species I know; it is a native of hedges, &c. amongst the mountains.

Root ligneous, perennial.—Culms erect, from four to twelve feet high, often as thick as the little linger, round, and smooth, inside replete with a fibrous spongy substance.—leaves smooth, from one to two feet long; and from one to two inches broad at the base, tapering-from thence to a fine point.—Panicles erect, oval, or oblong* from one to two feet long, composed of alternate, ramous, filiform, expanding or bowing branches.—Calyx, valves equal, four times shorter than the corol.—Corol, exterior valve fringed round the margins, wiih long, soft, white hairs.—Stamens two.

Obs. The leaves of this plant are much more like those employed by the Chinese to pack up various articles with, than any ether I have yet seen.

HOLCUS. Schreb. Gen. N. 1565.

Polygamous. *Calyx*, glume two-valved, one to three-flowered-*Corol*, glume two-valved, the hermaphrodite awned.—*Stamina* three. *Styles* two.

1. H. iiervosus. R.

Erect, hairy. *Panicle* oblong. *Glumes* three, and five-nerved, cuspidnte, two-flowered; *flowers* both sessile, one hermaphrodite and awned; the other male and avvnless.

A native of Coromandel.

Calms erect, ramous; long, wiry roots issuing from the lower joints.—Leaves and their sheaths papillose, hairy.—Panicles oblong, smooth. Ramifications alternate, simple.—Flowers paired; one sessile, the other pedicelled.—Calyces two-flowered, three to five-nerved, smooth, straight, cuspidate, longer than the flowers.—Corol in both two-valved, the exterior floret male, large, and awnless, the inner minute, hermaphrodite, and awned.—Stamens three.—Style* two, in the hermaphrodite.

2. H. ciliatus. R.

Erect, hairy, panicle linear, hirsute. *Glumes* papillose, ciliate, two-flowered, both lowers sessile, oue hermaphrodite and awned, the other male and awnless.

A native of Coromandel.

, Whole plant about a foot high, erect. The *culms* with bearded joints.—heaves rather large, hirsutely papillose, as are also their sheaths —Panicles linear,,shaggy with the numerous hairs of the *calyces.*—Calyx two-valved, two-flowered; valves nearly equal, considerably longer than the flower, backs covered with little warts, from each of which arises a very conspicuous hair; apices cuspidate, and recurvate.—Corol two-valved in both.—Exterior floret rather larger male, or male hermaphrodite, and awnless; inner hermaphrodite and awned —Stamina three.—Styles two in the hermaphrodite, in the male hermaphrodite the rudiments of two, but no germ.

ISCHJEMUM. Schreb. Gen. N. 1569.

Polygamous. Calyx two-valved, two-flowered. Corols two-valved.

1.1. aristatum. Linn. Sp. PI. ed. Willd. iv. 939.

Annual. Leaves sword-shaped, ciliate and hairy, with coloured margins. Spikes paired, secund. All the calyces two-flowered; valves striated; exterior of the sessile flower with a bifid membranaceous border round the anterior margin; an awned hermaphrodite floret in each flower.

A native of newly formed pasture land, in various parts of India, appearing about the close of the rains. It is a scarce grass, and does not appear to be fit for cattle.

Culms at the base resting on the ground and there rooting, ramous; erect portions from one to two feet long, slender, with woolly joints—Leaves length of the spikes, ensiform, broadest at the base and there cordate, hairy, ciliate, with hispid, coloured margins.—Spikes two, terminal, secund, from one to two inches long. Racltis flexuose, joint-

ed, three-sidSd, with the angles very hairy.—Flowers in pairs, one sessile, the other pedicelled. Pedicel three-sided, and ciliate.—Ctf-lyxoi"the sessile flowers two-valved, two-flowered; one floret hermaphrodite, the other male. Exterior valve striated, with its anterior margins and apex enlarged with a broad, membranaceous, bifid bolder; inner valve boat-shaped, keeled, ciliate, and sub-aristate, one floret male, the other hermaphrodite.—Carol, glumes of each flore two-valved; t^p exterior one of the hermaphrodite floret bifid, with a Jong arista in fhe fork,—Calyx of the pedicelled flower two-valve"; two-flowered; valvelets equal, boat-shaped, keeled, ciliate, and sub-aristate; one floret male, the other hermaphrodite.—Carol, as in the sessile flowers, and also awned in the same manner.

Obs. I am not certain that this is the original I. aristatum of $l^{\wedge m}$ IKUS and Ketzius.

2. T. rueosum. Linn. Sp. PL ed. Willd. iv. 940.

Erect, ramous. Leaves lanceolate; spikes paired, bolh-flow ers awned; calyces oblique, obtuse, hard, and transversely rugose.

Is generally found growing among rice, and is so much like it, the inflorescence excepted, that they are not, till in flower, to be distinguished—Leaves large, smooth; mouths of the sheaths crowned with along, two-parted liguV—Spikes terminal, and fron* the exterior axi|s paired, erect, from two to three inches long. Rachis joiuied.—=Flowers in pairs; one sessile, the other on a short, thick, angular clubbed pedicel.

in size nearly equal, the exterior one rugose, and, very hard; one or the florets hermaphrodite, the other male, each with two membranaceous vato**-; the inner valve of the hermaphrodite flower has along twisted awn issuing from the middle of its back.

PEDICELLED FLOWER smaller. Calyx as in the other, but containing two male flowers, one of which is also awned.

3. I. semisagittatum. R.

Annual. Leaves ovate-lanceolate, semisagittate. Spikes paired,

secund, all the calyces two-flowered, exterior valvelets transversely rugose; hermaphrodite floret of the sessile flower awned.

A native of newly formed pasture land in Bengal. It is a rare grass, appearing about the close of the rains.

Culms ruinous, resting on the ground near the base, and there strikingrbot at the joints, the sub^erect portion from twelve to eighteen inches, very delicate, firm, atid smooth.—Leaves short, broaden si form, or rather ovate-lanceolate, with a cordate base, and one of the lobes generally projecting considerably beyond'the culm; margins slightly hispid, length one and a half or two inches.—Spikes two, terminal, sub-secund, an inch and a half long. Rachis jointed, scarcely flexuose, three-sided; angles hairy-Flowers in pairs, one sessile, the other sub-sessile, both with their base bearded.—Calyces of both flowers almost alike, two-flowered, two-valved; exterior valvelets obliquely-lanceolate and rather obtuse, the lower gibbous half transversely rugose, as in I. rugosum, upper portions triated lengthways; margins of the tower rugose portion notched; of the upper striated part ciliate; inner boat-shaped in both, one floret is male, the other hermaphrodite.—Cdrol, glumes of each floret two-. valved; the exterior valvelet of the hermaphrodite floret bifid, with a long arista in the fork.

Obs. It ought to be compared with I. barbatum.

4. I. conjugatam. J2.

Partly creeping. Leaves short, acute, with broad cordate base; Spikes conjugate, seemingly united. Flowers paired, with the exterior valves of both calyces even, and very woolly; the sessile one hermaphrodite, awned.

A native of pasture land in the vicinity of Calcutta, appearing in the cool season.

Culms very ramous, creeping near the base, filiform, smooth, length from six to eighteen inches, generally purplish.—Leaves with broad cordate base, from thence tapering to a fine point, sheaths smooth,—Spikes conjugate on a slender., clavate, purple peduncle j

united at the base, at all times continuing close as if one. Rachis very hairy, and jointed.—Flowers from four to eight pairs on each spike, one sessile, the other sub-sessile.—Calyces nearly alike* two-valved, two-flowered; the exterior valves even, acute, and uncommonly woolly on the backs; the inner boat-shaped, acute, and smooth. In each, one of the florets is hermaphrodite, the other male.—Carols all two-valved, hyaline; the inner valve of the hermaphrodite floret in the sessile flower bifid and awned.—Stamina three.—Styles two.

5. I. geniculatum. R.

Stems geniculate, creeping, smooth. Leaves ensiform; spikes conjugate, apparently only one. Calyces two-flowered, smooth, and crested; with the hermaphrodite flowers awned.

A small species, a native of Bengal. Flowering time the cooi season.

Culms polished, from one to two feet long, very ramous, diffuse, geniculate; joints large, emitting smooth, very brown roots.-" Leaves small, ensiform, smooth; sheath smooth, and shorter than the polished joints of the culm.—Spikes terminal, conjugate, generally so close as to seem only one, smooth, about an inch long. R& Clus jointed, flexuose; angles sharp, and sometimes hairy.—Flowers pan*' cd, one sessile, one peduncled.— Calvees, both two flowered; one Juxtertor hermaphrodite and awned, the other male and awnless. valve of the sessile flower enlarged with two, hard, serrulate crests, one on each side of the apex; inner mucronate, with a simila* crest on the back, under the apex; of the pedicelled flower hot are boat-shaped, mucronate, or sub-aristate, and the exterior one crested on the back under the apex; all are smooth and marked with green, longitudinal veins—Carols two-valved; the exterior valve of the hermaphrodite flowers bifid and awned.

6. I. tenellum* It.

Greeping near the base- Leaves linear; spikes paired; exterior

valve of the sessile flower truncate, the rest cuspidate, hermaphrodite flower alone avvned.

A weak straggling species.

Culms weak, creeping and ramous towards the base; towards the heads erect; the thickness of a pigeon's quill; joints bearded. Leaves a little hairy near the base, mouths of the sheaths ligulate, and hairy.—Spikes paired, &c. as in the last species.—Flowers paired, &c. Califx of the sessile flowers two-valved, two-flowered; exterior valve retuse and bordered; inner valve ending in an awled point—Flowers two, one hermaphrodite with a two-valved cofol, the exterior of which ends in an arista, the other is male with an awnless two-valved corol.—Calyx, of the pedicelled flower both valves alike, and ending in an awled point; it contains a single flower, which is sometimes hermaphrodite, and sometimes male, with the rudiment only of the second flower.

7. I. repens. R.

Creeping. Leaves short and acute. Spikes paired. Flowers all polygamous and awnless; glumes of the calyces smooth and cuspidate. Rachis smooth.

A native of Pulo-penang.

Culms creeping, flexuose, smooth, from one to two feet long.—
Leaves bifarious, sword-shaped, short, rigid. Sheaths as long as
the joints, a little hairy, with a stipulary process at the mouth—
Spikes terminal, paired, uniting a little above what seems to be
their base. Rachis jointed, three-sided, smooth.—Flowers about six
pair, one of each pair sessile, the other peduncled, both the pedicelled and sessile one consisting of a two-flowered, two-valved, rigid,
acute, smooth calyx.—Flowers polygamous, one hermaphrodite, the
other male, both awnless, each floret having a corol of two acute
valves.

8- 1. cuspidatum* K.

floating on' sweet water with a portion of the tops of the plant

emerging. Leaves linear, smooth. Spikes three-fold. Exterior valve of the calyces with a long, waved, en si form point; all the coroliets two-valved, and avvnless.

A native of Bengal, where it is found floating on pools of sweet water, and blossoming about the close of the rains in October.

Culms appear to be perennial, a fathom or two long, joiute: J. as thick as the little finger, floating_'Leaves linear, acute, from one to two feet Ion5, margins backwardly hispid, in other respects sm^-Hli.—

Spikes tormiual, three hi the only plant that has yet blossomed in this Garden, each about six of eight inches long, a little coinoressed; when the flowers expand about noon they appear like C'.^vaux <ie frise, at other times they appear smooth.—Flowers in pairs, une sessile, containing one hermaphrodite, and one male floret, the ot^1' pedicelled and neuter, or with two male florets.—Califx tw6-valved; erferzorValve rigid, with hispid margins and long,Hat, waved,.'h^ pid-margined, ensiform points; inner valve boat-shaped with « **** hispid keel.—Corols of each floret two-valved.

APLUDA.

Polygamous. J/iw/wc/'eone-vulved, two-flowered, one-ses^e, the other pedicelled with a pedicelled neuter rudiment. Calyces in of flowered, the sessile one poh famous, the pedicelled one the same, *

or with male only. Corols two-valved.

1. A. aristata. Linn. Sp. PL ed. Willd. iv. 938.

Perennial, creeping, orscandent. Leaves laaceolate. Hermaphrodite flower awned.

Ben*. Goroma.

Teling. Pootstrangali.

Is commonly found in hedges, under the siade of trees and sue like places.

Culms creeping, or climbing, as thick as a crow-quill, jointed, coloured, the lower part naked, inwardly spongy; from the join's Spring, erect, ramous, flower-bearing branches of from one to sevefl

feet high.— Leaves very elegant, somewhat bifarious, sheathing, petioled, linear-lanceolate, balkwardly hispid; from six to eighteen inches long; sheaths smooth, mouths short-stipuled.—Panicles terminal, and from the exterior axils, or, the whole may be considered, as one language panicle—Dractes three-flowered, boat-shaped, with an calcal point.—Flotfets, one of the three sessile, or rather sitting on a globular receptacle, consisting of a common, two-flowered culjax, one of which is sessile, awnecfc, and hermaphrodite; the other sessile male and awnless; just without the calyx on each side, tlit-rc is a bent, compressed pedicel, one of these supports a common calyx, with two male, two-valved, awnless flowers, the other only the nidi men is of one or more florets.

2, A?geniculata. R.

Perennial, creeping, or scandent, intricately geniculate. Leaves lanceoiar. In each calyx one hermaphrodite, and one male flower, all av/nless.

FtSuid op the banks of the Gauges in flower during the latter part -4>f the rains and the cool season.

Culms ' eping, or climbing amongst bushes, reeds, 2005 to an extent of many feet, smooth and slertder,4)ent at angles about a span distance at the swelled joints, emitting numerous wiry^roots, filled with spongy pith, {he thickest about the size of a crow-quill.

— Leaves linear lanceolate, and smooth, but much smaller than in A. aristata. Sheaths shorter than the joints. Ligu/a lacerate.—Panicks terminal, composed of numerous slender branchlets of distinct fascicles of flowers, each fascie'e containing many short pedicelled, three-flowered, boat-shaped, cuspidate, smooth bractes or involucres.—Flowers one of the three sessile, containing one hermaphrodite, and one male floret; the other two elevated or broad silicate; proper pedicels, one minute and abortive, the other polygamous as >n the sessile flower.—Calyces of both the sessile and pedicelled flowers two-valved: two-flowered.—Corol in all of them two-valved walves unequal^ exterior one thin, and transparent.

Obs. The accurate Gartner, Carp, vol. ii. p. 466 t. 175 gives to the sessile flower of A. *mutica*, one hermaphrodite, and one female floret, and to the pedicelled one two male ones, consequently twis must be different, and a second avvuless species.

AIR A. Schreb. Gen. N. 112.

Calyx two-valved, two-flowered, without the rudiment of a third. 1. A. Jiliformis. liön. Mss.

Smooth, erect, one foot high. *Leaves* ensiform. *Panicles* oblong, compound, of simple, linear, secund racemes.

A native of pasture ground.

Cuhn% erect, mostly naked, round, smooth, about a foot high!""*
Leaves small, smooth; mouths of the sheaths enlarged by a mem' brauaceous, torn process.—Panicle erect, thin, oblong, composed of alternate, simple, one-ranked, filiform, expanding racemes.— $Flo@^{\theta}$ ers in two rows.—Calyx two-flowered, large.

MELICA. Schreb. Gen. N. 113.

Calyx two-valved, two-flowered, with the rudiment of a third.

1. M. digit at a. JR.

Culms from four to five feet high. Spikes terminal, expanding? mostly five-fold. Calyx one-flowered; outer valvelets of the corol and rudiment awned.

A large beautiful species, a native of hedges, thickets, &c.

Culms near the base procumbent, but when supported by bushes erect and often from four to five feet high.—Leaves upper side somewhat hairy; mouths of the sheaths bearded.—Spikes four or five, digitate, secund, spreading, filiform, from six to nine inches longi hairy at the base, llachis three-sided.—Flowers in two rows, sessile, awned.—Calyx one-flowered; glumes unequal, the interior being three or four times longer than the exterior, and short-awned.

Corol, valves unequal, the largest has along awn issuing just bdow

its apex oh the outside.—Corpuscle, or neuter floret pedicelled, and awned.

2. M. refracta. R.

. Perennial, ascending. *Leaves* lanceolate. *Panicle* ovate, with the Ramifications refracted. *Petals* bearded, with stiff refracted bristles.

A native of the Moluccas, and from thence introduced amongst other plants, into the Botanic Garden, where it blossoms during the cold season.

Root perennial.—Culms ascending, from one to three feet long, round and smooth.—Leaves lanceolate, smooth; sheaths smooth, scarcely bearded at the mouths.—Panicle terminal, ovate; ramifications somewhat compound, and refracted like the drooping branches of 9ome species of Pinus.—Calif x smooth, two-valved, tWQr-flowered, with an abortive third, or the rudiment of one.—Corol, exterior glumes, chieriy of the second flower, bearded with refracted, sharp, stiff bristles which fix to every thing that touches them*

3. M. diandra. R.

Smooth; *culms* from two to four feet high. *Leaves* lanceolate. Panicle of long, simple, expanding racemes *powers* awnless, diandrous.

Poa malabarica. Linn. Sp. PL ed. Willd. i. 394.

A native pf mountains on the Coromandel Coast.

Culms ascending, from two to four feet high, firm, smooth, about as thick as a fine quill.— Leaves bifarious, lanceolate, striated, smooth; margins waved, unequally divided by the nerves, about an inch and half broad, and six inches long; mouth of the sheaths projecting above in a membranaceous process.— Panicles large, thin, oblong, bowing a little, composed of sub-alternate, simple, spreading racemes.—Flowers awnless.— Calyx two-flowered, with the characteristic corpuscle, which is also here pedicelled, but awnless.— Coroh exterior valve of the inner one has its margins and keel ciliate,—Stamens two.

4. M. latifolia. 22.

Perennial; *calms* erect, simple, from four to eight feet high-Leaves lanceolate. Panicles large and open, with alternate, compound drooping branches.

A native of the Garrow hills, from thence it was brought -to the Botanic Garden, by Mr. Robert Kyd, where it blossoms in March, at which period and indeed at all times it is one of the most elegant plants in the whole order.

Stems very numerous from the same root, erect, straight, and always without branches, more or less invested in the sheaths of the leaves; very smooth, texture remarkably hard, and filled with firm pith, generally about as thick as a goose quill, and when in flower from six to eight feet high.—Leaves sessile on their sheaths, lance-olate, smooth; from six to twenty inches long, and from one to four broad. They are much like the leaves employed by the Chinese to put between the boxes and lead canisters in which their Teas ar packed.—Seed ventricose-oval, smooth, both ends rather pointed.

CHLORIS.

Polygamous. *Calyx* two-valved, from two to six-flowered; hermaphrodite flowers sessile; male, or neuter ones pedicelled. *Corol* * the hermaphrodite flower two-valved; of the male, or neuter one-valved, all of them awned.

1. C. tenella. JR.

Spikes solitary; Spikelets with three or four hermaphrodite a\vn-cd florets, and a neuter rudiment.

A native of the Peninsula of India.

Culms delicate, erfect, smooth, about a foot high.—Leaves rather large in proportion to the rest of the plant, smooth, and soft.—Spikes solitary, secund, scarcely two inches long,—Spikelets alternate, and alternately pointing two ways.—Flowers of the spikelets, or to each calyx, three, four, or five, all hermaphrodite, (at least in the rather imperfect state in which 1 have found this rare species) <***

c*.pt the innermost one which is a one-valved corpuscle or rudiment, as in *Melica.—Calyx* from three to five-flowered, two-valved; *xalvelets* unequal, broad lanceolate, smooth, acute, permanent.—*Corol* of the hermaphrodite two-valved; exterior *vatvelets* obcordate, cucullate, awned; *margins* smooth, but with three hairy nerves on the back and sides; *interior* oblong, with edges ciliate and always awuless.

2. C. montana. H.

Spikes digitate, secund, united at the base; hermaphrodite flower ciliate, and awned; neuter of three awuless valves.

This a native of mountainous tracts only. It differs from *Chi. bar-bata* only in the following respects. *1st.* The spikes are in number from four to six, and united into a common flower-bearing rachis near the base. 2t/. The neuter floret has a third awned valve and the awns are all straw-coloured.

3. C. barbata. Linn. Sp. PI. ed. Willd. iv. 926.

Spikes digitate, secund; hermaphrodite corol ciliate, and awned, neuter of two awned valves.

Andropogon barbdtum. Linn. Mant. 302. 588.

Konda-pulla. Rheed. mal. 12. p. 95. t. 51.

Grows in large tufts on pasture ground, Sec. *very* common every where.

Culms, below creeping, and ramous, the joints perfectly smooth. —Leaves near the base bifarious; margins near the base and mouths of the sheaths ciliate.—Spikes terminal, from six to t\yelve, sessile, secund, expanding, from one to two inches long. Rachis striated, not hairy, nor jointed.—Flowers pedicelled, alternate, in two rows on the outside of the spikes .—Calyx two-flowered, two-valved, niembranaceous and awnless. The lower flower is sessile and hermaphrodite, its corol consists of two unequal ciliate valves, the base of which is surrounded with hairs, the exterior one ending in a long, coloured awn. The other floret I have always found neuter;

it staods on a short pedicel and .

the involucre by an articulation and drops off most readily, particularly when dry, leaving the involucre attached to the rachis.—• *Calyx, Corol*, and *Stamens*, are as König describes them; but the germ is obcordate, and there are always two 3tyles with feathfery recurved stigmas.—*Seed* as he describes it.

POA. Schreb. Gen. N. 114.

Calyx two-valved, containing many dowers of two unequal valvlets disposed alternately on distichous spikelets.

1. P. bifaria. Vahl. symbol, ii. 19. Linn. Sp. PI. ed. Willd, i. 401. Smooth; culms straight, from one to two feet high. Spike terminal, straight, secund-Spikelets sessile, alternate, bifarious, the inferior from lour to six-flotf ered, above many-flowered.

Teling. Wooda-tallum.

I believe Köuig called it Poa malabarica.

Grows on mountains and other dry situations.

Culms straight, simple, from twelve to twenty-four inches high, a little compressed, smooth.—Leaves small, smooth.—Spikes straight, secund, from four to eight inches long. Spikelets alternate, sessile, lanceolate, in two spreading rows, though issuing from one side of the common rachis.—Calyx below, from four to six-flowered; above many-flowered.

2. P. chinensis. Linn. Sp. PL ed. Willd. i. 395.

Smooth, from two to four feet high. *Panicle* of many alternate, simple, expanding, secund ramifications; *Spikelets* alternate, short-pedicelled, from four to six-flowered.

Beng. Btfra-ptnt-niitt.

A large, beautiful species, growing on the borders of water courses, and ptaces where there is much moisture.

Culms ruinous, creeping near the base, above expanding, from two to four feet high, every part smooth, and a little compressed.—

Leaves as in other grasses, smooth; *mouths* of the sheaths bearded. —*Panicle* large, oval, composed of long, alternate, filiform, simply expanding, secund branches. *Spikelets* alternate, from four to sixflowered, short-pedicelled, expanding, in two rows from one side of the simple branches.

3. P.procerd. R.

Smooth, erect, from three to five feet high. *Ligula* large; *ram** foalioits of the panicle simple; *spikelets* pedicelled, rather remote, linear, many-flowered.

Teling. Rewa.

Delights in a moist rich soil.

Culms nearly erect, brauchy, from three to five feet high, round* smooth, much covered by the sheaths of the leaves.—Leaves longr slender and smooth. Sheaths longer than the joints, with their mouths crowned with a long ragged membranaceous process.—Panics laige, from nine to eighteen inches long, oblong, bowing a little^composed of numerous, long, filiform, expanding racemes, scatter ed round the common rachis; which is filiform, waved, three-sided* and hispid. Spikelets alternate, pedicelled, linear, remote, many' flowered.

4. P. cynosuroides. Limi. Sp. PL ed. Willd. i. 393.

Smooth, straight, from one to three feet high. *Leaves* long and acute. *Panicle* straight, sub-cylindrical; *ramifications* horizonta *spikelets* depending, from six to twelve-flowered.

Un'wla bipinnata. Linn. Sp. PI. 104.

Cusa or Cusha. Asiat. Res. iii. 255. and 490. and iv. £49-Beng. Koosċ.a.

Teling. Dwbha, Dahlia, or Dwrpa.

A strong coarse species, a native of dry barren ground.

Root creeping, perennial.—Culms straight, rigid, round, smooth* from one to three feet bigh.~Z<att« numerous, very long; chiefly

about the base of the culms, rigid margins hispid.—Panicle erect, linear-oblong, often tending to a conical form, composed of many somewhat threefold, verticelled, horizontal, short, rigid, secund ramifications. Spikelets many-flowered, depending, in two rows, from the under side of the ramifications.—Corol, valves pointed, the inner one rather the largest.

Obs. It is employed by the brahmins in their religious ceremonies. Cattle do not eat it. Can this be Grainencapillaceum, &c. Pink* Aim. p. 176. t, £4. Fig. %.—Cuaa, or Cusha, the Sanscrit name of this much venerated gras9, was given to it at a very early period, by (he Hindoo Philosophers, and, believed, by Sir William Jones, to have been * consecrated to the memory of Cash, one of the, sons of Ram. See Asiatic Researches, vol. iii. p. 490. If so, we have here a very ancient precedent for the present ^ery convenient practice of giving such arbitrary names to plants, and to their families.

5. P. ciliaris. Linn. Sp. PL ed. Willd. i. 402.

Smooth, sub-erect, from one to two feet high. *Panicle* contracted, linear, with the lower ramifications remote. *Spikelets* from six to twelve-flowered; *inner* valvelets of the corol ciliate.

Delights in the same soil and situation with the last described species.

Culms near the base procumbent, above ereqt for one or two feet.—Leaves as in the last.—Panicle linear, from three to six inches long, the ramifications short, those of the lower part stand at some small distance, their insertions are not hairy.—Calyx from six to twelve-flowered, not ciliate.—Corol, only the inner valve ciliate.—Seed as in the last.

6. P. cylindrica. R*

Erect, slender, from twelve to eighteen inches high. Leaves slenkr. Panicle cylindric, crowded with short, adpressed, ramous, altremate branches; spikelets from six to twelve-flowered; Jlowers diindrous, inner valve of the corol ciliate. From Canton in China the seed was received into the Botanic Garden, where the plants grow freely and blossom during the rain* and the cool season.

7. P-ciliata. ft.

Smooth, stib-erect/from one to two feet high. *Panicle* columnar: *spikelets* from six to twelve-flowered r *mdroins* of all the valvelets of the calyces and carols fciliate. *Seed* globular.

Is generally found on a poor dry soil.

Hoot perennial.—Culms erect, rigid, smooth; from one to three fee* high.—Leaves smooth, mouth of the sheaths downy.—Panicked**¹* nar, from two to four inches long, branches thereof crowded, insertions hairy, spikelets from six to twelve-flowered.—Cfl/jtf, margin ciliate.—Corol, the margins of both valves much ciliate, the extern one has three nerves and is pointed, the inner one two-nerved—&** obovate, smooth, brown, dropping from the corol when ripe.

8. P. inlerrupta* Km* Mss.

Erect, smooth, from one to three feet high; ramifications of the linear panicle short, and collected into remote fascicles. Spikelets from six to twelve-flowered. Seed obcoidate.

Teling. Nakurnaral.

Grows about at the borders of rice fields.

Clums generally erect, from one and a half lo three feet high, round, smooth.—Leaves narrow, long, sharp, and smooth.—Panicles erect, from six to twelve inches long, linear; ramifications sessile, nearly erect, remote, particularly those of the lower part, where they are often twice their length asunder; one, two, or more from the same point, which makes it appear verticelled.—Spikelets minute, pedicelled, from six to twelve-flowered.—Corol, valves smooth.—S*** as in the last two species.

9. P. nutans. Linn. Sp. PI. ed. Willd. i. 395. Retz. Obs. iv. 19-Erect, smooth, from three to five feet high, panicles contracted} ramifications adpressed, fascicled, and approximated. Spikelets from eight to fourteen-flowered; seed oblong.

Teling. Ureoka.

. Delight in a rich, moist soil, such as the banks of water courses, borders of rice fields, &c.

Culms erect, from three to five feet high, generally simple, round, smooth.—Leaves narrow, long, sharp; and smoo'h.—Panicle linear, from one t) 'two feet long; ramifications ^filiform, pedunded, adpressed, one, two, or more from neatly the same place, but seldom bo far asunder as their own length. Spike/ets pedicelled, from eight to fourteen-flowered.—Calyx and coral smooth.—Cecd oblong, smooth, broxvii. '

Obs. The best mark to distinguish it from the last species is the form of the seed, which in that isobovate, in this-oblong. Cattle are not fond of any of these tall, erect, coarse species.

10. P. *diandra.* **R**.

Erect,, smooth. Leaves long, fine-pointed; panicle linear, half the length of the whole plant; ramifications scattered, compound, expanding, smooth; spikelets from four to eight-flowered. Flowers diandrous.

A native of Bengal, where it blossoms during the cold season. Culms erect, growing in tufts, with few blanches, smooth; height of the whole plant in a good soil, from three to six feet.—Leaves from one to two feet long, smooth in every part, tapering to a long fine point.—Panicle linear, half the length of the whole plant; ramifications thereof scattered, expanding, smooth, compound, iroui two to three inches long.— Spikelets lanceolate, small; smooth, from four to eight-flowered.—Corol, with both valves smooth, and rather obtuse.—Stamens two. Anthers purple.

31. P. viscosa. Linn. Sp.PL ed Willd. i. 398. Retz. Ohs. iv. p. 20. Culm ascending, from nine to eighteen inches' high, clammy. Panicle linear-oblong; ramifications vciticelled, short, spreading;

spikelets from three to twelve-flowered; inner glumes of the corol ciliate.

This species grows in tufts on dry pasture ground.

Cul'its numerous, spreading, with their extremities ascending, famous, from nine to eighteen inches long.—Leaves small, margins involute; sheaths shurtejr thaw the joints, \utharrow\therefore their mouth surrounded with long, slender, white hail.—Vanities linear-oblong, from two to four inches loug, composed of short, sub-verticelled, sessile, expanding ramifications.—Call\(\lambda\)x fioiu three to four-flowered.—Corol, woe valve ciliate.

Ubs. Every part of the plant is covered with tenacious gluten.

12. P. tenella. linn. Sp. PL ed. mild. i. 395.

Erect, smooth, from one to two feet hihh. *Panicle* linear-oblong>
•erlicelleri. *Spikdets* pedicelied, from four to six-flowered, smoothA native of pasture ground. *

Cuifns erect, round, smooth, from one to two feet high.— Lea*** smooth, moidh of ihesheaihs much bearded.—Panicles hnear-oblong* composed of verticelled, filiform, expanding, ramous branches, having always at their insertions and sub-divisions a few fine, long hairs-Spikelels pedicelled, from four to six-flowered.—Calyx and corol smooth.—Seed oval, brown, smooth, falling from the corol $*n^e$ ripe, as do all the other species of this genus that I have yet seen-

Obs. The anthers shine through the valves, as in P. punctate and indeed in most, if not all the Poas.

IS. P. plumosa. linn. Sp. Ft. ed. Willd. \. 403, Retz, Obs. iv. 20. Sub-erect, smooth. Panicle o\ ate-oblong; ramifications scattered, horizontal; insertions hairy; ramuli depending. Spikeletspedicelte from four to six-flowered; inner valvelets of the corols ciliate.

Tsjaina-puHu. Rheed. maL xii. p. 75. £.41.

Gramen fumi. Rumph. Amb. vi. p. 10. t. 4.f. 0.

Is found growing in tufts on pasture ground.

Culms filiform, many, ramous, spreading a little at the base, aboverect, from one to two feet high, round, smooth.—leaf**, months

and *margins* of the sheaths fringed, with long delicate white hairs.— *Panicle* oblong, composed of many, capillary, alternate, horizontal, ramous branches, their insertions and sub-divisions are fringed with a few, tine, white hairs. *Spikelets* mi'iute, pedicelled, depending, from four to six-flowered.—*Calyx* smoo .1.—*Coral*, inner \alve fringed with hairs in the back.—*Seed* oblong, brown, smooth.

14. P. punctàta. Linn. Sp. PL ed. JVilhL i. 395.

-•Erect, smooth, from six to eighteen inches high. *Tanicle* oblong; *ramifications* simple, expanding, lower ones verticelled. *Spikelets'* from twelve to fourteen-flowered, smooth.—*Seed* obliquely oblong.

This species grows in tufts 011 pasture ground.

Culms erect, generally, simple, round, smooth; from six to eighteen inches high.—Leaves small, smooth; mouths of the sheaths bearded.—Panicle oblong; romifications simple, expanding, the lower ones collected into one verticel; above alternate.—Spikelets* pedicelled, rather remote, linear, from twelve to fourteen-flowered.—Calyx and coral smooth, thin, showing the unexpanded anthers and sligmas through them.—Seed oblong, smooth, brown.

15. P. elegans. R.

Sub-erect, smooth, from one to three feet high. *Panicle* oblong, nodding ramifications solitary, ramous, adpressed. *Spike/ets* from eight to twelve-flowered. *Seed* globular.

A very elegant, tall, delicate species, a native of moist pasture ground.

Culms simple, at the base spreading for a few inches, the remaining partis erect, round, smooth; from one to three feet high—Leaves few and very small, smooth in every part, except the mouth of the sheaths, which are bearded.—Panicles linear-oblong, nodding, composed of erect, adpressed, distinct, somewhat remote ramification, each of which forms a small, but similar panicle. Partial rachis with the angles hispid. Spikelets pedicelled, linear, from eight to twelve-flowered, purplish.—Corol, outer val\e three-nerved.—Seed globular, smooth, and brown.

16. P- multiflora. R.

Sub-erect, smooth, from six to eighteen inches high. Tanic longer than the rest of the plant, nodding. Sinkelets crowded, from fifty to seventy-flowered. Seed globular,

Is'found* on ''dry elevated places.

Culms nearly erect, naked, except at the base, fioai six to twelve inches high, rmnd, »;id smooth:—Leaves one-or two near the base of each culm, short; mouths of the sheaths a little haiiy.—! anlC le oblong bowing; ramifications sub sossile, short, filiform, simp sthe lower collected into one or two remote branches; the upper on alternate, tyike/ets ptdicelled, veiy long, linear, from fifty to seven ty-fl'>weied.—Calyx smooth, obtuse.—C rol smooth, outer va three-nerved.—Seed round, smooth, blown.

17. P. nnio/oides. Linn. Sp. PL ed. JVilld. i. 393, Retz. Obs*- ^ Erect, smooth, from one to two feet high. Panicle ovate; Tatl% JicalioHs .short, simple, below fascicled; above solitary, horizonta spike/ets long-pedicelled, from sixteen to twenty-flowered.

.Benjr. Konee.

A most elegant species, a native of dry elevated situations.

Culms, below ramous, with a small portion resting on tliegrounc's the 1 e&t erect, and from one to two feet high, round and smooth.—

leaves few, small, and smooth; mouths of the sheaths bearded.—

rankles half as long as the whole plant, erect, oblong, thin; ranw''

cations peduncled, filiform, disposed as in multiflora. Spikelets ova

from sixteen to twenty-fl.iwered, generally of a bluish purple colour
Corolo outer valve three-nerved, as in P... multiflora.—Seed oblong*.

smooth, brown.

33. V.Jlexuoşa. R.

Sub-erect, flexuose, nodding, smooth, from eighteen to twenty-inches high. *Panicle* ovate, crowded; *ramifications* solitary, ra*

mous, expanding, insertions hairy, *spikelets* twenty-flowered. *Seed* globular.

A pretty large species, growing in tufts on old walls, so exactly resembling P. *unioloides* as to be easily mistaken for it. it has much the habit of *Briza Eragrostis*.

Culms sub-erect, winding, round, smooth; from one and a half to two feet high.—Leaves much larger than in the last species, and the mouths of the sheaths more hairy.—Panicle oval, very large, generally more than half the length of the whole plant, branches alternate ueaily horizontal, raxnous, with a brown, hairy gland in the axil of eacu division of the panicle.—Spikelets white, or pale green, lanceolate, large, about twenty-flowered.—Seed globular, brown, and smooth.

19. P« yanicmata. B.

Erect, smooth, from two to four feet high. Leaves long; mouths of their sheaths bearded. Panicle oblong; ramifications most numerous, filifoim; insertions hairy. SpHelets from four to sixteenflowered; valvelets of the calyces ciliate. Seed globular.

Culm snb-erect, round, and smooth-; length from-one to two feet high to the panicle, which is about the same length, making the whole height from three to four feet—Leave* large, mouths of the sheaths very hairv.—rankle oblong, very large, composed of numerous, ramous, filiform, expanding branches, their insertions and subdivisions involved in fine, long, white hairs. Spikelets long-pedicelled, linear, from four to sixteen-flowered,—Corol, outer valve round at the apex, and three-nerved; -inner one slightly ciliate on the back.

20. P. gangetica. R.

Grows in very dense tuft". Panicle thin; spikelets linear, from thirty to forty-flowered.

A native of the banks of the Ganges, but scarce.

Culms numerous, and ramous, growing in crowded tufts, smooth in every part, general length about a foot.—Leaves few, small, and smooth.—Panicle ovate, composed of a few, remote, alternate, sub-

diverging branchlets, each supporting a number of heaped, linear, acuminate, smooth spikelets, of from twenty to fifty-flowers each; as they advance from the apex the lower-florets drop, leaving the zigzag rachis naked as they ripen.— $Calyx_j$ both valves smooth and obtuse.—Seed oval, smooth, brown.

DACTYLIS. Schreh. Gen. N. 117.

Calyx two-valved, compressed, one valvelet larger, keeled. *Seeds* few.

1. D. lagopoides. Linn. Sp. PL ed. IVilld. i.410. Burm. Ind.Q& t. 12./. 2.

Creeping. Leaves rigid, with spinescent points. Heads globular. Calyces from six to eight-flowered, hairy, as are also the corols; an^m there blue.

It is generally found growing on a salt sandy soil near the sea.

Culms creeping to a great extent, with from four to tight inches of the tlower-bearing portions, erect, they are of a firm, ligneous texture, round and smooth, every part of the erect portions covered by the sheaths of the leaves. Leaves numerous, small, approximate, firm, acute, resembling thorns.—Head, or spike terminal, short-pedicelled, globular, composed of many, closely crowded, sessile, roundish spikelets—Cali/r from six to eight-flowered; glumes equal, shorter than the flowers, obtuse and hairy.—Coral two-valved, exterior striated, hairy, and obtuse; innermembranaceous, involving the stamens and pi still urn.—Stamens three. Anthers blue*

2. D. brevifolia. Linn. Sp- PL ed. Willd. i. 410.

Creeping, rainous. *Leaves* short. *Heads* sub-globular, composed of three, secund spikes. *Calyces* acute, from six to twelve-flovvered. *Corols* hairy, acute.

It is found on dry s'ndy ground at a small distance from the sea. 'Culms spreading, ramous, creeping, with their flower-bearing extremities ascending, from six to twelve inches long. Branches ge*

nerally opposite. Leaves short, with their margins ciliate.—Head or spike terminal, long-peduncled, globular, composed of two or three, sessile, secund, short spikes/wiich are again composed of two rows of alternate, from six to twelve-flowered, sessile, ovate-oblong spikelets.—Calyx, from six to twelve-flowered, equal, acute, stnated.—Corol, outer valve keeled, acute, three-nerved, very hairy near the base, inner valve as in Foa, with its back ciliate.—Sied oval, compressed, smooth, and brown; chopping from the corol when ripe.

O6s. Both these species are of a coarse nature.

The Longon definition of the genus does not accord well with the only two species I have met with in India. That of Foa agrees better with their essential character; and had not Iiurman, in his Flora indica, made them both belong to this genus, I should certainly have considered them as species of Poa, though in their general habit they by no%ieans agree with the elegant plants of that genus. When I had an opportunity I forgot to examine the seeds in a sufficiently exact" manner. I suspect they have the aril of the following genus, because they have much of its general habit.

ELEUSINE. Gart. Carp. i. p. 7.*

Calyx two-valved, containing many flowers of two equal valvelets. Seed with a complete membranaceous aril.

1. E. Coracana. Gart. Carp. i. 8. t. 1.

Culms erect, from two to four feet high, compressed* Leaves l>ifurious. Spikes digitate, incurved. Calyces from three to/six-flowered. Seed round.

Cynosurus Coracanus. Linn. Sp. PL ed. Willd* i. 415.

Tsjetti-pullu. Rheed. HorU Mai yii. p. 149. t. 78.

Panicum gramineum seu Naatsjoni. Rumph. amb. \dot{v} . p.200. £.76. /. 2.

It is called Nutchaneeby Europeans on the Coromandel Coast.

I adopt Gaertner's name on account of the aril, whi«?h envelops the seed, and the total want of the involucre of Cyno.iurus in all thelnU'an species that 1 have yet met with.

Ponas«a, or early Soloo, is the Telinga name of the grain, and Sodee the name of the plant.

Jieng* -Miirooa.

Raggee of the Coast Mahomedans.

This specie* is cultivated during the rains. I never saw it wild* Culms eiect, generally several from liie same grain of seed; from two to four feet high, a liltle compressed, smooth.—Leave* bifanous, large, smooili; mouths of the sheaths bearded.—Spikes, from four to six, digitate, incuivate, secund, from one to three inches long, composed of two rows of sessile, from three to six-flowered spikelets. Hackis compressed, a little waved.—Califx from three tq six-flowered, exterior glumes twice as long as the inteiner; both are keeled, obtuse, and meinbrauaceous-margTicd —Corul, valves nearly equal.—Seed globular, dark brown, a little wrinkled, covered with a thin, pel* lucid, nieinbiranaceous aril.

2. E. stricta. R.

Culms erect, from two to five feet high, compressed. Leaveshifarious. Spikes digitate, straight. Calj/ces from three to six-flowered. Seed round.

Telitig. Pedda, viz. great Soloo.

Hind. Raggee.

This is still more cultivated than the last, and differs from it only in having the spikes straight, being generally of a larger size, and more productive, the great weight of the seed, when full growii bends the spikes down into a horizontal direction.

There is a variety of this straight-spiked sort, which the Telinga farmers called *maddee rooha soloo*; it grows to still a larger size, with a greater number of straight spikes.

They all require a light rich soil, on which the water does not remain after heavy rains. The first or early sort does not require so rich a soil as the other two, it is sown earlier by which means the same ground yields two crops. From July to January inclusive they reckon on an increase of about one hundred and twenty fold if the soil and season, are favourable.

The second sort requires a richer soil; it is sown later in the season; its increase is greater.

The third sort, *maddi ruba soloo*, requires a still richer soil; land fit for it is scarce, and the rent high. I am informed that it is nearly twice as much as that of land fit for the first soit, the increase of thia kind is prodigious, five hundred fold, the farmers say, if the season and soil are favourable.

About twenty years ago, there came up accidentally amongst some rubbish in my garden at Samul-cotah, two tufts- of this plant, each, upon examination, I found to be the produce of one seed, each had twenty-five culms, and each of these culms had on an average two lateral branches making in all seventy-five culms and branches, each produced upon an average, six spikes, (for they had from four to eight) in all four hundred and fifty spikes, each of these had at a medium sixty spikelcts, and each spikelet ripened on an average three or four seeds, total produce eighty-one thousand. I was myself particularly attentive hi counting the above produce because it was so astonishingly great.

In the Rajamundry Circar, where these observations were made, the soil is in general rich, and the season favourable.

S. E. agyptica. /J.

Culms with a creeping base, from one to two feet high. Spikes four-fold,, cruciate. Calyces daggered, from thres to four-flowered-Seed oval, somewhat three-sided, and transversely rugose.

Cynosurus aegypticus. Linn. Sp. PL ed. Willd. i. 4lG*

Gramen vaccimim. Rumph. amk. vi. p. 10. t. 4.y. 1.

Cavara-pullu. Rheed. Mai. xii. p. 13 K t. 69.

Hind. Makura-jali.

Grows in pasture ground, and by road sides, 8cc.

Culms, creeping near the base; the remaining part nearly erect for a foot, or a foot and a half, ramous, a little compressed, and smooth.—Leaves fringed with hairs ___Spikes terminal, from three to five, horizontal, secund, Sec. as in E. CQracana.-~Ca>'yx from three

to four-flowered; *glumes* acute, pailiculaily the exterior one which ends in a short awn.—*Corol*, outer valve very acute.—*Seed* oval, somewhat three-sided, wrinkled, arilled, but in this species the aril is so thin and delicate, as to be often removed by the time the seed is lull grown.

Obs. Cattle are fond of it.

4. E. indica. Gart. Carp. i. p. 8. t. 1.

Erect, smooth, from one to two feet high. *Leaves* bifarioti9. *Spite** from live to seven, digitate. *Calyces* from three to five-flowered* *seed* oblong, three-sided, rugose.

Cynosmus indicus. Linn. Sp. PL ecL IVilld. i. 417«

Hind. Mal.ank/m.

Telitig* Kuror, viz. wild soloo.

A common coarse species, found growing in large tufts on pasture ground, road sides, &c.

Culms ascending at the base, ramous, a little compressed, smooth, from one to two feet high.—Leaves bifarious, large, with a¹ few long -white hairs scattered over the insides and sheaths.—Spikes terminal, from three to six, expanding; one generally standing single a little below the rest, linear, secund, from two to four inches long; insertions glandular and hairy, spikelets in two rows on the underside.—Calyx from three to five-flowered; glumes equal, as long as the flowers, smooth and rather obtuse—Gorot, valves smooth, obtuse.—Seed obtusely three-sided, rugose, arilled.

Obs. Cattle are not fond of it.

5. E. verticillata. R.

Erect, smooth, from one to four feet high. *Leaves* bifarious. *Sptke/els* numerous, panicled. *Calyces* from eight to twelve-flowered; *glumes* daggered; *seed* oblong, wrinkled.

It is a native of moist pasture ground.

Culms erect, round, smooth, from one to four feet high.—Leaves as In the last described.— TQuick erect, oblong, composed of many

verticelled, expanding, round, sessile, linear spikes, much resembling those of E. *indica; spikelets* imbricated in two rows on the under side of the spikes.—*Calyx* from eight to twelve-flowered, corol-like.—Corol₉ exterior valve euding in a long dagger, inner valve membranace-ou*.—*Seed* oblong, wrinkled, arilled; in this species the aril is fully as delicate as in £. *agyptica*, and is nearly found whole on the full giown or ripe seed.

<). E. calycina. R-

Erect, from two to three feet high* Vanicle linear. Spikes numerous, alternate; glumes of the calyces equal, many times larger thau those of die corol, daggered, three-flowered. Seed three-sided, wrinkled.

Teling. \Vadata-tc4te-gttddee-

Grows in small tufts on dry pasture ground, but generally amongst bushes*

Culms erect, generally about two feet high, much covered by the leaves.—Leaves very thinly scattered with hairs.—Panicle linear, erect, from eight to twelve inches long, composed of many sessile, expanding, alternate, secund spikes\ spihelels occupying, as in the other species, the under side of die spike.—Calyx generally three-flowered, glumes equal, twice as long as the three flowers they em. brace, each ending in a long, sharp dagger—Cowl, \alves obtuse.—Seed three-sided, wrinkled. I cannot say that I have seen the aril in this species, though I have often looked for it; it may therefore be a species of Dactylis.

ARUNDO. Schreb. Gen. 124.

Calyx two-valved, containing one or more two-valved flowers, surrounded with long hairs.

1. A. bifaria. Relz. Obs. iv. 21. Linn. Sp. PI ed. fVilld. i. 455. Erect, smooth, leafy, from twelve to eighteen feet higU. Panicle

erect, linear, oblong, dense; *calyces*, three-flowered, much longer than the florets; glumes or the corol woolly.

Tiling* Patoo-ederoo.

·Is'"'found chiefly among bushes on the banks of rivulets, lakes, &c. on the Circar mountains.

Culms sword-shaped, smooth, about ten to fifteen inches long, and from one to two broad.—Panicle erect, oblong, very much crowded with innumerable ramifications, which stand erect and press close on one another while in seed.—Flowers erect, on a common "woolly pedicel within the calyx.—Calyv three-flowered} glumes equal, pointed, larger than those of the flowers.-^Coro/, exterior valve twice the size of the inner one, it is pointed and woolly on the outside.

Obs. The leaves seem to be one of those sorts with which the Chinese line the inside of their Sugar-candy tubs and other packages.

*C. A. Karka. Linn. Sp. PL ed. TVilld. I 456. Retl Obs. iv. 21. Erect, smooth, leafy, from eight to twelve feet high. Panicle loose, verticelled. Calyces, from three to four-flowered, exterior glume of the corols three-nerved, and daggered.

Sans, 5ff, Nffdtf, if[^], Hula, [^]fRif, Dkttiniraa, [^] J I [^] , Pottfgula.

lien? Nal, Nur.

Te/ing. Naga-sara maitantos.

Is a native of similar places with the last described.

Culms erect, ramous, from eight to twelve feet high, and as thick as the last, round, smooth, entirely covered with the sheaths of the leaves.

—Leaves approximate, sword-shaped, smooth, from twelve to twenty-four inches long, and one or one and a half broad; mouths of the sheaths bearded.—Panicle bowing with the wind, but if not disturbed erect, oblong, composed of many filiform, erect, (in luxuriant plants drooping,) sub-verticelhd, ramous branches.—Ilackis of the branches angular and hispid.—Florets alternate, on a longer common w jolly pedicel than in A. bifaria, within the calyx,— Calyx from

three to five-flowered; *glumes* unequal, the largest shorter than the exterior valve of the corol.—*Corol*, exterior valve three-uerved, tapering into long tine subulate points, inner valve scarcely half so long. —*Stamens* often only two, and the pistil is frequently wanting.

Ob\$. it does not agree wi Ji Retzius's description of A. Kaika in the number of flowers in the calyx. Pipes are made of the culms, particularly those used by the people who carry about the dancing snakes.

In Bengal it is more luxuriant than on the Coast. The common Durma mats of that place it re made of the stalks split open. Vessels from the port of Calcutta are generally duniaged with them.

3. A. lengalemi v>. 17. ed. JViUd. 1455. Retz. Obs. v. 20. Culms from six lo ten feet high, fishulous. Leaves bifarious, sword-shaped, drooping. Panicle lax; valvekts of ihe calyx equal, from two to three-flowered; exterior valve of the corol woolly, daggered, and three-nerved.

Beng' Gaba-nul.

This elegant species is found growing in ditches, &c. low places in the vicinity of Calcutta, where it blossoms during the mouth of October and November.

Culms erect, from six to ten feet high, fistulous.—Leaves very numerous, approximate, bifarious, drooping, sword-shaped, from one to two inches broad at the base, from thence taper to a fine point; bmooth on both sides, and in the margins.—Sheaths also smooth, with a long membi anaceous margin round the mouth.—Panicle oval, lax, from one to two feet long, erect; ramifications alternate, ramous, drooping a little!—Flowers pedicelled, scattered.—Calyx two ov three-flowered; valves nearly equal, and of the length of the flowers.—Carol, exterior valve three-nerved, and woolly on the back, with a very fine, long, taper point. Inner valve small and smooth.—Nectary two, cunei-form scales embrace the germ on the two sides. Obs. The wool which girds the base of the corol, in most of tht

Obs. The wool which girds the base of the corol, in most of tht species, $\frac{1}{2}$ ia this species, found growing on the back of its exterior

AR1&TIDA. Schreb. Gen. NT. 125.

Caylx two-valved, one-flowered. Coral one-valved, with three was at the top.

J. A. sefacea. Uelz. Obs. iv. 22. Linn. Sp. PL ed. Willd.'u 46Q. Erect, smooth, from two to four feet high. Paiucle linear-oblong, composed of fifteen to twenty sub-alternate, erectish ramifications*

Teling. Sh/pwr-gadz.

Grows in a dry, barren, binding soil.

Root perennial.—Culms straight, generally simple, from two to four feet high, and about as thick as a crow quill at the base, solid, and of a very firm ligneous texture, round and smooth.—Leaves fow, narrow, margins involute, nerveless, smooth.—Panicle townig with the wind, lmear, from six to twelve inches long, composed of subaessile, remote, ad pressed ramifications.—Calyx, carol, &c. as in the family, except that the three awns are erect.

Obs. Cattle do not cat it, yet it is very useful. The Tcliuga paper-makers construct ifoeir frames of the culms; it also serves to make brooms and tooth-picks. It is employed in preference to other grass-*s for making the screens called *Tallies*, for this purpose it is spread thin on bamboo i mines, and tied down, these placed on the weather side of llie house, during the hot land winds and kept constantly watered during the heat of the day, renders the temperature of the air in the house exceeding pleasaut, compared to what it is without. The Thermometer in the out side exposed to the wind, but not to the sun, will then be at one hundred or one hundred and fifteen •degrees, or even more; and within, if the *Tatties* are properly disposed and well watered, they will keep it down to from eighty-fiv* lo ninety, with two or even three rows of Tatties, made very thin, and all kept well watered, the Thermometer, when it blows hard; may bd brought •) eighty, but then it is absolutely chilHng, and disagreeably cold. The difference between the open air and this iefi-1..! .-:- :- «_{0 t}h_e fce^r— -- ivably great The Thermometer in the sun, at this season rises to from one hundred and thirty to one hundred and forty. This contrivance we received from Bengal, and by it the hot season which used to be so much dreaded, is now rendered to those who can keep within doors tolerable. I have never observed any bad effects from this cool moist air; however the hot season *is* the most healthy of the whole year.

2. A. IlystrLw Linn. Sp. PL ed. IVilld. i. 459.

Culms diffuse, about two feet long. P ankle oval, large, thin; ramifications spreading, two-forked.

m Teling. Shilpwroo-kalli.

This species is a native of the same soil with the last described.

Culms depressed, straggling, crooked, rigid, somewhat branchy, about two feet long.—Leaves as in the last species.—Panicle large, oval, thin; direction various, composed of diverging, generally two-cleft peduncles and pedicels.—Cali/x, corol> &c. as in the genus.

Obs. This species is of no use that 1 know of.

3. A. depressa. Retz. Obs. iv. 22. Linn. Sp. Pl.td. Willd.uAQl. Ascending, ramous, from twelve to eighteen inches long. Panicle linear, of six to eight alternate ramifications; glumes of the calyces keeled.

Teling. Nallt-poottki.

Is found upon the same kind of land with the two last species.

Culmshdow depressed, ramous; above ascending, filiform, round, smooth, solid, rigid; from twelve to eighteen inches high.—Leaves as in the former.—Panicle smaller, and with fewer ramifications than in A. setacea.—Calyx, the glumes have a large green keel.—Coral, &c. as in the genus.

Obs. This is also so far as T know, perfectly useless,

MANISVRIS. Schreb. Gen. N. 1370.

Polygamous, *liachis* joiuted. *Hermaphrodite* calyx two-valved, one-flowered. *Carol* two-valved, less than the calyx. *Male*, or ueu* ter calyx two-valved, one or two-ftowered. *Corol* two-valved.

1. M. Myurus. Linn. Sp. PL ed. Willd. iv. 945. Corom. PL £. iV. 117.

Culms creeping, smooth, from nine to eighteen inches high. Spikes solitary; exterior valve of the hermaphrodite calyx panduriform and emarginate; male calyx two-dowered.

Teling* Nalla-punookoo.

Is a native of dry elevated sandy ground.

Culms several, ramous, diffuse near the base, rooting at the joints, extremities ascending, from nine to eighteen inches long, as thick as a ciow quill, compressed, smooth, not piped.—Leaves small and smooth; mouths of the sheaths increased by a lacerated membranaceous border or stipule.—Spikes solitary, terminal, and from the exterior arils peduncled, secund, joined, smooth, a little compressed, from one to two inches long.—Peduncles articulated, and bracted at the middle ___Flowers, the hermaphrodite ones occupy a waved row of pits on the four sides of the spike, while the male ones possess two sides, the back is naked.

HERMAPHRODITE FLOWERS. Ca/yx two-valved, one-flowered; the exterior valvelet has a broad coloured margin, which is emarginate, and deeply indented at the sides, like a riddle; inner valvelet oblong, lodged in a pit of the rachis.—Corol two-valved, membranaceous. Nectary two obcordate, crenulated scales embrace the germ.—Stamens three. Styles two,

MALE FLOWERS. Calyx two-flowered, two-valved, valvelets nearly equal, boat-shaped.—Corol with two membranaceous valves*
—Stamens three.—Pistil none.

2. M. gramdaris. Linn. Sp. PL ed. Willd. iv. 945. Corom. PL &. N. 118.

Ramous, sub-erect, hairy, from one to two feet high; *spikes* fascicled. *Hermaphrodite* calyx oval, and rugose; *male* or *neuter* one-flowered.

Grows among bushes.

Culms very ramous, nearly erect; filiform^ hairy, from one to two

feet high.—Leaves numerous, very hairy, stiff and sharp.—Spikes terminal, and axillary, peduncled, several together, small, compressed, from half an inch to an inch long.—Panicles as in the former. Rachis jointed, much waved, and excavated as in Rottbcellia.—Flowers from four to ten of each sort, their situation exactly as in the last species, viz. the hermaphrodite occupy the forepart, while the male, or neuter are placed on the sides, the former are globular, and the latter lanceolate.

HERMAPHRODITE FLOWERS. Calyx one-flowered, two-valved, exterior valve round or rigid, and very rugose; inner valve less rigid.—Coral two-valved, meinbrauaceous.—Stamens three.—Styles two.

MALE or NEUTER FLOWERS. *Calyx* two-valved, one-flowered. —*Corol* two-valved.—*Stamens* three or none.

ROTTB(ELL1A. Schreb. Gen. N. 1572.

Rachis (generally) jointed, variously excavated for the reception of one, or two flowers in a two-valved calyx, in each excavation.

1. R. glabra. R.

Near the base creeping, with extremities erect, smooth. *Leaves* bifarious, all hermaphrodite. *Calyx* one-flowered, *corol* three-valved. *Beng*. Bwksha.

A native of Bengal, where it grows on pasture lands, the borders of rice fields, and other moist places. Cattle are fond of it.

Culms jointed, smooth, compressed, filled with pith, creeping near the principal root for a foot or more, the remaining part from one to two, or even three feet, erect.—Leaves alternate, bifarious, approximate, short, spreading, ensiform, smooth.—Sheat/is shorter than the joints of the culm, smooth.—Spikes axillary, solitary or in pairs, with a solitary terminal one, subulate, three-sided, smooth, short-peduicled, the peduncles with generally a part of the spikes hid in the sheaths of the leaves; general length from two to three inches.—Flowers opposite, in general all, or the greatest part henna-

phrodite and as long as the joints of the rachis.—Cah/x one-flowered, two-valved, smooth, cartilaginous. The exterior valve of one, of the pair obliquely emarginate, the other acute.—Carol, the hermaphrodite and male three-valved, one valve on the inside, and two on the outside; all tinged with deep red at the base.

Q. R. compressa. Linn. Sp. PL ed. Willd. i. 465. Corom. PL "• N. 156. Retz. Obs. iii. 12.

Culms climbing, from five to twenty feet high, smooth, compressed; spikes axillary and terminal; rachis jointed; Jlowers opposite, hermaphrodite calyces one-flowered. Corol three-valved.

Beng. Pansheroo.

Teling. Shervoo, i. e. lake panookoo.

Is found on the borders of lakes, amongst other roots of long $gras4_f$ and brush wood.

Culms several, creeping or climbing, ramous, compressed, from five to twenty feet long, piped, smooth, about as thick as a common quill, and very hard.—Leaves numerous, bifarious, small for the size of the plant, smooth and soft; sheaths short, compressed, and smooth.—Spikes peduncled, terminal, and from the exterior axills, generally from two to live together, compressed, a little smooth, from two to four inches long.—Peduncles articulated at the middle and there bracted, lanceolate, chaffy, bractes also surround their insertion.—Flowers all hermaphrodite, opposite, decussated, lodged in the excavations of the jointed rachis. Calyx one-flowered, twovalved, valves nearly equal; the flowers have alternately their valves pointed and somewhat longer than the excavation in the rachis, both cartilaginous;—and obtuse, equal to the pits in the rachis, with the exterior one only caitilaginous.—Corol three-valved, valves membrana-Nectary, two triangular bodies embracing the base of the stamens and germ.—Stamens three.—Styles two; stigmas plumose.

3. R. exaltata. Linn. Sp. PL ed. Willd. i. 466. Corom. PLQ. N. 157. Polygamous. Culms erect, hirsute, from six to ten feet high.

Spikes solitary, secund. Polygamous flovven on the front with neutej OUCS on the sides.

llviig. Bwra-swooate.

Teling. Konda panookoo.

A native of mountains.

Root consisting of strong woody fibres.—Culms erect, ramous,* little compressed, inwardly of a spongy nature, from six to ten feet hijrh, and as thick as the little finger near the base, were they are ainu;(i with strong and short, white hairs.—Leaves large and numerous, smooth on the outside, and hairy on the inside; margins hispid, sheaths very hairy; hairs elevated on glandular points, very stiff and fchai p.—Spikes terminal, and from the exterior axills, generally soli* laiy, cyliudric, &c.—Mowers of three sorts, hermaphrodite, male, :.ud neuter, the first and second occupy alternate pits or one side of the spike, while the neuter stand on each side of them, so that the spike may be called secund.—Calyx of the hermaphrodite and male floret two-valved.—Corol as in the last.—Stamens, &c. as in the genus.—Calyx of the neuter flower two-valved, valve lets oblong.—Corol, glumes two, membranaceous.

4. R. corymbosa. Linn. Sp. PL ed. Willd. i. 446. Corom. PL iu A\ 181.

Polygamous, erect, smooth, from three to five feet high. Spikes fascicled, terminal and axillary; rachis jointed flowers alternate, on opposite sides of the spike. Calyces generally two-flowered.

Teling. Pedda-pauookoo.

R. punctata. Retz. Obs. iii. 12.

Aegilops eraltata. Retz. Obs. ii. 27.

A native of low rich pasture ground, grows in erect tufts.

Culms many, straight, mostly naked, the sheaths of the leaves be* ing short and covering but a small part of them; round and smooth, from three to five feet high, and like those of the last species, very firm, and not piped.—Leaves a few, from six to twelve inches long, margins sometimes fringed with a few hairs; sheaths short

and smooth.—Spikes terminal and from the exterior axills several, peduncled.—Peduncles filiform, curved, jointed near the base and there bracted, besides there are chaffy, filiform braciec at their insertions\—Flowers alternate in two rows; one row on each side of the spike.—Calyx two-flowered, two-valved.—Corol_t one hermaphrodite within, and one male without, each has two valves, sometimes there is only one hermaphrodite floret, in which case it has three valves*

5. R. perforata. Corom. PI. ii. N. 182.

Culms erect, smooth, from three to five feet high. Spikes solitary, below the flowers are opposite, and the rachis perforated* Calyx generally two-flowered; one flower male, the other hermaphrodite.

Deng. Kttilu.

Teiing. Panookoo.

This species is rather scarce, it grows on low rich pasture ground.

Culms many, erect, simple, round, smooth, jointed, but not piped; from three to five feet high, and about as thick as a crow quill.— Leaves small for the size of the grass, slender and smooth; margins hispid; mouths of the sheaths and a little way up the base of the leaves woolly.—Spikes terminal, and from the exterior arills, solitary, peduncted, round, smooth, as thick as a crow quill, and from three to six inches long; where the flowers aré opposite, there is an oblong perforation of the rachis, so that the backs of the inner glumes of the calyx touch one another.—Flowers in pairs, nearly opposite on the lower half or more of the spike; above alternate, sometimes all hermaphrodite, sometimes hermaphrodite and male mixed.— Calyx one or two-flowered, two-valved; valvelets simple; the exterior oue rigid, the interior one firm and white, both obliquely linearoblong.—Corol, when single, hermaphrodite, andthree-valved; when double the exterior one is male, in which case the two have four valves, viz. two valves each; all membranaceous, in shape conform* ing to that of the calvx, but smaller.

6. R. setacea. Corom. PL ii. N. 132.

Erect, setaceous, smooth, from two to six inches high. *Spikes* a solitary, terminal, unilateral; *rachis* not joined. *Calyces* one-flowered. *Corols* two-valved, hermaphrodite.

Grows on old walls.

Culms many, erect, ramous, filiform, smooth, from two to six inches high.—Leaves, inside a little hairy, in size proportioned to the plant.—Spikes terminal, solitary, awled, secund, about an inch, or an inch and a half long. Rachis excavated on one side, but not joined.—Flowers, they are all hermaphrodite, imbricated trans versly on the excavated side of the rachis.—Calyx one-flowered, two-valved; valvelets equal, membranaceous margined.—Coro/two-valved, membranaceous, hairy.—Stamens three.—Styles two.

7. R. Thornaa. Linn. Sp. PL ed. Willd. i. 4fi4. Corom. PL ii. N. 132. Erect, compressed, about two inches high. Spike's solitary, terminal, two ranked. Rachis not jointed. Calyces one-flowered. Corol two-valved,

R. Thomaea and pilosa. Linn* Sp. PL ed. Willd. i. 464. 5. are, I suspect this very species.

Grows, with the last species, on old walls.

Culms minute, erect, compressed, about an inch high, exclusive of the spike, and two with it.—Leaves bifarious, numerous.—Spikes terminal^ solitary, subulate, distichous, compressed. Rachis waved, excavated on the opposite side, not articulated.—Flowers all hermaphrodite, disposed alternately in the excavations of the rachis. ~—Calyx one-flowered, two-valved; exterior valvelet rigid, linear; interior boat-shaped, and less rigid.—Corol two-valved, membranaceous, hairy.—Stamens three.—Styles two.

8. R. biflora. R.

Setaceous. Spikes simple, subulate; rachis not articulate, but bifariously excavated for the reception of the two-flowered spikelets.

A native of the peninsula of India; and in size and appearance ve-

ry like R. *Thomaa* and *setacea*; and were they not two-flowered in the same calyx I should no doubt have taken it for ft. *incurvata*, *Linn*.

Culms scarcely more than may be called the scapes of the spikes, the whole plants being but two or three inches high.—Leaves many, filiform; rachis rigid, and with the sheaths somewhat pilose.—Spikes terminal, solitary, subulate, about two inches long. Rachis nut jointed, but alternately excavated on the opposite sides for the reception of the fiowers.—Calyx two-valved, two-flowered; valves very unequal, the exterior being many times larger than the inner one, which is a minute scale in the bottom oi the excavations of the rachis, and not readily detected.—Florets two in each calyx, both hermaphrodite, one-sessile and the other short pedicelled, each with a corol of two equal membranaceous, smooth valves*

I10RDEUM. Schreb. Gen, N. 129.

Calyx lateral, two-valved, valves narrow, accuminate, distant, altogether forming a six-leaved involucre, one-flowered, by threes ad each toothlet of the rachis.

1. H. hexastkhon. 'Linn. Sp. PL el Willd. i. 473.

All the flowers hermaphrodite and awned, placed regularly in six rows.

Sans. -w> Vwa, fecf^:, Situshooka.

Beng* J«ba.

Arab. She-eer.

This species is much cultivated in most of the temperate parts of Hindoostan during the cool season.

Qbs. I have had specimens and abundance of seeds of this and also of what I consider to be Siberian Barley (H, *coeleste*) both gathered in 1818 in Tartary, the latter in Dapa, by my highly esteemed friend Capt. W. S. Webb, surveyor at Kemaoon, who has favored me with the following observation on them: "These two sorts of Barley are called *Oo-a*, and deserve to be particularly examined. They are not known in the low lands of India, produce the hardiest

of all grains, and are most nourishing, as the lusty Tartars almost exclusively live upon them and Tea. The grain cleared from the husk resembles no kind of Barley that 1 am acquainted with, and if they should prove new species might from their defiance of cold and many good qualities be a valuable acquisition in the Highland* of Scotland/'—N. W.

TRITICUM. Schreb. Gen. N. 130.

Calyx two-valved, solitary, generally three-flowered.

1. T. astivum. Linn. Sp. PL td. Willd. i. 476.

Calyces four-flowered, ventricose, smooth, imbricate, awned.

Sans. |Î|VTH> Godhooma, ¥r\$[*T> Sooniiauz.

Ueng. Go in.

Hind. Gioon.

Pers. Gundum.

Arab. Burr.

Two varieties are very generally cultivated in the interior and northern parts of Hindoostan during the cool season.

a. T. hybernum. Linn. Sp. PL ed. Willd. i. 477.

Calyces four-flowered, ventricose, even, indicated, with little or no awn.

Two varieties of this species are also cultivated in the northern parts of Hindoostan during the cool season.

TRIGYNIA.

M0LLVG0. Schreb. Gen- N. 139.

Calyx five-leaved. Carol none. Capsule superior, three-celled, tliree-valved, many seeded. Embryo annular, and furnished with a perispenn.

1. M. pentaphylla. Linn. Sp. PL ed. Willd. i. 492.

Annual, diffuse. Leaves verticelled cuneate-lanceolar; flowers panicled.

Hind, and Beng. Khet-papara.

Teling. Veri Sliadrasi.

A common weed in gardens throughout India.

2. M. Uiphylla. Lour. Cochinch. 79.

Annual, diffuse; branches angular, smooth. Leaves sub-verticilled, lanceolate, unequal. Panicles of long dichotomous racemes of alternate flowers; seeds dotted.

Beng. Jid-papara.

Alsine multiflora. Pluh..Phyt.Q>\, t. 259-/- 2. good.

Muliugo stricta. *Linn. Syst.* 129. is probably the same plant, if so, the specific name is a very improper one. Is also a weed in gardens all over India.

3. M. verticillata. Linn. Sp. PLed. Willd. i. 492.

Annual, diffuse, dichotomous, smooth. *Leaves* sub~verticelled,sessile, cuneiform peduncles inserted amongst the leaves, one-flowered* *Heed* furrowed along the back,

Qbs. Found over most parts of India, and a common weed in our gardens during the dry season phiefly.

HOUTTUÝNIA.

Spatke four-leaved. Spadix oblong, covered with naked flower*. Capsule one-celled, many-seeded.

1. H. cordata. Thumb. Jap. 12. et. 234. t. 26. Sir. J. E. Smith in Rees's Cyclop, in loco.

Polypara cochinchinensis. Lour. Cochinch. ed. Willd. i. p* 78-

A native of the valley of Nepala, where it grows in very great abundance, blossoming during the hot and rainy seasons, and producing ripe seed from August to the end of February. The Hon. Mr. Gardner has likewise sent me specimens gathered in the vicinity of Gossein Than (also called Neei-kiintha) in Nepal*. I have been favored with specimens found by Dr. G. Gowan, the sUpennu ndent of the Botanic Garden at Saharunpore, on his tour to the Sewalic mountains.

Name in Nepali, Kala or Kullum-Soa.

An erect, slender, pretty smooth, from two to three feet high, annual plant; rising from a long, thin, somewhat creeping root, with many short, capillary, verticilled fibres.—Stem round, slightly zigzag, about the thickness of a common goose quill at its base, with obscure, remote, pubescent, leaf-bearing joints: generally simple, though some limes sending forth several short undivided branchlets toward its summit.—Leaves petioled, alternate, spreading, broad-cordate, wilh rounded distant lobes, acuminate, entire, from two to three inches long, dotted with copious semi-pellucid points, glaucous, and while young slightly furfuraceous below, reticulated, five-nerved, the three middle nerves generally uniting near the petiol.—Petiol stipulary slender, channelled, about half as long as the leaf, into the base of which it gradually widens.—Stipules membranaceous, flaccid, oblong, obtuse and rounded, slightly ciliated and sometimes marked wilh a few tootlilets, scarcely stem-clasping at the base, having their petiol inserted about the middle of their back, persistent, the lowermost forming remote bractes on the base of the stem.—-Peduncles leaf-opposed and terminal, naked, solitary, club-shaped, generally longer than the petiol, sometimes reaching to the middle of the leaf.—Spat he consisting of four equal) white, spreading, persistent, obovate or cuneate, obtuse, smooth, veined leaves, during the aestivation imbricating in the shape of a cone, about six lines long.—* Spadix cylindric, much lengthened as the flowers decay, generally twice as long as the spathe and when fruit bearing sometimes measuring an inch and a half. Flowers very numerous and small, close together, covering entirely the spadix, which they render oblong and obtuse, sub-verticilled, destitute of both calyx and corol.—Filaments invariably three, subulate, somewhat longer than the pistils, inserted

on the angles of their ovarium, a little above its base.—Anthers erect, oblongs two-celled, bursting lengthways along their margins."—Ov&" rium round, three-cornered, most slightly pubescent, one-celled, many-seeded; ovula attached to the sides of the cavity * Styles three, persistent, rising from the apex of the angles on the ovarium, above the insertion of the filaments; leaving its vertex naked anti somewhat depressed; they are spieading awl-shaped, acute, marked along the upper part and the furrowed inside (the stigmas?) with numerous* short papillae.—Capsule about the size of a mustard seed, brovinish green, of ihe same shape as the ovarium, membranaceous and unilocular, bursting at the top, with a triangular, opening reaching half way up the styles.—Seeds about eight, brown, smooth, striated, oblong, acute at each end, somewhat darker coloured at their bases, which are attached to three parietal, oblong, elevated placentas alternating with the angles of the cavity. - Iniegument single, crusta-*Embryo* minute, lodged in a copious milk-white, mealy ceous. perisperm, towards the umbilicus, centrifugal.

Obs. In the numerous spadices which I have examined I have with Father Loureiro invariably found⁴ three stamina and as many styles attached to each ovarium, the former above the base, the latter at the apex of its angles; I have therefore not hesitated continuing this most interesting plant in the very class and' order where it has been placed in the flora.of Cochinchitia. As there is no reason* for considering it at all different from the original Japan plant I am at a loss to account for the difficulty which the celebrated Chevalier Thunberg experienced in determining its station in the sexual 3ys<* tern; nor can there at present be any doubt of its neither belonging to Heptandiiti, Polyandria, or Mouoecia.

The seeds are 'so small and their embryo proportionably minute that I have not been able to ascertain the structure of the latter; they appear to me however, to bear great resemblance to those of Tacca and Aiistolochiae, to which family the plant is still further allied by the epigynous insertion of the stamens. But its chief affinity seems to be to the *Aroideoe*, forming an additional connetting link between the two mentioned families. The leaves are

much like those of *Aristolochia Clematitis*, as has beep justly remarked by the illustrious author of the article *Uouttuynia*, in Rees's Cyclopaedia.

The plant is used while young as a potherb by the inhabitants of Nepal a as well as those of Cochinchina. Loureir. 1. cit.—N. W.

Class 4th.

TETRANDRIA MONOGYNIA.

RHOPALA. Schreb. Gen. N. 144.

Calyx none. Coral four-petalled, bearing the stamina above the middle. Nectary four-scaled. Germ one-celled; ovula two,attached to one side of the cell.

1. R. moluxana. Brown. Linn. Tram. x.p. 191.

heaves -alternate, sub-sessile, oblong, entire, racemes axillary, and from the branchlets, longer than the leaves. Ntctarial scales naked*

A native of Pulo-pinang.

As my description is laken from dry specimens I cannot say lyhether it be a tree or shrub, but the large woody specimens evidently show it to bo perennial.—Leaves shor.-petioled, alternate, obovate, oblong, obtuse-pointed, entire and smooth on both sides, six or more inches long and less than three broad.—Stipules none. Racemes generally solitary, from Lhe uaked woody branchlets belotf the leaves, very long and completely clothed to the-base with numerous beautiful, diverging, pretty large, delicate flowers.— Bractes minute.—Calyx none.—Petals four, very long and slender, near the apex they expand into 3 concave lanceolate shape for the reception of the stamens^ they first open in the middle then at the apex, and soon after become revolute. Nectary, four scales embiacing the lower part of the germ.—Filaments four, short, inserted into the petals* *bove the middle. Anthers linear, curved in an opposite direction

to the petals.—Germ above, ovate, style long and slender. Stigma clubed.

2. R. serrata. Brown. Linn. Trans, x. p. 192.

Leaves alternate, sub-sessile, oblong, serrate. Racemes axillary; pedicels two-flowered. Nectarial scales ciliate..

A native of the Malay Archipelago.

My description and drawing being from dry specimens, I cannot say whether it is a tree or shrub.—Young shoots clothed with ferruginous down.—Leaves alternate, short-petioled, oblong, acute, tapering at the base, serrate, firm and smooth on both sides; from four to six inches long, and from one to three broad.—Spikelets roue.—Racemes axillary, solitary, shorter than the leaves, clothed with ferruginous down.—Pedicels two-flowered.—Bracfes minute, cordate, one at the base of each common pedicel—Calyx none.—Petals few, long, slender, clavate^ from ihe middle downwards, their sides touch, and forni a slender tube*—Nectarial scales four between the base of ihe petals and germ, obcordate, ciliate.—Filaments four, hiseited on the petals, about one-third below their apices. Anthers ovate.—Germ superior, very hairy. Style as long as the corol. Sligma clavale.—Seed vessel not seen.

3. R. excelsa. R.

Leaves alternate, short-petioled, cuneate-oblong-, obtuse, pointed, smooth, with a few large blunt serratures near the apex.—Racemes axillary and terminal, as long as the leaves, downy.—Nedariul scales four, distinct, and naked.

A large timber tiee, a nati\e of the forests of Chittagong, where it flowery in March and April.

Trunk of the full-grown trees about four feet in circumference, covered with dark-coloured, scabrous bark; branches numerous, spreading far, and dividing much; young shoots clothed with ferruginous down.—*Leaves* alternate, short-petioled, cuneate-oblong, obtuse-pointed; interior margins generally with one, two, or three

large, blunt serrature on each side, texture firm and polished; length from four to six inches, by two or three broad.—Racemes axillary, and terminal, but chiefly the former, one, two, or three together, nearly as long as the leaves! straight and simple, densely cloathed with ferruginous down. *Pedicels* short, two-flowered.— *Xtractes*, a small oval one at the base of each common peduncle and one about the middle of each pedicel.—Flowers numerous, crowded, small, yellowish green.—Calyx none. Petals four, linearly spatulate, revolute. *Nectarial* scales four, rounded, smooth and distinct. —Filament short, inserted on the petals. Anthers linear—Germ oblong, very completely covered with long, reddish brown hairs, one-celled and containing two ovula attached a little to one side of Jhe bottom of the cell. Style filiform. Stigma clavate, entire.

4. R. robusta. R.

Leaves alternate, sessile, cune^te-oblong, smooth, remotely serrulate. Racemes axillary, and below the leaves, smooth. Nectary a smooth four-toothed cup.

Joweea, the vernacular name in Silhet where it is indigenous, and grows to be a large, stout timber tree. Flowering in June.

Young shoots sipooth.—Leaves alternate, sub-sessile, cuneate-ohlong, obtuse-pointed, remotely and acutely serrulate, smooth on both sides, about twelve inches long, by five or six broad.—Racemes axillary, and below the leaves, one, two, or three together, about half the length of the leaves, smooth. Pedicels short, two-flowersd.—Bractes smooth, one at the base of each common pedicel, and one about the middle of each of the proper ones.—Flowers numerous, pale, greenish yellow, and fragrant.—Calyx none. Petals four, linearly spatulate, smooth, revolute.—Nectary one-leaved, cup-shaped, obtusely four-toothed, with the margins somewhat ciliate.—Germ superior, oblong, smooth, one-celled; ovula two, attached to one side of the cell. Style filiform. Stigma clavate, entire.*

^{*.} **Both** this apd the preceding species are distinct from R. cochinchinen**, Brown. Unn. TraDS. x. p* 102.—N. W.

DIPSACUS.

Common calyx many-leaved; proper superior, single. Receptacle chaffy,

1. 0. inermis. Wall.

Leaves oblong, senate, villous, petioled, sub-Iobate; cauline connate; heads globular, villous; chaff cuneate, •ubulate-acuminate, scarcely longer than the tube of the corolla.

j31 with all the leaves pinnatifid-lobate.

Grows wild at Katmandu and Gossain Than, from whence Mr. Gardner has sent me specimens and seeds. Dr. Gowati has likewise found it to the Northward of Saharunpore. Blossoms during the rainy season.

Nepala name, Barberi and Gooja.

Root strong, fibrous, ash-coloured.*-Stem erect, slender, fistulous, four or more feet high, many-sided, bi achiate, the lower half densely clad with reffexed soft hairs, the upper sparingly beset with inoffensive bristles, chiefly along its ribbed corners. Leaves unequally and doubly serrated, soft and villous on both sides, with a few scattered bristles; radical about a foot long, three inches broad, acute, tapering much downwards and sub-decurrent on their equally long blender petiol; sometimes with a deep lobe on one or both sides of their base; those of the stem consisting of two or three remote pairs, five or six inches long, acuminate, undivided, generally more bristly than the others, connate at their base and forming there a short cup.—Peduncles very long and slender, few, erect, mostly with a pair of narrow short leaves at their middle.— Heads nearly round, obtuse, an inch in diameter; involucre consisting of six or eight linear channelled recurved ciliate leaves, an inch long—fie* ceptacle ovate, marked with square impressions for the insertion of the flowers, beset with membranaceous pale, hairy, cuneate, concave spreading scales, with a rounded apex ending in a straight ciliate purple-coloured lanceolate acute point, which is as long as the Inmina itself. Corolla yellowish white, pubescent, whh four almost

equal lacinia*.—Stamina spreading, long.—Seed precisely as in D. ladnialus, Gart. Carp. ii. p. 40. t. 86.

065. The plant is approaching to D. *pildsus*, but seems to dillt-r sufficiently in the form and size of the leaves, and involuciiu»« am doubtful whether the variety suggested above may not ioitn distinct species. It seems on the whole to be smoother, its leave-deeply pinnatifid or pinnate at the base, with acuminate lanceolate segments.—N. W.

IIEDYOTIS. Sckreb. Gen. N. \55*

Calyx four-parted. Corol one-petalled, funnel-shaped. Cap $\$w^{l}$ inferior, two-celled, many-seeded. Receptacles adhering to the partition their whole length. Embryo centripetal, and furnished with a perisperm.

1. H. hhpida. Retz. Obs. Bot. iv.p.23. Linn. Sp. PI* ed. FFiltdA. 565.

Diffuse, four-sided, rooting at the joints. *Leaves* sessile, lanceolate, Mfth hispid margins. *Flozcers* axillary, crowded.

It sprung iip and blossomed in December in the Botanic Garden, amongst plants introduced from the Moluccas, in 1798-9*

Stem none, but several square, creeping branches, with their floriferous extremities ascending.—Leaves opposite, sub-sessile, lanceolate; margins hispid, and entire, smooth, from two to three inches long; the connecting membrane divided into many subulate portions.—Flowers axillary, sessile, small, white.—Capsule roundish, two-celled.—Seeds numerous.

2. H. geniculata. U,

Weak, straggling, jointed, round, smooth. *Leaves* sub-sessile, lanceolate, smooth. *Flowers* sub-verticilled, short-peduncled.

A native of the Malay Islands.

3. H. scandem. R.

Perennial, scandent, round, smooth. *Leaves* broad lanceolate. *Panicles* corymbiform, terminal; mouth of the tube of the corol and apex of the style bearded.

*Gujee*_y the vernacular name in Silhet, where it is indigenous; flowers and ripens its seed during the hot and rainy seasons.*

Stems and branches perennial, round, smooth, scandent.—Leaves short-petioled, broad-lanceolate, smooth, entire.—Stipules cup-shaped, connecting the leaves, with a short process on each side between the leaves.—Panicle corymbiform, terminal, sub-globular, through* out trichotomous, all the ramifications a little villous.—Bractes linear, spreading.—Calyx four-toothed.—Corol with the tube longer than the calyx, its mouth and the base of the four linear segments of the borders of the corol very woolly.—Germ oval, two-celled; ovula numerous, attached to the sub-globular receptacles, rising from the middle of the partition. Style longer than the corol, apex woolly | stigma two-cleft.—Capsule ovate, two-celled, many-seeded.

4. H. lineata. R.

Annual, diffuse, hairy. *Leaves* sessile, ventricose-lanccolar, longitudinally marked with simple, parallel veins. *Peduncles* axillary, two or three together, pretty long, many-flowered. *Capsula* round, hairy.

Native of Chittagong, where it blossoms during the rains.

5. H. Aurkularia* Linn.

Sub-die ho tonio us diffuse, adscending, villous. *Leaves* lanceolate, sub-sessile, smooth above, many-nerved below. *Flowers* sub-deswile, densely whorled. *Capsules* villous.

Mariguti. Rheed. tlort. MaL x. p. 63. t. 32.

A native of Silhet and Nepala, where the plant blossoms during the hot and rainy seasons. From the former place the plant was

^{*} It is very common about Katmandu where it blossoms from December to March. Native name Gwtee.-N. W.

introduced in 1615 in the Botanic Garden near Calcutta, by Mr. Smith.

Beng. Muttia-lata.

Root fibrous.—Stem short, woody, divided into many slender generally once or tuice dichotomous roundish or slightly four-sided branches, measuring a foot in length, densely villous sometimes rooting at the base.—Leaves lanceolate, tapering and acute at bolh ends, an inch or an inch and a half long, even above, with several oblique villous nerves underneath, margins scabrous; pairs approximate and exceeding in leugth their interstices.—Petiols very short, the uppermost somewhat longer, hispid, uniting into a meinbramiceous, villous, stipulary membrane, which is terminated by long hispid ciliae.—Flowers small, crowded into sessile, globose, axillary, copious, villous, verticils, concealing, but scarcely longer than the petiols and rendering their stipules reflexed.—Lacinia of the calvx li near.—Tube of the corolla scarcely longer than the calyx.—Lacini& lanceolar acute.—Throat pubescent.—Stamina exserted, erect, shorter than the limb of the corolla, with *pubescentJilaments*.—Style barbate.—Stigma oblong.—Capsule small, round, slightly furrowed. —Dissepiment entire.—Seeds many, three-cornered, shining, brown. Obs. I took this plant to be H. rjtcrtosa, Lam. or hirsuta of the same author, until I discovered that Sir J. E. Smith had proposed them as varieties only of H. Auricularia; Rees's Cyclop, in loco.—• The branchy dichotomous habit of my plant, its hairy petiols and capsules are wantiug in them all and may perhaps be deemed sufficient to form it into a new species, which I am unwilling at present to add to this difficult genus. It differs very little, perhaps only in the rounded branches from the species described by Roxburgh as Retzius's hispida.

I have not cited Burman's *Valerianella palustris*, Thes. Zeyi- 227. p. 108./. 1. because it does not well agree with Ruede'a or my plant___N. W.

6. H. ulmifolia. Wall.

Decumbent, hispid with short spreading dense hairs. Leaves

ovate-lanceolate, nerved and plaited. *Corymbs* peduncled, aggregate, axiilary, opposite, shorter than the leaves, open. *Flowers* pedicelled, mostly ternate. *Calycine segments* very long.

Sun to n\e from Nepala by the Hon. Mr. Gardner; time of blossoming ihe rainy season.

Root fibrous, strong.—Stem short, woody, divided into several simple, long, very hairy branches, rounded, smoother, and jointed low aids the base, somewhat flattened at their upper-ends.— Leaves in approximate pairs, from two to three inches long, somewhat more than an inch broad, acute at the base, attenuate and acuminate at their end, rough and hairy on both sides, with many approximate, parelkl, downy nerves, deeply furrowed and plaited above, acquiring on being dried, as well all the younger parts, a yellow appemance.—Fetio/s half an, inch long, broad and slightly marginaled, furrowed.—Stipula broad-lanceolate or triangular, as long as the petiols, ad pressed, tapering into a very long, sometimes bifid, or trifid, hispid acumen.—*Peduncles* slender, an inch long, several in each axil, erect, once or twice trichotomous, with subulate bractes under each division.—Flowers rather large, pedicelled, mostly in threes.— Calyx round, hispid, with four lanceolate persistent laciniae, almost as lonij as the smooth tubular corolla, the segments of which are linear-lauceoiate, acute*—Stamina short. Filaments and Style pubesbtigma two-lobed —Capsule globose, as large as a Coriander cent. seed, crooned, hispid, many-ceeded.

Obs. In general appearance and in the leaves this species agrees with H. capitata, Lam.; but it differs in having opposite aggregate corymbs, and in the flowers not being capitate.

7. H. gracilis. Wall.

Erect, slightly scabrous, with lengthened, sub-dichotomous, naked branches. *Leaves* linear. *Stipules* truncate, fimbriated, at last naked-*Peduncles* terminal, very long, tern, sub-panicled. *Stigmas* linear.

H. strkta, WalL in Asiat- Res. xiii. p. 3G9-

A native of the Turraee and of Nepala; sent to me from the

former place by Mr. Assistant Surgeon William Jack, from the latter by Mr. Gardner. Flowering time the hot season.

Nepaltf name Goshega-soa-

Obs. I take this opportunity of correcting, an error which I committed in the description referred to above by calling my plant H* strict a: a name which had already previously been given to a different species from Sierra Leone, by Sir J. E. Smith, in Rees's new Cyclopaedia, and which therefore I have altered to gracilis.

SPERMACOCE. Schreb. Gen. N. 155.

Calyx four-leaved. Corol funnel-shaped. Capsule inferior, crowned, two-celled, two-valved. Seed solitary, longitudinally furrowed on the inside. Embryo erect, and furnished with a perispenn.

1. S. sumatrensis. Linn. Sp. PL ed. JVilldL 571. Retz. Obs. iv. 23. Shrubby, erect, four-sided. Leaves lanceolate, remote, short-petioled. Corymbs terminal, decompound. Capsule opening from the base.

A native of moist places amongst the Circar mountains. Flowers during the rainy season.

Siemerect, woolly, obsoletely four-sided. Branches opposite, four-sided.—Leaves opposite, spreading, short-petiuled, lanceolate, downy; size very various.—Stipules connecting, membranous, two or three-toothed.—Umbel compound, terminal.—Flowers white, very small.—Calyx four-leaved.—Corol with! short, gibbous tube.—Cap* side oblong, two-celled, two-valved, two-partible from the base.—'' Seed solitary.

Obs. This species ought to be carefully compared with *Hedyotis* fruticosa, Retz. Obs. ii. 8; and the capsule of the same species in Linn. Flor. Zeyl N. 63. should be well examined/* The stipules seem the chief difference. In my plant they are always a lacerated connecting membrane.

^{*} The reader is requested to consult the observation on this plant in !*«••'• Cyclopaedia, Vol. xvii—N« W.

Knoxia corymbosa, Linn. Sp. PL ed. Willd. i.p. otf2, which he considers as Gartner's K. stricta, appears to me to be this plant. Indeed the two genera Spermacoce and Knoxia differ so little from one another as to induce me to think one of them might be spared.

2. S. teres. R.

Shrubby, erect, round, villous. *Leaves* opposite, remote, lanceolate, entire, villous. *Corymbs* terminal, decompound, alternate; divisions becoming *spikes* when in seed. *Stamens* erect, but hid in hairs. *Style* twice the length of the corol.

Knoxia umbellata, Banks. Herb.

Found by Dr. Buchanan in the woods of Koorg, from whence he sent the seed to the Botanic Garden, where the plants thrive well, and blossom during the rainy season.*

Stem erect, perennial, round, while young villous. Branches opposite, a little inflected, round and villous, height of the whole plant about three feet.—Leaves opposite, short-petioled, lanceolate, downy, entire; length from two to four inches high.—Connecting membrane with several erect, filiform divisions; when they accompany the divisions of the inflorescence, they are more numerous, aiid may be called an involucre.—Corymbs terminal, brachiate, with the ultimate divisions lengthened into short spikes by the time the seeds are ripe.—Corol, mouth of the tube shut with much long white hair, which entirely conceals the large, erect anthers lodged amongst it.—
Style erect. Stigma two-cleft with divisions involute.

*Obs. This has much the habit of Hedyotis fruticosa, but differs widely in the stipules, (even if the pericarp of that plant should be that of a Spermacoce,) and in the form of the stem and branches. It is also very like S. sumatrensis, but there the branches are four-sided, here perfectly round; there the tube of the corol is smooth, short and gibbous, here cylindric, and shut with hairs; finally the capsule is there bipartible, opening from the base, with oblong brown seed, in

^{*} I have received specimens of this and the preceding species from Ncpala, va-Jytaff, however, a little iu their character from those described above—N« W.

reality it is that of a *Knoxia*; here it does not open spontaneously, and has black round seed.

3. S. exserta. R.

Shrubby, straight, tender parts villous. *Leaves* remote, opposite, petioled, lanceolate; *corymbs* terminal, decompound. *Stamina* and the bifid *stigma* exsert. *Capsule* oval.

A native of the Circars, where it blossoms in October and November.

06s. is nearly allied to S. *teres*, farther examination may prove them the same.

4. S. glabra. 22.*

Shrubby, round, smooth, erect *Leaves* linear-lanceolate, smooth. *Corymbs* axillary, compound; *styles* hairy. *Stigma* clavate. *Capsules* globular, smooth.

A uative of Pulo-piuaug, has much the habit of a strong grass or slender **bamboo**, **the** situation of the leaves excepted.

Branches round, smooth, straight, jointed, in the dry specimens fisiulous.—Leaves opposite, sub-sessile, linear-lanceolate, smooth, entire, length from four to six inches; connecting membrane with unequal avvned processes from its mouth.—Peduncles axillary, bearing several croas-armed, minute umbellets or headlets of small cream-coloured flowers.—Bractes minute.—Corol bell-shaped, mouth of the tube hairy.—Style longer than the coiol, hairy. Stigma clavate, grooved.—Capsule globular, smooth, size of a large pin's head.

5. S. *lavis*. it.

.Biennial, straight, round, smooth. *Leaves* sub-sessile, lanceolar. *Corymbs* terminal. *Anthers* hid in the bearded mouth of the infundibuliform corol.

A native of the interior of Bengal; in the Botanic Garden it

• This name was previously given to an American distinct species by Michaux.

blossoms and ripens its seed from September till February and is by far the prettiest Spermacoce I have yet met wilh.

Stems erect, perfectly straight, round, smooth. Branches opposite, and like the stems, whole height about three feet.—Leaves opposite, sub-sessile, lanceolate, smooth, entire; from one to three inches long.—Connecting membrane divided into several subulate segments.—Corymbs terminal, compound and decompound.—Flowers numerous, large, pale pink.;—Bractes small, and at the divisions of the coiymbs chiefly.—Calyx one of the four segments large, all the segments permanent.—Corol funnel-shaped, before expansion the apex is large, with four-horns; after expansion these projections form a conical knob under the apex of each segment. Mouth of the tube beaided.—Filaments short; anthers linear, just within the tube.— Germ two-celled, with one seed in each, attached to the top of the partition; style longer than the tube of the corol; stigma bifid, segments re|ol|xte.—Capsule oblong, crowned, two-celled, two-valved; valves keeled on the back. Seed solitary, longitudinally grooved on the middle of the inside.

Obs. It may be readily distinguished from S. teres (the only species known to me that it can be mistaken for) by its smoothness, greater size of the flowers, and the segments of their border being enlarged with a conic knob on the outside of their points.

6. S. lineata. R.

Erect, ramous, hairy. *Leaves* short-petioled, lanceolate, acuminate, linear. *Stipules* triangular and shaggy. *Heads* axillary on trichotonious short peduncles; *stamina* piotruded.

A native of the Moluccas* The lineate, hairy, very acute, tapering leaves, long shaggy triangular stipulas; and small peduncled heads of axillary flowers readily distinguish this species from all die other East Indian species known to me.

7. S. nana. JR-

Erect, simple, nearly round and smooth; *leaves* petioled, lanceolate, entire, smooth; *flowers* axillary and terminal, sessile, crowded.

A very small species, less than six inches high, a native of the Island of Honimoa.

8. S. stricta. Linn. Sp. Fl. ed. Willd. i. 573.

Annual, erect, four-sided. *Leaves* sessile, linear-lanceolate; *flowers* in dense, globular, axillary' verticils; *capsules* scabrous, gaping at the apex.

Te/ing. Sookwkada.

An annual, a native of wet rice fields, appears and flowers duiing the rainy season.

Stem erect, branchy, four-sided, about a foot high, angles acute and scabrous. Branches decussated, stern-like, but slenderer.—Leaves opposite, sessile, lanceolate, entire, a lntle scabrous.—Stipule, a connecting membrane, ciliate.—Verticils glob\xter.-Involucres leaf-like.—Flowers most numerous, minute, white.—Tube cyYmdric—Stigma globular,—Capsule, two-celled, opening at the apex.—Seed solitary-

9. S. costata. R.

Diffuse, very downy. *Leaves* broad-lanceolate, or oblong, ribbed. *Flowers* crowded on little axillary, proliferous umbellets. *Staminas* protruded.

Hedyotis Auricularia. Linn.*

Supposed to be a native of the Moluccas, as the plant sprung up in the Botanic Garden, from some earth brought with the spice plants from those Islands in 1800. It blossoms and ripens its seed during the greatest part of the year.

Root biennial, if not perennial.—Stems or rather branches many, diffuse, round, from one to three feet long, clothed with long, soft diverging hairs.—Leaves opposite, sub-sessile, broad-lanceolate, entire, ribed with numerous large, simple, parallel veins; downy on both sides, from two to three inches long, and about one broad;

^{*} This is unquestionably a distinct plant from tiiat described here, which in habit and leaves resembles my *tiedyotis ulmifdia*. See above, p. 370.-N. W.

connecting membrane with generally three, unequal, slender, subulate divisions.—Flowers axillary, numerous, pale pink, very small, crowded together into small round heads, on short j eduncles, and pedicels the whole forming little, proliferous, viilous umbels.—Involucre and Involucels annular, viilous, from three to six-parted.—Calyx, divisions equal, acute, hairy.—Corol funnel-shaped, hairy on the outside and in the throat of the tube; divisions of the bonier lecuived.—Stamens protruded beytond the mouth of the corol.—Germ beiiviath/broad-turbinate. Style about as long as the tube of the corol. Stigma two-cleft, vi)lous.—Pericarp with two seeds.

10. S. semierecta. R.

Stem variously bent, but ascending, square. Branches brachiate, alternately smaller. Leaves ovate. Flowers in small, compact \ertiCiI9. Stamens and style inclosed. Capsule turbinate, hairy.

x A native, I suppose, of Sumatra, as the plant from which this description is taken sprung up in a bed, where earth from that Island had been thrown, and in one year was about a foot and a half high.

The *lower brat*ches* brachiate; \he superior often solitary, they are all very exactly four-sided with angles sharp and somewhat hispid; in other respects they are very smooth <u>Leaves</u> opposite, with smaller ones in their a.\ills, short-petioled, ovate, accuminate, entire, very slightly scabrous, paiticularly the margins; with nerves and veins on the underside.—*Connecting* membrane divided into several filiform portions.—*Flowers* numerous, very small, white, sessile, collected into small compact, round verticills.—Ca/W, divisions of the border bearded in the centre.—*Anthers* within the tube,

U.S. scabra. Linn. Sp. PL ed. Willd. i. 572.

Annual, diffuse, round, hairy. *Leaves* opposite, sessile, round, obovate, the hairy margins much curved, and somewhat curled. *Flow-> ers* axillary, sessile. *Stamens* and *style* erect.

• Tardavel. *Rheed. Hort. Mai.* 9. p. 149. f • 76. The leaves however are a little too sharp for our Coromandel plant.

Stem short and generally annual. Lower branches opposite, superior alternate, rdund, coloured, very hairy, somevihat scabrous, weak, spreading fcud variously curved.—Leaves opposite, sessile, found, obovate, or nearly oval, somewhat acute; hairy on both sides, edge recurved and more or less curled —Connecting stipule with three, four, or five filiform processes.—Flowers axillary, generally in px hough often several together, but expanding in succession, sessile small, purple.—Calyx, the four divisions or in this specift nTher leaflets, lanceolate, nearly as long as the tube of the corol.—Coro* £ub-campanulate, half four-cleft.—Stamens as long as the segments of the corol.—Style as long as the stamens. Stigmas two, two-lobed, segments revolute.—Capsule oval; two-celled. Partition uieuibw* naceuus.—Seed solitary, oval, equally obtuse at each end.

12. S. articuluris. Linn. Sp* PL ed. Willd. i. 572.

Annual, diffuse, four-sided, *leaves* opposite, sessile, broad-lanceolate; connecting stipules from three to five-bristled. *Fiowers* verilicelled. *Corol* infundibuliform, four times longer than the circly stamens and style erect

A native of the sandy soil on the Coast of Coromaudel near the sea, and in flower the greatest part of the year.

Root generally annual.—Stem scarcely any, but many diffu5C straggling, four-sided, alternate, hispid branches from one to two feet in length.—Leaves opposite, sessile, lanceolate, a little hairy; veins simple, from one to two inches long, and half an inch broad—Connecting stipules cup-shaped, with from three to six biistles from each side.—Flowers axillary, sessile, two, three, or four expanding in succession from the same axill.—Cah/x with slender, linear divisions.— Corol infuiidibuliform. Tube slender, three or four time* longer than the calyx.—Stamens erect.—Stigma erect, bifid; lobes broad, and rtvolute.—Capsule two-celled, partition meinbianaceou*—Seed solitary, oval, furrowed on the flat uide.

13. S. hispida. Linn. Maul. 558. Sp. PL ed. Willd. i. 572.

Annual, with diffuse, obsoletely four-sided, hairy branches. *Leaves* oboyate, cuneate, waved, scabrous. *Flowers* verticelled, two, three, or four in each axil. *Tube* of the corol twice the length of the calyx. *Stamens* and *style* erect.

Tdiig. Madana-bunta-kada.

Galeopsis zeylanica. Burnt. Zeyl. t. 20. /. 3. agrees pretty well with my plant except in the numerous pedjcelled floweis.

Common on the sandy lands near the sea on the Coast of Coro inandel.

14. S. pusilla. Wall.

Erect, simple, four-sided, scabrous, with short hairs.— Leaves sessile, linear, smooth and silvery beneath, rather shorter than their in. terstices. Stipulary cilia very long. Verticils capitate.. Stamina exserted. Capsule villous at the top and bursting their in two bifid valves.

Native of the Valley of Nepala; discovered by Mr. G irdner during the rains.

Root small, fibrous—Stem single, undivided, four-sided, filiform, from four to six inches high, as well as the upper surface of the leaves, rough with short, whitish, subulate hairs; erect, somewhat adscending at the base.—Leaves about an inch long, spreading, tapeiiug into a point, dark-green above, smooth and of a silvery white colour below, with an elevated hairy rib; nerveless; above the base they are a little contracted, thence they widen into an ample membranaceous truncated stipula which is crowned with five capillary long cil.se. Flowers very small, pale, sub-sessile, crowded together into four or five dense axillary verticils, of which the uppermost are larger and capitate and supported by four retiexed floral leaves.—Segments of the calyx erect, linear, as long as the filiform, smooth tube, deciduous. Throat of the corolla wide; lacinia lanceolate, equalling the spreading filaments. Ovariwn oblong, slightly compressed, wiih a longitudinal furrow on each side, smooth at the base, villoiu at the lop.—Cap-

sule ovate, chartaceous, bursting at the apex in two bifid slightly recurved valves. Dissepiment evanescent. Seeds two, linear, with a ventral furrow.

Obs. The description of Crafeogonum (amboinicum) minus si'tf-rum, Hort. Au»b. vi. p. 25 agrees well with this plant; but it has been quoted under Spermacoce stricta of .the younger Linneu*, which differs in having lanceolate lineale leaves and a branchy stem. The same plant has been cited by Sir J. E. Smith under his Uedy* otis verticillata (Oldenlandia, Linn. Mant.Jin Kees's Cyclopaedia. On these grounds I conclude that Rumphius's plant is diffeieiit fi^m mine, which approaches to S. iinifolia, Vahl, and remota, Lain.—S. liana of Roxburgh differs in being smooth on all its parts, and in having petioled leaves.—N. W.

HYDROPHYLAX. Schreb. Gen. N. 159.

Calyx four-parted; corol companulate. Germ two-celled, one-seeded, inferior. Capsule inferior, angular, two-celled. Seed solitary; embryo erect, and furnished with a perispei in.

1. H. maritima* Linn. Sp. PL ed. Willd. i. 581. Sarissus anceps. Gcert. carp. up. 118. t. 25.J\ 4. Diodia orieiualis. Kön. Mss.

A native of the sand lulls along the shores of Coromandel and Malabar, where it i& in blossom most part of the year.

Moot perennial.—Stem none, Lut many long, slender, variously bent, stiailing, round, coloured blanches running over the san i and often striking root from the joints.—leaves opposite, approximate, shoi-t-petioled, from a deep, stem-clasping, dentate cup.—Flowers axillary, siib-ses9fle, one or two together, of a pale pink 'colour.—Calyx above, four-pai ted; divisions ensiform, permanent.—Corol companulate, tube hairy on the inside near the bottom, the four divisions of the border ovate, spreading, with their apices somewhat revolute.—Fr laments four, erect, shor er than the corol, and inserted on the mouth of its tube, opposite to its fissures. Anthers purple.—Germ oblong*

Style length of the corol; stigma of two round lobes.—Pericarp when ripe a dry berry of a lanceolate shape, crowned with the remaining calyx, two-celled with a single linear oblong seed in each, as detailed and fijgtired by that very eminent and most accurate botanist Gaertner.

GA LWM.

Corolla of one petal, fla% superior. Seeds two, roundish.

1 G. asperifolium. Wall.

Leaves in sixes, cuneate-oblong, retuse with a suWate point, very spreading, short-petioled, scabrous above, with hispid iil> and maigins; stem villous, four-sided, branchy, flaccid\ panicles slender; corolla awned; ovarium smooth.

A native of Nepala from whence this and the fallowing species were introduced into the Botanic Garden at Calcutta in IS 18, by the Hon. Mr. Gardner.

Stem four-sided, strong, clad with copious soft recurved hair; branches numerous, weak and leaning; joints slightly swelled.—leaves mostly six in each whorl; those below remote, oblong-cuneale, an inch and more long, those above smaller and closer together, almost reflexed, cuneate; all are tapering at the base into a very short petiol, retuse or rounded at the end and invariably terminated by a short triangular withering gre\i&n point; above dark-green, shining, scabrous, with short stiff hair, below pale and soft, except along the recurved, entire margins, and elevated rib, which are beset with stiff hair. Panicles lengthened, with ternate or opposite, copious small floral leaves. Flowers fascicled. Corolla large, expanding; each lanceolate segment ending in a capillary point. Style half-cloven. Stigma capitate. Ovarium perfectly smooth.

Obs. This species has m ch of the habit of G. Mollugo. The stem and branches are very soft, while the leaves possess a considerable harshness on account of their stiff hair; the epidermis separates partly from their upper surface when dry, assumes a greyish

shining colour and has the peculiar roughness of some of the species of Cordia.—N. W.

2. G. Aparine.

Leaves m eightg, lanceolate; keels scabrous, with prickles pointing backwards. Joints villous. Fruit hispid. Linn. «S/\ 17. ed. H lid* i. p. 597*

' In the Botanic Garden at Calcutta it blossomed freely iu Maich, 1819'.

The description of this well-known species, which Miller ami Lamarck have given, agrees well with the Nepal*/ plant. It measured when in flower about two feet in length, with abundance of weak opposite or alternate branches, by which it supported it*elt on the nearest plants. The *stem-leaves* in whorls of six or beven, front an inch to two lung, about two lines broad at the ir middle, and from thence much tapering. The upper ones sualler, generally in sixes or fives, but all equalling their interstices, upper surface scabrous, the margins and keel as well as the sharp angles of the stem and blanches beset jurith pellucid recuived prickles—*Peduncles* axillary, mostly opposite and three-flowered.—*Calyx* imperceptible.—*Corolla* exceedingly small, of a yellowish tint.—*Styles* two.—*Fruit* thickly beset with hooked bristles,—N. W.

3. G. elegans. Wall.

Leaves in fours, ovate or round-ovate, obtuse, three-nerved, soft, hairy with villous nerves; *stems* diffuse, hairy; *panicles* tnchotomous; *seeds* beset with hooked bi is ties.

A native of Nepala, from whence I received specimens in 1818 from Mr. Gardner.

Root slender, creeping, red, with verticilled fibres.—Stems weak, elongated, four-cornered, two or more feet loug, very villous \vhil« young, afterwards smoother, having only some roughish slightly recurved hair along the corners; with a few alternate branches.—Leaves about half an inch, sometimes an inch long, sessile, entire, mostly shorter than their interstices, slightly tapering towards the base, dotted and hairy above, smoother below'; the recurved mar-

gins and elevated nerves very villous.—*Panicles* divaricate, terminal or axillary, generally opposite, with some pairs of opposite small leaves. *Ramifications* divaricate, trichotomous, filiform, with minute biaotes at **flRir** base.—*Divisions* of the *corolla* lanceolate, acute* one-nerved__*Seeds* round, covered with copious soft, hooked biis* ties.—N. W.

RUBIA. Şchreb. Gen. 164.

Calyx scarcely any. Corol one-petalled, from four to five parted. Herri*s inferior, twin. Seeds solitary. Embryo erect, and furnished with a peri sperm.

1.'R. Muijibta. R.

Peitnniul, scandent. *leaves* four-fold, long-petioled, cordate, acute, .10111 live to seven-nerved, hispid. *Corol* flat, iive-parled, pentaudrous. F.tmiifg n A si at. Res. xi. 177*

Beng. Mimjit or Mwijibilia.

A native of Nepala, and other mountainous countries, north and noith east of Bengal. It grows in the Botanic Garden at Calcutta, but requires uncommon care to keep it alive during the rainy season and lias never blossomed there.

liont peiennial.—Stems woody, scandent, climbing over trees and bushes. Blanches cross-armed, from the axill of the large pair of leaves, jointed, swelling at the jo uts, hairy for a little distance below tht in, fo us-sided; angles sharp and armed with small, recurved prickles; the exierior cortex, which forms these angles, drops off by age, leaving the longer branches and steins lound, and coveted with a soft reddish somewhat downy bark.—Leaves lour-fold, petioled, one of the pairs always much larger, viz. about double the size of the other, and with longer petioles, all are beautifully cordate, entire.

acute, pointed, generally five or seven-nerved, though in the largest there are sometimes nine, and in the smallest three, or even sometimes obhimted; tlirseneives aie aimed withsmall receed piick!es,like tliote on the angles of the branclilets; both sides channelled.—Par vktes terminal, oblong, composed of numerous, oppose, small, subglobu'ar, tiichotomous panicles from the axill of the floral leaves.

— Teduncles and pedicels four-sided, smooth.—Bractes opposite, sessn, long, cordate.—Flowers numerous, minute.—Catyr) if any/so niujuie as not to be visible.—Corol flat, five-parted; divisions lanceolate, acute, with points inflected.—Stamens live, shorter than the corol.—Germ beneath, twin. Style scarcely any, stigmsj large, two-cleft —Berries two, or one; the second nut always coming to maturity, globular, size of a small grain of pepper, smooth.—Seed single, round, smooth, with a deep pit on one side.

Obs. ltd.ff. rs.irom R. cordifoUa in being peutandrous.* The roots, stems, aiul larger branches are used to dye red with.

2. R tt'a'a. Wall.

Leaves lanceolate, three-nerved, petioled, quatern, very scabrous. Stem and branches four-winged prickly. Flowers pentandrous, hispid in tiichotomous, elongated, straight, axillary, and terminal corymbs.

A native of Nepuia, from whence Mr. Gardner sent me specimens. It blossoms iu June.

lioo red—Stem several feet long, apparently leaning, strong, to* geiher wuli the opposite or veMicilled branches four-cornered, and iuur-vunged, the wings beset with short, recurved prickles, otherwise pret y smooth; joints remote.—Leaves spreading quatern, unequal, fium an inch to an inch and a half long, much shorter than their in* teïslice's, rough on both sides, especially along their margins, fur-

^{*} I Atrongly suspect t^at R. $ct^*i'.ifoL$ i,Linn. IXORA*, Schreb. Gen. N. 167.

Calyx four-toothed. Corol one-petalled, funnel shaped. Tube long, with the stamina in its mouth. Germ two-celled, one-seeded, lateral. Berry inferior, two-seeded. Embryo erect, curved, and furnished with a perisperm.

1. I. coccinea. Linn. Sp. PL ed. Willd. i. 609.

Shabby. Leaves oblong, cordate, sessile, acute, smooth, entire. Segments of the corol ovate-lanceolate, acute. Berry crowned with the shut segments of the calyx.

Schetti. *Rheed. mal. li.p.* 17* t. 12, is a pretty good figure of it, but the description of the colour of the flowers does **not** so well agree.

Jasminum flore tetrapetalo. Burm. ZeyL 125. t. 57, good.

In the Tanjore country and in China I have found this most beautiful shrub in great abundance in its wild state. In a cultivated state it flowers all the year round. I have had it eight years in my garden, and it is not more than three or four feet high! with many erect branches, but scarcely any thing like a trunk.

• Sir William Jones observes' (*Ariat. Res.* iv. 951), that no Indian god was ever named IXORA; be adds at the same time that ISWARA, which is indeed a title of *Shivtk* would be a very improper appellation of a plant which has already a classical name*

leaves opposite, sessile, approximated, decussate, oblung, pointed, entire, smooth, shining, from three to four inches long, and one and a half broad.—Stipules within the leaves with an awled process on each side.—Corymb terminal, three-forked.—tirades small, rigid.—Teduncles and pedicels short, coloured.—Flowers numerous, pretty rge, bright scailet, inodorous.—Calyx four-toothed; divisions acute:—Corol, stamens and pistil as in the genus.—Berry size of a small .cherry, red, juicy, two-celled.—Seed solitary, couvex on one si'le, and flat on the other.

Obs. Flanima sylvarum. Ram ph. amb. iv. p. 105./. 46. is a very bud representation of this species, and much more like my lxord fulgens. I have therefore doubtfully quoted it for lhat plant.

2.1. Bandhica. JR.

Shrubby, spreading. Leaves oval, stem-clasping. Cdrymhs crowded; segments of the corol ovate, obtuse. Berries crowned with the open calyx.

Asiat. Res. iv. p. 250.

Sans. Xll[1i*> Ruktuka, $^{\#}$ Wi, Bmidhooka, or s<u>T</u>-w^an, Bwndhooka, $^{\#}$ Crar** Bnndhoojeevftktf.

• Jieng. Ri/ng^wn, Tiujuna.

 \setminus A very elegant, uiicoinnionly ramous, bushy shrub, a native of Hindoos tan. Sir William Jones observes that the flower is often mentioned by the best Indian.Poets. It is in flower the whole year but chiefly during the rains, when it is highly ornamental.

Stem none, but branches innumerable, which di\ide much and spread close on the ground, forming a large hemispherical bush.— J&rftofthe large branches dark brown, and rather scabious; that of the young; shoots, smooth, aifd green.—Leaves opposite, stem-clasping, obloug, obtuse, with a small point, entire, firm, smooth on both *ide\$.—-Stipules interfoliaceous, annular, with a subulate process on each side.—Corymbs terminal, crowded, divisions many, but short.'—Flowers numerous, when they first open scarlet, changing afterwards to crimson—Bractcs opposite, conic, acute.—Calyx \$u-

perior, four-toothed, coloured, permanent.—Carol with a very long slender tube; segments of the border four, ovate, rather obtuse, spreading.—Filaments four, short, inserted without the mouth of the tube, spreading, anthers linear, spreading.—Germ two-celled, with one seed in each, attached to the middle of the partition. Styfe length of the tube of the corol. Stigma bifid.—Berry spherical, size* of a large pea, smooth, fleshy, when ripe purple, two-celled.—Seed solitary, oval, convex on the outside, flat, with a deep pit on text inside. Integuments two; exterior nuciform, inner membranaceous.—Terisperm conform to the seed, cartilaginous.—Embryo erect, curved, nearly as long as the perisperm. Cotyledons reniform, cordate. Radicle cylindric, longer than the cotyledons, inferior.

Obs. This species is nearly allied to I. *coccinea*, but differs hi the following respect9:

1st. This is a very ramous spreading bush, that much less so, and nearly erect.

2d. In this the leaves are stem-clasping, and obtuse; in that sessile and acute.

3d. In this the segments of the border pf the corol are ovate, and rather obtuse; in that ovate-lanceolate, and acute; and lastly,

Ath. The calyx on the fruit is open in this species, in that bhut into a conical point.

3. L/ulgens. J2.*

Shrubby. Leaves sub-sessile, lanceolate, acute. Corymbs terminal, highly coloured. Segments of the calyx cordate. Tube of the corol long and filiform, with smooth contracted mouth; segments.-lanceolate, and larger than the erect stamens. Berries two-lobed«

Tlanuna sylvarum. Rumph. amb. iv. 105. t. 46? pretty good!

This elegant, highly ornamental shrub is a native of the Moluccas, and from thence was introduced into the Botanic Garden, where it blossoms most part of the year.

^{*} I- fongifoKa) Sir J. E. Smith in Rees's Cyclopaedia—T. tanceotaia, Lam, EncycU; Sot. iii. 343, aiclus. omn. synon. prater Rumphiuin.—N. W.

Trunk short, soon dividing into many straggling weak branched covered with smooth dark-brown bark. Leaves opposite, shoit* petioled, lanceolate, entire, acute, smooth on both sides; ttov* slx Stipules conto eight inches long, and from one to three broad. necting, with an acute point on each side. Corymbs terminal, com-"posed of short, decussate, highly coloured branches, and hranchletSj supporting numerous, short-peduncled, long-tubed, pretty large* scai let flowers, with the four segments of their border acute, and Berry two-lobed, size of a maf-Broad-lanceolate, stamens erect. row fat pea, smooth, when ripe of a deep purple, two-celled. Seeds solitary, nearly round, convex on the back, with ft deep cavity on tb^e inside, a..d from thence attached by a thick short cord to the centre Integuments two, the exterior corresponding *** of the partition. vhat Gaertner calls the arillus in Caffea, ash-coloured, and firm hk« parchment; the *inner* membranaceous, and darker coloured.— i'*• risperm conform to the seed, pale blue, and of a soft cartilaginous Embryo erect, one-third shorter than the perispermi consistence. curved. Cotyledons two, cordate. Radicle sub-clavate, inferior.

4. I. stricta. JR.*

Shrubby, straight. Leaves sub-sessile, oblong. Corymbs dense* compound, hemispheric. Lacinia of the corol round, spreading-Anthers bristle-pointed.

Ixora coccinea. Loureir, Cochinch. 95. Curtis's Botanical Mag^a* zine, No. 169*

Flamma sylvarum peregrina. Rumph. amb. iv. 107. f. 47.

This beautiful plant was brought to the Botanic Garden from the Moluccas in 179B, where it is in constant blossom the whole y^{ear} round; but rarely ripens its fruits* The plant, when in flower i* highly ornamental, though by no means so gaudy as I. coccinea »ⁿ⁽¹⁾ Bandhuca, which are certainly two of our most showy Indian shrubs* Trunk scarcely any, but a few perfectly straight branches, covered

[•] I. flammta. Satis. Hort. 62, according to fir J< R Smith, I cit I. $chfc \$B \&_9 1^{***}$ 1. cit. 314.—N. W.

with dark-brown smooth bark; height from three to four feet.

•^Leaves opposite, sub«3essile, oblong, entire, smooth on both sides.

—-Stipules interfoliaceous, long, taper, acute-pointed—Corymbs terminal, very dense, sub-hemispheric, primary divisions brachiate, and short, extreme divisions trichotoinous; all smooth and of a bright, deep red colour.—Flowers numerous, colour at first a lively orange approaching to scarlet, becoming deeper and deeper from the time of expansion.—Calyx bright red, fleshy; divisions short and obtuse.-*

Corol, tube cylindric. Border of four round spreading segments.—

Filaments without the tube, short, spreading, flat, with their linear acute anthers over the divisions of the border of the corol.—Stigma two-cleft, elevated a little above the mouth of the tube. Berry spherical, smooth, succulent, red, two-celled, with a single rugose seed in each

Obs. In the Botanic Garden at Calcutta there is a more ramous variety of this charming plant introduced from China where it is caU led Hong-mou-tang, with pale pink flowers which it bears in abundance sill the year. #

5. I. alba. Linn. Sp. PL ed. Willd. i. 906.f

Leaves sessile, broad lanceolar. Corymbs decompound, dense, sub-hemispheric; lacinia of the corol obovate and re flexed.

Until I came to Bengal I had not an opportunity of seeing this elegant plant. I have found it only in gardens. Flowering time the hot and rainy seasons. The shrub itself is much like *Ixorq coccinea*.

Ramous, erect, and smooth in every part. *Leaves* opposite, sessile, broad-Ianceolar, smooth, a little waved, from three to six inches long.—*Stipules* within the leaves.—*Corymbs* terminal, compound, or decompound, dense, often hemispheric; *divisions* or *sub-divisions* by threes.—KF/OOCTJ very numerous, inodorous, white, with a straight, rather longer and more slender tube than in *Ixora coccinea*; divisions of the border reflexed, obovate.

Obs. This is probably nothing more than a variety of I. stricta,

[•] I. incanata, Roxb. Ms\$: according to Sir J. B. Smith, 1. cit.—N» Wi

t This species is widely different from I. otta, linu.«-N. W.

or that of this. It \va%originally brought from China where it is call* cd ·Ta-moxi-tang.

G. 1. cuncifolia. 72.

Slnubby. Leaves b»oad-cuneate, lanceolate, pointed. Corymbs terminal, long-peduncled. Flowers crowded; segments of the calyx oblong, conic.

A native of the country about Dacca, from thence the late Colonel Peter Murray sent seeds to the Botanic Garden, whue the plants grow freely, blossom in March, and ripen their seed in August and September.

Trunk shoit. Branches opposite, nearly erect, round, and covered, with smooth brown bark; young shoots smooth, and green.—Leaves opposite, short-petioled, broad, cur.eate, lanceolate, recurved, entire, taper, obtuse-pointed, firm and polished, somewhat bullate; length from four to six inches, by one and a half or two broad.—Stipules tapering, subulate, pointed—Corymbs terminal, long.-peduncled, tricliotomous, alternate divisions ending in fascicles oT sub-ses&ile, crowded,^ pure white flowers, with a slight tinge of pink on the outside.—Braetes in opposite pairs, at the various divisions of the corymb and under the calvx subulate.—Flowers very numerous, pure white, fragrant.— Calyx four-cleft to the base, divisions long, narrow and * acute.—Tube of the corol cylindric, very slender, three quarters of an inch long; the four segments of the border oblong and obtuse.— ' Filaments from the inner edge of the fissures of the border of the corol.—Anthers narrow, sagittate.—Germ oval, two-celled, with one seed in each, attached to the middle of the partition. Stigma of two linear lobes, elevated considerably above the mouth of the tube. —Berry round, turbinnte, size of a small cherry, when ripe bright • red, and smooth, two-celled—Seed solitary, round, oval, convex on • the outside, with a large deep pit on the inner. Integuments two; exterior nuciform; inner membranaceous, and greenish.—Perisperm * conform to the seed.—Embryo erect, curved like the convex seed. —Cotyledons reniform. Radicle cjlimUic^ length of the cotyledons^ inferior.

Obs. Vriil'& figure of *l.partifiora*, Symbol Bot. iii. t. 52, is much like this plant; his description however agiees better with what I have always considered to be ins parvifhra and which is so labelled in Sir Ju2>tj.h Banks's herbarium. They differ in the following respects. That (1 parvi/lora) is a tree, this a shrub; in that the leaves are linear oblong with a cordate base, of a much firmer texture, and more polished; in this they taper for two-thirds of their length to the base (hence the specific uame cunei/blia.) In that the segments of the calyx are short and obtuse, in this long and acute. In that the berries are round and black; in this short, turbing and red. The connibs also differ sdmewliat. In both species the dowers are white, but in this much larger.

7 1. brachiata. R.

Shrubby. Leaves short-petioled, lanceo'ar. Panicles brachiate, with remote, diverging brunches.

A stout jhrub, a native of the forests of Bengal. In the Botanic Garden it flowers in March, and the seeds iipcu in Slay.

J rank e; ect. Branches opposite, spreading much, but they are not P° nmnt-Fousas in 1. parti flora. Bark brown, :md pretty smooth.— Leaves opposite, short-pelioled, lanceohir, obtuse, smooth, of a hard letture, from four to six inches long, by less than two broad.—&'i-Pules triangular, acute.—T.anicles terminal, biachiate; ramifications few, remote on long, round, smooth peduncles.—Flowers numerous, minute, much smaller than in I. panijiora.—Calyx small, deeply four-toothed, coloured.—Corol with a filiform tube; segments of the "rder obovate, emarginate.—Filaments noue. Anthers linear, at-^clied by their backs to the bottom of the fissures of the border of the corol.—Gem turbinate, two-celled, with one seed in each, at-, tached to the partition. Style scarcely longer than the tube. Sligma Jarge, two-Iubed.—Berry the size of a large pea, smooth, *succulent, da*k brown purple, tuo-cellcd.—Seeds solitary, round, convex, on 1the.outside concave, with a pit on the inner. Integument* two, ellerior white, hard, thin, and elastic; inner tender aud'thin.-

Perisperm afcetabuliform, amygdaline.—Embryo erect, curved. Cotyledons cordate. Radicle cylindric, curved, inferior.

Obs. A handsome shrub, and nearly allied to Vahl's I. parviflora, though very different from the plant so labelled in the Banksian herbarium, which grows in abundance in this garden.

1st. In the shape of the leaves, which in that species are sub-sessile, and generally have a broad stem-clasping base; in this the petiole is about half an inch long, and the leaves taper more towards the base than at the exterior end.

Zd. In the thinness of the panicle, (though of the same confer, mation), and the size of the flowers, which in this species are niucb smaller, and every way more delicate, and also in their shape, which in that species is oblong before expansion, but in this round.

3d. In this the anthers are sessile, in that they have short filaments.

8.1. villosa. R.

Shrubby. *Leaves* broad-cuneate, lanceolar, ullous underneath. *Corymbs* super-decompound to the sixth or seventh degree, divisions trichotomous, vilkms. *Calycine* segments oblong and ciliate.

Beng. Choonaree.

This species is a native of Silhet, where it grows to be an elegant middling sized shrub with large crowded corymbs of fragrant white flowers, which appear in May and June.

Young shoots straight and villous.—Leaves opposite, short-petio-le,d, bro&d-cuncate, lanceolar, entire, acuminate, underneath soft with very short down; from six t& ten inches long, by from two to four broad.—Stipules downy, with the ends subulate.—Corymbs terminal, from four to eight times trichotomous, all the divisions downy, and the last three-flowered.—Bractes opposite, downy j two slender small ones pressing the base of each calyx.—Calyx four-parted, seg« merits obloug, ciliate.—Carol with a very long, smooth, filiform tube; segments of the border four, oblong, spreading; in the oblong ob* tuse bud they are imbricated.

9-1. acuminata. R.

Shrubby. *Leaves* petioled, lanceolar, acuminate, smooth | *floral* pair stem-clasping, and broader. *Corymbs* super-decompound, much crowded, and smooth. *Calycine* segments ensiform.

A very charming shrubby species, a native of the forests near SiU het, where it/blossoms during the hot season, and perfumes the air with the fragrance of its flowers.

Addition by N. W.

The shrubs in the Botanic Garden have acquired a height of five *> six feet-:Bar* scabrous, ash-coloured.—Branchlets roundish, smooth, pale.—Leaves lanceolate-oblong, acute at their base, from *ix to eight inches long, from two to three broad, of rather a thin but firm texture, pale and glaucous, opaque, slightly bullate above, whitish and scabrous beneath, with copious, opposite, parallel nerves uniting into sub-marginal arches; veins reticulated.—Petiolshort, roundish. —Floral pair of leaves smaller than the rest, ovate-oblong, rounded at the base.—Stipules broad, triangular, acute, purplish.—Corymbs 'urge, sub-sessile, round, with snow-white, «*>st fragrant, crowded tlowers.— Peduncles twice or tin ice trichotomous, very short, pubescent, with opposite linear-lanceolate bractes under each division. *-Ca/yx ovate, with white lanceolate straight laciniae supported by a pair of bractes.—Tube of the corol slender, an inch aud a half long. Lacinia spreading, ovate-oblong, obtuse, with recurved sides; mouth surrounded with a series of silky long hairs.—Filaments reflected between the lacinioe.—Anthers linear.—Stigma elevated above the mouth, club-shaped, bifid.

The opaque remarkably pale and glaucous leaves, the sub-sessile crovded corymbs of large white blossoms, with white calyces, sufficiently distinguish this elegant bhiub from I. baibata, R. and all the other species.

10. 1.paniflora. VahL Symbol, iii.p. iht.52. Linn. Sp. PLtd. Willd. i. 609.

Aiboreous. Leaves sub-sessile, oblong, smooth. Vankles ovate oblong, decussated. Lacinia of the corol oval. Style hairy. Berries round.

Beng* Gundhttl-rtmgun.

'feting* Tadda-pullu.

Among the mountains of the Coast of Coromandel this species grows to be a pietty large tree; in the low lands it is much smaller, seldom exceeding fifteen or twenty, feet in height. Flowering time February and March.

Bark dark-coloured, scabrous.*-Leaves opposite, short-petioled_f linear-oblong, pointed at the base, often cordate; smooth, shining. firm, entire, from three to four inches long, and from one and a half to two broad.—Stipules as in I. coccinea.—Panicles ovate, terminal, erect, cross-armed; divisions always three-forked.—Bractes at the principal divisions stipulaceous, with four subulate processes; the rest are small, one below each ramification.—Mowers small, white, fragrant. The st\le is hairy.—Berry generally two-seeded, somewhat twolobed, size of a pea, black.

31.1. barhala.R*

Tube of the corol long; mouth bearded. *Leaves* opposite, short-petioled, oblong, entire, smooth, shining; *fioral* leaves round, cordate, sessile. *Panicles* open.

This elegant, densely ruinous, large shrub, or small tree, I have found only in the Botanic Garden. Flowering time the hot season.

liunk scarcely any, branches numerous, opposite.—Leaves opposite, short-petioled, oblong, entire, smooth, and shining on both sides, from six to nine inches long.—Stipules within the leaves as in the other species.—Corymbs, or rather panicles terminal, decompound, large, diffuse, always trichotomous, smooth in every part.—•

Bractes, the lowermost pair embracing the base of the common peduncle, large, and cordate, (they may be called floral leaves;) the

• This plant must not be confounded with *Pavetta barbata* of Sir J. E. South in Reeg'a Cyclopedia, in loco—N. W.

*est gradually decrease in size till they become very minute at the ultimate divisions.—Calyx as in the genus, with acute divisions.—2\ibe of the corol long and slender, its mouths crowned with long white hairs.—Style the length of the corol. Stigma clubbed, just without the mouth of the tube, apex slightly bifid.—Berry red, smooth, size of a pea, two-seeded.

Obs. Bem-Schetti. Rheed. MaL $\ddot{u}.p$. \g. t. 13. is a tolerable representation of this plant, but a bad one of what I consider to be Ixora alba.

12.1. undulata. R.

Leaves opposite, broad-lanceohr, acute, much waved. Panicles terminal, open; divisions of the calyx acute. Filaments as long as the anthers. Stigma two-cleft. Berries transversely oval.

Betig. Paluka-Jooi.

A ramous shrub, a native of forests in Bengal, dowering time the *ot season.

Leaves, opposite, sub-sessile, spreading, broad-lanceolar or oblong, pointed, margins much waved, smooth on bollrsides but not shining. "-Stipules within the leaves, with a long awled process on each side. *—Corymbs or rather panicles terminal, decumpound, &c. as in L barbata, but much smaller.—Bractesas in the other species.—Flow- ^{er}s numerous, small, white.—Calyx, divisions acute.-r-Coro/, divisions of the border reflexed, rather shorter than the tube.—Filaments from the fissures of the corol, pretty long, spreading and variously k nt. Anthers as in the genus.—Style rather longer than the tube. Stigma two cleft; divisions recurved.

J3,1. Pavetta. R.

Shrubby. Leaves short-petioled, smooth, entire. Panicles fastigiate, axillary, and terminal. Style twice the length of tilt Corol Stigm entire. Berries globular.

•Pavetta Mica. Linn. Sp. PL ed. Willd. i. 610,

Pavetta, s. Malleamothe. *Rheed. Hort. Mai* v. 19. t 10, is cer* taiuly this plant.

Beng. Kookoora-choora.

Tellag. Noonż-papoota.

A middle sized shrub, common on road sides, hedges, uncultivated lands, &c. where there is a good soil.

Branches cross-armed, ascending. Bark ash-coloured.—Leaves opposite, petioled, oblong, entire, pointed, always smooth on both sides, which forms the chief difference between this and the next species; from four to six inches long, and two, or two and a half broad.— Stipules a»in the former species.—Corymbs compound, terminal, large, nearly level-topped, cross-armed.—Peduncles and pedicels round, and smooth.—Bractes as in the former species.—flowers white, somewhat fragrant.—Calyx, divisions obtuse.—Style twice the length of the tube. Stigma clubbed.—Berry globular, size of a pea, one or two-seeded.

14.1. tomentosa. 22.*

Shrubby. *Leaves* oblong, ventricose, entire, tomentose. *Panicles* lax, sub-globular, tomentose; *style* twice the length of the corol. *Stigma* entire. *Berries* globular.

Beng. Jooi.

Teling* Nam-papoota«

A large shrub, native of the same places, but not so common as the last described. Flowers the beginning of the hot season.

Branches cross-armed, ascending. Bark ash-coloured.—Leaves opposite, petioled, ovate, pointed, entire, both sides very downy, from four to eight inches long, and from three to five broad.—Stipules as in the former species.—Panicles terminal, globular, cross-armed, divisions always three-forked.—Fed uncles and pedicels round, downy.—Bractes as in the former species.—Flowers numerous, white,

• Cousult Rees's Cyclopaedia under *Pavttla.-1* have had tht species from Katmandu and Aknora.-N. W.

faintly fragrant.—Style twice the length of the tube. Stigma clubbed.—Berry generally two-seeded.

O6s. In all the foregoing species the berries are two-seeded, though it often happen that but one *comes to* perfection. I never met with any that had three or four.—I do not find that the inhabitants of these parts make use of any of the trees, except for fuel.

J5. I. tenuiflora. JR.

leaves short-petioled, oblong, obtuse, smooth; panicles terminal, corymbifonn, contracted. Segments of the calyx cordate, and obtuse, tube of the corol long, and most slender; segments o(its border oblong, obtuse, and longer than the erect style, or stamina.

A native of the Moluccas, and with flowers infinitely more deli* cale than 1. fulgent which it most resembles*

IG, I. congesta. R.

Shrubby. Zozrmhort-petioied, oblong, strongly veined. *Corymbs* terminal, short, dense. *Flowers* sub-sessile. *Segments* of the calyx obscurely reuiform; those of the border of the corol oblong, and obtuse.

A native of the Moluccas, and differs from *Lfulgens* in the firm • *oniewhat coriaceous leaves, with stronger parallel veins.

^7.1. lanceolaria. Colebr.

Shrubby, smooth; *branches* slender, pendulous, sub-dichotomous. **aves in approximate pairs, very long, linear-lanceolate, acuminate *bort-petioled. *Corymb* terminal, sub-sessile, small, with coloured *caly_f crowded *peduncles*. *Tube* of the corol filiform \ *lacinia* linear- *blong. *Anthers* linear with deeply bifid base.

A native of Travancore. Introduced into the Botanic Garden by ^r- A. Berry in 1808. Time of blossoming the hot season; the fruit ripens towards the close of the rains.

An erect shrub, five, six, or even more feet high, with trichotonous, very little spreading, ash-coloured branches*. *Brancklets* very

slender and twiggy, hanging, green, with numerous compressed widened joints, like all the other parts of the plant smooth.—Leaves. spreading, from five to seven inches long and almost as many times exceeding their interstices, an inch or less broad a little above their acute base, from thence tapering into a sharp acumen, opaque and somewhat glaucous above, pale beneath, with a slender white rib and very fine sub-opposite nearly transversal nerves which communicate with each other in sub-marginal arches.—*Petiols* about two lines long, channeled. Stipules adpressed, lanceolate, as broad as the interstices between the insertion of the two opposite leaves, tapering into a subulate point which generally exceeds the petiols in length.—Corymb small, supported by a pair of very short leaves, consisting of twice or thrice trichotomous, reddish, pubescent peduncles, with opposite linear, subulate bractes under each division, having a stipuliform, fiin• briated process between their bases* *Pedicels* ternate or fascicled, two or three lines long, with three pairs of reddish fleshy subulate scales, the uppermost adpressed to the calvx.—Calvx very small, oblong, reddish, with erect subulate teeth; at the bottom, within, there is a series of fleshy, subulate, withering and sphacelated *cilia* as in the family of Asclepiudea and Apocynecs. Corolla white; tube slender, half an inch long; *limb* spreading, equalling the tube, with linear oblong-fatcate, slightly pubescent *lacinia*.—Anthers linear and long; the base bifid and ending in two whitish processes; Jilame?its short, Styk clavate; stigma two-lobed, subulate, spreading, exserted. elevated above the mouth of the corolla. Beny as large as a mar* row-fat pea, red, smooth, crowned with the four subulate, erect teeth of the calyx.—Seeds cup-shaped, hemispherical.

Obs. This species is so distinct from all the others as to be easily known. Its slender hanging branches, pallid and glaucous leaves, and the small corymbs of crowded flowers contribute to render it a very ornamental plant in the shrubber/.—N. W.

18.1. ro\$ea. Wall
Shrubby. Leaves oblong, aqute with contracted sub-emarginate

base, pubescent beneath; sub-sessile. *Corymbs* super-decompound, open and large, terminal and from the exterior axils. *Lacinia* of the corol oblong-cuneatc, acute.

Khasee name, Mattia-Ciuinda.

A native of the hilly parts on the borders of Bengal about Silhet, from thence introduced, in 1815, into the Botanic Garden at Calcutta, by Mr. M. R. Smith. It blossoms most freely during the hot and rainy seasons.

An erect, strong, branchy shrub, about four Feet high, with scabrous, brown bark. The younger branches pubescent, slightly compressed towards the insertion* of the leaves, ash-coloured.—Leaves sub-decussate, spreading, leathery and firm, five or six inches long, about two broad, tapering towards the base and there rounded or slightly emarginate, dark green, bullate, smooth and shining above, pale and pubescent beneath, especially along the elevated rib and copious nerves.—Petiols thick and woody, scarcely more than a line long.—Stipules broad ovate, pubescent ending in a long subulate adpressed point, connected and stem-clasping by means of a narrow membrane, continuing within the base of the petioles, and concealing a series of small rust-coloured cilia.—Corymbs round, as large as the leaves, mostly elevated on a peduncle, with trichotomous brachiate spreading pubescent reddish peduncles, the lower ones an inch long; the whole forming an ample terminal inflorescence of innumerable, most beautiful, pale, rose-coloured, ternate, sessile *flovers.-Bractes* opposite, lanceolate, connected by a ciliated margin—Cflfyx very small, oblong with four reddish lanceo-W ciliated teeth, supported by two adpressed bractes.-C*7/tf as It the preceding species.-Corolla pubescent; tube slender, a little ttore than an inch long; lacinia smooth, spreading, at last reflect-*d, equalling one-fourth of the tube in length.-Filaments reflected. Anthers linear-sagittate.—Stigma reddish.

Obs. This shrub is exceedingly elegant on account of its large round corymbs which for eight months of the year are produced in a constant Accession. The colour of the flowers is a pale pink, gradually be-

coming reddish as they grow old, beautifully contrasting with the shining dark green leaves, which are not unlike those of I. Bandhuca. The colour of the flower lesembles that of the pink variety of I- cu^* 7ieifolia; it is paler than the variety of I. siricta, which Roxburgh formerly used to call 1. incarnata.—N. W.

GARDXERIA.

Calyx inferior. Corol flat. Stamina partly cohering into a tube* Berry two-celled. Seeds solitary, cup-ahaped.

1. G. ovata. Wall.

A native of the mountains in the district of Silhet in Bengal, and of Nepala. It blossoms in the hot and rainy season, and ripens it» fluit in the cold.

Khasee name, tluldi. In Nepala, Oocha-Soa.

A strong climbing smooth shrub, with long slender round branches; the new twigs have a green bark and are obscurely four-sided. —Leaves opposite, approximated, spreading, petioled, ovate or lanceolate, acuminate, pointed at the base, entire, smooth on both sides, very dark and shining above, pale underneath, with elevated rib and transversal sub-opposite very fine nerves, which unite with each other and with the reticulated veins iu sab-marginal arches. They measure from three to four inches, and are generally twice as long as their interstices.— Tetiols round, channeled above, slightly curved, half an inch long, widening at the base and surrounding the branch with an elevated, fleshy, narrow, erect margin, concealing in their axils a series of short subulate fleshy withering cilia.—Stipules no others than the appendices just described.—Corymbs axillary, opposite, equalling or somewhat exceeding the leaves in length, slender, with one or two pairs of small lanceolar leaves under their primary divi-Peduncles slender, opposite, an inch or an inch and a half sions. long, three-flowered, pedicels clavate with two lanceolate minute bractes at the base, and generally a pair above their middle; the intermediate ones.shorter.—Calyx very small; cup-shaped, persistent,

9* 1. acuminata. R.

Shrubby. *Leaves* petioled, lanceolar, acuminate, smooth; *floral* pair stem-clasping, and broader. *Corymbs* super-decompound, much crowded, and smooth. *Cafj/cine* segments ensiform.

A very charming shrubby species, a native of the forests near Silhet, where it blossoms during the hot season, and perfumes the air with the fragrance of its flowers.

Addition by N. W.

The shrubs in the Botanic Garden have acquired a height of five to six feet.—. Bark scabrous, ash-coloured.—Branchhts roundish, smooth, pale.—Leaves lanceolate-oblong, acute at their base, from six to ei"ht inches long, from two to three broad, of rather a thin but firm texture, pale and glaucous, opaque, slightly bullate above, whitish and scabrous beneath, with copious, opposite, parallel nerves uniting into sub-marginal arches; veins reticulated.—Petiolshort, roundish. -^Floral pair of leaves smaller than the rest, ovate-oblong, rounded at the base.—Stipules broad, triangular, acute, purplish.—Corymbs large, sub-sessile, round, with suow-white, most fragrant, crowded flowers.— Peduncles twice or thrice trichotomous, very short, pubfescent, with opposite linear-lanceolate bractes under each division. "--Calyx ovate, with white lanceolate straight lacinis supported by ^a pair of bractes.—Tube of the corol slender, an inch and a half long. Lacigia spreading, ovate-oblong, obtuse, with recurved sides; mouth surrounded with a series of silky long hairs.—Filaments reflected between the lacinise.—Anthers linear.—Stigma elevated above the **^outh; club-shaped, bifid.**

The opaque remarkably pale and glaucous leaves, the sub-sessile crowded corymbs of large white blossoms, with white calyces, suffici* ently distinguish this elegant shrub from I. *barbata*, R. and all the other species.

10.1. parviflora. Fahl. Symbol iii.p. ll.t.52. Linn. Sp. PLed. Willdi. 609-

Arboreous. Leaves &ub-sessile, oblong, smooth. Vankles ovat© oblong, decussated. Lacuna of the corol oval. Style haiiy. Berries round.

Jieng. G/indhtcl-nfiigifn.

. Teling. Tadda^pullu.

Among the mountains of the Coast of Coromauddl this species grows to be a pretty large tree; in the low lands it is much smaller, seldom exceeding fifteen or twenty feet in height. Flowering time February and March,

Bark dark-coloured, scabrous.—Leaves opposite, short-petioled, linear-oblong/pointed at the base, often cordate; smooth, shiuingi iirm, entire, from three to four inches long, and from one and a half to two broad,—Stipules as in I. coccinea.—Panicles ovate, terminal, erect, cross-armed; divisions always three-forked.—Bractes at the piincipal divisions stipuluceous, with four subulate processes; the rest are small, one below each ramification.—Flowers small, white, fragrant. The style is hairy.—Berry generally two-seeded, somewhat two-lobed, size of a pea, black.

3 1.1. *barbala*. if.*

Tube of the corol long; mouth bearded. *Leaves* opposite, short-petioled, oblong, entire, smooth, shining; *Jloral* leaves round, cordate, sessile. *Panicles* open.

This elegant, densely ramous, large shrub, 01 small tree, I have found only in the Botanic Garden. Flowering lime the hot season.

Ttunk scarcely any, branches numerous, opposite.—Leaves opposite, short-petioled, oblong, entire, smooth, and shining on both bides, from six to nine inches long.—Stipules within the leaves as ia the other species.—Corymbs, or rather panicles terminal, decompound, large, diffuse, always trichotomous, smooth in every part.—BracteSy the lowermost pair embracing the base of the common peduncle, large, and cordate, (they may be called floral leaves;) the

^{*} This plant must not be confounded with *Pavetta barbata* of Sir J. E. Smith U> Kees's Cjdo|>aidia, in loco.—N. W.

٠:

rest gradually decrease in size tilt they become very tain ut6 at the Wtimate divisions.—Calyx as in the genus, with acute &virsions.—Tube of the coro! long aud slender, its mouths crowned with long while hairs.—Stifle the length of the coro!- Stigma clubbed; just without the mouth of the tube, apex slightly bifid.—Berry ted, smooth, size of a pea, two-seeded.

Obs. Bein-Schetti. Rheed. Mai: it. p. 19. t. 13. is h tolerable representation of this plant, but a bad one of whit I cansider to be from a alba.

)2.1. undulata. R.

i -aves opposite, broad-fanceolar, acute, much waved. *Panicles* terminal, open; *divisions* of the calyx acute. *Filaments* as long as the withers. *Stigma* two-cleft. *Berries* transversely oval.

Bens. Puhtka-Suoi.

A lainous *shiuh*, a native of forests in Bengal, flowering time the hot season.

Leaves opposite, sub-sessile, spreading, broadJanceolar or oblong, pointed, margins much waved, smooth on boih sides but not shining. —Stipules within the leaves, with a long aw led process on each side. "^Corymbs or rather panicles termiua!, decompound, &c* as in IV barhata, but much smaller.—Bracleszs in the other species.—Flow* er\$ numerous, small, white.—Cfl/yr, divisions acute*—Coro/, diviku onjr of the border reflexed, rather shorter than the tube.—Filaments from the fissures of the corol, prttty long, spreading and variously kent. Anthers as in the genus.—Style rather longer than the tube. Stigma-two cleft; divisions recurved.

IS. I. Pavetta. R.

Shrubby. *JJares* short-petioled, smooth, entire* *Panicles* fasti- **\$^te**, axillary, and terminal. *Style* twice the length of the corol. **\$tig ma** entire. *Berries* globular.

Pavetta indica* Linn. Sp. PL ed. Willd. I 610.

Pavetta, s. Malleamothe. *Rheed. Hort. Mai.* v. ig. t. 10, is certainly this plant.

Beng' Kookoora-choora.

Teling. Nooni-papoota.

A middle sized shrub, common on road sides, hedges, uncultivated lands, &c. where there is a good soil.

Branches cross-armed, ascending. Bark ash-coloured.—Leaves opposite, petioled, oblong, entire, pointed, always smooth on both sides, which forms the chief difference between this and the next species; from four to six inches long, and two, or two and a half broad.— Stipules as in the former species.—Corymbs compound, terminal, large, nearly level-topped, cross-armed.—Peduncles and pedicels round, and smooth.—Bractes as in the former species.—flowers white, somewhat fragrant—Calyx, divisions obtuse.—Style twice the length of the tube. Stigma clubbed.—Berry globular, size of a pea, one or two-seeded.

14. I-tomentosa. B.#

Shrubby. *Leaves* oblong, ventricose, entire, tomentose. *Panicles* lax, sub-globular, tomentose; *style* twice the length of the coroK *Stigma* entire. *Berries* globular.

Beng. 300i.

Teling. Nam-papoota.

A large shrub, native of the same places, but not so common as the last described. Flowers the beginning of the hot season.

Branches cross-armed, ascending. Bark ash-coloured.—Leaves opposite, petioled, ovate, pointed, entire, both sides very downy, from four to eight inches long, and from three to five broad.—Stipules as in the former species.—Panicles terminal, globular, cross-armed, divisions always threlfeforked.—Peduncles and pedicels round, downy.—Bractes as in the former species.—Flowers numerous, white,

• Consult Rees's Cyclopadia under *Patetta.-!* ba*e had the species from Kat-manda and Almora.—N. W,

faintly fragrant.—*Style* twice the length of the tube. *Stigma* clubbed.—*Berry* generally two-seeded.

Obs. In all the foregoing species the berries are two-seeded, though it often happen that but one comes to perfection. I never met with any that three or four.—I do not find that the inhabitants of these parts make use of any qf die trees, except for fueL

15. I. temiflora. R.

leaves short-petioled, oblong, obtuse, smooth; paniclet terminal corymbiform, contracted. Segments of the calyx cordate, and obtuse, tube of the corol long, and most sleuder; segments of its border oblong, obtuse, and longer than the erect style, or stamina.

A native of the Moluccas, and with flowers infinitely more deli* cate than *Lfulgens* which it most resembles*

16.1. congesta. R.

Shrubby, leaves short-petioled, oblong, strongly veined. *Corymbs* terminal, short, deuse. *Flowers* sub-sessile. *Segments* of the calyx obscurely reuiform; those of the border of the corol oblong, and obtuse.

A native of the Moluccas, and differs from *Lfulgens* in the firm *°me\vhat coriaceous leaves, with stronger parallel veins.

7-1. lanceolaria. Colebr

Shrubby, smooth; *branches* slender, pendulous, sub-dichotomous. **<*ves in approximate pairs, very long, linear-lanceolate, acuminate *horupetioled. *Corymb* terminal, sub-sessile, small, with coloured lcaty, crowded *peduncles*. *Tube* of the corol filiform; *lacinia* linear-oklorig. *Anthers* linear with deeply bifid base.

A native of Travancore. Introduced into the Botanic Garden by A. Berry in 1808. Time of blossoming the hot season; the fruit ripens towards the close of the rains.

An erect shrub, five, six, or even more feet high, with trichotovery little spreadipg, ash-coloured branches. *Sraṃhhti* very

slender and twiggy, hanging, green, with numerous compressed widened joints, like all the other parts of the plant smooth.—Leaves spreading, from five to seven inches lons? and almost as many times exceeding their interstices, an inch or less broad a little above their acute base, from thence tapering into a sharp acumen, opaque and somewhat glaucous above, pale beneath, with a slender white rib and very fine sub-opposite nearly transversal nerves which communicate with each other in sub-fnarginal arches____Petiots about two lines long, channeled. Stipules adpressed, lanceolate, as broad as the interstices between the insertion of the two opposite leaves, tapering into a subulate point which generally exceeds the petiols in length.—Corymb small, supported by a pair of very short leaves, consisting of twice or thrice trichotomous, reddish, pubescent peduncles, with opposite linear, subulate bractes under each division, having a stipuliform, um* briated process between their buses. *Pedicels* ternate or fascicled, two or three lines long, with three pairs of reddish fleshy subulate scales, the uppermost adpressed to the calvx.—Calvx very small, oblong, reddish, with erect subulate teeth; at the bottom, within, there is a series of fleshy, subulate, withering and sphacelated *cilice* a? in the family of Asclepiadea and Apocynea. Corolla white; tube slender, half an inch long; limb spreading, equalling the tube, with linear oblong-fatcale, slightly pubescent *lacinix.—Anthers* linear and long; the base bifid and ending in two whitish processes | filaments short, Style clavate; stigma two-lobed, subulate, spreading; exserted. elevated above the mouth of the corolla. Berry as large as a mar* row-fat pea, red, smooth, crowned with the four subulate, erect teeth of the calyx.—Seeds cup-shaped, hemispherical.

Obs. This species is so distinct from all the others as to be easily known. Its slender hanging branches, pallid and glaucous leaves, and the small corymbs of crowded flowers contiibute to render it » very ornamental plant in the shrubbery.—N. W.

18.1. rose a. Wall.

Shrubby. Leaves oblong, acute with contracted sub-emarginate

base, pubescent beneath; sub sessiif. *Corymbs* super-Secompouud, open and large, terminal and from the extejior axils. *Lacinia* of the corol obloug-cuneate, acute.

\uasee. name, Matiiū·Chāndā.

X uati''c o; tile hilly parts on the borders of Bengal about Silhet, nom thence ntroduced, in 1815, into the Botanic Garden at Calcutta, by Mr. M. It. Smith. It blossoms most freely during the hot and raniy seasons.

An eiect, strong, branchy shrub, about four feet high, with scabrous, brown bark. The younger branches pubescent, slightly coin* piesstd towards the insertion of the leaves, ash-coloured.—Leaves sub-decussate, spreading, leathery and linn, five or six inches long, about two broad, tapering towards the base and there rounded or. sightly emarginate, dark green, bullate, smooth and shining above,, pale and pubescent beneath, especially along the elevated rib and copious IK^Jrves.-r-Petiols thick auti woody, scarcely more than a line long.—Stipules broad ovate, pubescent ending in a long subulate, adpressed point, connected, and stem-clasping by means of a narrow mei«,braue, continuing within the base of the petioles, and concealing a series of sma!l rust-coloured cilia:.—Corymbs round, as large as the leaves, mostly elevated on a peduncle, with trichoto* mous brachia^e spreading pubescent reddish peduncles, the lower Ones, an inch long; the whole forming an ample terminal inflorescence of innumerable, most beautiful, pale, rose-coloured, ternate, Be *sile flowers.—Bractes opposite, lanceolate, connected by a cilia**d. margin, __Calyx very small, oblong with four reddish lanceo-'ate ciliated teeth, supported by two adpressed bractes.—Cilia as lu the preceding species— Corolla pubescent; tube slender, a little ^ r e than an inch long; laciuia smooth, spreading, at last reflect* ed, equalling one-fourth of the tube in length.—Filaments reflected. Anthers linear-sagittate.—Stigma reddish.

Ob\$. This shrub is exceedingly elegant on account of its large round ^{cor}ymbs which for eight months of the year are produced in a constant •uccession. The colour of the flowers is a pale piuk, gradually be-

coming reddisli as they grow old, beautifully contrasting with the shining daik green leaves, which are not unlike those of I. *Bandhuca*. The colour of the flower resembles that of the pink variety of I- *cu* neifolia*; it is paler than the variety of I. *stricta*, which Roxburgh formerly used to call 1. *incarnata*.—N. W.

GARDXERIA.

Calyx inferior. Corol flat. Stamina partly cohering into a tube.

Berry two celled. Seeds solitary, cup-3haped.

1. G. ovjta. Wall.

A native of the mountains in thd district of Silhet in Berigai, and of Nepala. It blotfsomA in the hot and rainy season, and ripens its fruit in the cold.

Khasee name, Huldi. In Nepahr, Odcha-Soa.

A strong climbing smooth shrub, with Icng slender round branches; the new twigs have a green bark and are obscurely four-sided. —Leaves opposite, approximated, spreading, petioled, ovate or lanceolate, acuminate, pointed at the base, entire, smooth on both sides, Wy dark and shining above, pale underneath, with elevated rib and transversal sub-opposite very fine nerves, which unite with each other and with the reticulated veins in sub-marginal arches. They measure fresh three to four inches, and are generally twice as long as their interstices.— Petiols round, channeled above, slightly curved, half an inch long, widening at the base and surrounding the branch with an elevated, fleshy, narrow, erect margin, concealing in their axils a series of short subulate fleshy withering *cilia.—Stipules* no others than the appendices just described.—Corymbs axillary, opposite, equalling or somewhat exceeding the leaves in length, slender, with one or two pairs of small lanceolar leaves under their primary divisions. *Peduncles* slender, opposite, an inch or an inch and a half long, three-flowered, pedicels clavate with two lanceolate minute bractes at the base, and generally a pair above their middle; the intermediate one? shorter.—Ca/p very small, cup-shaped, persistent,

divided into four-concave, orbicular, ciliated, alternately imbricating lac'tnia.—Corol thick and leathery, yellow, deeply four-parted; /aciwfl? ovate, acute, slighty concave, very" spreading, almost recurved, about two lines long, alternating with those of the calyx and with the insertion of the stamens, covered above, particularly towards the thickened apex with a sericeous down, margins broad and flat; during the aestivation they are valvate.—Tube none.—Stamens four, erect, 'somewhat shorter than the corol: Filaments scarcely perceptible, inserted at the bottom of tlie corol just below the fissures. Anthers ovate, acute, and free at both ends, fleshy in the middle; the side? uniting into a ventricose, pervious, four-toothed tube; within, towards their margins, they are two-celled; the cells separated by a longitudinal partition, which becomes free and keel-formed at their bursting.—Ovarium above, and perfectly distinct from the calvy, ovate, minute, two-celled, two-deeded: ovula attached to the centre of the partition.—Stijle filiform, shorter than the tube of the anthers.—Stigma simple? acute.—Berry supeiior, round, somewhat depressed, smooth, crowned with the persistent base of the style, supported by the calyx, scarlet, about the size of a large Currant, fleshy, two-celled, two-seeded. Pulp pale red.—Dissepiment very thin, nienibranaceous, marked on each side with some vessels disposed in the form of a cross.-^Placenta fleshy, short, originating from the centre of the dissepiment, entering the cavity of the 3eed and filling it entirely with a soft pulp.—Seed solitary in each cell, ' very thin, bullate and excavated in the shape of a hemispherical cup with a flat somewhat widened, exactly circular margin, gibbous at fte back, smooth on both sides, of a grayish brown colour—fnte-&*ment single, coriaceous, closely adhering to the horny, pearl-coloured Perisperm, which has exactly the form of the seed.—Embryo dicot) ledoneotis, erect, cylindrical, adscending, from above the inferior portion of the margin, about one-third the length of the seed, 8lightly curved, milk-white.—Cotyledons leafy, lanceolate, flat, parel-1el to the sides of the seed. Radicle cylindiic, inferior and slightly centripetal, twice as long as the cotyledons, its apex situated immediately within the margin of the seed at its lower part.—Flumula inconspicuous.

Ql)s. The general habit and structure of the fruit of this interesting shrub are those of the family of liubiucea, especially its primary sub-divisions, who a single two-celled, two-seeded fruit; while its $superior\ free\ ovarium$ is irreconcilable with the character of that most extensive tribe. In this point, to which may be added the connate anthers and stipulation, the genus agrees with $Appciuea^*$ But it differs from them both in the aestivation of its flowers, forming with the axillary subulate bodies a more remote affinity with $Asch'piadea_f$ among which Mr. R., Brown has lecorded a solitary iustauce of& alvate corolla in. his Leptadenia.*

The difficult) thus encountered in assigning my plant to its proper station in the natural arrangement has fortunately been lessened by M. Savigny, who concludes his description of *Pagamea* of Aublet, inserted in Lamarck's Eucyclop. Bot.f by suggesting that it ini^ht be united with Gaertnera of Lamarckj: under a distinct order; aud finally removed by Mr. K. Brown who, having on a previous occasion[^] pointed at the existence of an intermediate family between Jiubtacecc and Apocinee, afterwards confirmed its existence in his in* teresting observations on the plants collected in the vicinity of the River Congo by nfy lamented friend and fellow student the late Profebsor Christian Smith. To this connecting group my plant necessarily belongs, requiring a separate section m addition to those pro* posed by Mr. Biowu. The fruit appears to a ree with Gaerlnerd of Lamarck, with Fagamea, especially if the doubts of Jussitu respecting the latter[^] should be verified, and with Baconia of Decaiidolle. Its general structure, as well as the horny aud copious peris* perm which, dm ing germination, is raised up wiili the young plallt and remains a considerable time in that state, and the relative post*

^{*} Memoirs of the VVern Soc. i. p. 10 et 34. 1 Vol. iv. p. 694. \$ Illustr. tab. 1G7 et Poiret in £uc>cl. but. suppl. append, p. 081. \$ P1' • • for.Nov. Holl.i. p.455.

H Narrative of Capt. Tuckey's Expedition to the River Zaire; Append- P. Geu* plant, ed. Uauri, p. 232,

tion of the Embryo are perfectly like those of *Tsychotria*, *Cofea* and *Irora*. It has the excavation of the seed in com mod with *Pavetta iudica** and several species of *hora*; the ventral aperture is how. e*er much larger here and circumscribed by a somewhat widened margin.—The younger parts of the plant as well as the dark-colour* ed shining leaves contain a yellowish juice, from which probably the Silhet name is derived; indeed they are not unlike those of *Guttiferfa*

My Nepala specimens differ m some degree from the others; their leaves are smaller, lanceolate and more narrow; the segments of the corolla lanceolate and more villous, the beiries larg: and crowned with the persistent *long* style; sti^na bitiJ.

I have dedicated this new genus to ihe Hon. Edward Gardner, lute resident at the court of the Kaja of Nepali/, by whose indefatigable exertions nud liberality the Botanic Garden at Calcutta has been enriched by the most splendid additions of growing plants, secds, and specimens of the interesting and hitherto mostly unknown vegetable productions of that country, of which ample and frequent coU lections have been transmitted to Great Britain.—N. W.

PYROSTRIA. Juss. Gen. ed. Usl. 229.

Calyx four-toothed. Corol whh cyJindric tube, and four-cleft; border. Drupe inferior, with as far as eight, one seeded nuts.

1. P. heiasperma. -ft.

Leaves opposite, short-petioled, oblong, acute, entire. Corymbs, axillary, and also within the cuspidate, hairy, aiipules, dichotomous^Drupe six-seeded.

A uative of the Island of Honimoa.

Tender-bhoots clothed with brown hairs.—Leaves opposite, approximate, shoi't-petioled, oblong, acute, entire, a little hairy; froia three to four inches long.—Stipules within the leaves cuspidate, hairy.— Pedwwc/es-opposite; with the stipules many times longer ihan the petioles, each ending in a small twice dichotomous, corjmbifoiin,

panicle of recurved secund spikes.—*Bractes* subulate, one-flowered. —*Flowers* rather small, hairy.—*Calyx* four-toothed.—*Corol* with a slender, cylindric, villous tube, and contracted, four-parted border. —*Filaments* none. *Anthers* linear in the mouth of the tube of the corol, and affixed to it by their backs.—*Germ* beneath. *Style* shorter than the corol. *Stigma* simple.—*Drupe* round, six-ribbed; size of a *pea.*—*Seeds* or nuts regularly six, sub-cyliudric.

SALFADORA. Schreb. Gen. N. 220.

Calyx four-toothed. Corol one-petalled, four-cleft. Style none or short. Berry inferior, one.seeded.

1. S. persica. Linn. Sp. PI. ed. Willd. i. 695. R. Corom. PL i. N. 26. Hivina paniculata. Syst. nat. x. p. 899*

Teling. Pedda-vvarago-wenki.

A middle sized tree, a native of most parts of the Circars though by no means common; it seems to grow equally well in every soil. Produces flowers and ripe fruit all the year round.

Trunk generally crooked, from eight to ten feet high, to the branches, and one in diameter. Bark | ery scabrous, and deeply cracked. Branches exceedingly numerous, spreading, with their extremities perfectly pendulous, like the weeping Willow.—Leaves opposite, petioled, oval or oblong, entire, very smooth, and shining on both sides, without veins; from one to two inches long, and about one broad.—Stipules none.—Panicles terminal, and from the exterior axills.—Flowers minute, very numerous, greenish-yellow. ~-Bractes minute.—Calyx inferior, four-toothed, permanent.—Corol one.petalled. Tube short, border four-cleft; segments oblong, revolute.— Filaments four, inserted into the tube of the corol under its fissures, and rather shorter than the border. Anthers oval.— Germ globular, style none. Stigma scabrous.—Berry very minute, much smaller than a grjiiu of black pepper, smooth, red, juicy. beed one.

Obs. The berries have a strong aromatic smell, and taste much like gardcu cresses. The ftark of the rcotis remaikably acrid,

bruised and applied to the skin, it soon raises blisters; for which purpose the natives often use it. As a stimulant it promises to be a medicine possessed of very considerable powers.

CALLICARPA. Schreb. Gen. N. 175.

Calyx four-to'othcd. Corol one-pe tailed, tubular, four-parted. Germ four-celled, cells one-seeded; ovtila attached to the middle of the axis. Berry four-seeded. Embryo erect, and furnished with a perisperm.

1. C. arborea. R.

Arboreous. Leaves long-petioted, oblong, ventricose, tapering much toward both ends, entire, hairy underneath. Panicles axillary, aub-globular, throughout dicholomous.

A stout tall tree; a native of Chiltagong.* Flowers at various* times through the year.

Trunk nearly erect, and in trees nine years old, thirty-three inches in circumference four feet above the surface of the soil, liranch-Branchlels obtusely four-coint-red, and mtaly. ts spreading. Leaves opposite, long-petioled, oblong, ventricose, tapering equally at each end, entire/smooth above, hairy underneath, while young and unexpanded very mealy on both sides; length from six to twelve inches petiole included, which may be reckoned one-fourth of the whole.' - Panicles axillary, solitary, or paired, the largest on a pedun* cle as long as the petioles, sub-rotund, from six or eight times dicho. tomous, aU the ramifications somewhat four-cornered and mealy. —Bowers small, very numerous, lively purple, or lilac, small, rather offensive.—Bractes minute.—Cn/yJ companulate, obscurely fourtoothed, mealy on the outside.—Corol with the tube much longer Aan the calyx, one of the segments of its border smaller—J7/aments twice the length of the corol. Anthers brown—G^ra superior, round, four-celled, with one ovula in each, attached to the middle of the axis. Style as long as the stamens, and bent in aa opposite direction. Stigma headed—Berry superior, round, poliah-

• It M vev common also about Katmandu iu Nepa!a.-N. W.

cd, lively purple, succulent, size of a small grain of black pepper, one-celled.— Seeds four, convex on the outside, with two flat faces on the inner, rough; interior integument hard like the shell of a nut—Tetisperm oval, soft, amjgdaline.—Embryo straight, erecr, nearly as Vug as the perisperm. Cotyledons oblong. Radicle oblong, the length of the cotyledons, inferior.

2. C. Janata. Linn. Sp. PL ed. Willd. i. 620.

Aiboreous, all the young parts mealy. *Leaves* opposité, oval, entire, downy. *Corymbs* axillary, dichotomous throughout. *Coroh* oblique.

Toniex tomentosa. Flor. ZeyL N. 59-

A piett\ large tiee, a native of the Circar mountains, and of the vallies between them.

Trunk perfectly straight, and of a considerable height.— Bark smooth, ash-coloured. 'Branches few, and near the top, forming but a small head for so large a trunk. Young-shcots somewhat four-sided, and covered with grey farina.—Leaves opposite, petioled, ovate, taperiug to a point, entire, downy, below whitish with much down; from nine to ten inches long, anil five or six broad.—Petiols round, two or three inches long, covered with down.—Corymbs axillary, erect, two-forked throughout; every part covered \uth grey farina.—tirades small.—Flowers very numerous, small, purple.—Calyx short; border four-sulcated, permanent.—Corol; tube bent to one side. The other parts as in the genus.—Style descending.

Obs. The wood of this tree is white, spongy, and of course not fit for much use.

3. C. cana. Linn. Sp. PI ed. Willd. i. 620.

Shrubby, downy. Leaves ovate, glandular-dentate-serrate, downy underneath. Panicles axillary, sub-globular. Stigma bifid* \bar{B} er-ries purple.

Ca/licarpa americana. Loureiro. Cochinch. ed* Willd. i. p. 88tliis shrub was introduced into the Botanic Garden from the Moluccas in 1798, and in three years had attained to the height of from four to eight feet high, considerably ramous, with the young parts downy, and the ligneous ones covered with smooth, pale ash-coloured bark. They are in blossom in March and April chiefly, though more or less the whole year.

Leaves opposite, shorl-petioled, from broad cordate to oblong, reticulated with margins glandular-dentate-serrate; upper side soft and of a deep green colour, but very downy, and pale underneath.—

Cymes axillan, dichotoinous, scarcely longer than the petioles, villous.

Flowers numerous, small, pale red colour.

Bractes subulate, caducous.

Calyx woolly, four-toothed.

Corol companulate; divisions sub-coidate.

Filaments longer than the corols, and insetted into the base of its tube, ascending.

Style declined, length of th4 filaments. Stigma two-cleft.

Berry small, round, smooih, deep purple; seeds four.

Dos. It diffeis from C americana, Willd. in having a woolly, toothed cally, two.lobed stigma and in the form of the leaves.

4. C. iticana. R.

Sin ubby, young shoots hoary. *Leaves* lanceolate, obtusely serrulate, tine- and en lire-pointed, hoary underneath.

Mashandaii. Abiat. Res. iv.233.

Beng. Muttuva, "Miitlriiijfl.

A stout shrub, with all the tender parts and the under surface of the leaves densely clothed with long, s<*ft, \\hite, stellate pubescence: common in the vicinity of Calcutta, where it is in flower and seed nearly the whole year.

1 Ion" considered this to be Vahl's *macrophylla*, but on rearing *hat I also took for the same species from Silhet and Chittagong, in the Botanic Garden, I could plainly observe a striking difference ^vhen growing near each other, and as the Chittagong and Silhet sort agrees much better with Vahl's figure and description, I must coufiider it to be his *macrophylla*. In the Calcutta plant, which I now call *incatia*, the leaves are never so broad iii proportioa to their length,

more round at the base; much more pointed, with the long taper point* entire; all the rest of the margin, except what may be called the base, obtusely-serrulate. In *macrophylla*, the leaves are crenate, more obtuse, and the margins cut to the very apex: the two are however very nearly altied, though I think sufficiently distinct to authorize their being considered as different.

5. C. macrophylla. FahL Symbol, iii. 13. t. 53.

Shrubby, downy. Leaves opposite, ovate-lanceolate, serrulate, reticulate, hoary underneath. Corymbs axillary, dichotomous, rather longer than the petiols. Berry minute, white.

Native of Silhet and Cliittagong.

A shrub, from four to eight feet in length. *Trunk* scarcely any, but several, round, erect branches, covered with white down.— *Leaves* ^opposite, petioled, lanceolate, or oblong lanceolate, fine-pointed, finely serrate, wrinkled, above soft, and a little downy, below covered with much whitish soft down, from six to nine inches long, and two or three broad.—*Stipules* none.—PeJio/s about an inch long, downy.—*Corymbs* axillary, peduncled, two-forked, nearly globular, downy, many times shorter than the leaves,— *Peduncles* as long as the petioles, round, downy.—*Bractes* lanceolate, one under each division of the conmb.—*Flowers* very numerous, small., rose-coloured.—*Calyx* woolly,'the four divisions distinct and acute.

6. C. acuminata. R.

Shrubby, tender parts hoary with a stellate pubescence. *Leaves* broad-lanceolar, acuminate, remotely repand, denticulate. *Panicles* axillary, loug-peduncled, dicliotomous, shorter than the leaves.

A native of Silhet, flowers in May. In this species the panicles ara elevated on longer peduncles than in the other species, the ltaves and young parts very hairy, except the upper surface of the forme Mhen fully expanded, which-is then naked and reticulate; fr<W four to five inches long by nearly two-broad*

7. C. loHgifolia, Linn. Sp. PI ed. Willd. 1. 621.

Shrubby, with erect weak branches. *Leaves* rather long-petioled, broad lanceolate, serrulate, smooth above, downy underneath. *Tanicies* axillary, dichotomou9, length of the petiols. *Berries* white.

A native ef Prince of Wales Island, where it blossoms in June, July, and August.

8. C. cuspidal a, R.

Shrubby, all the tender parts, and the under surface of the short* petioled, elliptic, dentate, cuspidate. *Leaves* woolly. *Corymbs* axillary, their division and the calyces clothed with minute grams uuder the wool.

A native of the Moluccas; the leaves are always acutely dentate, and end in a long taper, acute point. The Berries are very small, smooth, and purple.

9. C lanceolaria, R.

Shrubby, hairy. *Leaves* lanceoiar, serrulate, acuminate. *Tanicles* axillary, short-peduncled, sub-globular. *Berries* white.

H. Koamoora.

A pretty, shrubby species, with narrower leaves than any of the other species 1 have yet met with in India, they taper most toward the base, are nearly smooth on the upper surface, but very hoary UD« derneath; as are all the other tender parts. *Flowers* numerous, minute, purple.

A native of the forests of Silhet, where it is in flower most part of the year.

10. C. pentandra, R.

Shrubby, tender parts meally. *Leaves* opposite, with an alternate one between, oblong, entire, cuspidate. *Corymbs* axillary, *I'tower** pentandrous. *Stigma* from three to four-lobed.

A native of the Moluccas.

11. C. purpurea, Juss.

Shrubby; branchlets and younger parts slightly scaly. Leaves sub-sessile, lanceolate, acuminate, serrate, with sub-entire cuneate base, smooth above, glandular»dotted below. Corymbs axillary, very small, diohotomous; flowers glandular.

Porphyra dkholoma. Lour. Cochinch. ed. Willd. i. 87.

A native of China. Introduced in 1812, into the Botanic Garden, at Calcutta, where it thrives extremely well, has attained a height of from four to six feet, and blossoms from April to September. The berries ripen at the close of the rainy season.

Shrubby, spreading, with roundish branches, covered with scabrous gray bark. Branchlets veiy slender, slightly scabrous, and beset with ferruginous stellate and somewhat scaly pubescence; lie** shoots almost mealy.—Leaves from lanceolar to oval, two inches long, tapering at both ends, but more so at the base, and only tlieffe entire: the rest of the margin serrulate; without any hair or down, but scabrous below, from a great number of minute brown shining glandular dots which impart on being rubbed, a faintly aromatic smell; nerves and ribs elevated and slightly scaly.—Feiioh very short.— Corymbs axillary, or rather supra-axillary, small, round, two or three time9 dichotomous, many times shorter than the leaves; peduncles short, divaricate, beset with mealy pubescence, with minute lanceolate scales under each sub-division.—Flowers fragrant, purple, marked with glandular dots.—Calvx turbinate with very small obtuse teeih.—Carol about three times longer than the calvx, infundibuliform; *lacinitc* oval, obtuse.—*Filaments* almost twice as long as the corolla, purple; anthers large, orange-coloured, covered with many glandular clots.—Stigma sub-capitate, elevated above the anthers.^* Berry very small, purple, at last red, with one or two fertile seeds-

Obs. I cannot but consider this as Loureiro's plant quoted above, which Jussieu has justly placed among the genus Callicarpa. ** seems to be nearly allied to Cjaponka, but differs chiefly in wanting the smoothness, the short stamina and pistillum, and the acute tigma of the latter. Its flowers are besides of a beautiful purple

colour, especially within, while those of Thuubcrg's plant are white. - N . W.

BUDDLEIA. Schreb. Gen. N. 184.

Calyx four-cleft. Corol four-deft Capsule superior, bisulcate, bilocuiar. Seeds numerous.

1. B. Nemda, Buchanan.

Arboiescent. *Leaves* lanceolate, sub-serrate, hoary underneath. *Spikes* terminal, lengthening, *vrhh Jlowen* three-fold.

Niiuda the vernacular name at Chutagong, where the plant ia iiun^euous, and from ihence introduced iulo the Botanic Garden bj Dr. Buchanan, where it begius to blossom about the close of the cutd season. Seeds ripen in March and May.*

Trunk erect; branches numerous, opposite. Bark of the longer Wool'y parts ash-coloured, young shoots covered with white down. il tit lit of the tree, in two years, about fifteen feet.—Leaves opposite, short-petioled, lanceolate, slightly hairy; from four to eight mdies long.—Petioles short, their bases joined by a connecting niembraue.—Spikes terminal, generally three-fold, there being a lar^iT, and longer in the centre, with a smaller on each side; long, Stender, hairy, lengthening, and blossoming for three months.— Flamers generally three-fold, sub-opposite, sessile, very numerous, >i*iill," pure white, and of a pleasant smell.—Bractes lanceolate, one under each flower.—Calyx inferior, four, rarely five-toothed, tillous.— *Corol* oue-pelalled, hypocrateriform. Tube the length of the cai).\; mouth villous, border of four, rarely five, rounded, equal segments.—Filaments short, inserted near the base of the tube of *ta corol. Anthers broad, sagittate, hid in the tube.—Germ coni-Stigma large, oblong, bisulcate, even with the cal. Style short. tops of the anthers __Capsule ovate-oblong, two-celled, two-valved. Seeds minute, numerous, imbricated, compressed.

^{*} I have received specimens of this charming plant collected by 8>y friend Dew Govan at Saharunpore—N, Y.

Obs. The whiteness of the leaves, and young shoots of this plant, independently of its numerous, beautiful small, fragrant, pure white flowers, makes it highly ornamental, particularly amongst plants with daiker foliage.

2. B. paniculata, Wall.

Leaves lanceolate, acuminate, entire, acute at the base, villous above, densely hoary beneath; racemes short, hoary, sessile, crowded into terminal panicles; flowers fascicled*

A native of the valley of Nepal*, from whence the Honorable E. Gardner sent me specimens in 1818. Flowering time February to April.

A small ramous tree with round spreading branches, covered with smooth fibrous separating bark.—Branchlets slightly compressed, and, as well as the leaves and iufloresceiice, covered with dense white stellate easily separating toinentum; especially while young.—Leaves lanceolate, tapering into an acumen, quite entire, acute at the base, from four to five inches long, rugose above, soft and homy below, with conspicuous sub-opposite nerves and Teticulated veins. —Peti* cles half an inch long, obscurely furrowed above, connected by an elevated line running across the branch.—Racemes short and stout, obtuse, the lowermost from the terminal axils about two or three inches long, the others shorter and more simple, until they become a terminal elongated raceme; the whole forming an elegant crowded attenuated sessile panicle or thyrsus. Common peduncle about six inches long, and, as well as the outside of the flowers, hoary; partial one very short, and supported by opposite narrow linear acuminate /fortf/ hates or bractes.—Flowers fragrant, white, numerous, sessile, crowded into approximate sub-sessile fascicles, each with a pair of subulate elongated bractes, besides some smaller ones under the exterior calyces.—Calyx with ovate teeth.—Tube of the corolla cylindric, three times longer than the calvx, slightly hairy within. Lacinia short, oval, obtuse.-*Anthers linear, sub-sessile below the mouth, enclosed.— Qvarium and base of th\$ sbwt style villous. Stigma clavate.—N. W*

EXACUM. SchreL 6en. N. 185.

Calyx four-leaved. Corol salver-ihaped. Capsule superior, two-celled, two-valved. Seeds many.

1. E. tricolor, R.

Annual, erect, four-sided. Leaves sessile, ovate, five-nerved. Flowers axillary, apices of the segments of lie coroi blue, the icst vhite. Anthers erect.

A native of Cuttack, where it appears during the cool season.

Hoot almost simple—Stem eject, biauchy, four-sided; angles somewhat wniged, fioni oue to two feet high.—Leaves sub-&e&*iie opposite, oval, live-nerved, suiooiii, size veiy various. Floral leaves small and narrow.—Flowers axillary, solitary, short peduacled, large of a beautiful white and biue colour.

2. E, tetragonum, R.

Annual, simple, erect, four-sided. *Leaves* sessile, lanceolate, tilenerved. *Flowers* numerous^ terminal. *Stamens* and *style* declinate. *Beng. Koochuii*.

A native of Bengal, where it grows among long grass; and flowers during the rains.

Stem erect, simple, exactly four-sided, smooth; from two to three or even four feet high.—Leaves opposite, decussate, sessile, lanceolate, five-nerved, smooth and shining, from two to lour inches long.—Flowers terminal, numerous, large, of a most beautiful blue colour, inodorous*—Calyx divided nearly to the base into four, daggered segments.—Corol\ segments oblong, acute, spieading—Filaments on the tube of the corol, short. Anthers linear, bending to one side, with two pores at the top, for the discharge of the pollen, as in Cassia.— Germ oval. Style projecting obliquely with the stamina; stigma enlarged.—Capsule two-celled, two-valved—Seeds numerous.

Obs. This is one of the most elegant plants I have met with, the flowers being not only numerous, large, and beautiful, but retaining their beauty and expansion for many days, which is a rare circumfltauce in an Indian plant

3. E. teres, Wall.

Stew round. Leaves linear-lanceolate, acuminate, tapering at the base, and sub-sessile, three-nerved. Peduncles opposite, three-Howcred, forming a terminal corymb. Segments of the Corolla lanceolate, acuminate.

Communicated by Mr. M. R. Smith from Sillier, where it blossoms during the iainy season.

This plant is nearly allied to the preceding species (which I have also received from the Hon. E. Gardner from Katmandu, where it is called Kaskwa Soa, and from Mr. William Jack, who discovered it in the Tunayee, bordering on the Nepal*/ mountains), agree in habit and beauty; but my species differs in the following point It is smaller and more ^lender, the whole height not exceeding two feet; the stem perfectly cylindic, as thick as a small goosequit, with a few branches at the base. The leaves are three or four juihes long, and about half an iuch broad at the middle, from thence tapering towards both ends, narrow at the base and almost petioled, inely acuminated; like the whole plant, smooth. Fed uncles almost Pedicels slender, about half an Inch to an is long as the leaves. inch long, teiniinated by a dark blue large flower. Lacinia of the Corolla narrower ind more acuminated than in E."tetragonum. In other respects the plants are very much like each other.—N: W.

4. E. zeylanicum, iJ.

Annual, pentandrous. *Leaves* opposite, subsessile, lanceolate, three-nerved. *Flowers* five-cleft. *Calyx, with* five, broad membranaceous wings with subulate points.

Chironia trinervia, Linn. Sp. PL ed. Willd. i. 1065.

Lysimachia folio sinuato, acuminato trinervio, flore cceruleo, arnplo calyce carinato, alato. *Burnt. Zeyl.* p. 145. *t.* 67.

A native of Ceylon.

Stem erect, somewhat four-sided, smooth, annual.—Leaves opposite, short-peiioled, lanceolate, entire, smooth on the sides, tliree-Berved, from one to three inches long,—Racemes terminal, and opposite from the exterior axils, the whole forming an expanded co-

rymbiform panicle.—Peduncles and pedicels four-sided, smo3tli.—.

Mowers numerous, large, of a violet colour.—Calyx five-cleft; du visions with a broad membranaceous wing on the back, and a long subulate point.—Coro/; tube gibbous, length of the calyx, some shoit filaments amongst the insertions of the stamina crown the mouth of the tube. Border of five, obovate, beautiful, violet-coloured, divisions.—Filaments on the mouth of the tube, erect. Anthers linear, with two poies at the top, and also opening on the sides.—

Style declining, rather longer than the filaments.—Stigma headed.—Capsule oblong, two-celled.

Obs. The quthtrs remain straight, and hard, with two pores at the top, and also bursting by two longitudinal openings on the sides, I have for that reason removed this plant from the genus. *Chironia*, the essential mark of which consists in its spiral aulhers.

5. E. carinatum, JR.

Annual, eject. *Leaves* sub-sessile, lanceolate, three-nerved. *Co* rols* four-cleft. *Calyces* broad, membranaceo-cariuated. *Stamens noii* uded. *Style* declined.

A native of Cellon.

Root i'ainous, annual.—Stem erect, with one or two opposite pairs of branches about the middle; above these dichotomous, somewhat fours ded, smooth, from six to twelve inches high.—Leaves opposite, short-petioled, lanceolate, entire, three-nerved—Flowers teiiiupal, numerous, pretty large, yellow, collected on dichotomous corymbs, with a Jong peduncled one in each of the divisions.—Calyx fouuparted, each division augmented by a broad membranaceous. ketl on the back.—Corol four-parted.—Filaments short, inserted on a membranaceous rim round the inside of the mouth of the tube. Anthers erect, yellow, opening on the sides.—Style longer than the stamens, declined. Stigma ascending, simple.

6. E. sulcatum, R.

Annual, erect, ramous, sulcated on the opposite tide* of the stem.

and branches. Leaves sub-sessile, lanceolate, fleshy, three-nerved. Calyx with four ridges; stamens erect; capsules globular.

A native of Bengal; blossoms during the cool season; the seeds ripen in March.

Root iibroiis, annual.—Stem erect, from six to twelve inches high, smooili, sulcated o|| opposite sides. Brandies opposite, their flower-b'earuig extremities two, and three times two-cleft.—Leaves opposite, sub-sessile, lanceolate, fleshy, entire, three -nerved; from one to two inches long.—flowers terminal, numerous, of a bright blue colour, those in the divisions of the branchlets long-pcduncled.—P*-duncles four-sided.—Btactes ovate, recurved.—Calyx deeply four* parted; divisions with an ample keel.—filaments short, inserted in the mouth of the tube of the corol. Anthers ovate, oblong, touching at the sides, apices perforated.—Style longer than the stamens, declined; stigma two-lobed.—Capsule globular, two-celled, two-valved.—Seeds numerous.

Obs. This is a vjery beautiful small plant.

PLADERA. Solanders Mss.*

Calyx cylindric, four-toothed. Corol funnel-shaped, border irregular. One of the stamina larger. Stigma two-lobed. Capsuli superior, one-celled, two-valved. Seeds numerous.

1. P. sessiliflora, R.

Annual, erect, four-sided; *angles* winged. *Leaves* opposite, se»•ile, ovate, entire. *Flowers* sessile.

Exacum heteroclitum, *Linn. Sp. PL ed. Willd.* i. p. 639. Gentiana heteroclita, *Mant. 560.*

A native of Coroniandel and Bengal, appears on moist pasture ground during the raius and first part of the cool season.

Stem erect, with two or three pairs of opposite branches, which are again once or oftener dichoiomous, all are four-sided, with a thin

uing to each angle; height of the whole plant about a span.--Leaves opposite, sessile, ovate, entire, ihree-nerved; dillering much in size, the largest rarely an inch long.—Flowers solitary, in the divisions of the plant, sessile, small, pale red.—Calyx sub-cylindric, four-toothed; teeth acute.—Coroi with the tube as long as the Border three-cleft, two of the divisions equal, oblong, and crowded at the apex, the third divided half way down.—Filaments four; three longer, and inserted in the mouth of the tube; the fourth just below the fissure of the bifid segments of the corol. Anthers equal, oblong.—Germ linear-oblong. Style as long as the. Stigma two-lobed; lobes large, obovate, thin.—Capsule sub-cylindric, nearly as long as the permanent calyx, and hid in it, Receptacles consist in the incurved mar. one-celled, two-valved. gins of the valves, (parietal, and two-lobed.) Seeds numerous, an* gular, very small.

2. P. virgata, i2.*

Annual, erect, four-sided, branches opposite, alternate. *Leaves* sessile, lanceolar, three-nerved. *Flowers* terminal, sub-pauicled.

Exacum diffusum, Linn. Sp. PL ed. IVilld. i. 037.

Gentiaua dift'usa, laid. Symbol, iii. 47.

A beautiful erect, ramous annual; growing on the banks of watercourses, and on low fallow lands. Flowering time the wet season.

Stem about a foot, or sometimes two feet high, erect, four-sided, ramous, smooth; inferior branches opposite, above alternate, very slender and twiggy.—Leaves opposite, sessile, Uie lower lanceolate, the upper broader, all are pointed, and three-nerved, entire, smooth; size various. Floicers numerous, terminal, peduncled, small, rose-coloured.—Calyx four-toothed, permanent.—Corol funnel-shaped. £order irregular, three-parted; the two upper segments equal, and orbicular, the lower one two-parted; with a deep groove; in the groove is lodged the fourth or large stamen.— Filaments four, inserted into

[•] Canscora diffusa, Brown, Frodr, Fl. Nov. Holl. 1451—J-inu. Syst. Veg. ed. Roenu et Schult iii. 301,—N- W.

the mouth of the tube, the lowermost longer than the other three,, and bearing an orange-coloured, and longer *anther*, which when shedding its pollen, is bent over the fissure of the *stigma*; anthers of the other three filaments equal, pale yellow.—*Style* single, length of the short filaments. *Stigma* two-cleft, segments recurved—*Capsule* one-celled, many-seeded.

3. P. decussata, JR.*

Annual, erect, four-winged, branches cross-armed. *Leaves* ovate-lanceolate, three-neTved. *Flowers* terminal, three-fold, peduncled.

Beng. Dfinkoni.

This species resembles P. rirgata, but is a little more robust, and seldom so high. It is a native of the same placés. Flowering time the same.

Stem about a foot high, perfectly erect, four-sided; angles very sharp, or rather membrane-winged, smooth, ranious, branches always opposite, cross-armed, in other respects like the stem.—Leaves opposite, spreading, sessile, lanceolate, sharp-pointed, entire, smooth, three-nerved, size various.—Flowers terminal, and axillary, peduncled, the terminal flowers three-fold; the axillary single, larger than those of the last species, and white.—Peduncles four-sided, like the stem and branches.—Calyx large, four-toothed, four-sided, four-winged.—Corol, stamens, 8cc. exactly as in the last species.

4. P. perfoliata, R.

Annual, erect, four-winged. *Cauline* leaves lanceolate, threenerved; *floral* leaves (or bractes) perfbliate.

Canscora, Lamarck's Encyclop. Bot. i. 601.

Kansjan-Cora, Rheed. Mai. x. p. 103. t. 52.

A native of India, where it delights in a low moist soil. Flowering time the rainy season.

Root ramous, annual.—Stem erect, somewhat four-sided, with
Exacuin alatam, Roth. linn. Syst. Veg. ed. Roem. et Schult. ill- lfifc—N. W.

four broad membranaceous wings. *Branches* opposite, and like the stem; all are smooth. Height of the whole plant about eighteen in. dies.—*Leaves* of the stem opposite, sessile, lanceolate, three-nerved* *Floral* leaves perforate, all smooth and entire.—*Flowers* terminal, peduncled, numerous, pretty large, pale rose colour.—*Calyx* fourtoothed, striated, permanent.—*Corol* irregular, somewhat two-lipped; the upper one larger and deeply two-parted, the lower one consisting also of two lobes, but smaller.—*Filaments* four, three of them rather shorter, and inserted qn the upper side of the tube; the third larger, and inserted below the fissure of the lower lip/ *Anthers* oblong.—*Style* as long as the stamen^. *Stigma* two-parted, *Se*—*tnenls* recurved.—*Capsule* oblong, one-celled, two-valved.

5. P. pusilla, R.

Annual, from one to two inches high. Leaves sessile, sub-cordate. Flowers terminal, sessile, three-fold, monandrous. Corol hid in the calyx. Capsule globular.

Compare with Hopea dichotoma.* Fahh Enumer. i. p. 3; also with Exacnm sessile , JVilld. i. G35.

A beautiful minute plant, a native of Coromandel.

Stem erect, four-sided, branchy; from one and a half to two inches high.—Branches cross-armed.—Leaves opposite, sessile, cordate, minute, smooth.—Flowers terminal, sessile, three-fold, small, yellow.—Calyx one-leaved, sub-cylindric, as long as the corcri)fcfour-tooth« ed, permanent.—Corol one-petalled. Tube a little gibbous, moutli four-toothed.—Filaments four within the tube of the corol, and inserted into it near the base. Anthers, three minute, and abortive; one large and fertile.—Germ globular. Style short. Stigmas two, globular.—Capsule oval, covered by the caly.v, one-celled, two-valved. Seeds numerous, black.

* Sir J. E. Smith bas confirmed the identity of this plant (which Dr. Roxburgh formerly referred to Exacutn) with Hopea of Vahl, See that Article in Rees's Cyclop.

M1TRASACME, Labillard.

Calyx angular, four, seldom two-cleft. Corolla deciduous, with angular tube, and four-cleft equal border. Style single, bind at the base. Capsule bursting between the divisions of the style.

1. M. capillaris, Wall.

Stem erect, hairy; leaves lanceolate, hairy above, connected at the base by means of a narrow ciliated membrane, the uppermost approximated, sub-quatern; vmbel peduncled, mostly compound; calyx half the length of the corolla, its segments villous at their apex; stigma almost entire; apex of the capsule exserted.

A native of the valley of Nepalfl, where it blossoms in September. Specimens were communicated by the Hon. JJ. Gardner.

Root fibrous. Stem erect, capillary, from three to six iuches high, mostly undivided, slightly compressed.—Leaves spreading, acute, ciliaie, three-nerved, sessile, smooth below, four or five lines long, exceeding their interstices; the uppermost two pairs so close together as to appear almost verticilled.—Vmbel terminal, divided into three or four rays, which are again sub-divided into several slender pedicels. Two cr three lanceolate, minute, connate bractes under the primary divisions.- Calyx four-cleft; its segments lanceolate, acute, united at the base by a small membrane. Corolla sub-campanulate, slightly pubescent, white, with ovate laciniee.—Stamina inclosed; anthers oblong, attached to the back of the filaments.—Ova* Hum ovate, bi-cuspidate. Style capillary, persistent; when the capsule ripens, the division at the base extends almost up to the slightly two-lobed, sub-capitate stigma—Capsule ovate, smooth, bursting at the top with a roundish aperture between the divisions of the style; salves very short, scarcely equalling one-third of the capsule, acute, incurved. Seeds minute, whitish.

Obs. This little plant comes near to M. connata, Brown, Prodr. Flor. Nov. Holl. i. 4.54; it differs in the shorter limb and the ovate segments of the corolla, and the stjlc not being entire when the flower opens.—N. W.

PLANTAGO. Schreb. Gen. N. 186.

Calyx four-cleft. Corol four-cleft, with border re flexed. Stamina ^ery long. Capsule superior, two-celled, cut transversely.

1. P. Ispaghuln, R.—Fleming in A*iul. lies. xi. 174.

Annual, caulescent. *Leaves* linear-lauceolar, three-nerved, slightly Coolly. *Peduncles* axillary, naked, simple, length of the leaves; heads cylindric. *Capsules* two-celled.

Ispagool, the Iliudee and Persian name, and that by which it is tiiost generally known in Bengal and on the coast of Coromandel.

Native place uncertain, but it is cultivated during the cool season.

Root ramous, annual.—Stem, if any, very short, soon dividing into three or four ascending, round, villous branches, which are a few inches in length.—Leaves alternate, linear-lanceolate, three-nerved, luxuriant, in young plants remotely denticulate, somewhat woolly, toward the base channelled, and stem-clasping; length from six to eight inches by a quarter or half an inch broad.—Peduncles axillary, solitary, naked, erect, round, a little villous, the length of the leaves.—Spikes solitary, terminal, before the flowers expand ovate, afterwards cylin-<Wc; when in seed about an inch or an inch and a half long and erect. -Flowers numerous, imbricated, small, dull, white, withering Bractes one-flowered, ovate, concave, with the keel green, and the sides membranaccous.—Calyx four-leaved. l*eafiets oblong, ovate, with broad membranaceous margins.—Corol. Tube gibbous. Senr, ments ovate, acute.—Filaments oblong, two-celled, four, much larger than the segments of the corol.—Germ oblong, two-celled, with one seed in each, attached to the middle of the partition. Style rather longer than the corol. Stigma subulate, villous.—Capsule circum-8cr'ssa, ovate, two-celled.—Seeds solitary, ovate-elliptic, convex on tfie outside; concave on the inner. Integtiment single, rather thick, Slfiooth, tough, and brown.—Pei isperm conform to the seed.—Em-^ryo sub-cylindric, erect. Cotyledon long, linear. Radicle inferior, one-fourth the length of the cotlledon.

Obs. From the seeds a mucilaginous drink is prepared, and often

preserved by our medical-gentlemen in India, where emollients are wanted. They are also ustd by the native practitioners in medicine aiad are to be met with for sale in the Bazars of India under the Persian name UspagooL

2. P. attenuate, Wall.

Leaves lanceolate, ending in a bluntish acumen, tapering at both ends, with a few remote toothlets, smooth, five-nerved, decurrent on their short petiole, the base of which is woolly- *Scape* five-sided, sulcated, much longer than the leaves, with adpressed hairs. *Spike* cylindric, dense; *bractes* acuminate; *calyx* four-leaved, ciliate.

Specimens collected along the fields about Katmandu were communicated to me by the Hon. E. Gardner. Flowering time the hot season.

Root thick, sending forth a number of long ash-coloured fibres; immediately within the insertion of the leaves and on the inner surface of the base of their petiols there is a quantity of long whitisn wool—Leaves from three to four inches long, nearly an inch broad; slightly oblique, terminating in a short cylindric, somewhat thickened point, with a few unequally remote obtuse sub-glandular ioothlets, quite smooth, decurrent on the short flattish striated petioles, the base of which widens a good deal and is woolly within.— Scapes several, erect, slender, several times longer than the leaves, from one to three feet high, five-cornered, striated, while joung, thickly beset with grevish adpressed hairs, becoming much smoother when old—Spike from one to three inches long, cylindric, densely covered with ash-coloured flowers—Bractes membranaceous, ovate, acuminate, smooth, keeled.—Calyx unequally four-leaved, nearly tiaⁿ³ parent, slightly ciliated and tipped with a few white hairs. tubular, with reflected ovate acute lacinise and a prominent mouth. '—Style very long and villous.

Obs. This tall and slender species comes very near to P. eriostachya and altissirna, Jacqu.; from the former it diffeis in the smoothness of its leaves and form of the spike, and smooth bractes j from

the latter, in its hairy scape, acuminate bractes, and ciliate calyx. Ifc is also akin to P. lapceolata and eriophora.—N. W_f

3. P. erosa, IVall.

Leaves ovate-lanceolar, acute, grossly and unequally repand-den* tate, smooth, sub-ciliate, five-nerved; petioles short with woolly base. Scape adscending, compressed, slightly angular and hairy, nearly equalling the leaves. Spike slender, equalling the scape in length, With distinct flowers, which are somewhat remote towards the base.

A native of Nepala, growing with the preceding species.

Root consisting of numerous sub-simple fibres, from the head of which issue several tufts of scapes and leaves.—Leaves almost smooth, about three inches long, tapering towards the base; their mar. gins remotely and unequally sinuate, with large, unequal, triangular, acute teeth.—Petiols shorter than the leaves; their base widening, ^embrane-margined and woolly within.—Scape slender, adscending, somewhat compressed, when young, villous.—Spike much lengthened, round, erect.—Flowers distinct, becoming somewhat remote downwards, mostly geminate.—Bractes ovate, membrane-margined, with a green thick rib, shorter than the calyx___Style villous.—Cap-rule ovate-oblong, with numerous flattish brown seeds N. W.

CISSUS. Schreb. Gen. N. 192.

Calyx four-toothed. Corol four-petalled. Germ two-celled; ovula **two**, erect. Berry superior, from one to four-seeded. Embryo erect, in the base of an ample perisperm.

1- C. adnata, R.

Leaves round-cordate, bristle-serrate, acuminate. Stipules orbi^{Cu}'ar, adnate, with gibbous centre, and scariose margins. Cymes

flat, flowers drooping.

A native of the country about Dacca, from thence the late Colonel Peter Murray sent it to the Botanic Garden, where it thrives well, blossoms in May and June, and ripens its fruit in September.

Stem and large branches ligneous, climbing over trees to a considerable extent, young shoots round, a little downy and slightly furrowed.—Leaves alternate,, round-cordate, and often obliquely so, acuminate, bristle-serrate, the largest sometimes slightly repand; pretty smooth above, but downy underneath, particularly the veins, from two to six inches long, one-fourth less in breadth.—Peduncles half the length of the leaves, downy.—Stipules nearly oval, adnate, elevated, and of a deeper green in the middle; margins scariose, and brown.—Tendrils opposite to the leaves where there is no cyme.— Cymes opposite to the leaves, on villuus peduncles, as long as the petioles, very ranious, flat.—Flowers numerous, small, drooping-The germ has two cells, in each" of which are two seeds attached from their lower end to the partition at the bottom of the cell.— Berry succulent, size of a pea, when ripe black, and smooth, generally one-celled.—Seed for the most part solitary, obovate, lower end pointed.—Integuments two, exterior nuciform, and rugose; inn^ a very thin, white membrane, which adheres firmly to the perisperm* -*-Perisperm conform to the seed, dull white, cartilaginous, divided' by two fissures into three, nearly equal parts.—Embryo scarcely half the length of the perisperm. Cotyledons reniform. Radicle oblong, inferior.

2. C. vitiginea, Linn. Sp. PL ed. fVilld. i. 655.

Leaves cordate-serrate. Cymes decompound. Berries one off two-seeded.

Hind, and Beng. Guali-lata.

Teling. Maratta-tiga.

This species is a native of forests, mountains, and way sides J° uncultivated places.

Trunk woolly, branchy, climbing over trees and shrubs to a gree extent. Tendril opposite to the leaves, two-cleft.—Leaves alternate, petioled, cordate, serrate, or dentate, pretty smooth on both sides, from four to six inches long, and from three to four broad.—Stipte cordate.—Cymes peduncled, leaf-opposed, more than coinpound.-T

F/owers small, jed.—Germ superior, half immersed in the four-sick ed, fleshy nectaiy.—Berry small, black, one or two seeded.

3. C. glauca, R.

Leaves cordate, brisire-serrate, smooth. Stipules broad-sulcate. Cymes decompound. Berries one-seeded.

Schunambu Valli, Rheed. Mai. vii. />. 21. f. 11.

This species is srill larger than the Ijst, and a native of the same or similar places; the shoots, the tendrils, petioles and peduncles are all quite smooth and somewhat glaucous, which does not admit of my considering it to be either fepanda, or latifolia-

Tendrils leaf-opposed, \x\dW\&\\$d.—Leaves alternate, 'petioled, broad-cordate, more or less a. miiinale, sometimes when large slightly lobed, bristle-senate, smooth, from four to eight inches each way. Stipules broad-fulcate, apex rounded, caducous—Cymes with from felliree to live primary branches; ultimate divisions umbelliferous,—Berry nearly round, size of a pea, smooth, succulent, purple, rarely more than one-seeded.—Seed obovate. Integument a double membrane, with a spungy silver-coloured substance between___Peru* perm and embryo as in the genus.

4. C. coidata, R.*

Shrubby, scandent, smooth. *Leaves* cordate, slightly and remote* ly bristle-serrulate. *Cymes* compound, Jtaf-opposed.

Meriam-Pulli, Rheed. Mai. vii. p. 91. t. 48.

Funis crepitans major, Rumph. Amb. v.p. 446. t. 1G4./! 1.

A native of Amboyna, from thence introduced into the Botanic Garden, in 1796—7. Flowering time in Bengal, the rainy season.

Stem and branches long, slender, climbing over bushes to a coo. 8iderable extent. Bark smooth; on the young parts polished and purplish.—Leaves alternate, petiuleil, cordate, remotely and slightly serrulate, serralures acute, both sides smooth, length from four to six inches.—Tendrils leaf-opposed, simple, coloured.—Stipules adjoiu-

« C. repent, Lam. Encycl, i. 31; et Foiret in ejusd. Sappl i, 103.-N. W.

ed, oval, coloured.—*Cymes* leaf-opposed, first divisions trichotomous.—*Flowers* small, dull purple.—Taste of the leaves very acrid, and continuing long.

5. C. quadrangularis, Willd. Spec. I p. 657.

Perennial, scandent, jointed, four-winged. *Leaves* reniform-cordate, serrate. *Berries* sperical, one-seeded.

Beng. Harjora.

Funis quadrangularis, Rumph. Amb. v. p. 83. t 44. f. 2.

This plant is one of the most common over every part of India; blossoms during the rains; and ripens its seed in the cool season.

Rout iibrous.—*Stem* and branches perennial, scandent, and often of very great length, smooth, succulent, jointed, contracted at the joints, four-winged, wings large, and sharp, young parts succulent, tender, and very smooth. These are very generally eaten by the natives in their curries.—Leaves alternate, one at each joint, short-petioled^ reuiform, cordate, serrulate-dentate, smooth on both sides, an inclV or an inch and a half each way.—Stipules Iunulate, entire.—Tendrils solitary, simple, leaf-opposed—Umbels solitary, opposite to the leaves, occupying the place oh w hich the tendril would otherwise grow, compound. UmOellets generally three or four, sub-globular.—Involucre and involucels scarcely any.—Germ ovate, immersed in the nectary, two-celled, with two ovulain each, attached to the bottom of the partition; style short. Stigma simple.—Berry round, size of a small pea, smooth, red, succulent, one-celled *Seed* solitary, obovate, covered with a double, dark brown, spongy integument* —Perisperm conform to the seed, a double, dark-coloured fissure runs down the middle.— *Embryo* small, erect, lodged on one side of the bottom of the double fissure just mentioned. Cotyledons with minute points. Radicle oblong, inferior.

6. C. pentagona, R.

Young shoots lucid, with five rounded angles and grooved sides. *Leaves* cordate, rarely sub-lobate, serrulate, acuminate, smooth.

An extensive perennial climber, a native of the forests of Chittagong-

7. C. angiistifoHa, R.

Dioicous. Leaves ternate; leaflets lanceolate, serrate, smooth. Stipules ovate, acute. Cymes shorter thuu ihe petioles. Berries spherical, one or two-seeded.

A delicate, scandent, perennial species, a native of Sumatra. Flowers in February; seeds ripen in November.

Stem scaudent, slender, flat like a piece of tape.—Tendrils sim-P'e.— Leaves ternate. Leaflets petiolatej lanceolate, remotely serrate, acuminate, smooth on both sides, from three to six inches long, and from one to one and a half broad.—Petioles shorter than the leaflets, channelled, smooth.—Stipules triangularly ovate, acute, smooth.—Cymes axillary, solitary, nearly round, small, and shorter than the petioles.— Flczcers small, greenish yellow, male ou one plant and female on another.

MALE.— Ctf/yr, *Corol* and *Stamina* as in the genus.—*Pistil* no ^other than a small abortive roundish body on the centre of a fourlobed gland.

FKMALE.—Calyx and Corol as in the male.—Germ round, two-celled, with two seeds hi each. Style none —Stigma iarge, obscurely foiir-lobed, and somewhat lacerated.—Berries spherical, smooth, size of a pea, white, one or two-seeded, when cut or bruised very fetid.—Perisperm conform to the seed.—Embryo lodged in the lower half of the perisperm. Cotyledons nearly round. Radicle cylindric, inferior.

8. C. carnosa, Linn. Sp. PI ed. TFilld. I 60S.

Stem flattened, perennial. Leaves petioled, ternate; leaflets ovaf, serrate. Berries four-seeded.

Tsjori-Valli, Rheed. Mai. vii.p. 17. t. 9.

Folium Causónis, Rumph. Amb. v. p. 460. t. 166./. «.

Teling. Kanapa-tiga.

Is common in hedges and forests. Flowering time the rainy season.

Stem perennial, flat like a piece of tape, climbing to m extent of **Bbbil**

many fathoms, young shoots, villous. *Tendrils* leaf-opposed, from hvo to three-cleft;—I earn alternate, petioled, ternate. *Leaflets* oval, grossly serrate, downy, from two to thiee inches long.—*Petioles* round, downy.—*Stipules* oblong, caducous.—*Cymes* as in the former apedes.—*Flowers* small, white.—*Berry* black, four-seeded.

9. C. sefosa, R.

Herbaceous, scandent, bristly. Leaves sessile, ternate; leaflets grossly bristle-serrate. Berries one*seeded.

Teliiig. Bflrubiitsali.

A native of forests and hedges in the Rajamundree Circar. Flowering time the rainy season.

Root fusiform, perennial.—Stems herbaceous, succu'en', round, striated, and covered with distinct, glandula-, round-headed, white bristles, as is every part of the plant, even to the fruit—Tendrils, leaf-opposed, generally two cleft.—Leaves alternate, sessile, ternate, rare-< ly quinate. Leaflets, the lateral two (or four, when there are five) are sessile, the middle one is slior -petioled; all are oval, waved, fleshy, irregularly and grossly bristle serrate, both sides armed with the forementioned bristles, size various, from one to five inches long.—Sti" pules cordate.—Cymes as in the former species.—Petals re volute.

• Obs. Every part of the plant is exceeding acrid. 1 unfortunately tasted both the roots and berries.

The leaves toasted and oiled, are applied to indolent tumors to bring them to suppuration.

10. G. fetoinea, i2.

Leaves digitate; leaflets petiolate, broad-lanceolar, entire. Styl* none. Stigma from four to five-lobed.

A large scandent woody species, a native of woody mountains. Flowers during the wet and cold seasons.

Stem woody, climbing over trees. Branches flexuose from leaf to leaf.—Tendrils simple, opposite to the leaves.—Leaves alternate, Pooled, digitate. Leaflets oblong, and lanceolar, a little crenulate,

pointed, smooth, shining, from four to six inches long, and one or two inches broad.—*Petioles* round, smooth/from one to two inches long.—*Cymes* short-peduncled, axillary.—*Bractes* small, falling.— *Flowers* small, green.—*Calyx* small.—*Corol* four or five-petalled, generally four. *Nectary* scarcely any.—*Stamens* none, or at most a small seemingly sterile one.—*Germ* superior, globose. *Style* "<'iie. *Stigma* four, or five-lobed, according to the petals in the coiol.—I have not seen the ripe fruit,

11. C- elongata, R.

Tender shoots succulent, polished. *Leaves* digitate; *leaflets* petiolate, oblong, acute, remotely serrate, smooth.

Beng. Dhemna, which is also the name of a long serpent.

Found amongst the mountains of the Coast of Coro man del, as Well as in the forests of Bengal. Flowering time the hot season.

£ Stem very long, running up and over the highest trees, a little compressed, and until many wars old smooth, polished, succulent, deep green. Branches few or i.one, until the plant arrives at a great height, and is several years of age.—Leaves alternate, pctioled, digi-Leaflets five, petioled, oblong, the lower pair obliquely so, •errate, smooth on both sides, from two to six inches long, and from "He to three broad.—*Tetioles* round, smooth, from four to five iuches Pedolets channelled.—Stipule cordate, small, sub-adjoined. ^-Tendrils leaf-opposed, simple.—Cymes trichotomous, and dichoto-*nous; the last divisions short, and ending in small umbellets—Bracks cordate, permanent.—Calyx four-toothed.—Carol, petals four, inserted in a belt which surrounds the body of the germ. ^u four-lobed, coloured elevation between the stamina and the insertion of the style,—Filaments four, inserted opposite to, and just within the petals. Anthers incumbent.—Germ oval. Style short. Stigma simple.—Berry the size of a cherry, round-turbinate, smooth, When ripe black.—Seed single, large, somewhat rugose.

12. C. auriculata, B.

Scandent, perennial. *Leaves* quinate; *leaflets* oblong, acute, obtusely serrate, smooth above, villous underneath. *Stipules* ear-shaped. *Bentcs* round, smooth, one-seeded.

A native of Mysore, from thence sent to the Botanic Garden in 1802, by Mr. B. He)ue, where it flowers and ripens its fruit through the whole year.

Stem, in live years old plants, as thick as a man's wrist, and of great length, even up to the tops of high trees. Bark spunky, and deeply cracked, young shoots succulent, round, and villous.—Leaves alternate, remote, long-petioled, quinate. Leaflets pelioled, oblong-ob" ovate, or rhombic, acute, serrate, smooth and shilling above, villous underneath; the *superior* from two to three inches long, and twothirds of that in breadth, the *exterior* much larger.— Tetioles nearly as long as the leaflets, round, and villous.—Stipuhs ear-shaped, recurved.—Tendrils leaf-opposed, two or three-cleft.—Ci/mes axillary or terminal; dichotomous or tiichotomous, these again several times divided.—Germ conical, containing four seeds in one cell, attached to its bottom.—Berry, the size, shape, and appearance of a fed cherry, one-seeded.—Seed obliquely obovate, a little compressedi somewhat pointed at the base, and there attached to the bottom of the cell. Integument single, nuciform, rugose, covered with the green

pulp of the berry, which adheres to it, and may, when dry, be considered a second integument.—Perisperm conform to the seed, cartilaginous, grey; from the inner edge two-fissures penetrate deeply* and divide it nearly into three portions.—Embryo erect, white, lodged in the base of the perisperm—Cotyledons two; pedicelled, reniform. Flumula minute. Radicle oblong, inferior, a little curved, with the apex to the umbilicus.

13- C. lanceolaria, K.

Dioicous. Leaves pedate.quinate; leaflets lanceolar, smooth, remotely serrulate. Stipules conically lanceolate. Cymes the length of the petioles.

VaUia-Tsjori-Valli, Rheed. Mai vii.p. 15. t. 8.

A native of the mountains along the eastern frontier of Bengal. la the Botanic Garden it blossoms in February and March.

Trunk scaudent, stout, ligneous, in six year-old plants as thick as a man's wrist, flattened, and grooved on the two flat sides. dark brown, rough or deeply cracked. **Branches** and **Branchlets** climbing, or pendulous uhen not supported; young parts round, green and generally smooth; extent of the whole plant several fathoms.—Tendrils leaf-opposed, generally undivided.—Leaves alternate, petioled, pedate. Leaflets generally five, lanceolar, recurvate, 'inost remotely and sharply serrulate, long, taper, acute-poinled, both sides polished; texture rather fleshy, length from three to six inches, and from one to two broad.—Petioles and petiolets clothed with short, ieddish hairs.—Stipules large, of a narrow conic shape.—Cymes bub-axillary, or close by the side of the base of the petioles, shorter than the petioles, or when most luxuriant much shorter than the Jeaves, the ultimate divisions each supporting a small globular umbellet, of small pale yellow flowers.—Braetes round the base of the peduncles, cordate.

MALE.—*Calyx* scarcely any.—*Corol* and stamina as in the genus. —*Pistil* none, an umbilicate, yellow, round, convex gland occupying its place.

14. C. pedata, linn. Sp. PI ed. Willd. i. 659.

Perennial, scaudent. *Tendiils* simple, or two-cleft. *Leaves* pedate; *leaflets* broad-lanceolate, serrate. *Berries* four-seeded.

Belutta-Tsjori-Valli, Rheed. Mai \ii./?. 19-1. 10.

C. heptaphylla, Betz. Obs. v. C2.

JBetig. Gwalia.

This is another very extensively climbing species, as indeed they all are; a native of forests, hedges, &c. Flowering time the rainy season.

Stems woody, climbing over trees, &c. young parts covered with soft down.—Tendrils leaf-opposed, simple or two-c\eft.—Leaves alternate, petioled, pedate. Leaflets oblong, irregularly serrate, downy,

size various, the intermediate one is from four to six inches long, and the lowermost of the lateral ones from two to three inches long, the rest between these sizes.—*Petioles* common, round, downy, irom three to live inches long.—*Stipules* cordate, pointed, falling.—*Cytnes* leaf-opposed, or axillary. *Teduncles* half the length of the petioles, jointed, and bracted a little above the middle.—*Berries* white, fourlobed, depressed, four seeded.

15. C serrulata, R.

Perennial, scandent, smooth. Leaves pedate-quinate; leofieh d^* long, serrulate.

A native of Chittagong, where it blossoms in April and May.

CORNUS.

Calyx superior, four-toothed. Petals four. Drupe with a two-celled nut.

1.C. oblonga, Wall.

Leaves oblong, acuminate, acute at the base, glaucous and scabrous beneath, with many excavated glands along the axils of the rib and nerves. *Cymes* spreading, panicled.

Native of Nepala, where it is pretty common about Katmandu; blossoming during the first half part of the year.—Specimens and seeds communicated by the Hon. E. Gardner, in 1818.

A midling sized tree with copious spreading branches; the young shoots covered with short adpressed hair.—Leaves in approximate pairs, spreading, from four to six inches long, acute at the base, an inch or an inch and a half broad, finely acuminate, beset with short adpressed hairs, dark-green and shining above, glaucous and scar brous beneath, with elevated rib and sub-opposite arched nerves, the latter having in the axils at their base and along their outer side numerous ciliated glandular excavations which, when the leaves are dry, become slightly visible on their upper surface.—Pcliols from half an inch lo an inch long, slender, channelled, rough.—Cyme ter-

nnna!, sessile, broad-ovate with opposite spreading ramiBcations, which terminate in fascicles of shorUpedicelled, crowded, sub-racemed white or pale-purplish, fragrant flowers—*Dractes* opposite, ovate, acute, deciduous—*Calyx* small, four-toothed, as well as the pedicels and petals dollied with adpressed, short, silvery hairs.__*Petals* linear-oblong, even, four times longer than the calyx, at last revolute.—*Anthers* purple.—Ow/iMi three-celled__*Style* deciduous__ *Drupe* oiate-obloug, with an elevated umbilicus, smooth. *Putamert* two, sometimes three-celled.

(*Jbs*. Dr. G. Govan has favored me with fruit-bearing specimens, collected to the Northward of Saharunpore of a tree, which in general appearance and leaves comes very near to this species; the latter are however larger and less glandular. The chief difference consists in the peduncied cymes with umbel led ramifications and the unripe fruit being compressed, oval, and resembling that *of* a Viburnum. I have not seen its flowers.—N. VV,

2. C. macrophylla; Wall.

Leaves broad-ovate, acuminate, rounded at the base, smooth,, glaucous and soft beneath, with axils slightly glandular. Cymes sub-Utnbelled; flowers racemed.

Communicated by Dr. Govan who found the tree to the North-'Ward of Saharunpore.

Branches smooth.—Leaves six inches long, by four broad, very pale and glaucous below, slightly pubescent, soft and dotted; nerves copious, sub-opposite, oblique—Petiols an inch and a half long*, with a few hairs in their axils.—Cyme ample, terminal, pessile, flat-* tish; the divisions terminated by several racemes of unilateral flowers.—Ctf/y.r with acute teeth.—Petiols linear-oblong, hairy on their outside.—Ovarium sulcated, hairy.—Style shorter than the stamina. Stigma capitate.—Drupe round, smooth, as large as a black pepper corn, with a two-celled nut.

Obs. This tree differs from all the species of Cornuain.the size of its broad-ovate leaves.—N. W.

x S. C. capitala, Wall.

Arborescent, *leaves* lanceolate, acuminate, short-petioled, seafcrous with adpressed hair, *timers* sessile, densely aggregate, forming a round head supported by a very large, four-leaved¹, scabrous-involucre.

Specimens communicated by the Hon. E. Gardner from Gossain-Than in Nepalcr, where the tree is called *Chuwwa*; by Sir Robert Colquhoun from Sirinagur, where it is called *Bhumowra*; and by, J)r. G. Go an who gathered them between the Sutlej and Jumna.

It grows lo be a small tree, which according t> Sir It Co!quhoun^rsobservation has much of the habil of the Custard ap; le.— Branches woody, spreading, opposite, like all the other parts covered \H'.h fchort stiff adpressed hairs; the younger ones slightly compressed.— JLeaves opposite, coiiaceeits, tapeiing at both emls, entire,, about two inches long, scabrous, covered on both sides with reflexed hairs, lvhich on being rubbed off leave an iinpiession on the surface; g!au~ cous, very pale beneath with elevated, so lire times pink-coloured, sublongitudinal arched nerves, having each a minute gland in their axils* — fytio/es very short, furrowed. Head terminal, solitary, round, as large as a modeiate-sized cherry, thickly covered with flowers, supported by a sulcated, club-shaped peduncle, which widens at the upper end into a convex ligneous receptacle for the insertion of theflowers —Involucre consisting of four spreading, somewhat unequal, caiiaceous, yellow, obovjite-cuneate, sometimes.broad-ovate, veined, scabrous leaves, an inch long, rounded at their ends, with a short • slightly gFooved point.—Califx cylindric, pubescent, with four oblotig* erect, obtuse segments—Carol twice as long as the calvx, consisting of four spreading cuneate leaflets; their upper surface slightly keel-'ed^—*Slameds* equalling the petals, subulate, recurved. **Anthers** Ovarium immersed in the receptacle, oblong, two-celled, ovate. with a pendulous ovulum in each cell. Style thick, clavate, striated, shorter than the stamens, surrounded at its base by a short, cytti>dric fleshy, crenulate nectary. Stigma truncate.

Obs. This beautiful tree is \ery distinct from all the other

cies. It approaches a little to C. *Itorida* and *canadensis*, but is -easily recognised by its copious, harsh, ad pressed hairs, its stature, which is that of a large shrub or small iree, and the position of ju leaves.—N. W.

SAMARA. Schreb. Gen_% N. 195.

Calyx four-parted. Carol four-petalled. Stamina inserted opposite to the centre of the insertions of thepeiaJs. Diupe sup»eiior, one-seeded.

3. S. paniculate, R.

Aiboreous. Leaves opposite, entire, broad-lanceolate. Fankles axillary. Stigma two-lobed.

A tree, a natise of tj-ie Circar mountains.

Leaves opposite, petioled, broad-lanceolate, tapering to a sharp narrow point, entire, smooth, from three to five inches long, and one and a half or two broad.—Corymbs axillary, small, peduncled, shdrt-wer than the leaves, divided by three-forked divisions.—Drupe dry, oblong.—Nut one-celjed.

€ S. potygama, R.

Leaves opposite, shorUpetioled, broad-lanceolate, firm and polished. Panicles axillary and terminal. Filaments shorthand inserted in a notch near the edge of the base of the petals.

A native of the Moluccas.

BLACKBURNIA. Schreb. Gen. N. 199.

Calyx four-toothed. Cord four-petalled. Nectary a staminifer. oiis ring surrounding the base af the germ. Berry superior, oue-fieeded. Seed arilled,

1. B. monadelpha, -B.

Arboreous. Leaves alternate, lanceolate, Filaments united at the base.

A large erect timber tiee, a native of the mountainous parts of the Circars. Flowering time the beginning of the hot season.

Bark thin, firm, yellowish green on the outside; Trunk erect. On the inside deep red, tinging the spittle with that colour. It is a strong astringent. Branches numerous, forming a large⁴ shady head. Leaves alternate, short-petioled, linear-oblong, smooth, below a little whitish, entire, waved, pointed; five or six inches long, and one and a halt' or two broad.—Stipules none.—Racemes axillary, small, erect, frequently compound.—Bractes small, subulate.—Flowers small, yellow.—Calyx four-toothed.—Petals fou; oblong, expanding, apices revolute.—Nectary, a ring surrounding the base of the germ, slaminiférous—Filaments four, shorter than the petals, hairy, inserted into the margin of the nectary. Anthers oval.—Germ superior, globular. Style short, stigma headed.—Berry vertically compressed, succulent, the size of a large cherry, when ripe it 1ms a deep purple bloom, which makes it very inviting to the eye. Seed one, arilled, seemingly two-lobed, of a lively purple throughout.

O6s. The wood of this tree is white, close-grained, and durable, the natives employ it for a variety of purposes.

TAG AHA. Schreb. Gen. N. 196.

Calyx four-parted, or four-leaved. Corol four-petalled- Germ superior. Capsule superior, two-valved, one seeded. Embryo iu* verse, with but little perisperm.

1. F. tviphylla, Linn. Sp. PI ed. Willd. i. 666.

Leaves opposite, temate; leaflets oblong, entire. Panicles axillary, brachiate.

Ampacus angustifolia, Humph* Amb* ii. p. 188. t. 62.

Found indigenous, by Mr. W. Roxburgh, on the Island of Pulo-Penang, and from thence sent to the Botanic Garden, where in several years it has only reached the height of four-feet, and for these last three years has blossomed regularly dining the dry season.

Stem erect, ligneous, as thick as a walking cane, smooth, ash-oo-

loured. Branches opposite; the tender parts round and slighty viN lous.—Leaves opposite, long-petioled, teinate. Leaflets lanceolar or oblong, entire, smooth on both sides, length from two to ten inches, and from one to four-broad.— Panicles axillary, and in our single young individual, shorter than the petioles, brachiate, villous. ^-Flowers numerous, minute'white, inodorous. Bractes triangular, solitary below the divisions of the panicle.—Calyx small, one-leaved, four-toothed.—Petals four, oblong, white, smooth, spreading, length of the pistil, and four times longer than the calyx—nianienls four, length of the petals. Anthers oblong, incumbent.—Germ superior, roundish, woolly, four-grooved for the filaments to rest in, four-celled, with two ovula in each cell, attached to the middle of the thickened axis. Style as long as the germ. Stigma large, four-Iobed. —Capsule from one to four, distinct, obovate, smooth, size of a field bean, one-celled, two-valved, opening along the upper and inner inargin, and round the apex; a portion on the back does not separate spontaneously.—Seeds generally two, roundish, size of a grain of black pepper, shining, blackish-chesnut colour, as in the allied Xanthoxylum alatura.

2. F. Budrunga, R.

Arboreous, armed with small incurved aculei. *Leaves* pinnate; *leaflets* five or six pair, unequally ovate, lanceolate, entire, accumu Hate; panicles crowded.

Bttdrwng the vernacular name in Silhet, where it grows to be a largft tree. Blossoms in March and April, and the seeds lipen in July and August; they are used medicinally by the natives, being of a warm spicy nature with the fragrance of Lemon peel.

Trunk straight, vhile young armed, but by age the aculei fall off. Branches and branchlels armed with innumerable, small, white, sharp/incurved prickles.—Leaves crowded, from six to ten inches long. Leaflets five or six pair, opposite or nearly so, unequally ovate-lance-olate, entire, finely acuminate, smooth, from three to four inches long, hy one and a half broad.—Panicles terminal, much crowded, long.

peduncled, trichotomous, the uljole forming one large, very rauaous globular panicle, which is shorter than the leaves.—Calyx four-tooihed.—Petals four, elliptic, spreading.—Stamina four, much longer than the petals.— Germ ovate. Style short.—Capsule the size of a pea, drupaceous, one-celled, two-val veil; the exterior tunic is niarted with cells filled with a fragrant balsam.—Seed solitary, attached to the apex of the suture of the valves, round, smooth, polished, shiuing black. Integuments three; the exterior one thin and brittle, between it and the secund h spread a quantity of dark orange-coloured pulpy matter, the second thick and hard, a perfect nut, and of a dull black-colour, the third or innermost membranaceous.—Terisperm in small quantity.—Embryo inverse. Cotyledons obovate. Radick; ovate, pointing to the umbilicus.

3. F. Rhetsa,R.

Arboieous, round. *Leaflets* from eight to sixteen pair, lanceolate, .•falcate, smooth, entire. *Panicle* terminal.

Teling. Rhetsa-maun*

I'hetsa means a committee, or select number of men assembled to settle disputes, Sec. and maun, means trees of the largest size. Under the shade of this tree the Hill people assemble to examine, agitate, and determine their matters of public concern, deliver discourses, Sec.

It is a very large 'tree, a native of the mountainous parts of the Coast. Leaves deciduous during the cold season, they come out again, with the flowers about the beginning of the hot season.

*es numerous, spreading to a great extent. Prickles very numerous, scattered over every part of the tree, small, very sharp, incurved i on the old wood they acquire a conical solid base. Leaves about the extremities of the branchlets, abruptly pinnate, from twelve to twenty inches long. Leaflets opposite, from eight to sixteen pairs, snor-f>etioled, oblong or lanceolate, waved, attenuated to a narrow point, rentke, smooth, about five or six inches long, and two broad, all near-

rior division being twice as broad as the interior.—Petiols round, smooth, a little channelled.—Stipules nones-Panicles terminal, and from the exterior arils, frequently cross-armed, particularly the extreme ramifications.—Peduncles and Pedicels smooth, sometimes compressed.—Bracten minute, falling.—Flowers very minute, yellow.—Calyx four-leaved.—Filaments shorter than the petals.—Style thick, length of the filaments. Stigma tapering.—Capsule round, size of a pea, dry, one-celled, two-valved^ seed one, round, glossy black.

Obs. The unripe capsules are like small berries, they are gratefully aromatic, ancj taste like the skin of a fresh orange. The ripe seeds taste exactly like bfack-pepper, but weaker; from this circum*-stance I conceive this may be F. *Piperila*, yet I have always found the leaflets entire. The bark, I mean the inner laming is also acrid, with a mixture of bitter..

4. F. nitida, Tioxb.

Shrubby. *Uranchlets*, *petiok* and *ribs* armed. *Leaflets* two or three pairs, with a terminal odd one, oblong, lucid, remotely gland* crenate, apex rather long and emarginate. *Racemes* axillary.

Tcheum-tsew of the Chinese.

Introduced from Canton into the Botanic Garden by Mr. W* Kerr in 1812, and in Jaiuiary of the following year one of the plant* blossomed abundantly.

The flowers as in the other species, but the prstillum is three or four-lobed, each to be appearing to end in a recurved style with a two-lobed stigma. The shrub, therefore, approaches nearer than any of the preceding species to Zanthoxylon.

Additional Remarks.

The shrubs have continued to blossom yearly, without producing any fruit. *Branches* long and slender, rambling over the nearest bushes, covered with shining brown bark; the younger ones pubescent. *Aculei* numerous, compressed, purple, recurved. *Leave**

petioled, from six to twelve inches long, with pointed, prickly petiols. Leaflets almost sessile, lanceolate-oblong, rounded and nearly equal at the base, apex tapering into a narrow acumen, about three inches long, with undulated margins, entire or notched with remote glandular indentures, especially while young, shining above, with numerous sub-marginal, glandular, transparent dots; pale beueatb, with a more or less prickly rib.—Racemes from one to three, fascicled in the exterior axils, a couple of inches long, erect, cyliidric, on short villous round peduncles, covered with numerous white, fragrant, short-pedicelled flowers. Calyx flat, with very small ovate acute segments. Petals lanceolate, slightly concave, four times longer than the calyx, ending in a short point. Stamina twice the length of the petals, spreading.—Fistilla? four, ovate, small, ending in a short recurved style; stigma acute, marked above with a short tooth.

It appears to be the same as Loureiro's *Fagara piperita*, Flor. Cochinch. ed. Willd. i. 101, differing from Linneus's plant, as has been justly remarked in Iloern. and Schult. Syst. Veg. iii. 296. It has also some resemblance to Tetradium, Lour. 1. cit. 115* which Sir J. E. Smith considers as related to Fagara.—I have not been able to discover any ovula in the four bodies in the centre of the flower, which therefore may be considered as nectaries or abortive pistils, a supposition which is much strengthened by the circumstance that none of the shrubs in the garden have produced any fruit. This dioicous species ought therefore to be referred to Zanthoxylon as suggested by Dr. Roxburgh.—All its younger parts and leaves have a slightly pungent aromatic taste and smell.—N. W.

LUDWIGIA. Schreb. Gen. N. 204.

Calyx four-parted. Corol four-petalled. Capsule inferior, four-fided, four-celled. Seeds numerous.

1. L. parvifiora, R.

Annual, branches diffuse. *Leaves* alternate, lanceolate, short-pe i-oled, smooth. *Bowers* axillary, sessile* *Capsule* linear, obsolete!/four-sided.

· Obs. This species is so much like my L. parviflora as not to be distinguished, except by attending to the germ, or capsule. In plant it is shorter, thicker, always straight, and with numerous crowded seeds in each cell, attached (o a projecting receptaclej as in L. alternifolia, Gart. Carp, I 158. t 31. In this there is only one vertical row in each cell attached to the axis.

OLDENLANDIA. Schreb. Gen. N. 205.

Calyx four-parted, permanent. Corol one-petalled, four-parted. Capsule inferior, two*celled, many-seeded. Receptacle free, fastened to the partition by the base only,

- *Obs*. Would it not be better to omit this Gaertnerian part of the generic character, and unite our Indian species of *Hedyotis* to 01-denlandia? Tor except the attachment of their respective receptacles 1 can find no other mark by which the two genera are to be distinguished, and surely this is too minute and ^conspicuous fur the travelling Botanist to he able at all times to discover.
- 1.0. umbellata, Linn. Sp. VI ed. Willd. i. 676. Soxb. Cororn. ?/.i. K 3.*
- Erect. *Leaves* opposed, tern, and quatern, linear, scabrous. *Umbels* terminal. Inside of the corol hairy*
- . Teling. Cheri-Velloo.

Tam. Saya-wer, or Imburel.

Much cultivated on the light sandy lands near the shores of C° romandel; where the root is employed to dye the best, and most dux rable red on cotton cloth.

2 O. data, König's Ms\$.

Erect, four-sided. *Leaves* opposite, sub-sessile, elliptic, smooth, *Tanic/es* terminal; *corol* campanulate j mouth shut with hairs. *Cap-sales* turbinate.

Beng. Gandha-badttlż.

Hedyotis racemosa, Linn, Sp. PL ed. Wilty. i. 565*

•Hedyotis, Lam . - N . ^ .

Annual, a native of the borders of rice lands and moist places; appears and flowers during the rainy season.

*foot or eighteen inches high.—Leaves opposite, bub-sessile, oblong, smooth/ entire, succulent, about two inches long.—Stipules, connecting membrane broad, toothed.—Umbels terminal, few-flowered_____blowers white, small. Pedicels four-sided.—Capsules tuibinate, smooth; receptacle clubbed, free, affixed by the small end into the partition near its base.

3. O.pamċulata, Burnt, tl. Ind. 38. f. 15. f. 1.

Biennial, creeping. Leaves ovate-lanceolate. Peduncles three* flowered, or three times that number.

Introduced into the Botanic Garden from the Moluccas, in 1798/ where it blossoms the greatest part of the year.

Stems none; but numerous diffuse, four-sided, smooth, ramous brunches, spread close on the ground in every direction, and strike root from their joints, their general length about twelve inches.—

**eaves opposite, sessilr, ovate-lanceolate, smootjif and of a firm thick texture, the largest about an inch long. Connecting membrane with subulate divisions. Peiunclet axillary, and terminal, longer than the leaves, smooth, four-sided, with generally three, small, V'hite flowers, on pedicels of unequal length.—Corol; Tube gibbous, mouth shut with fine white hairs,—Stamens, in the belly of the tube below the haiis which shut its mouth.—Stamina entire.

4. O. crytfallina, #.

Annual, very ramous. Pedicels solitary, shefter than the leaVesy generally two-flowered. Leaves sessile, lanceolate, otrtonrg, underneath marked with crystalline dotts.

Beng. Punkf.

Hedyotis pumila, Linn. Sp. PL ed. Willd, i. 566.

A small, very ramous, diffuse, annual plant, a native of Bengal; appearing in the rainy seascu.

Stem none; branches numerous, diffuse, about six inches loug, somewhat fouwiided—Leaves opposite, approximate, sessile, oblung, and lanceolatcoblong, smooth and marked with beautiful crysthiie specks underneath, length about half or three quarters of «• inch.—Peduncles, from within the stipulary sheaths, about half th» length of the leaves, generally bearing two minute, white flowers ow their proper pedicels.—Coro/, mouth of the tube hairy.—Capsule* much compressed laterally.

Ob\$. It is readily distinguished from O. bifiora by the general habit of the plant, this being short, diffuse, very ramous, with oblong or lanceolate-oblong lcalves, while the other is slender with long straggling branches, and linear Janceolate leaves. 1 place less confidence in the crystalline appearance of the underside of theleaves, a& soil* &c. may remove it.

5. O.diffusa, It.

Annual, round, flaçcid. *Leaves* sessijc, lir*ear-lanccolate, acute. *Peduncles* axittary, solitary, one-flowered \ capsules sub-globular, smooth.

Hedyotis diffma, Linn. Sp. PL ed. Willd. i. 566.

Found growing in boxes, which were sent with Nutmeg plants to the Botanic Garden at Calcutta from Banda.

Root ramous, annual.—Stems short, flaccid, spreading, round/ most slightly scabmus, from six to twelve inches long.— Leavre opposite, sessile, linear-lanceolate, acute, smooth on both sides.—Connecting membrane, from entire to many-clèft.—Peduncles axillary, solitary* four times shorter than the leaves, one-flowered.—Flowers pretty large* pure white, smooth. -Stigma deeply two-cleft.—Capsule roundish, smooth*

Ohs. The Linneau definition of O. eapexsis would lead one to $\frac{im}{n}$ of ohe similar to be that plant; but the observation similar O. repenth tapsula glabra, in the Suppl. Pla?*. p. Ifc7, convinces m^{**}

cannot be so; as this plant has not the smallest reseiaujanc* to QU dertlandia revens, $uo\s Deniella$.*

6. O. lifora, Linn. Sp. PL ed. Willd. I 076.

Peduncles solitary, two-flowered, shorter than **the** narrow Iapce-ol&t sessile leaves.

Sans. tQ^mcTe'lf Kshetra-purputee.

Bevg. Kliet-pnpftra.

Antirrhinum bumile, &c. Burm- ZeyL 22. t.M; good.

Annual; native of most parts of India. A small weak straggling delicate plant, appearing in the rainy season.

7. O. herbacea, R.

Erect, Jour-sided, dichotomous. *Leaves* linear-lancevlate, Pe-duncles in pairs from alternate axils, one-flowered.

Hedyotis kerbacat, Linn Sp* PL ed. Willd* i. 566.

Telin<£. Veri-Hclia-vemoo.

A native of road sides under thitt bushes, &c. Flowering time the rainy season.

Stem erect, four-sided, smooth, short, ramows. Branches always two-cleft; from .sis to twenty-four inches high.—Leaves opposite, smile, linear-lanceolate, spreading, .smooth.—Stipules, connecting membrane, finely-toothed.—Peduncles axillary, always two from (he small axils, with a hranchlet, or the rudiments of one between them, round, nearly as long as the leaves, oiie-flowercci.— Capsule smooth.

8. O. ramoso, R.

Diffuse, ramoiis. *I*^*azn* narrow-lauceolate. *Peduncles* axillary, 'with from one to several flowers.

A native of Pegu, from thence introduced into this Garden by Mr. F. Carey, WIICFC it blossoms and ripens its seed during the rains, and the early part of the cool season.

• Conf. H- capensis in Rees's Cyclopedia. The reader *« also referred to tlie hit. tor? of the genus *Uetlytii* in that work for an elucidation of icvsralof the above •pecies of OMcnlanditf^N* W.

Root annual.—The Stems and numerous branches diffuse, somewhat four-sided, pretty smooth, spreading to the extent of one or two feet.—Leaves opposite, narrow-lanceolar, smooth, entire, whiter uudcrneath; leng'h about an inch.—Coiiuectwg membrane'' iftuny-tooihed.—Peduncles axillary, froin one to niany-tiowered.—Flowers small, white.—CJ/^OT, the divisions conical.—Coro/ with gibbous tube; mouth bearded.—Filaments short. Anthers within the tube, Mae.—Germ, &c. as in the genus.

AMMANNIA. Sckreb. Gen. N. '206,

Corol four-petalled, or none; when present inserted in the plait* ed mouth of the calyx which is from four to eight-toothed. Capsule superior, from one to four-celled; seeds numerous.

1- A- rotundifolia, Buck.

Diffuse. Leaves opposite, round, entire. Flowers spiked, petals oval. Capsule four-lobed.

Plants sent from Lwkshmee-poora and Maida, u&here they are indigenous, flowered in the Botanic Garden during the cold season of 1797.*

Stems several, creeping, with ascending apices, round, smooth, and succulent; whole plant spreading from six to eight inches.—

Leaves opposite, sub-sessile, orbicular, entire, smooth; and succulent.

—Spikes terminal and axillary, the terminal often compound.—*

Bractes opposite; exterior cordate; inferior lanceolate, and often very small, one-flowered.—Flowers numerous, small, pink-coloured.—

Calyx four-parted, divisions obtuse.— Corol of four, large, oVal, sessile, pink-coloured withering petals.—Capsule hid in the bottom of the remaining calyx, and corol, four-lobed.—Seeds numerous.

2. A.octandra, Linn. Sp. FV. ed. tVilld. i. 679. &oxb. Corom. PL 2. N. 133.

"Ihave had this elegant plant frem Mr. Win. Jack, who gathered it at the Tur, ray*, where it is called *Thuntuneea* and *Mirkooa*; also from Nepala iu the vicinity cl Katmandu, from the Hon. E. Gardner,—N. W.

Annual, erect, brachiate, four-sided. *Leaves* sessile, narrow-sagittate; *peduncles* from two to three-flowered; *flowers* octandrous. *Capsule* four-celled.

Ammannia octundra, Suppl. Plant, p. 127»

Annual, native of *moist* places; appearing *in* the rainy and cold seasons.

Boot fibrous.—Stem straight, fouNsided, smooth; from one to three feet high.—Branches numerous, cross-armed, and like the stein.—Leaves opposite, sessile, linearly-sagittate, smooth, margins a little revolute, from one to two inches long, and about a quarter of an inch broad.—Peduncles axillary, very sliort, from two to ihree-flowered.—Flowers small, colour a beautiful bright red.—Bract e\$ minute.—Calyx and corol as iii the genus.—Filaments as long as the corol. Anthers incumbent.

3. A. multiflora.

Erect, four.sided, ramous brauches simple. *Leaves* sub-sagittate, stem-clasping* *Peduncles* from three to seveu-flowered; *petals* large; *capsule* one-ceJIed.

A native of open lands about Calcutta, annual, from six to twelve inches in height, appearing in the wet and cold seasons.

Stem straight, four-sided; angles sharp; sides convex. Branches cross-armed. Leaves opposite, decussate, horizontal, sessile, linear with enlarged cordate, stem-clasping base, size very various. 7V-duncles axillary, almost always solitary, about as long as the smaller leaves, generally three-flowered, though in the luxuriant plants there are often two or three, with ojie. between, the lateral flowers have pretty large long pedicels.—Calyx as in the family.—Petals large, roundish, red.—Capsule one-celled, one-valved, receptacle globular, affixed at the base only.

4*A. vescicatoria, R.

Erect, ramous, branches undivided. *Leaves* opposite, sessile, Ian« «*olfir. *Flowers* axillary. *Corol none*. *Capsule* one-celled.

Beng. Daud-maree.

Tzling. Aghundra-pakoo.

An annual species; found in wet cultivated ground during the rainy and ccld seasons.

Stem erect, from six to thirty-six inches high, obsoletely four-sid* ed, very branchy. Branches, below opposite, decussated; above frew quently alternate,—leaves opposite, sessile, lanced, smooth; floral leaves many times smaller than those below.—Corol iione.--iV*-carp one-celled, one-valved, half covered with the calyx.

Obs. It differs from A. *baccifera* in having a capsule of one cell, in being evalvular, and in the leaver being lanced, in that specie* they are linear-cordate at the base, -and embrace the stalk.

This plant has a strong muriatic smell, but not disagreeable. Its leaves are exceedingly acrid; they are used universally by the natives to raise blisters in rheumatic pains, fevers, Sec. The fresh leaves bruised and applied to the part intended to be blistered perform their office in the course of half an hour or *ix* little more, and most effectually.

5. A. pentandra, A.

In the lower part of the plant creeping and simple, erect portion famous; four-sided; branches simple. Leaves sessile, lanceolate. Flowers axillary, solitary, sessile, pentandrous. Capsule one-celled.

A native of moist places; flowering in the rainy and cold seasons. *Stems* creeping near the base, above erect; the erect part is branchy, four-sided, smooth, and coloured; from six to eight inches high.—Xtfratj opposite, sessile, lanceolate, smooth, entire.—*Flow* ers* axillary, solitary, sessile.—*Bractes* two, lanceolate, pressing the calyx laterally.—*Calyx* ten-toothed, alternately smaller and inflect* ed.—*Corol*, petals five, *very* minute.—*Stamens* five.

6. A. nana, R.

Base cieeping, erect portion ramous; branches compound. Leavet ^edge-shaped, se*aile, Pleven solitary. Capsule one-celled.

A native of such places as the last described; it is considerably smaller than that species, but more branchy.

Stems as in A. pentandra.—Leaves opposite, sessile, wedge-form* ed, smooth, entire.—Flowers axillary, solitary, sessile.

TRAPA. Schreb. Gen. N. 208.

Calyx four-parted, or four-leaved. Corol four-petaled. Germ inferior, two-celled; cells from one to two-seeded, attachment of the ovulum superior. Nut lurbiuate, armed with two or four horns, (which were the leaflets of the calyx.) Embryo simple, lodged io the apex of ihe ample perisperm.

1. T. bicornis.

Nuts with two, opposite, recurved, very obtuse horns.

Chin. Lin-ko.

A native of China, where it is carefully cultivated in lakes, pond* and other receptacles of water.

2 T. hispinosa, R.

Nat with two opposite, straight, barbed, spinous horns. *Nectary* cup-shaped, curled.

Shringala, Abiat. Res. vol. iii. p. 0,53.

Sans. 3jfji3-:, Sriiigata, Sf^j^^t, JKli/kimU/ka,

Betig. Panee-phul. Singhara.

Panover-tsjerana, *Rheed. Hort. Mai* vol. xi. p. 64. t. 33. (evidently intended for this plant, and not T. *natans*.)

Found floating on sweet, standing water in Bengal and many other parts of India. Flowering time the rainy season.

Root consisting of numerous, simple, capillary fibres which issue from the under margins of the cicatrices of the fallen leaves.—Stems stoloniferous, often several feet long, floating.—Leaves petioled, aU ternate, approximate round the apex of the shoots, of a lhomboidaU Uniform shape; with the posterior margins entire, and the anterior Ones serrate-dentate; smooth above, of a deep green, villous and pur*

pie Underneath; from three to four inches broad, and nearly as long. —Petioles villous, lengthening with the age of the leaves, tdwards the apex much smaller, this part contains many inflated vescicles, which render the whole plant very buoyant.—Stipules two pair, the superior ones simple, semi-lanceolate, and caducous, the inferior pair at first simple and filiform; but becoming ramous by age, permanent.—Peduncles axillary, solitary, shorter than the petioles, one-flowered, incurved until the blossoms begin to decay, after which they bend down under the surface of the water, where the fruit crows, and comes to matuity.—Flotcers pure white, expanding above the surface of the Mater late in the afternoon.—Calyx four-leaved, in opposite pairs, leaflets lanceolate, villous, one of the pairs permanent.—Corol contracted; petals four, contracted into a tube at the base by the firmness of the calyx, above much broader, and expauding; margins much curled.—Nectary cup-shaped, on the top of the germ, round the swelled base of the style, eight-grooved, with the margins minutely lacerate, and curled.—Filaments four, incurved. Anthers oval, incumbent.—Germ inferior, obconical, two-celled, with one ovuluiu in each attached to the top of the partition.—Nut inferior, of a turbitoate triangular shape, a hard ligneous texture, and a blackish brown colour, armed with two, strong, straight, conic, barbed spines, from the upper angles; elegantly embossed, one-celled, not opening, but having a perforation in the top for the Embryo to pass, which i* guarded with a circle of stiff converging bristles from its margin, forming a conical roof over the aperture. Seed single, conform to Integument single, of a slightly brown colour, thin, but the nut. rather tough, and adhering firmly to the perisperm.— PerisperM conform to the seed, white, and of a firm cartilaginous texture. JZmbryo in the apex of the pei-isperm,

Obs. This is evidently a species perfectly distinct from *natam*, and *bicornis*. From the former it differs in having only two horns, and from the latter in the horns being straight, |ery sharp, and barbed*

The nuts are sold in the markets when in season, their kernels being much esteemed by the Hindoo*.

S. T. quadrispinosa, JR.

Nut with two opposite pairs of straight, acute, spinous horns.

A native of Silhet, where it is found floating on lakes, and pools of fresh water, its kernels are also esculent.

POTHOS. Schreb. Gen. N. 210.

Spathe sub-cylindric. Spadix covered with florets. Calyx none, or four-petalled; corol none. Stamina indefinite. Germ one-celled, from one to three-seeded; attachment of the ovula inferior (in Aefe-Tophijlla superior.) Berry one-celled, rarely many-seeded. Embryo uncinate, without perispenn.

1. P. 'scandens, Linn. Sp. PL cd. Willd. i. 684.

Parasitic, rooting. *Petioles* as broad as the lanceolar leaves. *Flow** ers axillary; spadix gobular, reflex.

Ana-Parua, U/ieed. IlorL Mai. vii. p. 75. t. 40.

Adpeudix duplo folio, Rumph. a tub. v. 490. t. 184./. 2.

A native of Chittagong, Malabar, Ambo}na, and other eastern Islands. Flowering time in the former country, the month of April* Stems as thick as a slender ratan, often ramous, rooting upon trees in the most shady forests, round, smooth, and less succulent than any other species which I have yet met with, except P. graci-Us.—Leaves alternate, petioled, lanceolate, entire, smooth | length from two to four inches, breadth about an inch.—Petioles most amply winged, so as to be nearly as broad as the leaves themselves, almost as long, equally entire, smooth and marked with similar veins. "—Peduncles axillary, solitary, clothed with many small, ovate, bractiform scales up to the spathe, where they are completely recurved. —Spathe boat-shaped, erect.—Spadix globular, reflex.—Calyx, or corol, some roundish scales mixed amongst the germs, and of nearly the same length, the exact number to each germ not ascertained.— Stamina, about four oboyate scales to each germ, with two polliniferous pits on the inside under the retuse apex.—Germs many, ob-[]], one-celled, with one, two, or three acula attached to the boU

torn of the cell, and immersed in a clear gelatinous liquid.—Style none. Stigma, an umblicated elevation on the apex of each germ.—Berries oblong, size of a French bean, red, pulpy, one-seeded.—Seed solitary, or two, conform to the berry.

P. officinaliSy fi.

Perennial. Parasitic, *stems* rooting. *Leaves* oblong, cordate, en-tire, *flowers* terminal; *florets* naked, octandrous. *Berries* one-seeded.

Sans. जनकार जी. Guia-pippulee, कशियकी, Kuri-pippulee, कशियकी, K«pi-v_Mllee, %rW5lft» Kolu-v«Hee, *n*ft, Shreywsee, दिश्रद[†], Vushiia.

J3eug. Gi/j-pippul-

A native of Bengal, and common in some parts of the Midiiapore district, where it is cultivated ior its fruit, which, cut into transverse pieces and dried, is an article of some importance in the Hindoo materia medico, called G«j-p»pp««, and sold by the druggists under that name. Flowering time the rainy season; seed ripe in January.

Stem perennial, creeping up to the top of large trees, and like the Ay, taking firm hold with its innumerable roots; about a* thick as' the little finger, smooth, except the cicatrices of the fallen leaves, and the roots from the side next the tree which supports it. -heaves alternate, sub-bifarious, petioled, oblong-cordate, entire, filiform, pointed, smooth on both sides; from six to ten inches long, and'from three to \sim x broad.—Petioles sheathing, channelled, smooth, shorter than the U <ves.—Peduncles terminal, solitary, round, smooth, scarcely half the Ir^th of the petioles; when in flower erect, but often drooping, from the increasing weight of the fruit. SpatKe sib-cylind'iic, opening 3 ittle on one side; when in flower, smooth on both sides; greenish without, and of a pale yellow colour wit an, apex filiform, and a little twisted; length about six inches.—Spa. a sub-cylindric, obtuse, equalling the spathe; colour a pale greenis yellow, dotted with the dark-coloured stigmas of the numerous fruc-

tifications which every where cover it T month none.—Coro/nofle, -Filaments; I conclude there are about eight to each germ, twoon each face; but the want of both perianth and corol, renders it difficult to assign the exact number oi stamens to eacii floret, they are very short, and seem inserted on the base of the germ. Anthers Germs numerous, parallelepiped, trunsub-sagit;a;e, four-lobed. cate, vertically aitached to, and completely covering every part of the common cylindric receptacle, one-celled, with one seed attached in an oblique manner to the bottom of the cell. The substance of the germs is leplete with rigid, sharp, vertical bristles, which are readily detached, and stick in the skin, causing pain and itching. The virtue of the drug may reside in these, as it does in the short stiff* hairs of the legumes of Carpopogon pruritns. Style none. a channel filled viih gelatinous matter, running from the cell of the germ to the centre of the truncate apex, where it ends in a small slit, embraced by two darker-coloured, somewhat callous lips.—Perkarps (cupsula circumscisse), as numerous as the germs, and of the same foim, only larger; a few only are fertile, of a soft fltohy texture, one-celled, one-valved; when the fruit is ripe they detach themselves from the receptacle, and drop off, leaving the seed behind still attached to it.—Seed single, ovate-cordate, somewhat twolobed covered at the base with a thin, red, succulent aril. Integumeats two, exclusive of the aril, exterior pale yellow, polished, thin, hard' ami elastic; inner luenibranactous. Perisperm none. bryo unciuate, while, very succulent. Radicle inferior, thickened, and in other respects exactly as in Gaertner's figures of Polamageton natans, vol. ii. p. 23. t. 84.

Ohs. The plant described by Sir William Jones by the name of Guj-peepul, (see Asiatic Researches, vol. iv, p. 303.) is my Tetranthera apetala. He, however observes, that it was from a native gardener he obtained the Sanscrit name of his plant, but as he mentions' that Valli means a creeper, he suspects in some degree, the ac juracy of his information*

Chavica, or Chavya mentioned under the same head is a new species of Piper.

3. P. Peepla, It.

Perennial, sub-parasitic, rooting on trees. *I*eaves* long-petioled\$ oblong, acuminate. *Flowers* sub-terminal *Jlovets* apetalous, letrau* drous.

Peeplee of the Hindoos in the Silliet district, where the plant grows. Flowering time, April and May.

Stem rooting on trees, like the common Icy of Europe, scarcely so thick as the little finger, round and smooth, somewhat contracted between the leaves.—Leaves petioled, alternate, oblong, entire, smooth on both sides, dagger-pointed; length from four to twelve inches.—Petioles as long as the leaves, channelled, smooth.—Pe* duncles sub-terminal, round, smooth; the base inserted in sheaths from three to four inches long.—Spat he sub-cylindric, opening on one side, smooth, acute,• length of the spadix.—Spadix cylindric, obtuse, length of the iusile of the spathe; colour pale yellow, every part completely covered with the fructification, without any proper perianth, or COVOWVL.—Filaments about four to each germ, and about half its length. Anthers linear.—Germs numerous, of a square, wedge shape, truncate, the whole of their substance replete with small pellucid, sharp bristles, which readily enter the skin, and produce pain and itching.—Style none. Stigma sub-rotund.

4. P. gracilis, U.*

Scaildent. Leaves lanceolate, entire, on short, round petioles above their sheaths. Spadix peduncled, cylindric, scarcely equalling its linguiform spathe.

A native of Amboyna; it has a great resemblance to *ltumpM*****Adpendix arborum, Uort. Amb. vol. v. f.1&1.y. 2.

• This name betas pre-occupied by a species described hi Rndge'f excellent woi*# Plant* *GUJQTKS* may be changed to *tenera_t—N*. W.

5. P. gigantea, R.

Perennial. Sterns rooting. Leaves oblong, cordate, entire. Flow* ers axillary; florets naked, heptandrous.

This is the stoutest of these parasitic *Aroidea* that I have met with. It is a native of Prince of Wales Island; from thence introduced into the Botanic Garden by Mr. W. Roxburgh. Flowering lime in Bengal the close of the rains in October. It has not yet produced ripe seed there.

Stems perennial, creeping on the ground, or upon trees and plants; in a very thri\iug state, of six years growth, fiot more than three and four feet long, and about four inches in circumference, round, and strongly marked with the circular scars of the fallen leaves.—Leaves alternate*, sub-bifarious, pelioled, approximate, oblong, cordate, entire, smooth; length from one to two feet high, and about two-thirds thereof in breadth.—Petioles as long as the leaves, channelled, smooth, much enlarged at the base, and stem-clasping.— Peduncles axillary, solitary, very short.—Spathe sub-cyliudric, short-pointed, opening a little on one side about the time that the anthers discharge their pollen, smooth on both sides, of a dirty dull purple colour, length about six inches.—Spadix cilindric, length of the spathe, obluse, every part most closely covered with the sessile fructifications; colour a pale lively yellow, beautifully dotted with the dark linear stigmas.—Filaments about seven to each germ, short, broad, and thin. Anthers two-Iobed.—Germs very numerous, parallelopiped, truncate, much flattened, vertically one-celled, with generally two uvula, obliquely attached to the bottom of the cell. Stifle none* Siigma a vertical, linear, grooved, dark-coloured projection on the middle of the truncate germ, as in the last species; the substance of the germ and spathe also abound in short stiff bristles, which readily enter the skin, causing pain and itching.—Califx and Corol noue.

6. P. pertusa, R.

Scandent, sub-parasitic, rooting on trees. Leaves cordate, perfo-

rated on one side, and pinnatifid on the other. *Corollets* apetalous, tetrandrous. *Anthers* two-lobed.

Elettadi-Maravara, Rheed. Hort. Mai xii, p. 41. t. CO and SI.

A very large perennial, sub-parasitical species, so much like *Dracontium* pertusum, that they may be readily taken for the same plant. It is a native of the mountainous pails of the Coast of Coiouiaudel, running up, and over the highest trees, to which it adheres like *Ivy* by roots issuing from the joints.

Leaves alternate, petioled, cordate, smooth, generally perforated with (near oblong holes on one side, and on the other passing through the margins as in the pinnatifid leaves; their length from twelve to eighteen inches long.—Petioles nearly as long as the leaves, deeply channelled, wanting the stipule-like processes at the apex, which Millei's fi.ure represents, in which particular this plant differs from that in the first instance.—Scape short.—Scathe gibbous, pointed, a Irtle longer than the spadix, cylindric, obtuse, every where covered with the fructifications.—Corol none.—Filaments intermixed amongst the germs, (the number to each germ cannot be determined, but 1 think about four,) compressed; apex bifid. An* thers oval, two to each filament.—Pistils mixed with the membrauaceous filaments, four-sided, lobed. Style none. Stigma, a knob on the centre of the lobed germ.

7. P. pinnate, Linn. Sp. PL ed. IVilld. i. 686.

Sub-parasitic, rooting on trees, the apices of the shoots clothed with fibres. *Leaves* pinnatifid. *Flowers* terminal.

Adpendix laciniata, Humph. Hort, Amb. v. 489. t. 183./". 2.

Found in forests in the Malay countries, rooting up and running over trees of great size. It is readily distinguished from my *decursiva*, by the abundance of brown fibres which are found on the young shoots, and the lower part of the petioles.

8. P. decursitd, R.

Perennial, rooting on trees, smooth. Leaves sub-dccursivel/ pine

nate; segments falcate, cuspidate. Flowers lateral, or axillary, long* pediincled.

Guj-p/ppwl is the vernacular name of this very large, powerful species, in the Silhet district, where it is indigenous, and blossoms during the hot season.

Stems as thick as a stout cane, rooting on, and ascending trees like the common Ivy; round, smooth, and rather contracted between the leaves.—Leaves approximate, alternate, petioled, pinnatitid, or completely pinnate; from two to six, or seven feet long, including the petioles; segments, or leaflets, linear-talc ate, cuspidate, entire, smooth, sometimes from three to four-nerved or triple-nerved; length from six to eighteen' inches, and two broad. — Petioles from six inches, to three feet long, round, smooth, stem-clasping, and the lower portion more deeply channelled.—*Peduncles* solitary, axillary or lateral, ab^ut six inches long, substantially thick, round, smooth, and replete with the same while bristly spicula that are found in the germ and teed vessels.—Spat he sub-cjlmdric, length of the peduncle.—Spa* riix cylindiic, length of the spathe, completely covered with the innumerable fructifications.—Calyx none. Carol none, nor any thing like either.—Filaments about four to each germ, and nearly of their Anthers coidate, appearing beyond the germ.—Germs nulength. merous, the most general form a four-sided wedge, apex truncate. Stifle, scarcely any. Stigma, an elevated vertically oblong opening,

9. P. helerophylla, R.

Caulescent, creeping, armed. *Leaves* from cordate-sagittate to piunatifid. *Spathe* erect, spiral, many times longer than the shurt cylindric spadix. *Florets* tetrapetalous, tetrandrous.

Can it be Dracontium spinosum, Flor. Zeyl. 323?

A native of Bengal, delighting in a rich, moist soil; it flowers, though rarely, during the cool season.

Hoot iibroįis.—Stems and branches creeping, armed with short, wharp prickles—Leaves until the plants are old, and begin to flower, "iuiple-sagitate, and cordate-sagittate, afterwards pinnalificl, with

long lanceolate, acuminate segments, smooth above, nerve and larger \eins armed on the under side; length from six to fourteen or sixteen inches.—Petioles completely armed; base sheathing; above round, generally shorter than the leaves.—Scapes axillary, solitary, one-HoWered, length of the petioles, and armed like them. — Spathe sub-cylindric, acute, spirally twisted above the spadix; colour a dark dull reddish purple; length from eight to twelve inches long, and as thick as the little finger, opening at the base only where the spdflix is lodged while the pollen is discharging, after which it shuts, as before that period.—Spad/jr cylindric, obtuse, completely covered with hermaphrodite florets; length little more than one inch.—Calyx none.—• Petals four, obovate, concave.—Filaments four, broad, length of the Anthers two-lobed.—Germ oblong, one-celled, containing petals. one ovula, attached to the top of the cell. Style none. Stigma glandular, flat.

10. P. Lasia, R.

Armed. Leaves radical, pinnatifid. Spathe very long, and twisted above the spadix. Berries one-seeded, muricate.

Lasia aculeata, Loureir. Cochinch. ed. Willd- i. 103.

Teling. Moola-sari.

Beng. Kanta-kittchoo.

A native of boggy, or wet places among the Circar mountain.

Leaves radical, petioled, pinnatifid; segments lanceolate, smooth shining, the nerves on the under side armed with prickles; length about two feet, breadth about a foot and half.—Petioles erect, from two to four feet long, round, every were thickly armed with sharp prickles.—Scape the length of the petioles, round, and equally covered with prickles.—Spathe very long, erect, below gaping; above the spadix twisted, leathery, dull red colour.—Spadix about one-sixth ot the length of the spalhe, cylindric, every where covered with the fructifications.— Corol; stamens, and pistil as in the genus.—Berries, {pirather capsules,} wedge-formed, somewhat four-aided, murexed, one seeded.—Sped two-lobed.

CHLORANTHUS. Schreb. Gen. 1730*

Calyx noue. Coral, a three-lobed, unilateral antheriferous petal on the outside of the pistillum. Germ s^mi-superum one-seeded; attachment of the ovulum superior. Drupe one-seeded.

C. inconspicuus, Linn. Spec. Plant, ed. Willd. i. 688. Tcheu-lan, of the Chinese.

.• From Canton it has been received into the Botanic Garden at Calcutta, where it grows freely to be a small upright shrub, with many straight sub-simple smooth branches, of about two feet in height, with oblong opposite serrulate smooth leaves. *Flowering* time in Bengal the rainy season. It has not yet ripened its seeds there.

ELJEAGNUS. Schreb. Gen. N. G13.

. Corol none* Califx gibbous, border four-parted. Germ one-ceU led, one-seeded; attachment of the ovulum inferior. Drupe inferior, one-seeded. Embryo erect. without perisperm.

]. E. triflora, R.

Shrubby, scandent, armed. *Leaves* oblong, obtuse, scaly. *Flow* en* axillary, three-fold, peduncled.

Elseagnus foliis oblongis acuminatis maculatis, *Bum. ZeyL p.* 92, t. 39-f. 1.

A native of Sumatra, from thence introduced into the Botanic Garden in 1804, where it blossoms in December. Seeds ripen three or four months afterwards.

Stems and branches of considerable size, and great extent, climbing; bark of the ligneous parts a beautiful dark purplish colour, and smooth. The short lateral branchlets which issue from the yotttg climbing shoots are more or less recurvate and answer the end of tendrils; when old, they become stout thorns. Bark of the tender

part most beautifully clothed with numerous ferruginous, stellate scales.—Leaves alternate, short-petioled, oblong, entire, obtuse, above smooth; underneath ornamented with numerous stellate, ferruginous and silver-coloured scales; from two to three inches long, and from one to two broad.—Stipules none.—Flowers axillary, thieefold, small, white.—Vedancles longer than the corols, one-ilowered.—Calyx with a short, four-sided tube; and border of four cordate segments, on the outside a little scaly; on the inside smooth.—Fila-Anthers four, sessile in the mouth of the tube of the ments none. calyx.—Germ superior, oblong, embraced by the contracted bottom of the calyx, one-celled, one-seeded. Style as long as the calyx.— Stigma oblong, glandular, oblique.—Berry oblong, succulent, when ripe pale orange colour, pulp soft, of rather a pleasant astringent taste, and not acid like E. conferta; one-seeded.—Seed sub-clavate. Integuments two; exterior eight-ribbed, soft, and lined with much wool; inner membranaceous.—Verisperm none.—Embryo erect. Cotyledons conform to the seed, amygdaliue. Plumula two-lobed-Radicle oval, inferior.

2. E. conferta> R.

Shrubby, scandent. *Leaves* alternate, oblong-pointed, covered with silver-coloured scales underneath. *Flowers* axillary, crowded, short-peduncled.

Ben*. Guara.

This is a very large and ramoiis, scandent shrub; a native of the mountains near Silhet, in Bengal.* Flowering time, the cold season*. Seed ripe in March.

Young *shoots* covered with innumerable rust-coloured scales.— *Leaves* alternate, short-petioled, generally erect, oblong-pointed, entire, with innumerable small silver coloured scales, particularly underneath, which gives them a bright colour; from three to four inches long, and from one and half to two broad.—*Petioles* short, scaly.—•

^{*} Also Nepala, Siripagur, Sirmore—N- W-

Peduncles axillary, crowded, short.—Flowers small, straw-coloured. Calyx; tube somewhat gibbous, four-sided; outside scaly; border of four cordate segments; its mouth marked on the inside with four curved lines, on their pointed junctures the filaments sit.—Style hairy.—Drupes oblong, succulent, when ripe red.

Obs. The calyx of my plant cannot be said to be placed on the germ; it ha*, as it were a lower tube which envelopes the germ only, this part grows with the fruit, and finally becomes the pulpy part thereof as in the *Nj/ctagineae* of Jussieu.

3. E. arborea, R.

Arboreous. *Brancktets* often spinous, pointed. *leaves* oblong and broad-lanceolate, entire, silvery underneath, *flowers in* axillary fascicles. *Fruit* cylindrical!; oblong.

A large tree, native of the Garrow Hills and there called *Sheu-Shong*. Flowering time December. The fruit shaped like an olive, but much larger; it is eaten by the natives when ripe, which it is generally in March and April.

CANSJERA. Juss. Gen. cd. Ust. 85.

Calyx large, gibbous, four-toothed. Corol none. Nectary four* petalled, embracing the germ, and of the same length. Berry superior, one-seeded.

]. C. scandens, Roxb. Corom. ii. N. 103.*

Shrubby, scandent. Leaves alternate. Spikes axillary.

Scheru-valli caniram, Rhecd. Mai. vii. p. 7. t. 4.

Tsjeru caniram, ibid. p. 3. t. 2. appears to be the same plant.

A large woody climbing shrub; a native of the Circar mountains.

'Leaves alternate, two-faced, short-petioled, broad-lanceolate, smooth, entire, about three inches long, and one broad.—Spikes txil-

• C. maUbarica, Lam. JEncjcUflk 433—Daphne polystacliyt, Willd. apec.iu 420.-N. W.

lary, generally single, short, every were covered with flowers.—Braetes solitary, small, oval, one-flowered.—Flowers small, sessile, yellow.—Calyx inferior, one-leaved, gibbous; mouth four-toothed.—Carol none, except the calyx, or nectary be accounted one.—Nectary four-leaved; leaflets cordate, acute, half the length of the calyx, inserted round the base of the germ and embracing it.—Filaments four, inserted into the base of the calyx, and rather shorter than it. Anthers, ovula within the calyx.—Berry oblong, smooth, red, juicy, size of a pea, one-celled.—Seed single, shaped like the berry.

SANTALVM. Schreb. Gen. N. 215.

Calyx semi-supera, campanulate, four-cleft. Cqfol none. Nectarial scales four, alternate with the stamina. Germ one-celled, one-seeded, attachment inferior. Berry one-seeded. Embryo inverse and furnished with a perisperm.

I.S. album, Linn. Sp. PL ed. Willd. i. 691.

Leaves oblong.

Pers. Sundul-sufcd.

Saudal-wood, Buchanan's Journey i. 186, and 202. ii. 117; 132, and 536. iii. 192.

A uative of the mountainous parts of the Coast of Malabar. That of Timor, and the neighbouring Islands is most probably the same species. In the Botanic Garden ueai Calcutta, the trees reared from seeds brought from the former country, thrive luxuriantly, and produce flowers and ripe seed nearly the whole year round.

Trunk in trees of twelve years grctw4kn the Botanic Garden, only a few feet high, when they divide into brauches; and there from two

and a half to three feel in circumference. Bark brownish, and scabrous, with longitudinal fissures. Branches numerous, dividing much, spreading, and rising in every direction, forming nearly a spherical head. Young shoots round and smooth; extreme height of our largest tweive or thirteen year-old trees, about twenty-five feet.—Leaves opposite, petioled, oblong, generally obtuse, smooth, entire, glaucous underneath: length from one and a half to three inches.—Petio/es scarcely one-fouith the length of the leives, smooth.—Stipules none. Thyrsi axillary and terminal, much shorter than the leaves. cels opposite, the lower pair of each thyrsus generally three-Howered.—Flowers numerous, small, when they first expand straw-coloured, changing to a deep ferrugenous purple, inodorous, as are all the exterior parts of the growing plant, even when bruised.—Calyx oneleaved, campanulate; border four-parted; segments otate, smooth, base of the bell only permanent.—Carol none, except the calvx, or nectarial glands are so called.—Nectary of four, roundish, ses'sile, thick, fleshy glands, on the mouth of tile bell of the calyx, alternate with the segments of its border, and when the flower first expands, the most coloured part, entire. In Sirium f now S ant alum) myrtifolium, they are lobate*—Filaments four, alternate with the nectarial scales, and of the same length, smooth, but behind each there rises a tuft of white hairs from the disk of the segments of the calvx, perfectly distinct from the stamina, but of the same length, the ends of these long, white, woolly hairs adhere to the back of the small, twolobed anthers.—Germ semi-superum, one-celled, containing one conical seed, attached to the bottom of the cell. Style, length of the tube of the calvx.—Stigma three-nerved, four-lobed. Berry pyren-OLIS, round, smooth, when ripe black, and succulent, size of a cherry, and crowned with the remaining calyx, one-celled.—Nut solitary, spherical; three small, equisdistant elevations from the apex run a little way down the sides Seed conform to the nut. Integument single, soft, white, spungy, lining the nut, and adhering to it and the "eed also.—Perisperm confc^feto the seed, white, amygdaline. *llmbryo* inverse, subulate, nearly as long as the vertical diameter of

the perisperm. *Cotyledons* two, unequal, linear-lanceolate. *Plumula* minute, semilunate. *Radicle* tapering, superior.

Obs. The descriptions and original figures of the following species, Sirium myrtifolium, Corom. Plants, vol. i. t. 2. were taken from the plants which grow wild, on the mountains north of the Rajamundii Ciicar, on the coast of Coromandel, where the trees are but of a small size scarcely more than a large shrub, or bush; with lanceolate leave*; and the wood of little value. It is now nearly twenty years since that description, and the drawings were made, and I have reasons to think the tree which produces the sandal wood of Malabar,* and Timor, to be different, and having had an oppor!unity of cultivating the former, viz. that of the Malabar mountains in the Botanic Garden for these thirteen years past, I do not hesitate to say, that the Circar tree it is at least a strongly marked variety of the Malabar sort. For that reason I have thought it adviseable to give the foregoing full description, of the true sandal wood, which 1 hope will tend to clear up the botanical history of this celebrated tree, ami its associate Sirium myrtifolium. They evidently belong to one genus, to which I have thought it necessary to assign a new essential character, and whether I consider then, to be distinct species of that genus, or varieties of one species, must be of very little consequence. For my o«n part I think it nearer the truth to consider them distinct species' I theretore call the narrow-leaved one Santalum myrtifolium.

The nature and history of the wood, white and yellow Saunders, or Sandal are nm too well known to require any thing in additiou from me,

2. S. myrtifolium, R.

Leaves opposite, lanceolate.

Sirium myrtifolium, Roib. Corom. PL i. K 2. Willd.

A native of the Circar mountains, where it is but of a small size, and the wood of little or no value.

[•] I include however the other Islands throat, !,,*«,,,• tfceleavci of our tie particularly wall vimit UampUio.'. $(, «, , »_b!)$ ve oUl .

Leaves opposite, short-petioled, spreading, Janceolate, entire, waved, smooth, shinning; about two inches long, and three fourths of an inch broad.—Stipules none.—Racemes th}isiforin, terminal, coin* pound, binall, erect.—Flowers small, reddish.—Calyx superior. Tube short, a little gibbous. Border four-cleft; divisions ovate, expanding, coloured.—Coroi DO other than the above, except ihe nectary be such.—Nectary four-leaved,, obcordate, notched, inserted into the mouth of the calyx.—Filaments four, short, hairy, inserted into the calyx, alternate with the leaflets of the nectary.—Germ globular. Style length of the tube. Stigma four-lobed.—Berry globular, si?e. of a large pea, smooth, juicy, black, when ripe one-seeded.

Obi. Birds greedily eat the berries,' by which means it is propagated extensively. I do not know that the wood of this small tree is ever used as a perfume.

GYROCARPUS. Jacq. Gart.

Calyx superior, four-leaved, unequal. Corol none. Nectary of four clavate glands, alternate with the stamina. Berry dry, one-seeded, ending in two long wings* Embryo erect, spirally rolled up; no perispenn.

]. G. Jacquini, Roxb. Corom. PL i. N. 1.

Polygamous* Panicles dichotomous.

Gyrocarpus asiaticus, Linn. Sp. PL ed. Willd. iv. p. 982.

Teling. Tuiukoo.

Grows to be a very large tree, is chiefly a native of the mountain¹* ous parts of the coast of Coromandel. Leaves deciduous about the end of the wet season. flowers during the cold season when the trees are naked; the leaves come out soon after.

Trunk generally erect. Bark smooth, greenish, ash-coloured.—
Branches thin, irregularly spreading in every direction.—Leaves ap*
proximated, about the extremities of the branchlets petioled, broadcordate, three-nerved, often slightly lobed, above smooth, bek>\V
<iowuy, with two pits on the ilipper side of the base; length and

breadih vařious, but iu general about five or six inches each way.— *Fetiohs* IOUIKI, dovvux, three inches long.—*Panicles* terminal, unv btl-hutJ; tiivisiuus iwo-foiLed.—*Flatters* very small, }ello\v.

HEBMAPHRODITE FLOWERS solitary, sessile in the divisions of the pawcle.—Calyx superior,iour-leaved; leaflets unequal \eiteiior \|iair binail, oval', braciiiorm, caducous; inteiior pair lar^e, wedge-shaped, lhite-*ioothed, ptiniaueut, increasing iu size with the pencarp into two long, meuibranaceous wings.—Coro/none.—viettartf consisting ef four clavate,)ellow glands.—Filaments four, longer than the cal\x, i\setited alternately with the nectainal glands into tf perforated receptacle. Anthers quadrangular, opening on each side With an oval lid.—Germ inferior, ovate. Style none. Stigma small, immeised in (he peiforation of the receptacle of the filament and nectarial glands.—Capsule globular, wrinkled, one-celled, one-valved, not opening spontaneously, size of a cherry, ending in two long, obtuse, lanceolate, luembrauaceous wings.—Seed one •

0/*. The wood of this tree which is white and very light, is cm-ph>ed to make *Catamarans* (floats,), when to be had, in preferenc© to any other.

DIGYN1A.

CUSCVTA. Schreb. Gen. N. 227.

Calyx four or five leaved or parted. Corol one-petalled. Germ two-celled, one or two-seeded, attachment inferior. Capsules super li^r, two-celled, circumcised. Embryo spiral, rolled round the perison, with an infeiior radicle.

1. C. reflexa, 7?o?6. Corom.PL ii. N. 104.

Parasitical; *flowers* racemed, pentandrous. *Scales* of the nectary Bearded. *Capsules* four-seeded.

Seng. Httldi.algu&zVuta.

Tehng. Sitama-yoorgoiWoo. $-J^{\wedge}$

This plant is parasitical, appearing on any busliin the cold seaafoff*

—Stems or branches filiform, succulent, twining, very rairious, leaf-less, smooth, yellow.—Racemes numerous.—Flowers white, short pedicelled.—Calyx five-leaved; leaflets cordate, permanent.—Coroi; tube cyliudric; mouth live-parted; division reflexed.—Nectary of five scales; which sin round the germ, and are inserted into the bottom of the tube.—F. laments five, very short. An then oval, appearing half above the mouth of the tube.—Style scarcely any. Stigma two, large, fleshy, expanding, pointed.

2. C. aggregata, R.

Head round, sessile, composed of ten or twelve perfectly sessile, ag3^{re}&ate, pentandrous flowers.

Accidentally introduced into the Botanic Garden amongst Flay: seed from Bagdad. When the *Flax* pLuts were a few inches high, this little delicate, leafless, filiform, round, yellow parasite began to make its appearance, adhering in such quantities to their stems and Itaves, as to destroy whole beds in a very short space of time.

5. C. sulcala, R.

Peduncles m fascicles, each bearing a few pentandrous, sessile flowers, with a fleshy furrowed calyx. Capsule two-seeded, surrounded by the deeply grooved calyx.

A native of Bengal, appears adhering to *Amaranth us oleraceus*, and some other plants, during the cool season. Is a plant of small size, of a pule yellow colour, throughout perfectly smooth.

Peduncles generally collected in small, remote fascicle? of two tlnee, four, or more, each supporting Fion two to four, small, sessile, white flowers.—Tirades ovate— Calyx five-.toothed, permanent, becoming ile&hy, and deeply ribbed, with from six to ten ribs, length of the lube of the corol.-HCu/o/. 'Tube short. Border five-cleft; tfivi&ioiis oval, obtuse, reflexed.—Nectarial scales five, below the Insertion of the filaments, divided nearly to the base, into many, fine, filiform segments.—Filaments five, inserted a little below the fissures of the coroi.—Oei m romul. totales two. Stigma headed.—Capsales in the coroi.—Oei m romul. Stores two. Stigma headed.—Capsales in the coroi.—Vere-celled.—Sre-/i' solitary.

.4. C. capitnta, R.

Heads round, sessile, bracted, with from ten to twenty pentandrous flowers. *Calyx* and *carol* papillose, pellucid and white.

Hind, and Beng. Alga/s?.

A most beautiful, small parasite, found in great abundance growing on the lower part of the stems of *Crotolaria jwicea*, during the monih of February and March*

Stems numerous, filiform, smooth, except at the parts where it grows to the stalks of its supporter, there tuberculate; extent from one to two feet high; colour pale yellow.—Leaves none.—Flowers from ten to twenty, forming most beautiful, round, sessile, white, pellucid heads.—Bractes a single one under each head, which is white, meuibranaceous, and oblong.—Calyx and enrol five-cleft, swelled vit.li pellucid cells, like the Ice-plant.—Nectarial scales reniform, ciliate.—Sfamens five—Germ two-celled, with t**o seeds in each, attached to the bottom of the cells. Styles two. Stigma simple.

COLDEMA. Schreb. Gen. N. 233.

Calyx four-leaved. Corol infundibuliform. Germ, superior, four-celled, one-seeded, attachment superior. Nuts four. Embryo in* verse, and furui&hed with a peri sperm.

I. Cprocumbens, linn. Sp. PL ed. Willd. i. 712.

A v^mall annual, spreading flat on the ground and in general very common on dry rice-fields during the cold season; but never to be seen from the beginning of the periodical rains till they are com* pletely over.

TETRAGYNIA.

BRUCEA. Schreb. Gen. N. 1508.

Calyx four-parted. Petals four. Germs four, one-seeded, attachment infeiior. Berries four, superiorjJJ^e-seeded. Embryo inverse, with scarcely any peris perm. Sometimes a fifth part is added*

1. B. sumatrana, R.*

Shrubby. *Leaflets* serrate. *Racemes* axillary, generally compound. Lussa-Radja, *Humph. Amb.* Auctuar. 27. t. 15.

MaL Ampadoo-Barrowing.

A native of Sumatra. From thence Mr. Ewer sent the seeds to the Botanic Garden, where in one year the plants were about four feet high with a straight ligneous stem; and few branches. They then began to flower in May, and continued to blossom and ripen their seed all the year.

Leaves scattered, unequally-pinnate, from twelve to eighteen inleaflets from four to six pair, opposite, short-petioled, ches long. obliquely ovate-lanceolate, grossly and obtusely serrate, pointed, vil* lous underneath, from three to six inches long, very bitter, and somewhat foetid.—Petioles common, round, and villous.—Stipules none. —Racemes axillary, solitary, from one to six, or eight inches long, somewhat compound, dark purple, and clothed with a few white hairs.—Flowers numerous, very minute, dark purple, and in all the Sumatra plant completely hermaphrodite.—*Bractes* subulate, hairy, very small, and caducous.—CG/J/.I four-leaved, or deeply four-parted. Segments small, ovate-lanceolate, deep purple, hairy on the out side and with the corols becoming retiexed.—Petals four, longer than the calyx, lanceolate, dark purp'e, and hairy on the outside.—Nectary a dark purple, four-lobed, fleshy cup surrounding the insertion of the germs.— Filaments four] short, purple, inserted under the margin of the nectary. Anthers oval, large, and deep purple till they discharge their pollen.—Germs four, superior, one-celled, with one ovulum in each attached to the upper and inner side of the cell.—Stifles a single, short, recurved, one to each germ. Stigmas simple.—Drupes four, when all come to maturity, size of a small grain of black pepper smooth, dark purple, one-celled.—Nut conform to the drupe, rugose, one-celled, inner edge thinner, and the upper half of it marked with a white line, (the umbilicus).—Seed conform to the nut. guments single, adhering to the perisperm, thin and white.—Peris* perm in very small quand indeed it may be called a fleshy inner

^{*} Gonus amaiissimus Lour. Cochinch. ed» Will, ii. 609.—N. W.

integument.—*Embryo* as long as the perisperm, straight, inverse* *Cotyledons* oval, fleshy. *Plumula* two-lobed. *Radicle* roundish, superior.

Obs. Since I first described this tree, and only from plants that were completely hermaphrodite 1 have found some-plant* perfectly male, and others as completely female, la this plant, therefore, we have another instance of Trioicom Polygamy.

From the sensible qualities of the green parts of thin plant, being somewhat fetid, and simply, though intensely bitter, it promises to be as jrood an antedysenterical medicine as $BrucSs.Abyssinian\ IVoogtvo*$ itself. As soon as the plants anive at greater ina?mii\ the birk shall be tried, and compared with Angiutura bark which lias by some been thought that of $Brucea\ an'cdjienterica$ of lime's jfrtf-vels, &c. vol. v. p. 69. also of IFMHer, Tib- 2.3! and still belter described and figure I by L ILtitier unde. the name $Brucea\ fenugiuea$, Stirp. Nov. 19. L 10. See also Linn. Sp. PL ed. Will. iv. 7^{\wedge} .

MYRIOPHYLLUM. Schreb Gen. N. 1440.

Calyx four-parted. Corol four-petalled. Style none; stignws four. Seeds four, naked. Embryo inverse.

1. M. telrandrum, R.

Leaves verticilled, all filiform-pinnatiiid. Flowers axillary, veiticilled, tetrandrous. Calyx four leaved.

Compare with Hottonia sessiliflora, *Liny* Sp* TL ed> IVitld*. i. 813. *Teling*. Neerla-pamarum.

It grows in sweet water; appearing during the rains.

Stems round, articulate, spongy below the v>ater, length various, above the water from fuiir to six inches, about the thickness oi a crow-quill.—Leaves \erticilled, piiiuatitid, below the water they are much huger, with capillary segments; above the water they are small—Flutters very small, white, verticilled, i. e. one in the axil of each leaf.—Calyx above, four-leaved; leaflets penualieut.—Fetalf four, ob'oug,—Filaments shoi ter than f^t petals,

• 2. M. tnhercnlatum, iJ.

Leaves urticilled, piuuatifiil. Fifteen axillary, verticilled, tetrandrous; ft nit telraceous, tttbeiculeri.

A native ol boideis of lakes, and other moist places near Calcutta. Is in blossom must pait ef the year, and very ui-ch like M. *telrandrum*.

btems cieeping, round, jointed, length various, the erect extremities about live or six inches*—JLeaze* verticilled, pinnatifid, or acutely serrate.—Flowers verticilled, sessile, one in the axil of each leaf, small, j-iuk-culoured.—Calyx none.—Carol; petals oblong, ex. piiiiumg, pink-coloured.—Filament short. Anthers linear.—Seeds united in the form of a four-lobed, tubercled pericarp.

rOTAMOGETON. Schrcb. Gen. N. 2S4.

Calyx none. Carol ibm-petalled. Germs four. Styles none. Seeds four. Embryo hooked, without perispeim.

I. P. indicum, if.

Creeping. Leaves alternate, from narrow-lanceolate to elliptic cally oval, opaque, glossy, many-nerved. Anthers four pair, attached to the claws of the round concave petals.

A native of the borders of fresh water lakes and ditches in the vi« cinity oi Calcutta. Flowers in February and March.

Stems creeping. The sma'l simple roots which issue from the joints are all 1 can discover, for while the plant 'advances from tho apex, it decays at the opposite end, so that 1 do not think any part of them exists for one }tar. Branches few and like.what I call the stems; they are all round, smoo.h and jointed at various distances.—

Leaves al:ernate,*e\cept next to the flowers, and there often opposite, petioled, from narrow-lanceolate, to elliptically oval, opaque, even, and very smooth, or rather glossy, entire, obtuse, obscurely many, nerved; size very various. Those that remain immersed are narrow-er, longer, more strongly marked with nerves, and subtransparent.—

Petioles simple, not sheafning, length various, iu plants left by the

water much shorter than the leaver—Stipules solitary, axillary, sheathing, length of the petioles, slit halfway or more on the inside — Peduncles solitary, axillary, or opposite to a leaf, round, rather thicker, smooth, and nearly as long as the cylindiic spike, which each supports.—Flowers small, numerous, green.—Calyx none.—'

Tetals long-clawed, nearly round, incurved, fleshy; concave within, convex on the back, permanent__Filaments none. Anthers, four pairs attached to the claws of the petals on the iuside.—Germs tour, ovate-oblong, one-celled, with one ovula in each. Styles short, a.ri thick. Stigmas a dark speck on the apex of the styles.—Drupes obovate, smooth. Nut conform to the drupe, one-celled.—*E:nb?yo curved, as represented by Gartner in P. nalans, vol. ii. t. 84*

2. P. taherosuniy R*

Leaves' alternate, and only opposite at the floriferous forks, sessile, linear, much waved, entire, clear, when dry membranaceous.

Found immersed in extensive masses, in Poiids, Lakes, and receptacles of fresh water in Bengal, during the dry season, chiefly when in flower in February, it rises so near to the surface as to allow the little spikes of flowers to emerge completely.

Root of long simple fibres, brown, &c. according to the colour of the mud they enter; on the creeping joints are generally found Small roundish lobate, viviparous tubers.—Stems and branches of various lengths, according to the depth of the water, &c. a groove on each side gives them the appearance of being compressed, thick as a pack-thread, smooth, at the bottom of the water creeping, towards the extremities when in flower dichotomous; previously to that period the branches are alternate and axillary.—Leaves sessile, alternate, except at the floriferous fork of the branches, where they are opposite, linear, rather obtuse, much waved, finely and acutely serrulate, with two slender nerves near the margin, pellucid, from two to three inches long, by little more than a quarter of an men broad.—Stipules sheathing, short, smooth, greenish like the other parts of the plant, and scarcely to be tistinguished from than*-*

Spikes solitary in the fork of the branches, rather long-petfuncled, from four to eight-flowered, when in blossom emerged, afterwards immeiged.—Corol, stamina, and germ as in the genus, but here there certainly is a style with four large, obliquely truncated stigmas.—Seed as in P. natans, Gaert. sem. ii. 23 tab: 84.

ILEX.

Calyx four-toothed. Corolla rotate, four-cleft. Style none. Berry from two-to four-seeded.

J. I. dipyrena, Wall.

Leaves oblong, accuminate, short-petioled, smooth, scarcely undulated, remotely serrate, serratures spinous *flowers* sessile in axillary fascicles; berries two-seeded.

A very large tree, native of Nepal a, where it is called Caulalu Blossoms from April to July, and produces fruit during the rainy season. 1 have also received specimens gathered by Dr. Govan about Saharunpore, and by Capt. W. S. Webb, on the confines of Chinese Tartary, where he informs me the tree is called Kundar*

Branchlets angular, with cinereous bark; young shoots pube-scent.—Leaves alternate, copious, approximated, oblong, sometimes lanceolate-oblong, attenuated into an acumen, sharp at the base; margins slightly undulated, while young repand-serrate with strong spines, when old more remotely and slightly serrated, sometimes almost entire; of a firm and leathery texture, perfectly smooth and polished; rib very prominent, furrowed above; nerves short, nearly transversal, divided towards the margin into rediculated veins; from three to nearly five inches long, one to one and a half broad.—Petioles not above two lines long, pubes'cent, deeply furrowed.—Flowers subsessile, collected into roundéd axillary subsessile fascicles.—Pedicels very short, each supported by a couple of minute rounded concave ciliated bractes.—Calyx divided into four brbad-ovate, acute, ciliate teeth.—Corolla deeply four-clefl, flat and spreading; segments ovate, four times longer thanflhe calyx, obtuse, smooth.T-Filaments

four, inserted on the mouth of the corolla, most spreading, alternating with the segments and somewhat exceeding them in length. *Anthers* roundish, two-celled.—*Ovarium* very small. *Stigma* obscurely two-lobed.—*Berry* round, smooth, about four lines jn diameter, when dry wrinkled and of a dark brown colour, crowned with a vestige of the two-lobed stigma, two-seeded; *pulp* scanty.—*Seeds* 'semi-ovate, obtuse, rounded at the base; the inner side flat with a gibbous protuberance above the centre, the outer one convex with about six unequal, very prominent ribs, separated by as many deep furrows.—The rest as in Aquifolium, *Gart. Carp.* ii. 7'2, *tab.* 92.

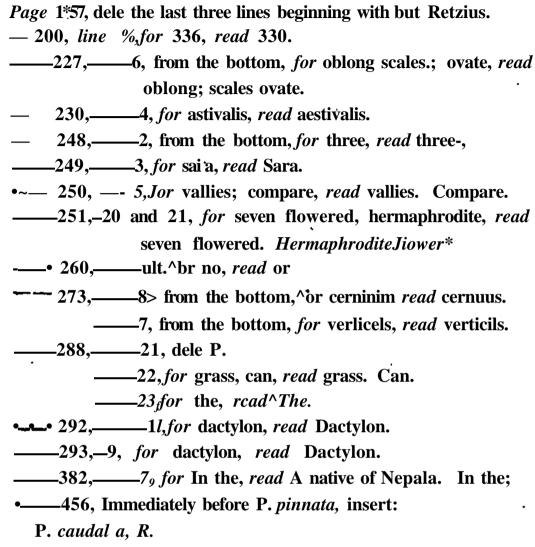

O6s. This species varies considerably in the shape and serratures of the leaves. Generally they are oblong and remotely serrate; sometimes, however, they are of a more ovate form, rounded at the base, the margins sinuated and marked with pretty strong unequal spinous serratures. But in all the varieties the berries are two-seeded; a character which sufficiently distinguish them from the varieties of the common Holly. I am indebted to my esteemed friend Capt. Webb for a specimen without tioweis which, if not the last mentioned varitey of my I, dipyrena, most probably is the I. Aquifolium; it was communicated to me with the following remark: "This Holly is found near stre ams in the Purgunna Choudans; it is called Gumshing in the Bhotea language, and form3 a bush often to twelve feet in height; its berries ripen in October."—N. W.

END OF VOLUME FIRST.

CORRIGENDA ET ADDENDA.

Page 13, line %?>,for loothlets, read toothlets.

3, from the bottoin,ybr permament, read permanent.
177;20,ybrTali-pulli, read Tali-pullu;—ibid, after 9,
add n. 123.

Perennial rooting. Extreme shoots leafless, flagelliform, and pendulous. *Leaves* ovate-cordate, from entire to pinnatifid, *segments* sub-ensifoim, one-nerved.

From Prince of Wales Island slips were brought to the Botanic Garden at Calcutta, in 1797; and now, 1812, it is one of the most common and most extensive climbers; but has not as yet blossomed in the garden. The long flagelliform pendulous extremities of its shoots readily distinguish it from every other species I have seen; the leaves also are oftener undivided than otherwise.

Page 457, Immediately before P. heterophylla, insert:

P. pinnatifida, R.

Peiennial, rooting on trees. Leaves piunatifid; segments falca €> one-nerved.

A native of Sumatra; from thence brought into the Bota vic Garden at Calcutta, where it grows freely on the trunks of tyees, to which its lateral roots adhere most firmly, the original one being still in the ground, where first planted. Although some of the plants are six or seven years old aud about twenty feet high, they have **uot** jet blossomed.
